

A close-up photograph of a hummingbird hovering over a cluster of pink flowers. The bird is in sharp focus, showing its iridescent green head and back, and its long, thin beak. Its wings are blurred from rapid movement. The background is a dark, out-of-focus green, suggesting foliage. The overall lighting is soft, highlighting the bird and the delicate petals of the flowers.

Hummingbirds

Their diet

- Bugs
- Nectar

Their predators

- Mantis
- Spiders
- Cats
- Dragonflies
- frogs
chipmunks
- Squirrel
- Ants
- Big birds

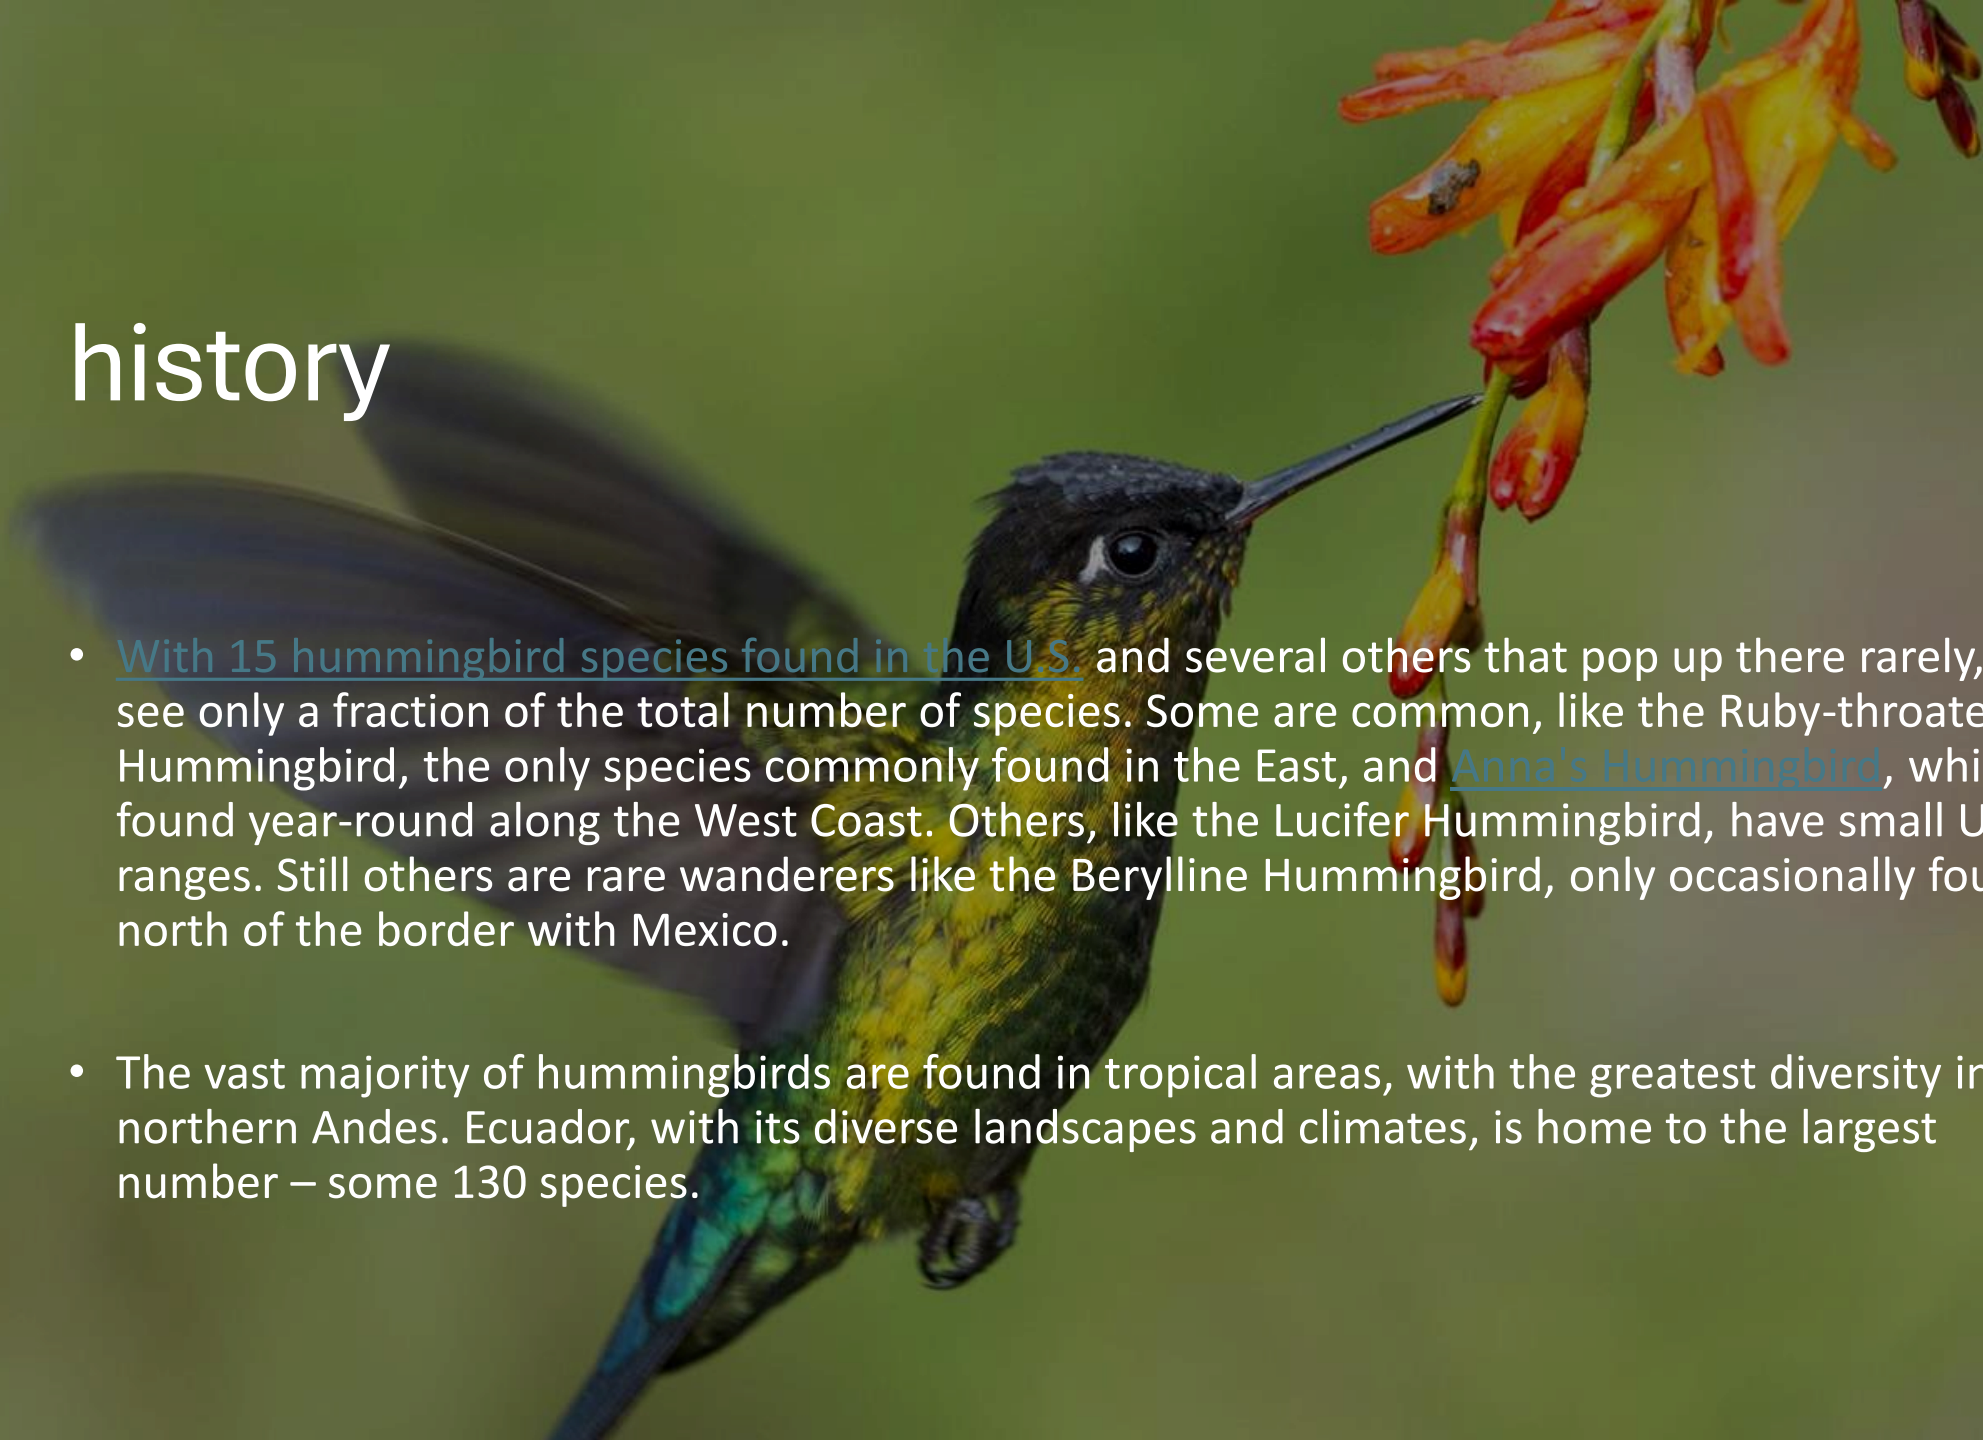

Their habitat

- From Tierra Del Fuego to southern Alaska and from below sea level deserts to steamy tropical forests at elevations of up to 16,000 feet in the Andes of South America.

history

- [With 15 hummingbird species found in the U.S.](#) and several others that pop up there rarely, we see only a fraction of the total number of species. Some are common, like the Ruby-throated Hummingbird, the only species commonly found in the East, and [Anna's Hummingbird](#), which is found year-round along the West Coast. Others, like the Lucifer Hummingbird, have small U.S. ranges. Still others are rare wanderers like the Berylline Hummingbird, only occasionally found north of the border with Mexico.
- The vast majority of hummingbirds are found in tropical areas, with the greatest diversity in the northern Andes. Ecuador, with its diverse landscapes and climates, is home to the largest number – some 130 species.

A hummingbird with iridescent feathers is hovering near a pink, cone-shaped flower. The background is a dark, blurred green. An orange horizontal bar is in the top left corner.

The vast majority of hummingbirds are found in tropical areas, with the greatest diversity in the northern Andes. Ecuador, with its diverse landscapes and climates, is home to the largest number – some 130 species.

More fun facts

Hummingbirds have outstanding spatial memory and can remember feeder locations years later. They are also able to keep track of bloom peaks and remember which flowers they've visited. This is because a large portion of a hummingbird's brain is occupied by the hippocampus, an area dedicated to learning and spatial memory.

Types of hummingbirds

Anna's hummingbird

Bee hummingbird

Violetear

Ruby-throated hummingbird

Rufous hummingbird

A hummingbird with iridescent green and blue feathers is shown in flight, hovering near a pink, cone-shaped flower. The bird's wings are spread, revealing brown and white patterns. The background is a dark, muted green. The text "Are hummingbirds endangered" is overlaid in white, centered on the image.

Are hummingbirds endangered

Yes they are endangered
