Systems

Eurofyre supply a range of fire, smoke, heat and gas detection systems to suit a wide variety of commercial and industrial applications. We strive to provide the highest quality products and offer an exceptional level of support. We regularly supply leading fire detection equipment to countries all over the world, including those in the Middle East, Asia, and America.

Fire Detection

Eurofyre supply a range of analogue addressable, 2-wire addressable and conventional fire detection systems. Our fire detection systems cater for a variety of applications with systems to suit very small to very large properties. All of our fire detection systems are built using an 'open' protocol giving the owner the freedom to choose their own installer or maintenance company.

Beam Detection

Open-area Smoke Imaging Detection (OSID) is a new innovation in projected beam smoke detection technology. By using advanced dual wavelength projected beams and optical imaging technology for early warning smoke detection, OSID provides a low-cost, reliable and easy-to-install solution that overcomes typical beam detection issues such as false alarm incidents and alignment difficulties.

Flame Detection

The FSL100 Series of flame detectors from Honeywell delivers robust, fast, and reliable detection of flaming fires in a wide range of applications.

The range consists of UV, UV/IR and IR3 flame detectors. All utilise sophisticated sensing and signal analysis to detect fires quickly while also rejecting false alarms.

Linear Heat Detection

Linear heat detection provides early warning of fire or overheating. Heat sensing cable detects high temperatures at any point along its length and can accurately pinpoint the location of a fire or increases in temperature. Linear heat cable can be placed in cable trays, around electrical equipment, around warehouse racking, in roof voids and in many other locations to provide fast and reliable detection.

Aspirating Smoke Detection

Aspirating smoke detection (ASD) systems use powerful aspirators to actively draw air from a protected area through a network of pipes and into a detection chamber. Aspirating smoke detectors are highly sensitive and can detect smoke even before it is visible to the human eye.
