From the author: *The Man Who Stole The Sun* is about a young athlete who grows up in Potomac Valley Track Club’s youth track & field program, track meets, other DC-area races, and runs Marine Corps Marathon at age 14 – after she heroically saves the world from disaster.

Love guides the story. Early on, we follow a murder mystery of someone who loves someone very much, and the love of a DC homicide detective who solves the case but at great cost to himself, but allows him to show his love for his daughter. Later we meet the world’s greatest inventor and see his love for his wife and his technology. We see the love of three brothers for their father – they will do anything for each other and for their father. We see the love of that father and daughter, now both Arlington Police officers as they overcome frightening danger on the night before the marathon. We see an emerging love story that carries the tale to its heartwarming end. Along the way, you learn the secrets of quantum mechanics and Stephen Hawking’s theoretical astrophysics, plus some Russian language and a bit of chess history.

It’s a fast-moving science-based suspense thriller, written “24” style, a tale of technology gone wild like something out of Michael Crichton. It’s also over-the-top funny sometimes, peppered with at least 20 famous quotes (count ‘em!). The first half builds up the characters with real-time action and flashbacks, and in the second half, they collide with great dramatic effect.

The book follows the laws of quantum mechanics – no quantum property is ever gained or lost – everything in the first half of the story plays a major dramatic role in the second half.

-- Jay Jacob Wind, author and once a champion marathon runner
