

NEED A BIGGER PICTURE OF YOUR BUSINESS APPLICATIONS TO SPEED UP YOUR MTTR?

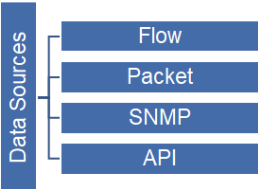

With the speed of today's digital economy, the cost to fix problems compared to preventing a major incident is potentially millions of dollars and lost customer confidence. IT organizations need proactive and predictive insights for preventative measures as opposed to reactionary measures.

Today's IT leaders have to manage several applications and a significant amount of data across their networks, ensure security from varying entry points, and be able to efficiently plan for migrations, consolidations or expansions. Having better visibility across your infrastructure is key in maintaining efficiency and solving problems quickly.

Tool Consolidation – Single Pane of Glass (SPOG) over entire Network

- End to End Visibility
- Visual Analytics Across Domains
- Real-Time Flow Topology and Deep Packet Analysis
- Real Time and Historical Analysis and Reporting
- Predictive Analytics and Insights

In partnership with **LiveAction**, **Resource Communications** can help simplify the management process by providing continuous insight, service assurance and control of enterprise networks.

LiveNX is a network performance and analytics platform that delivers real-time visual topology for situational awareness with precise control of end-to-end of policies and configurations to deliver service assurance across the enterprise.

LiveUX

The LiveNX (User Experience) module adds visibility to the network connecting

your users from Enterprise locations to the public cloud. It monitors end user experience of web applications deployed in private or public clouds over any network. You can gain insight into the availability and performance of any web-based applications.

LiveInsight

LiveNX Insight is a machine learning module which provides baseline trends, detects

anomalous network behavior and delivers predictive human-in-the-loop insights to enable the service assurance management of the user experience across the network.

LiveAgent

LiveAgent is an end point monitoring software that extends the visibility of LiveNX beyond network

devices by collecting data on virtual machines, servers, mobile devices or laptop end points to provide discovery, inventory, and usage tracking across the enterprise environment.
