

It's pretty clear that certain segments of American society don't want to be confused by scientific facts. Evolution? Never happened. Global warming? It snowed last winter! What are you talking about? Which brings us to this year's science deniers — the anti-vaxxers. It isn't new — it just continues to spread. (You know, sort of like a case of measles in a classroom where one non-vaccinated kid infects all of his classmates.) Ironically, in the end, the only people who might be able to help the anti-vaxxers are scientists, who we hope are in their labs, feverishly working on a vaccine for stupidity.

## Now there's a vaccine to prevent "Parental Anti-Vaccine Hysteria"

**"Parental Anti-Vaccine Hysteria" is contagious! Urge your parents to protect themselves with the breakthrough new Anti-Vaccine Vaccine.**

With just one shot, Mom and Dad will be instantly immune from believing everything they read on science-denying websites. *Other benefits of the Anti-Vaccine Vaccine include:*

Vaccinated kids will start inviting you to their birthday parties.

Neighbors will stop thinking of your parents as dangerous, ill-formed and delusional.

You won't die from a disease that was eradicated over a half-century ago.

**Kids, be sure to have your parents vaccinated. It's for their own good — but mainly yours.**
