

First remove the battery, release the battery stabilizer by pulling out the plunger and lifting up.

Next you can remove the battery and plug it into the charger.

The battery charger is plugged into a timer to avoid overcharging.

With everything connected you can now plug in the charger and turn it on by setting the charger to 6 hours.

The power light on the timer will come on and the light on the battery charger will turn on, first appearing green and then turning red to let you know it is charging. When the light on the battery charger turns back to green you will know the battery is fully charged.
