Definition

CSF rhinorrhoea is discharge of cerebrospinal fluid through a fistula (Psora/ Syphilis) between the subarachnoid space and the nasopharynx, either direct via the anterior cranial fossa and para nasal sinuses (PNS) or indirect from the middle or posterior fossa via the eustachian tube with an intact tympanic membrane.

Historical Perspective

- First described by Galen, 200 B.C.
- The first well-succeeded surgical approach was attributed to Dandy in 1926.

Causes and types

Traumatic

Acute / Early - within 1 week

- Main cause of CSF leak is head trauma, particularly, basilar skull fracture (Causa occasionalis)

Delayed - month/year later

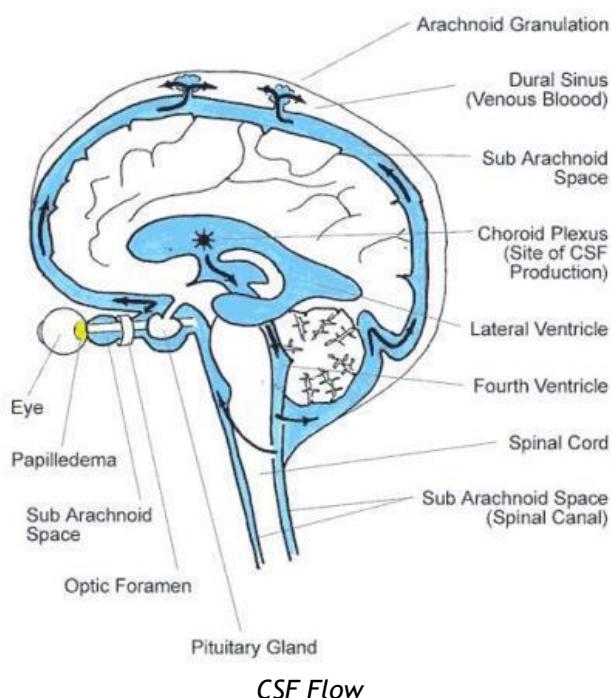

- Lysis of clot in the area of fracture (Syphilis)
- Resolution of soft tissue edema (Psora)
- Loss of vascularity with necrosis of soft tissue around the wound (Psora/ Syphilis)
- Delayed increase in intra cranial pressure (ICP) after trauma (Sycosis)

Non-surgical

- Blunt trauma - Basilar skull fracture (Causa occasionalis)
- Projectile trauma (Causa occasionalis)

Surgical / Iatrogenic / Post-operative leaks

- Craniotomy (Causa occasionalis)
- Paranasal sinus surgery (Causa occasionalis)
- Skull base tumor ablation (Causa occasionalis)
- Transsphenoidal surgery (Causa occasionalis)

Spontaneous / Non-traumatic

High-Pressure Flow

- Due to increased intra cranial pressure. (Psora/Sycosis)

Intracranial tumors

- Pituitary tumors are the most common neoplastic cause of spontaneous CSF leak, due to sellar erosion. (Psora/Sycosis/Syphilis)

Hydrocephalus

- Due to high pressure of CSF. (Psora/Sycosis)

Low-Pressure Flow

- Bony erosion, Osteomyelitis, Osteonecrosis. (Psora/Syphilis)
- Sellar atrophy (Syphilis)
- Olfactory atrophy / Focal cerebral atrophy (Syphilis)
- Congenital defects of skull base (Syphilis)
- Pneumatized bone (Psora/Sycosis/Syphilis)
- Idiopathic

Signs and symptoms

Discharge

- Unilateral clear watery nasal discharge with a salty taste
- Dripping in the back of throat

Headache

- Recurrent attacks of headache, fever and meningitis in a patient with history of head trauma.
- High pressure - build up over time & relieved by sudden discharge of fluid.
- Low pressure - postural headache relieved by reclining.

Reservoir sign

- Large volume of fluid flowing out of the nose during a change in head position - indicates that a CSF-filled sinus has drained at once.

Provocative Tests

- Occult CSF leak can be made manifest with the aid of
- Valsalva maneuver
- Jugular venous compression
- Flexing the neck in sitting position

Target sign/Halo sign

- Pseudochromatographic pattern produced by differential diffusion of CSF admixed with blood or other serosanguinous fluid on filter paper - CSF produces a "Bull's eye pattern" with blood in the center.

Anosmia

- Unilateral/bilateral anosmia - defect or leak in the region of cribriform plate.

Nervous symptoms

- Imbalance, dizziness, hearing loss, VII nerve dysfunction, temporal bone fracture.

Optic nerve lesion

- Injury in the region of tuberculum sellae, sphenoid sinus and the posterior ethmoids.

Glucose

- Rhinorrhea is applied to glucose oxidase strips and color change is observed.
- High false positives - tears and mucus can produce change on the glucose oxidase strips as well.

B2 Transferrin

- B2 transferrin protein band is identified in CSF only.

B Trace Protein

- 2ndmost common protein in CSF (albumin 1st)
- Produced by meninges and choroid plexus
- Present in serum but very low level

Complications

- Over drainage of CSF - pneumocephalus, intracranial haemorrhage
- High CSF protein concentration - Blockage
- Meningitis - incidence can be reduced by tunneling the external catheter and by prophylactic antibiotics

Diagnosis

- Plain X Ray Skull for basilar skull fracture and air-fluid level in the PNS
- CT with bone windows
- CT cisternography
- MRI
- Neuroimaging- Tracer study

CSF Leak

Treatment

Conservative

- Position - elevated head 30-45° for cranial leaks.
- Avoidance of sneezing, coughing, straining.

Surgical

- Repair of leakage.

Homoeopathic treatment
