Definition

Eagle syndrome is symptomatic elongation of the styloid process or calcified stylohyoid ligament, which is often bilateral (Psora/ Sycosis).

It may be defined as a rare condition caused by an elongated or deviated styloid process and/or calcification of the stylohyoid ligament, which interferes with adjacent anatomical structures giving rise to pain.

Etymology

Italian anatomist Pietro Marchetti described ossification of stylohyoid ligament in 17th century. It was first described by Watt Eagle in 1937.

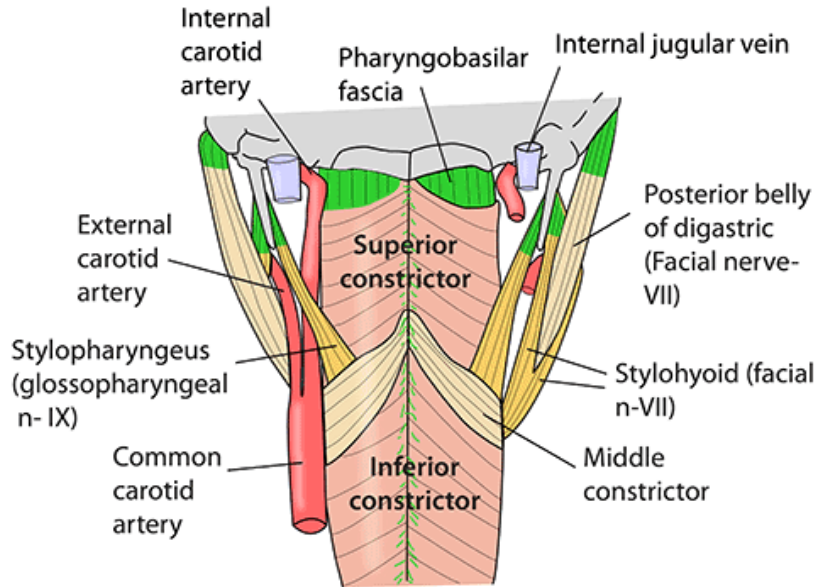

Synonyms

Eagle syndrome, stylohyoid syndrome, styloid syndrome, styloid-stylohyoid syndrome, styloid-carotid artery syndrome

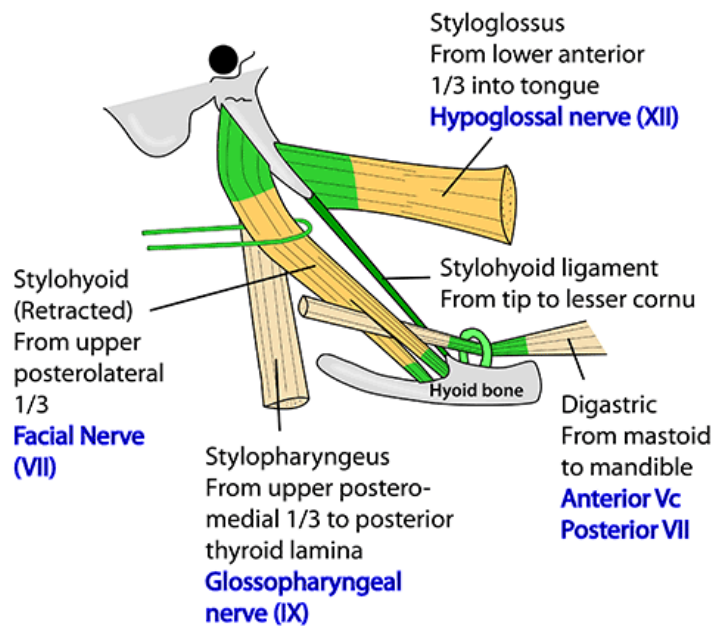

Regional anatomy

Styloid process or temporal styloid process (from Greek stylos (στῦλος), "pillar") refers to the slender, pointed process of temporal bone of the skull, which usually serves as points of attachment for muscles. The stylohyoid ligament, stylomandibular ligament, styloglossus muscle, stylohyoid muscle and stylopharyngeus muscle are attached to the styloid process.

STYLOID PROCESS MUSCLE AND LIGAMENT ATTACHMENTS POSTERIOR VIEW

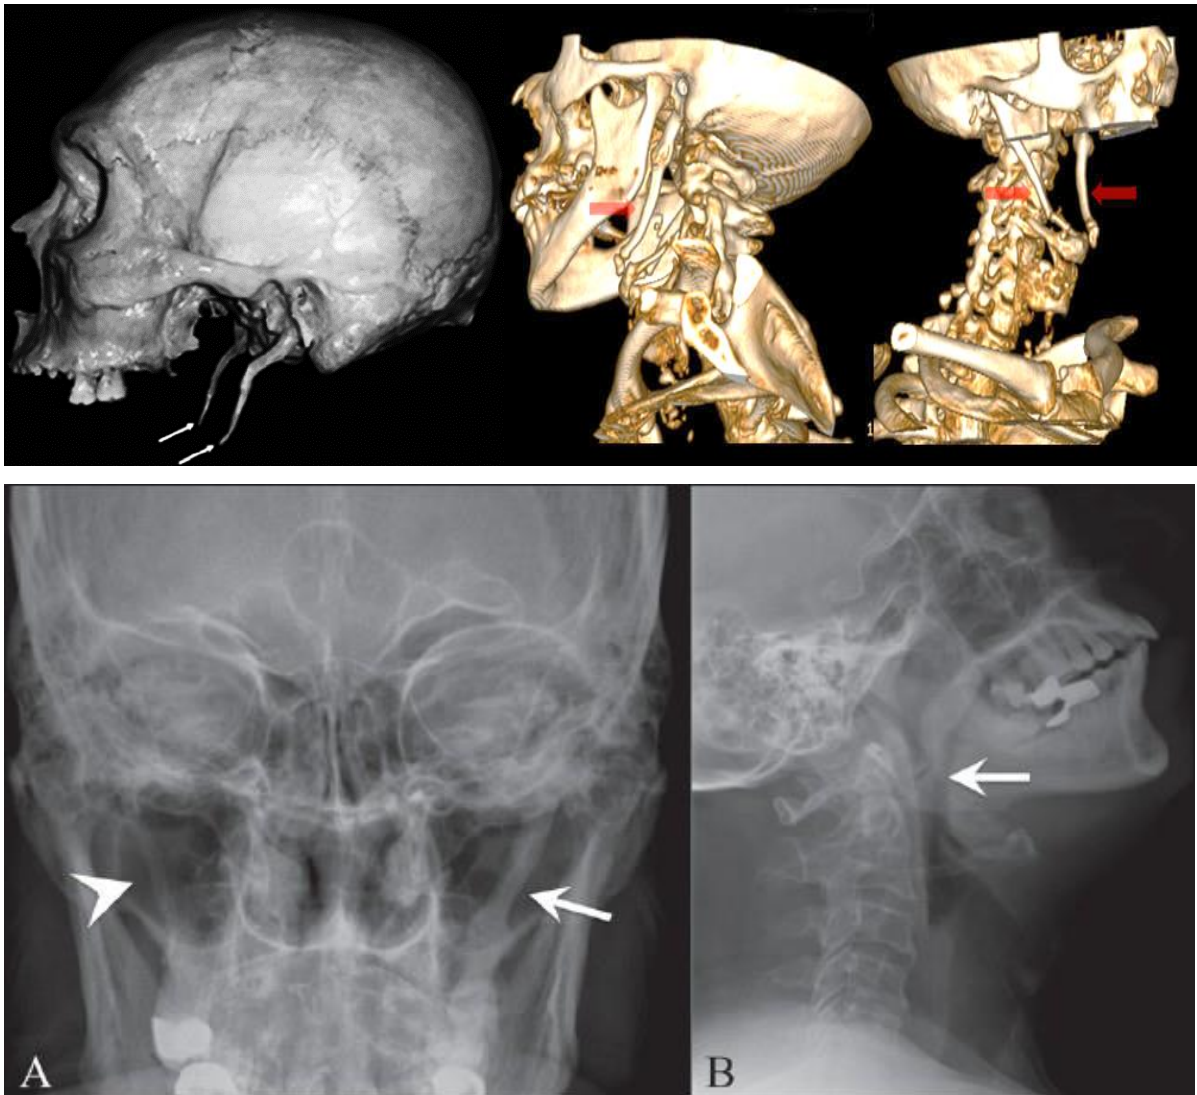

RIGHT STYLOID PROCESS MUSCLE AND LIGAMENT ATTACHMENTS LATERAL VIEW

Etiology

Ossification of the stylohyoid and stylomandibular ligament causes prolongation of the styloid process and clinical symptoms (Psora/ Sycosis).

Arrows- Styloid processes

Other syndromes closely connected with the styloid process syndrome are-

Costen's syndrome

A complex of symptoms that includes loss of hearing, tinnitus, dizziness, headache, and a burning sensation of the throat, tongue, and side of the nose mainly due to temporomandibular joint syndrome (Psora).

Trotter's syndrome

It is a clinical triad of unilateral deafness, neuralgia affecting branches of the trigeminal nerve, and defective mobility of the soft palate, which is caused by malignant tumors involving the lateral pharyngeal recess or Rosenmüller's fossa (Psora/ Sycosis/ Syphilis).

Myofascial painful syndrome

Myofascial pain syndrome (MPS), also known as chronic myofascial pain (CMP), is a syndrome characterized by chronic pain in multiple myofascial trigger points ("knots") and fascial constrictions (Psora).

In most cases of Eagle syndrome, the cause is not known however it is sometimes associated with disorders causing heterotopic calcification as in abnormal Calcium-Phosphorus metabolism and chronic renal failure (Psora/ Sycosis/ Syphilis). The Eagle syndrome may appear in two ways-

Cranial nerve impingement

The symptoms appear due to compression and irritation of cranial nerves in the region of cranial nerves V, VII, IX and X. On palpation of the tip of styloid process, symptoms are ideally aggravated (Psora/ Causa occasionalis).

Arterial impingement

The compression of the carotid artery may also produce vascular or ischemic symptoms along with pain in the area of artery as well as supplied territory which may be mediated by the sympathetic plexus (Psora/ Causa occasionalis).

Signs and symptoms

The clinical picture depends on the cause of styloid elongation or stylohyoid calcification as well as local compression of cranial nerves and carotids.

Typically, the pain appears after tonsillectomy, presumably due to distortion of the local anatomy following surgery, however it may appear without surgical injuries too.

The Eagle syndrome can present with two sets of symptoms appeared due to-

Compression of cranial nerves

- Change in voice (Psora/ Sycosis)
- Dysphagia (Psora/ Sycosis)
- Facial pain while turning the head (Psora)
- Foreign body sensation (Psora)
- Pain on extending tongue (Psora)
- Sensation of hypersalivation (Psora)
- Tinnitus or otalgia (Psora/ Sycosis)

Compression of carotid artery

The symptoms may arise due to-

- Mechanical compression of carotid artery (Causa occasionalis)
 - Visual symptoms
 - Syncope
 - Carotid dissection
- Sympathetic plexus irritation (carotidynia) (Causa occasionalis)
 - Eye pain
 - Parietal pain
