*Anatomic Location of Urinary Bladder*

## Definition

Neurogenic bladder is a condition in which the nerves of the urinary system don't work properly when the bladder is full. It can lead to different kinds of problems, including urine leakage if the muscles holding urine do not get the right message.

For some, the muscles don't get the message the bladder is full and its time to let go. If the bladder becomes too full, urine may back up into the kidneys, and the extra pressure causes damage to the tiny blood vessels in the kidney. Urine that stays too long may also cause an infection of the bladder or ureters.

## Risk Factors

Accident that causes trauma to the brain or spinal cord, exposure to heavy metal poisoning, diabetes, and acute infections.

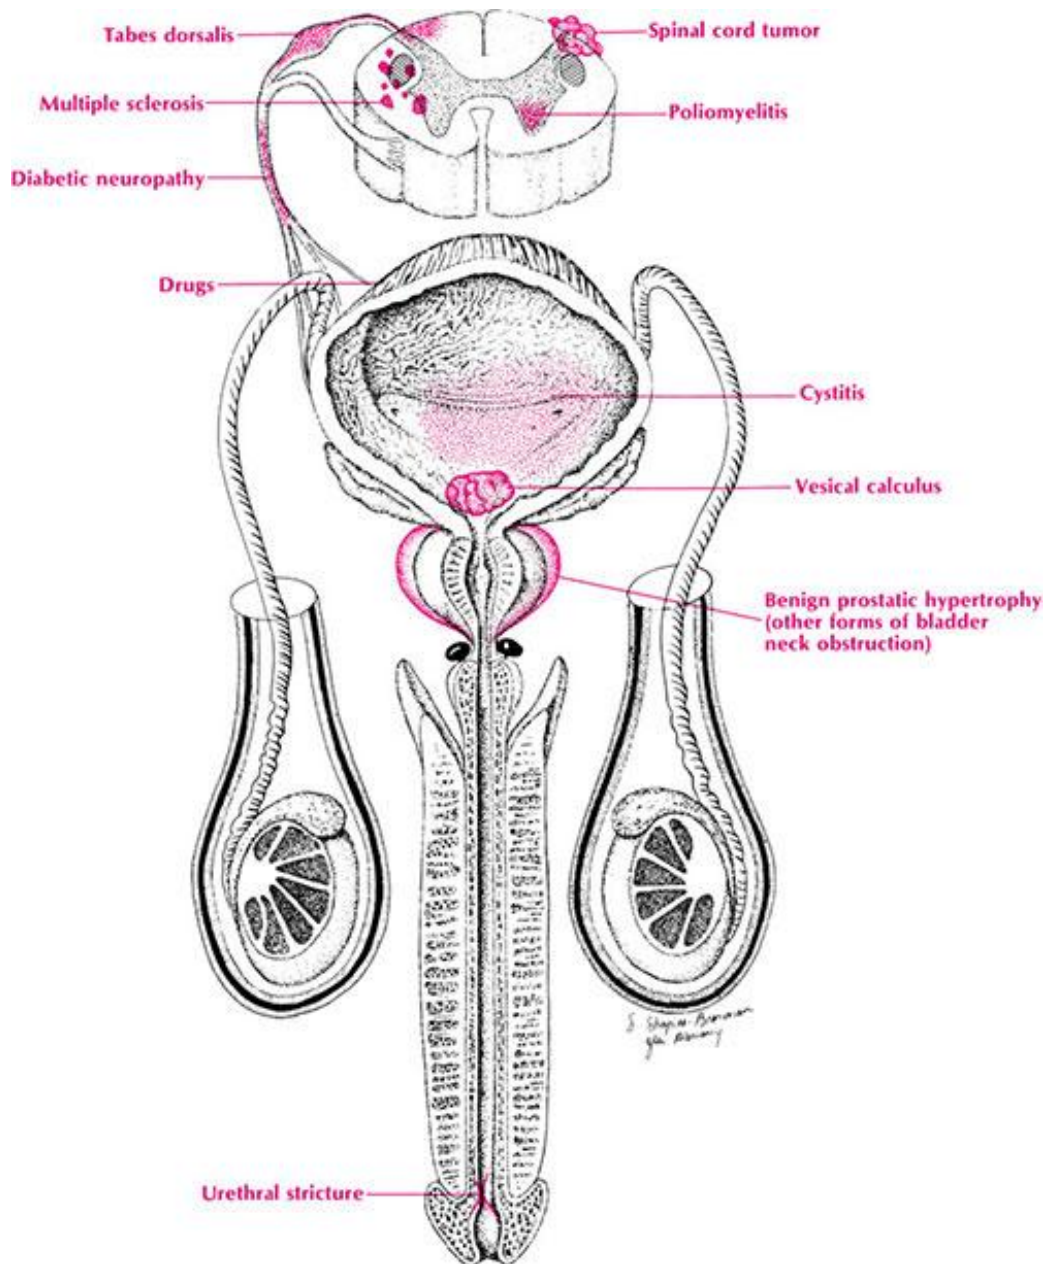

Some patients are born with nerve problems, which can keep a baby's bladder from releasing urine, leading to urinary infections or kidney damage.

## Causes

Hypotonic (flaccid) neurogenic bladder is generally caused by damage to the spinal cord due to congenital causes such as spinal cord lesions.

Spastic (contracted) neurogenic bladder is usually caused by brain or spinal cord damage that results in paraplegia or quadriplegia.

Several diseases, including syphilis, as well as diabetes mellitus, brain or spinal cord tumors, stroke, ruptured intervertebral disk, and degenerating diseases such as multiple sclerosis and amyotrophic lateral sclerosis can also cause hypotonic and spastic neurogenic bladder.

*Causes of Neurogenic Bladder*

## Symptoms

Patients with hypotonic neurogenic bladders have flaccid and distended bladders and constantly leaking small amounts of urine (overflow dribbling). In patients with chronic hypotonic neurogenic bladder, urinary tract infections are common.

Patients with spastic neurogenic bladders from upper spinal cord lesions usually suffer from incontinence.

There are two main types of incontinence:

- Stress urinary incontinence (SUI), which is caused by a deficiency of the closure mechanism of the bladder.
- Urge incontinence, which is caused by over activity of the bladder.

## Diagnosis

To diagnose neurogenic bladder, tests of both the nervous system (including the brain) and the bladder itself are necessary. X-rays and MRI of the skull and spine and an EEG may be needed.

- 1- Cystoscopy may be used to assess the loss of muscle fibers and elastic tissues and, in some cases, for removing small pieces of tissue for biopsy.
- 2- Urodynamics is the investigation of the function of the lower urinary tract - the bladder and urethra - using physical measurements such as urine pressure and flow rate as well as clinical assessment.
- 3- A midstream specimen of urine is sent to the laboratory in order to exclude infection.
- 4- A Pad test may be performed for women complaining of urinary incontinence. This test determines the severity of any incontinence and objectively demonstrates the symptom. The patient drinks 500ml of water and walks about performing normal everyday tasks while wearing a pre-weighed pad. The pad is then re-weighed and a gain of more than 1g per hour is taken to represent urinary incontinence.
- 5- The cystometrogram is basically performed to evaluate the compliance and stability of the detrusor muscle. Eighty five per cent of all incontinence occurs in women, and three quarters of those suffer with stress incontinence (ie leakage in the absence of over activity).
- 6- Compliance is simply the elastic property of the detrusor muscles. An evaluation of compliance is an evaluation of the ability of the bladder to 'stretch' to 'normal' capacity while maintaining low pressures.
- 7- Stability is evaluated by observing the detrusor while filling the bladder to normal capacity. The evaluation determines the presence or absence of detrusor overactivity (or instability).
- 8- Vesical pressure is the pressure that is measured inside the bladder, with a catheter that is specifically designed for pressure monitoring in the urinary tract. This is a combination

- of the pressure being exerted on the bladder by the abdominal contents, the weight or pressure of any urine in the bladder and the force that the detrusor muscle is exerting on that fluid. The pressure in an empty bladder is usually called resting pressure, which changes with position.
- 9- Abdominal pressure is measured by placing a special catheter either in the rectum or the vagina. Abdominal pressure information is significant because the bladder is contained in the floor of the abdominal cavity and it is important to isolate pressures and activities occurring in the bladder itself.
  - 10- The detrusor pressure is a subtracted pressure that is calculated by subtracting the abdominal pressure from the vesical pressure.
  - 11- Videocystourethrography can be done in situations of particular complexity, flow/pressure studies are combined with the use of X-ray screening in order to gain additional information about the anatomy of the bladder and urethra.
  - 12- Ultrasound scanning can also be used to demonstrate an abnormally low bladder neck.

## Treatment

Treatment for neurogenic bladder depends on the cause of the nerve damage and the type of voiding dysfunction.

If the problem is urinary retention, it may be necessary to use a catheter to empty the bladder at regular times.

Neurogenic bladder may be treated by attempting to reduce bladder stretching through intermittent or continuous catheterization.

Increased fluid intake also decreases the concentration of calcium in the urine, minimizing urine crystallization and the subsequent formation of stones. Moving around as much as possible and a low calcium diet also help to reduce stone formation.

Long-term management for the individual with an overactive bladder is aimed at establishing an effective spontaneous reflex voiding.

The Valsalva maneuver, involving efforts similar to those used when straining to pass stool, produces an increase in intra-abdominal pressure that is sometimes adequate to completely empty the bladder.

Some individuals who are unable to control urine output due to deficient sphincter tone may benefit from perineal exercises.

Male patients with extensive sphincter damage may be helped by the use of a Cunningham clamp. The clamp is applied in a horizontal fashion behind the glans of the penis and must be removed approximately every four hours for bladder emptying to prevent bacteria from growing in the urine and causing an infection.

Alternation of the Cunningham clamp with use of a condom collection device will reduce the skin irritation sometimes caused by the clamp.

Surgery is another treatment option for incontinence. Urinary diversion away from the bladder may involve creation of a urostomy or a continent diversion. The surgical implantation of an inflatable sphincter is another option for certain patients. An indwelling urinary catheter is sometimes used when all other methods of incontinence management have failed.

## **Homoeopathic Treatment**

The cause of the bladder problem must be determined and treated appropriately. Homoeopathy has a miraculous role in curing Neurogenic Bladder.

### **Ferrum phosphoricum-**

Incontinence of urine, if from weakness of the sphincter muscle. Wetting of the bed, especially in children. Enuresis nocturna, from weakness of the muscles, often seen in women, when every cough causes the urine to spurt. Cystitis, first stage, with pain, heat or feverishness. Suppression of the urine with heat. Excessive secretion of urine. Polyuria simplex. "Irresistible urging to urinate in the daytime, aggravated by standing and accompanied by pain along the urethra and neck of the bladder. Retention of urine with fever in little children, as well as involuntary spurting of urine with every cough." (M. Deschere, M.D.) Some varieties of red wine will cure nocturnal enuresis in children, owing to the iron contained therein. Dose night and morning. Diurnal enuresis depending on irritation of neck of the bladder and end of penis.

### **Kalium muriaticum-**

Cystitis, second stage, when swelling has set in (interstitial exudation), and discharge of thick, white mucus. "In this trouble there is no better internal remedy." (Peltier.) The principal remedy in chronic cystitis. Urine dark-colored, deposit of uric acid, where these exist torpor and inactivity of the liver.

### **Kalium phosphoricum-**

Cystitis in asthenic conditions with prostration. Frequent urination, or passing large quantities of water. Frequent scalding; nervous weakness. Incontinence of urine from nervous debility, bleeding from the urethra. Paralysis, affecting the sphincter muscle, causing inability to retain the urine. Enuresis in older children. Urine quite yellow. Itching in urethra. Cutting pain in bladder and urethra.

### **Kalium sulphuricum-**

According to Mitchell this remedy was used by Haerman, of Paris, and endorsed by the late T.F. Allen for Oxaluria. Magnesium phosphoricum Constant urging to urinate whenever the person is standing or walking. Spasmodic retention of the urine. Gravel. Pain after the use of the catheter, a sensation as if the muscles did not contract. Child passes large quantities of urine. [P. 334. ]

### **Natrium phosphoricum-**

Incontinence of urine in children with acidity. Polyuria. Urine dark-red, with arthritis. Frequent micturition. Diabetes. Atony of the bladder. Gravel. Schussler in his last edition claims that this is the chief remedy in catarrh of the bladder.

### **Natrium sulphuricum-**

Sandy deposit or sediment in the urine, gravel, lithic deposits, brickdust-like coloring matter in the water, associated with gout. Polyuria simplex, excessive secretion if diabetic. Urine loaded with bile. Wetting of the bed at night, or retention of urine.

### **Silicea terra-**

Urine loaded with pus and mucus. Red sandy deposit of uric acid. Enuresis from worms and in chorea. Must get up at night to urinate.

### **Calcarea sulphurica-**

Inflammation of the bladder, in chronic stage, pus forming. Red urine with hectic fever. Nephritis scarlatiosa. (S. Lilienthal.)

### **Calcarea phosphoric-**

Urine copious. Enuresis, wetting the bed in young children and in old people, as an intercurrent after Natrum sulph.. For gravel, calculous, phosphatic deposit. To check the reformation of stone in the bladder, also butter-milk or koumiss as a dietary help. Flocculent sediment in urine.

### **Natrium muriaticum-**

Polyuria, with much emaciation; haematuria after scurvy; cutting pain after urinating. Cystitis. Involuntary urination when walking, coughing, etc. Incontinence of urine. Cutting in urethra after urinating.

### **Calcarea fluorica-**

Copious urine with frequent urging. Urine scanty and high colored, and emits a pungent odor. Vaccination Should any bad results show themselves Kali mur. will give entire satisfaction. (Schussler.) If necessary, follow with Silicea.
