

BerdeMont HM001 Remedy Kit

Assembly Guidance

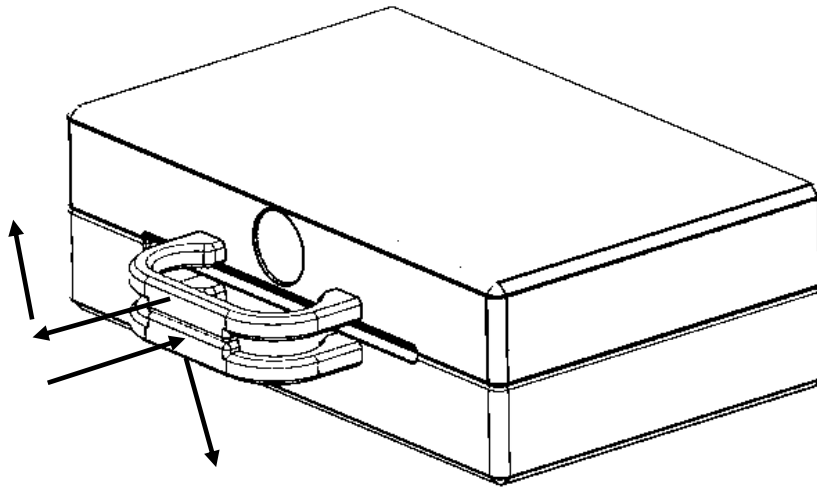

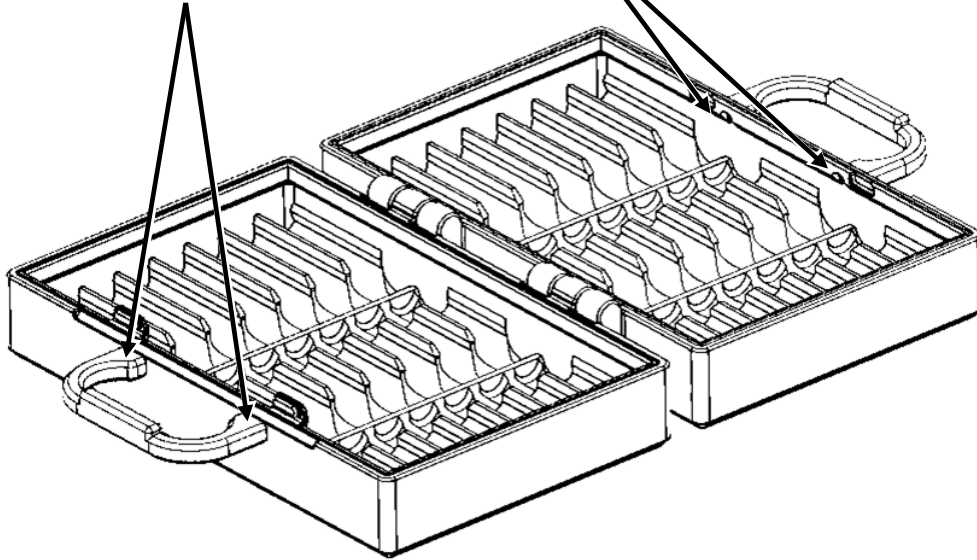

Thank you for purchasing a BerdeMont! We hope that you find the assembly process simple. We appreciate your effort to do this to ensure a safer delivery experience by reducing the risk of broken handles in shipment.

You will need a small Phillips (+) screwdriver to complete this assembly. The screws have been packaged pre-started in the handles to help them survive the journey to your home. Remove the screws from the handles. Hold each handle as shown in the image below placed over the screw holes on each side of the box, both top and bottom. Note that the handle bumpers should face UP as you install them with the kit opened up as shown. The purpose of these bumpers is to provide a secure feel when carrying the kit, and to avoid the handles weakening or breaking over time if over-squeezed. Install each screw from inside the box wall through the holes and into each handle end as shown. Do not over tighten, these are simple plastic fasteners and a strong hand could overwork them and strip out the plastic. You may use your own discretion to consider adding adhesive if desired (and if stripped out this is a way to remedy the error). No adhesive is required if installed properly. Just tighten gently you will feel when they are good and snug and that is when you should stop. The handles should not rock or move once both screws are tightened sufficiently.

The retention latches on the lid is designed to provide a reasonable security against the kit opening in transit. While they can be opened directly by pulling the handles apart from one another, it is a bit more smooth to jockey the handles (the lower inward, and the upper outward) slightly as shown in the image to help detach the retaining clips. This is simply up to you, but we wanted to provide a method.

Similarly, to remove the inner trays which are also designed to confidently retain a full assortment of Boiron remedy bottles, the recommended removal method is to place fingers on each of the lifting tabs, and rock the palms of your hands over the box walls as leverage to prop the tray up and out. Once you get the hang of this it's quite simple! We hope you find the balance between ease of use and item security / retention to be appropriate. The kit is designed to never let your remedy bottles spill out of the case (this was our first objective in designing this case)

2x screws at each location from inside
box thru and into handle pilot holes.

To open, simply pull handles apart (up and down) but consider trying to bias the handles with your fingers as you pull open by pressing the lower handle INWARD and the upper handle OUTWARD (this will help unload the retaining latches...try a few options to find what best works for you)
