ADHD usually persists throughout a person's lifetime. It is NOT limited to children. ADHD impacts works, family relations and social relationships.

Definition of ADHD

ADHD is a syndrome generally characterized by inattention, distractibility, impulsivity, and hyperactivity. It is further categorized into three subtypes:

- 1- Behavior marked by hyperactivity (Psora) and impulsivity (Tubercular) but not inattentiveness (Sycosis)
- 2- Behavior that is marked by the reverse characteristics (Psora/ Tubercular)
- 3- Mixed type (Psora/ Syphilis)

It can be diagnosed to children and adults who consistently display certain characteristic behaviors over a period of time. The most common salient features include:

- 1- Distractibility- poor sustained attention to tasks (Psora/ Sycosis/ Syphilis)
- 2- Impulsivity- impaired impulse control and delay of gratification (Tubercular)
- 3- Hyperactivity- excessive activity and physical restlessness (Psora/ Sycosis)

Attention Deficit Disorder (ADD) is similar to ADHD except that the victims do not have the excessive activity (Psora/ Sycosis). ADD can be just as harmful to a person's social and educational development as ADHD.

Causes of ADHD

ADHD is not caused by poor parenting (Tolle causum), family problems (Tolle causum), poor teachers or schools (Tolle causum), too much TV (Tolle diceret), food allergies (Causa occaionalis), or excess sugar (Tolle diceret). There is a great deal of evidence that ADHD runs in families, which is suggestive of genetic factors.

Physical Factors

Advanced imaging techniques have detected differences in the brains of ADHD children compared to those of non-ADHD children. In some studies, right side of the brain is smaller (Psora/ Syphilis) in ADHD children than in non-ADHD children (? ADHD is a right sided disease???- Lyco Group?). The right side of brain contains three important areas:

- 1- Prefrontal cortex- it is located in the front of the brain, is brain's command center and regulates the ability to inhibit responses.
- 2- Caudate nucleus- It is located near the center of the brain, controls the orders coming from the prefrontal cortex.
- 3- Globus pallidus- It is also located near the center of the brain and it also controls the orders coming from the prefrontal cortex.

Abnormalities in these areas may impair a person's ability to control actions. This may result in the impulsivity typical of ADHD people. Important neurotransmitters including norepinephrine, dopamine, and serotonin are also located here which affect mental and emotional functioning. Some study reported that adults with ADHD had abnormally low levels of DOPA decarboxylase, the enzyme that produces dopamine.

Problems during Pregnancy

ADHD is often associated with problem pregnancies and with difficult deliveries. Maternal smoking (Psora) during pregnancy is also associated with a higher risk for ADHD.

Genetic Factors

Researchers are reporting underlying genetic mechanisms that regulate hyperactivity, particularly those that affect the neurotransmitter dopamine.

Diet

A number of studies have suggested that sugar plays no role in hyperactivity. ADHD children have fewer problems after a high-carbohydrate breakfast than after a high-protein one.

The signs and symptoms of ADHD

- 1- Failure to give close attention to details (Sycosis/ Tubercular) or makes careless mistakes
- 2- Difficulty sustaining attention to tasks (Sycosis)
- 3- Does not seem to listen when spoken to directly (Sycosis/ Tubercular)
- 4- Fails to follow instructions carefully and completely (Syphilis/ Tubercular)
- 5- Loses or forgets important things (Sycosis/ Tubercular)
- 6- Restless, often fidgeting with hands or feet, or squirming (Psora/ Sycosis)
- 7- Runs or climbs excessively (Psora/ Tubercular)
- 8- Talks excessively (Psora/ Sycosis)
- 9- Often blurts out answers before hearing the whole question (Psora/ Tubercular)
- 10- Difficulty waiting for his or her turn. (Psora/ Tubercular)

In a busy atmosphere, such as a classroom or a crowded place, ADHD children often become distracted and react by strange behavior. ADHD children are often hypersensitive to sights, sounds, and touch and complain excessively about stimuli that seem little to others. Sleeping problems usually continue.

An essential feature in ADHD is impaired working, or short-term, memory (Psora/ Sycosis/ Tubercular). The exact nature and severity of ADHD symptoms varies from person to person.

DSM-IV (1994) Criteria: Either 1 (Inattention) or 2 (Hyperactivity-Impulsivity)

The Diagnostic and Statistical Manual of Mental Disorders, 4th edition text revision (DSM-IV TR) is used by clinicians and psychiatrists to diagnose psychiatric illnesses.

Behavior has persisted for at least six months and to such a degree that it is well marked and must present with six or more of the following-

1. Inattention

- 1- failure in giving close attention to details (Sycosis/ Tubercular) or makes careless mistakes in routine works (Tubercular)
- 2- difficulty in sustaining attention in tasks or play activities (Sycosis)
- 3- not looking to listen when spoken to directly (Syphilis/ Tubercular)
- 4- not following through on instructions and failing to finish schoolwork, chores, or duties in the workplace (Psora/ Syphilis/ Tubercular/ Sycosis)
- 5- difficulty in organizing tasks and activities (Psora/ Sycosis/ Syphilis)
- 6- Often avoids, dislikes, or is reluctant to engage in tasks that require sustained mental e.g. schoolwork or homework (Tubercular/ Syphilis)
- 7- Often loses things necessary for tasks or activities e.g. toys, school assignments, pencils, books, or tools (Sycosis)
- 8- Is often easily distracted by unconnected stimuli (Psora/ Tubercular)
- 9- Is often forgetful in daily activities (Psora/ Sycosis/ Tubercular/ Syphilis)

2. Hyperactivity-Impulsivity

Hyperactivity

- 1- Often fidgets with hands or feet or twists in seat (Psora/ Sycosis)
- 2- Often leaves seat in classroom or in other situations in which remaining seated is expected (Tubercular/ Sycosis)
- 3- Often runs about or climbs excessively in situations in which it is inappropriate e.g. in adolescents or adults, may be limited to subjective feelings of restlessness (Psora/ Sycosis)
- 4- Often has difficulty playing or engaging in leisure activities quietly (Sycosis)
- 5- Is often "on the go" or often acts as if "driven by a motor" (Psora/ Sycosis/ Tubercular)
- 6- Often talks excessively (Psora/ Sycosis)

Impulsivity

- 1- Often blurts out answers before questions have been completed (Psora/ Tubercular)
- 2- Often has difficulty awaiting turn (Psora/ Tubercular)
- 3- Often interrupts or intrudes on others (e.g., butts into conversations or games) (Sycosis)

Differential Diagnosis of ADHD

Attention Deficit Disorder without Hyperactivity

The child's primary symptoms are distractibility and an inability to persist in tasks (Sycosis/ Syphilis).

Oppositional Defiant Disorder

About half the children diagnosed with ADHD also have ODD. The most common symptom for this disorder is a pattern of negative, defiant, and hostile behavior toward authority figures (Syphilis) that lasts more than six months. In addition to displaying inattentive (Sycosis) and impulsive (Tubercular) behavior, these children demonstrate aggression (Psora/ Sycosis/ Tubercular), have frequent temper tantrums, and display antisocial behavior (Sycosis).

Pervasive Developmental Disorder

PDD is rare and usually marked by autistic-type behavior, hand-flapping (Sycosis), repetitive statements (Sycosis), slow social development (Syphilis), and speech and motor problems (Psora/ Syphilis). If ADHD does not respond to treatment, we might inquire about PDD.

Primary Disorder of Vigilance

PDV is a term for a syndrome that includes poor attention and concentration (Sycosis) as well as difficulties staying awake (Psora/ Syphilis). Symptoms are tendency to fidget (Psora/ Sycosis), yawn and stretch (Psora/ Sycosis), and appear to be hyperactive (Sycosis) in order to remain alert and a typical kind and affectionate temperaments (Psora/ Tubercular). The condition is inherited and gets worse with age, but is treatable with stimulants.

Central Auditory Processing Disorder and Hearing Problems

ADHD often has difficulties with tasks that involve listening or hearing (Psora/ Syphilis). Symptoms of these two disorders often overlap but may actually be two distinct disorders. Hearing problems themselves may cause ADHD symptoms.

Bipolar Disorder (Manic Depression)

ADHD may also have bipolar disorder (Psora/ Syphilis/ Tubercular), commonly called manic depression. Indications of this problem include episodes of depression (Syphilis) and mania (Psora/ Sycosis) (with symptoms of irritability, rapid speech, and disconnected thoughts), sometimes occurring at the same time. Children with mania and ADHD may have more aggression, behavioral problems, and emotional disorders than those with ADHD alone.

Anxiety Disorders

Anxiety disorders commonly accompany ADHD. Obsessive compulsive disorder is a specific anxiety disorder that shares many characteristics with ADHD and may share a genetic component. Young children who have experienced traumatic events, including sexual or physical abuse or neglect, exhibit characteristics of ADHD, including impulsivity (Tubercular), emotional outbursts (Psora/ Tubercular/ Sycosis), and oppositional behavior (Sycosis).

Other Diagnoses

Lead - Children who ingest even low amounts of lead (Causa occasionalis/ Tolle causum) exhibit many symptoms similar to ADHD; they are easily distractible, disorganized, and have trouble thinking logically.

Genetic Abnormalities - A number of genetic disorders cause symptoms resembling ADHD, including fragile X and Tourette's syndrome (Syphilis/ Tolle causum).

Medical Conditions - A number of medical problems can produce ADHD-like symptoms, including hyperthyroidism and hearing or vision problems (Tolle causum/ tolle diceret).

Post-traumatic Stress Disorder - Young children who have experienced traumatic events (Causa occasionalis), including sexual or physical abuse or neglect (Causa occasionalis/ Tolle causum), exhibit characteristics of ADHD, including impulsivity, emotional outbursts, and oppositional behavior.

Restless Legs Syndrome (RLS) - RLS and periodic limb movement disorder (Sycosis) are thought by some experts to be strongly associated with attention-deficit hyperactivity disorder in some children. The disorders have much in common, including poor sleep habits, twitching, and the need to get up suddenly and walk about frequently (Sycosis).

Treatment of Attention-Deficit Hyperactivity Disorder

A wide variety of treatments have been used for ADHD including, but not limited to, various psychotropic medications, psychosocial treatment, dietary management, herbal and homeopathic treatments, biofeedback, meditation, and perceptual stimulation/training.

Psychosocial treatments of ADHD

Important options for the management of ADHD are psychosocial treatments, particularly in the form of training in behavioral techniques for parents and teachers. Behavioral techniques typically employ time-outs, point systems and contingent attention.

Behavioral Approaches

The main psychosocial treatments for ADHD are behavioral training for parent and teacher, as well as systematic programs of contingency management.

Cognitive-Behavioral Therapy

CBT might be helpful in treating symptoms of accompanying disorders such as oppositional defiant disorder, depression, or anxiety disorders.

Psychoeducation

Adequate and appropriate educational resources to cases of ADHD may be helpful.

Other Methods of Treating ADHD

Multimodal Treatments

Medication used together with multiple psychosocial interventions in multiple settings may be more effective than medication alone.

Dietary Changes

A number of diets have been suggested for people with ADHD. Any minor deviation in the diet presumably throws the child immediately into hyperactive mode.

Neurofeedback

Neurofeedback is an experimental approach that uses electronic devices to speed up or slow down brain wave activity.

Homoeopathic Treatment of ADHD

Main Homoeopathic Remedies indicated in Treatment of ADHD in decreasing order of similarity-
