19
      THE CHAIR:
                                 Good morning, everyone. Please be
20
           seated.
21
                And welcome.
                               I think we've got a few technical
22
           glitches we're trying to sort out here, so maybe while
23
           that's happening I'll talk about a few things.
24
                Number one, welcome to the alternate universe.
                                                                  Ιn
25
           this world, the witnesses are on that side, the counsel
```

have switched, and the staff and Legal are on that side. So it might take us a little while to get used to where we're supposed to look, and I hope you don't have the same challenges as us.

Also, welcome to the Krokers and various other people who made the long drive from the far east to come here. Welcome.

And the last thing that I'm going to talk about is what happens in the event of an emergency. So there are two emergency exits out of this room. One is right behind me to my right here. You go out these doors and you turn left. You'll be into the hallways and go find the stairwells to go down.

And back through the way you came, through these doors, you turn right, go straight through and out the other set of doors you came in, and you'll find the emergency exits and the stairwells to go down from there.

So in the event of any type of an alarm that we're required to vacate, that's your way out.

So today we're going to hear the two remaining witness panels from the Clearview Group, and then we'll be taking a break for preparation of oral argument.

We'll have another break. We will then hear the reply, and that should pretty much conclude our day.

AMICUS

09:00

Does anybody have anything of a preliminary nature that we should deal with before we ask Mr. Fitch to introduce his panel?

Seeing none, maybe we'll wait a few minutes and just get the technical issues, get themselves sorted out. Please speak among yourselves.

All right. It looks like we've got things basically sorted out.

Just a few things I probably should have mentioned. We're pretty technology savvy here, so all of the exhibits are going to show up on the screens that you see. When you refer to an exhibit, we'll have the exhibit pulled up. So just give us a minute or so to make sure that the exhibit is up on the screen. We have the same real live transcript, as we had last week. And all the microphones are wireless. So, again, push the button to speak. The little light will turn green so you'll know it's on. Push it again, it will turn red. And you can pull the mic to you to make sure that people can -- or that the court reporter and the rest of the room can hear you.

I think that's probably all I really need to explain.

So let's go. Mr. Fitch, please introduce your panel.

09:04

		İ
1	MR. FITCH: Thank you, Mr. Chair and Panel	
2	members. Nice to see you again.	
3	So this is the final witness panel of the	
4	Clearview Group. I will introduce them by name, ask	
5	that they be sworn or affirmed and then we'll get	
6	going.	
7	So seated farthest from the hearing panel is	
8	Mr. Hank de Haan of dBA Noise Consultants, who	
9	helpfully created his own name tag. Thank you. It's	
10	been a long week and a half.	09:05
11	And seated next to Mr. de Haan is	
12	Mr. Ken Fairhurst of RDI, Resource Development Inc. So	
13	he's the fellow with no name tag.	
14	May I ask that the witnesses be sworn or affirmed,	
15	please.	
16	THE CHAIR: I'll ask the court reporter to do	
17	that, please.	
18		
19	H. DE HAAN, K. FAIRHURST (For the Clearview Group),	
20	sworn/affirmed	09:06
21	MR. FITCH EXAMINES THE PANEL:	
22	MR. FITCH: Thank you, madam court reporter.	
23	Mr. Chair, Panel members, I'm going to begin with	
24	Mr. de Haan.	
25	Q. So, Mr. de Haan, I'm going to now ask you to introduce	

1		yourself to the Hearing Commissioners by briefly	
2		running through your qualifications.	
3	Α.	MR. DE HAAN: My name is Hank de Haan. I'm an	
4		acoustical practitioner with about 28 years of	
5		experience. I'm a member of the Acoustical Society of	
6		America of the Institute of Noise Control Engineers of	
7		the USA. I'm a board certified member. I'm a member	
8		of the Canadian Acoustical Association, and I'm a	
9		member of the Royal Dutch Engineering Society.	
10		I've been practising in Alberta for about 11 years	09:07
11		now. I've been involved in several procedures before	
12		the AUC.	
13	Q.	Thank you. And, sir, can you confirm you have provided	
14		a copy of your curriculum vitae which sets out your	
15		qualifications in greater detail and that that has been	
16		marked as Exhibit 188?	
17	Α.	MR. DE HAAN: Correct.	
18	Q.	And, sir, can you confirm that your CV is accurate to	
19		the best of your knowledge?	
20	Α.	MR. DE HAAN: Yes.	09:08
21	Q.	Thank you. And, sir, I understand you were retained on	
22		behalf of the Clearview Group, my clients, to carry out	
23		a review of the noise impact assessment of the proposed	
24		Sharp Hills wind farm project that was conducted by	
25		RWDI?	

Examined by Mr. Fitch

- 1 A. MR. DE HAAN: That is correct.
- 2 Q. And, sir, further to that retainer, you prepared a
- 3 report with some appendices, and that report has been
- 4 marked as Exhibit 138?
- 5 A. MR. DE HAAN: That is correct.
- 6 Q. Thank you. And, sir, can you confirm that the report
- 7 is accurate to the best of your knowledge?
- 8 A. MR. DE HAAN: Yes, it is.
- 9 Q. And, sir, do you have any corrections you would like to
- 10 make to your report?
- 11 A. MR. DE HAAN: No. I stand by it as it is.
- 12 Q. Thank you. And, sir, you also prepared a memorandum
- dated May 10, 2018, setting forth the results of a
- field trip that you took to the project area on
- April 26 and 27, 2018. And that memo has been marked
- as Exhibit 177; is that right?
- 17 A. MR. DE HAAN: That's correct.
- 18 Q. Okay. And, finally, the Clearview Group was asked
- 19 several information requests by both EDP and the
- 20 Commission on the issue of noise, and you can confirm
- 21 that you prepared, on behalf of the Clearview Group,
- 22 the responses to those IRs on noise?
- 23 A. MR. DE HAAN: Yes, I did.
- 24 Q. Thank you. Sir, can you confirm that you adopt your
- report, your memo, and your IR responses on noise as

09:09

Examined by Mr. Fitch

- 1 your evidence in this proceeding?
- 2 A. MR. DE HAAN: Yes, I do. I do confirm.
- 3 Q. Thank you. You might want to -- that's wireless. You
- 4 might want to bring the mic just a teeny bit closer to
- 5 you. No, no. To you.
- 6 A. MR. DE HAAN: Okay.
- 7 Q. That's right.
- 8 A. MR. DE HAAN: Sorry.
- 9 Q. And I don't think it's on. Maybe that's part of the
- 10 problem. You have to hit it and then it will go to
- 11 green. Okay.
- And, sir, can you confirm that you have reviewed
- the reply evidence prepared by WDI on behalf of EDP in
- 14 this proceeding?
- 15 A. MR. DE HAAN: I did.
- 16 Q. And you can confirm you have also reviewed the
- 17 transcript of portions of the hearing so far, including
- my cross-examination of Ms. Drew of RWDI?
- 19 A. MR. DE HAAN: Correct.
- 20 Q. And, finally, sir, can you confirm that you have
- 21 reviewed the revised modelling results using a ground
- factor of 0.5 that were prepared by RWDI at the
- 23 Commission's request?
- 24 A. MR. DE HAAN: Yes, I reviewed that.
- 25 Q. Okay. And, sir, finally, you have prepared an opening

09:10

1		statement, which summarizes your report, provides your	
2		comments on RWDI's reply evidence and on the revised	
3		modelling results; correct?	
4	Α.	MR. DE HAAN: Correct.	
5	Q.	MR. FITCH: And for the Panel, the opening	
6		statement of Mr. de Haan and a couple of documents he's	
7		going to be referring to were uploaded to DDS	
8		yesterday. They, of course, don't have an exhibit	
9		number, but they're certainly accessible. In fact, I	
10		think Mr. de Haan's opening statement is right at the	09:11
11		top of the list, so to speak. So I don't actually have	
12		hard copies, but I'm assuming you can to the extent	
13		you want to look at the opening statement as	
14		Mr. de Haan presents it, we ought to all be able to	
15		view it?	
16	THE	CHAIR: Yes, sir. I think that is fine.	
17	MR.	FITCH: All right, thank you.	
18	Q.	So, Mr. de Haan, I'm going to ask you now to please	
19		proceed with your opening statement.	
20	Α.	MR. DE HAAN: On behalf of the Clearview Group,	09:12
21		I reviewed the noise impact assessment prepared by RWDI	
22		for the proponent EDP. I also reviewed EDP's response	
23		to various information requests on noise and EDP's	
24		reply evidence to my report.	
25		Finally, I also reviewed the recalculated noise	

Examined by Mr. Fitch

1		levels using a ground factor of 0.5 that were provided
2		by EDP during the hearing in response to a request from
3		the Commission.
4	THE	CHAIR: Sir, when we read something, we
5		have a tendency to go really fast, and the
6		court reporter is going to have trouble being able to
7		keep up with you
8	Α.	MR. DE HAAN: I'll slow down.
9	THE	CHAIR: so I would just ask you to go
10		not quite so quickly. Thank you.
11	Α.	MR. DE HAAN: Okay. To summarize my findings, I
12		believe, first of all, that the noise effect from
13		third-party facilities may be underestimated by both
14		not including all potentially relevant facilities and
15		by not modelling their noise contribution correctly.
16		Second, the noise effects from the wind turbines
17		may be underestimated due to a number of factors. The
18		sound power level used for the wind turbines does not
19		accurately represent the sound power level on the
20		maximum operating conditions.
21		Second, the general ground factor of 0.7 used in
22		RWDI's original modelling is optimistic.
23		Third, sound reflective ground surfaces were not
24		incorporated in RWDI's modelling.
25		The presence of second-storey dwellings in the

09:12

		ı
1	project area was not included in RWDI's modelling.	
2	And, lastly, representative propagation conditions	
3	in the study area were not considered in the modelling.	
4	And, by that, I mean atmospheric stability Class E.	
5	I therefore believe that the PSL may be exceeded	
6	at a number of residences under representative	
7	conditions. I will now briefly discuss each of these	
8	points.	
9	A short interruption, is this the speed a	
10	better speed?	09:1
11	THE CHAIR: We'll get the court reporter to	
12	get a nod on that.	
13	Yes.	
14	A. MR. DE HAAN: Thank you.	
15	THE CHAIR: Thank you, sir.	
16	A. MR. DE HAAN: Noise effects from third-party	
17	facilities may be underestimated. I have concerns	
18	regarding the selection process of third-party	
19	facilities. RWDI has stated that only pumping wells	
20	were included and not flowing wells or instrument	09:1
21	shacks or other facilities. Wells with other codes,	
22	like licences, reentered, issued, recertified, were not	
23	included in the NIA. If wells with these codes become	
24	operational again, then noise impact may lead to an	
25	exceedance of the PSL.	

Examined by Mr. Fitch

Future operations at all or a number of these wells may be permitted by the AER. No information was provided to assess whether or not operations at these wells are permitted and what their noise effects may be.

RWDI has stated that measurements of noise from third-party facilities were conducted according to ISO 3744, ISO 3746, or AMSI S12.57 (2011). That's not correct. As stated in the NIA and in responses to information requests from the Clearview Group, they were regarded as point sources over a reflective plane -- see Section 2.2.4 on page 16 of the NIA review. That's Exhibit X0138 and Exhibit 0129, IR 034 -- the reflective plane, being the facility terrain. However, the facility was modelled by RWDI as 70 percent absorptive.

It is common practice for dBA Noise Consultants to conduct field measurements when possible for the purpose of trying to verify the accuracy of our modelling. During my field trip to the project area on April 26 and April 27, the noise from several facilities were re-measured, along them Sedalia 9-29-31-5-GP. And that's referred to in the NIA as facility OG-2 or facility TPF-002.

I also conducted measurements at some distance

09:15

Examined by Mr. Fitch

09:17

1		from this facility. I then remodelled the facility
2		assuming a fully reflective terrain with the ground
3		factor of 0. A comparison between the measured noise
4		levels and the model noise levels revealed identical
5		results, spot on. That is, modelling using a ground
6		factor of 0 was found to perfectly match actual
7		measured noise.
8	Q.	Mr. de Haan, just if I can interrupt you briefly. I
9		leave it to your discretion, but you may not need for
10		the purpose of the flow of your statement to identify
11		every single reference, the exhibit number and all of
12		that. We can all read it, and it might just flow
13		better if you
14	Α.	MR. DE HAAN: Sure.
15	Q.	omitted that. Sure.
16	Α.	MR. DE HAAN: Finally, in my report we raised
17		concerns that not all potentially relevant third-party
18		facilities were included in the NIA for the project.
19		During my field trip, I made field observations and
20		conducted measurements. In response to information
21		requests from EDP, I submitted plots from the modelled
22		facilities.
23		A review of aerial photos subsequently provided by
24		RWDI as part of the reply evidence indicates that
25		several facilities that were not included by RWDI may

Examined by Mr. Fitch

be relevant. In my opinion, these facilities should have been visited to confirm whether or not they are relevant.

I'll move on now to the sound power level for the turbines. In my report, I raised the concern that the sound power level included in the NIA is valid for the hub height wind speed of 12 metres per second and not the maximum wind speed of 20 metres per second.

In its reply evidence, RWDI justified its use of 12 metres per second by reference to the mandated ambient sound level of 35 dBA as included in Rule 12. RWDI asserted that when hub height wind speed is greater than 12 metres per second the ambient noise levels will be higher than the assumed 35 dBA, and thus the sound from the wind farm would be masked by ambient contamination.

In my opinion, there is no connection between the operating conditions for the wind turbine at the mandated ambient sound level of 35 dBA and receptor heights. The ambient sound level is defined in Rule 12 as a composite of different airborne sources far away from and near the point of measurement. It does not contain the contribution from energy-related facilities or from the wind.

The value of 35 dBA is mandated in Rule 12 for

09:18

Examined by Mr. Fitch

rural Alberta and is not defined as valid for a single height only. There is no connection between the ambient sound level as mandated and operating conditions for the wind turbines. It has been demonstrated that both wind speed and direction can differ significantly between ground level and hub height.

To move on to the general ground factor of .7. As the evidence thus far in the proceeding has shown, NIA practitioners modelling noise from wind farms typically use a ground factor of 0.5. For this reason, in our report we concluded that RWDI's use of a general area-wide ground factor of .7 is optimistic. Revised modelling results using a ground factor of 0.5 showed the impact that using a ground factor has. We stand by our opinion.

The exclusion of sound reflective surfaces. As stated in our report, dBA Noise believes that waterbodies should be included separately in the modelling. Reflective areas may be present in different quantities in different propagation paths, affecting noise propagation differently for each source-receptor combination.

There is a substantial amount of waterbodies present in the study area. They should be included in

09:19

11 page 3.9, and I quote:  12 "Trees and bushes are very poor noise 13 barriers. They provide very little 14 noise attenuation as a result of 15 shielding. Their roots do provide some 16 ground attenuation by keeping the soil 17 porous. Therefore, the principal 18 contribution of foliage is not barrier 19 attenuation but, instead, ground			
waterbodies have been included as separate surfaces in other recent wind farm NIAs, such as Grizzly Bear Creek and Halkirk 2.  In reviewing Ms. Drew's testimony, I note that she has drawn a distinction between open water and marshy areas, suggesting that marshy areas are not reflective. According to the Handbook of Acoustics and Noise Control by Cyril M. Harris, the 3rd edition, on page 3.9, and I quote: "Trees and bushes are very poor noise barriers. They provide very little noise attenuation as a result of shielding. Their roots do provide some ground attenuation by keeping the soil porous. factor)"  ISO 9613 provides in Annex A to the standard guideline for the inclusion of vegetations in noise	20	attenuation, which is inherent in the	09:2
ISO 9613 provides in Annex A to the standard guideline for the inclusion of vegetations in noise	21	calculation for A ground (the ground	
guideline for the inclusion of vegetations in noise	22	factor)"	
	23	ISO 9613 provides in Annex A to the standard	
25 models. That annex states that the foliage and I	24	guideline for the inclusion of vegetations in noise	
$oldsymbol{II}$	25	models. That annex states that the foliage and I	

1	quote again: (as read)	
2	"The foliage of trees and shrubs	
3	provides a small amount of attenuation,	
4	but only if it is sufficiently dense to	
5	completely block the view along the	
6	propagation path. So when it is	
7	impossible to see a short distance	
8	through the foliage. The attenuation	
9	may be close to the source, it may be	
10	close to the receiver, or by both	09:2
11	situations."	
12	End quote.	
13	During my field trip I saw only short shrubs of up	
14	to a few metres high along the edge of some waterbodies,	
15	but never sufficiently high or dense close to a	
16	receiver due to the source height, there can be no	
17	shielding from foliage next to a wind turbine. After	
18	all, these are over 100 metres high to be taken into	
19	account as shielding by foliage.	
20	As a result of all this, I do not agree with	09:2
21	Ms. Drew's opinion that marsh areas should be modelled	
22	as being less reflective than other wetlands and	
23	waterbodies.	
24	In addition to waterbodies, we believe that the	
25	facility terrain should also be modelled as fully	

Examined by Mr. Fitch

reflective with a ground factor of 0. This is because we make a practice of conducting some downwind measurements of operating facilities to check our modelling.

We have noticed now the acoustic software has been adapted to reflect recommendations of an ISO standard, and I quote "recommendations for quality assured implementation of ISO 9613 in software according to ISO 17534, that treating tamped ground as fully reflective gives the most accurate results. This is illustrated by the comparison of modelled results for Baytex 09-29-31-05 west of the 4th, where we had spot-on results using a ground factor of 0. We compared it to using an average ground factor of .7 for that facility terrain and we modelled 1.7 to be short.

And that makes also sense if you think of how the sound power levels from third-party facilities were calculated from the measured sound power levels, both by us and by RWDI. We both assumed, as is industry practice, that sound levels propagated in a half sphere from source to microphone. That is, that all the sound energy directed towards the ground fully reflected in the facility terrain between each individual source and the microphone.

By consequently modelling the same facility terrain

09:23

Examined by Mr. Fitch

as mostly sound absorbent instead of reflecting, you 1 2 basically throw noise energy away. 3 Finally, we note the following: The way ISO 9613 calculates the noise level from a multitude of noise 4 sources to a receptor is by calculating the noise 5 contribution of each individual source to that specific 6 7 receptor along its individual propagation path, taking the specific of each path into account, such as 8 9 waterbodies or hard surfaces that may be present in one propagation path but not in another path. 10 11 Then, as the last step in the calculation, the 12 contribution from each individual noise source is summed 13 with all the other noise sources for that receptor, 14 arriving at the total noise level for that specific 15 receptor. 16 Given that there are a multitude of different-sized 17 waterbodies and hard surfaces in the study area, each 18 propagation path is different from another. 19 To illustrate the difference in propagation paths,

I brought an enlargement of part of the noise model that was assembled.

20

21

22

23

24

25

Q. If I could just stop you there, Mr. de Haan.

Mr. de Haan is referring to a document that was also uploaded yesterday to DDS at the same time as his opening statement. What's it called? It's simply

09:24

Examined by Mr. Fitch

1		referred to as "Enlargement of Model." And I do have	
2		hard copies of that, if anyone would like to have them	
3		handy.	
4	THE	CHAIR: Sure, if you've got them, it might	
5		be helpful for us. Thank you.	
6	Q.	MR. FITCH: All right, Mr. de Haan, please	
7		proceed.	
8	Α.	MR. DE HAAN: Okay. In the plot, receptors are	
9		indicated by a little green dot with next to them their	
10		identification, such as, in the upper right-hand	09:26
11		corner, R22 or R23.	
12		Noise sources are identified as little bright	
13		orange stars, with a number like 53A, 62, 63, 64. And	
14		waterbodies, hard surfaces are identified as blue	
15		polygons.	
16		To start in the upper right corner, I drew as a	
17		red line the propagation path from noise source 53A,	
18		that's a wind turbine, to Receptor R22 and R23. And we	
19		see that the propagation path only crosses a road and	
20		that's it and no other hard surfaces. So most of the	09:27
21		propagation path would be soft, relatively soft.	
22		If we go down in the plot to Receptor R20, and	
23		let's start with Wind Turbine 64 in the lower	
24		right-hand corner, and we see that propagation path, we	
25		see that it just touches some waterbody in the centre	

			<del>.</del> 1
1		of the propagation path, you see it right in the	
2		middle, and then it crosses some hard surface next to	
3		the receptor.	
4		If we move a little to the left to noise source	
5		63, Wind Turbine 63, we see that it crosses way more	
6		waterbodies in its propagation path from wind turbine	
7		to Receptor R20.	
8		And if we move to the left again, we see Wind	
9		Turbine 62, and it crosses a few waterbodies close to	
10		the wind turbine, and then a few bodies close to	09:28
11		Receptor 20.	
12		The main point being that each individual	
13		propagation path differs.	
14	Q.	And, Mr. de Haan, we probably should have already done	
15		this, but just advise the Hearing Commissioners where	
16		this document comes from.	
17	Α.	MR. DE HAAN: This is an enlargement from the	
18		model plots that we submitted earlier as part of an	
19		answer to an AUC information request.	
20	Q.	Thank you.	09:28
21	MR.	FITCH: Mr. Chair, if we could mark the	
22		enlargement plot document as the next exhibit, please.	
23	THE	CHAIR: That will be Exhibit 281.	
24		EXHIBIT 281 - ENLARGEMENT PLOT DOCUMENT	
25	Q.	MR. FITCH: Thank you, Mr. de Haan. Please	

Examined by Mr. Fitch

proceed.

A. MR. DE HAAN:

Also, if you look at the layout of receptors, there are receptors who have absorptive surfaces on one side of the house, like the backyard, and tamped ground or concrete on the other side where the access with vehicles is. This results in different propagations.

By modelling an area as accurately as possible based on the available information such as aerial photography and freely available shape files for waterbodies, an element of uncertainty is removed. You don't have to guess what the ground factor would be; the model does it all for you, and way more accurately than we can do it as well. And it's really no trouble at all.

In conclusion on this point, modelling with only an average ground factor of, say, 0.5 can be appropriate, but only in conditions where the propagation path between each noise source and each receptor is comparable. That's not the case here due to the presence of a large number of waterbodies, as we have just seen.

Further, the comparison we provided between measured and calculated results next to a third-party facility indicates that tamped ground near sources or

09:29

Examined by Mr. Fitch

receivers should be modelled as reflective surfaces with a ground factor of 0.

Second-storey dwellings were not included. The second storey is relevant for the nighttime noise impact and is included in Rule 012 for complaint situations. They were not included in the RWDI NIA, but they should have been included, in our opinion. This would result in approximately 1 dBA higher noise impact, but it could be, in some conditions, lead to 3 dBA higher noise impact.

09:30

In my view, it's important to include the second storey of a residence in a noise assessment where there's one present. That's where the noise effects are typically experienced by the public, and the noise impact at a second storey is typically higher.

Ground-level noise impact is typically lower than at second-storey height, and this may lead to an exceedance of the PSL.

09:31

Also, imagine a situation where only the ground-level height is assessed, so a height of 1.5 metre, and not the second-storey height, 4 1/2 metres. If the ground level is predicted to be only just compliant, and during compliance verification or a complaint, the second-storey noise impact is well over the PSL, what are we going to do then? That's why in

Examined by Mr. Fitch

our NIAs, the dBA will include the second storey if we know one is present and we will look for it during our field trips. We know that several of our colleagues do the same.

In several AUC-approved wind turbine projects, second-storey receptors were included, like the Bull Creek wind farm, for instance.

Representative propagation conditions were not considered, or stable atmospheric conditions. As stated in our report, we believe that stable atmospheric conditions should be considered in a noise survey. Considering that stable atmospheric conditions could lead to an increased noise impact if these stable conditions occur more than 10 percent of the time in a particular season, I believe they should have been considered as a representative.

The evidence we filed shows that under such conditions the noise impact could be higher than by predicting using ISO 9613 by itself. dBA asked EDP in an information request how frequently stable atmospheric conditions occur in the study area. They declined to provide the requested information on the basis that it's confidential.

Subsequently in their reply evidence, and that's number 200, RWDI stated that atmospheric Class E is

09:32

Examined by Mr. Fitch

representative for the study area. If that is indeed the case, it's my opinion that these conditions should have been considered in the NIA.

The conclusion of this all is that the PSL may be exceeded at a number of residences. As stated in my report, based on all the points discussed above, it's my opinion that RWDI's modelling results underpredict noise levels and the nighttime PSL may be exceeded at a number of residences.

The revised modelling results prepared by RWDI in response to the Commission's request do not change my opinion at all. In my view, these results are insufficiently representative for the following reasons.

The modelling does not include waterbodies and propagation paths between different noise sources and receivers may differ. Some combinations of noise source and receiver may not have any water at all between them, while others may have significant amount of reflective areas in their propagation.

Facility modelling -- facility terrain is not modelled as reflective, and we have demonstrated that facility terrain should be modelled as such.

Reflective areas near the receptors are not included in the modelling.

09:33

1		And the conclusions, the results are basically	
2		based on "baked in" meteorological conditions in ISO	
3		9613. RWDI states that atmospheric stability Class E	
4		is representative for the propagation conditions in the	
5		study area. However, ISO 9613 does not cover these	
6		conditions.	
7		We have recalculated our results included in	
8		Table 6 of our evidence on pages 43 and 44 for the same	
9		selection of 16 receptors for stability Class E, wind	
10		direction 315 degrees and wind speed 3 metres per	09:34
11		second.	
12	Q.	All right. And if I might just stop you there,	
13		Mr. de Haan.	
14	MR.	FITCH: We, Mr. Chair, also yesterday as	
15		part of Mr. de Haan's opening statement posted to DDS a	
16		document titled "Table 6B Updated Results, CONCAWE	
17		Class E." I do have hard copies. I might just pass	
18		them out. It's probably simplest.	
19	THE	CHAIR: Yes, sir. Thank you.	
20	Q.	MR. FITCH: And, Mr. de Haan, just so the	09:35
21		Commission is clear what they're looking at now, you	
22		can confirm that in your original report you had a	
23		Table 6 which provided recalculations for 16 receptors	
24		using the CONCAWE model and Class F stability; correct?	
25	Α.	MR. DE HAAN: That is correct, yes.	

i			1
1	Q.	And then so what you're saying is in the reply evidence	
2		EDP said that actually Class E stability conditions are	
3		representative in that they occur greater than	
4		10 percent of the time in a season; correct?	
5	Α.	MR. DE HAAN: That is correct.	
6	Q.	So then what you did in Table 6B here is you	
7		essentially reran your numbers that originally appeared	
8		in Table 6, but instead of Class F you used Class E;	
9		correct?	
10	Α.	MR. DE HAAN: That is correct.	09:36
11	Q.	0kay.	
12	Α.	MR. DE HAAN: We only changed the stability	
13		class. We did not change anything else.	
14	Q.	Okay. Sorry. Now, please proceed.	
15	Α.	MR. DE HAAN: In that updated Table 6B, we also	
16		included a comparison with the calculations according	
17		to ISO 9613 as provided in Table 5 of our evidence on	
18		page 41 and 42 of that evidence. Results indicate that	
19		under these propagation conditions the PSL will be	
20		exceeded by five out of the selected receptors with	09:37
21		between .2 and 1.7 dBA.	
22		And that concludes my opening statement.	
23	Q.	Thank you, sir.	
24	MR.	FITCH: If we could have the document	
25		titled "Table 6B" marked as the next exhibit, please.	

1	THE	CHAIR: Exhibit 282.	
2	MR.	FITCH: Thank you.	
3		EXHIBIT 282 - DOCUMENT TITLED "TABLE	
4		6B"	
5	THE	CHAIR: And, sir, I'm unclear as to	
6		whether or not we need to mark the written version of	
7		Mr. de Haan's opening statement as an exhibit. I	
8		believe we do. So that will be Exhibit 283.	
9	MR.	FITCH: Thank you.	
10		EXHIBIT 283 - MR. DE HAAN'S OPENING	09:38
11		STATEMENT	
12	Q.	MR. FITCH: So, Mr. de Haan, I just have a	
13		couple of follow-up questions for you. Earlier in the	
14		proceeding Ms. Drew, when she was testifying about	
15		noise on behalf of EDP, was asked by, I believe,	
16		Commission counsel about ISO 9613 and essentially, you	
17		know, the appropriateness of using it versus	
18		potentially this other model, CONCAWE.	
19		Can you just provide us your thoughts on using	
20		ISO 9613 for modelling turbines such as are applied for	09:38
21		by EDP?	
22	Α.	MR. DE HAAN: ISO 9613 is an international	
23		standard that was conceived in the early '90s when wind	
24		turbines were far less high up picked up somewhere	
25		that they were maybe 30 to 50 metres high. ISO uses	

Examined by Mr. Fitch

generally favourable propagation conditions, assuming downwind propagation conditions from each noise source from each -- to each receiver. And ISO 9613 is intended for ground-based noise sources. It's not valid for propagation over water, and that's included in that standard in several locations.

While the standard is widely used, I feel that with increasing size of wind turbines ISO 9613 is in a way becoming less and less appropriate to use because you kind of leave the criterion of it being a ground-based noise source. The turbine is up there, way up in the air, where propagation conditions and wind may differ.

We have -- we, the international community of acoustical practitioners, have been able to use ISO 9613 and -- in a good way, and it's proven to be good for downwind conditions, provided we fiddle with the settings in the model.

For instance, by not including ground that would qualify as an absorptive as hard grounds or ground with a different absorption factor or by -- instead of calculating the noise level at receptors at ground height, moving the receptor point up to 4 metres.

That's one of the recommendations made in the literature. Or by using a ground factor of 0 instead

09:39

Examined by Mr. Fitch

and by limiting things like screening to 2 dBA and it's not valid for -- it's stated that it's not valid for propagation over ravines.

So, to me, it feels like we're kind of pumping and pumping the balloon, but I'm not sure when it bursts.

That kind of sums up what I would like to say about it.

Q. Just to follow up on that, so if the noise source is not actually on the ground but rather 132 metres up in the air, are you saying that essentially there would be less -- just by virtue of the location of the source, there's just going to be less ground attenuation?

09:41

A. MR. DE HAAN: That is -- that is correct.

Ground attenuation occurs over absorptive ground providing grazing incidents, and in the literature you find values of 20 -- being less than 20 degrees or less than 30 degrees to define grazing incidents.

At steeper angles, as you're closer to the wind turbine, the ground is reflective and not absorptive at all. This would also occur in the propagation path if there's very stable conditions. So there's a strong downward reflection. So the angle of incidence from the sound rates towards the ground are much steeper than during daytime, daytime hours.

09:42

Q. Thank you. The next follow-up question I would like to ask you is when -- again, when Ms. Drew was questioned

l-			<del>.</del> 1
1		about her use of a general ground factor of 0.7 instead	
2		of 0.5. One of the ways she responded was to say that	
3		instead of using a more conservative ground factor,	
4		RWDI used this 1 dB uncertainty, which was applied to	
5		the noise source; i.e. the turbines.	
6		Can you comment on the use of a 1 dB uncertainty,	
7		I guess, as a measure of conservatism?	
8	Α.	MR. DE HAAN: Well, we don't do it. I don't see	
9		the need for it to just apply to the wind turbines and	
10		not to the third-party facilities, for instance. Both	09:43
11		would have the same amount of uncertainty applied to	
12		them. And I don't think that applying a general	
13		uncertainty of 1 dB is the same as modelling the	
14		situation properly and with a little bit of	
15		conservatism in it. It just doesn't match up.	
16	Q.	And I assume the community of NIA practitioners in	
17		Alberta is not large. Can you tell me, is a 1 dBA	
18		or dB uncertainty typically used by practitioners in	
19		Alberta, to your knowledge?	
20	Α.	MR. DE HAAN: Not to my knowledge, no. The	09:43
21		acoustical practitioners that I deal with from time to	
22		time don't use it, no.	
23	Q.	Okay, thank you.	
24		Finally, in my I think it was my discussion	
25		with Ms. Drew about the conservatism of her NIA, she	

Examined by Mr. Fitch

1		made reference to the fact that other wind farms, such
2		as the Oldman 2 wind farm and the Halkirk 1 farm and
3		the Wintering Hills farm, have all been determined
4		through post-construction monitoring, noise monitoring,
5		to, I guess, have shown that what was predicted turned
6		out to be the case.
7		Can you comment on her evidence in that regard?
8	Α.	MR. DE HAAN: Yes, I think I can. One always
9		has to be careful by comparing one project to another.
10		For instance, with Oldman 2, there were no waterbodies
11		present between the turbines and the receptors. In
12		that model, the Oldman River reservoir to the west of
13		the kind of the project area was included in the
14		model height. The turbine height was way less. It was
15		between 67 and 80 metres.
16		For Halkirk, the hub height was restricted to
17		80 metres and the rotor only had a diameter of
18		77 metres. Wintering Hills used a ground factor of .5.
19		I don't know. You have to be careful, as I just
20		demonstrated in my opening statement, by comparing one
21		situation to the other, to make sure that they are
22		really comparable. And in this study area, there's
23		quite some water present.
24	0	Thank you

Q. Thank you.

25

All right. I'm going to move on to Mr. Fairhurst.

AMICUS REPORTING GROUP

09:45

Examined by Mr. Fitch

09:46

1		If we could move the microphone.
2	Α.	DR. FAIRHURST: Thank you, Mr. Fitch.
3	Q.	So, Mr. Fairhurst, as I did for Mr. de Haan, I'm going
4		to ask you to introduce yourself to the Hearing
5		Commissioners by describing your qualifications,
6		please. Go ahead.
7	Α.	DR. FAIRHURST: Yes. I have 38 years of
8		progressive experience in visual resource management,
9		starting with BC government and two years with Alberta
10		government. In those responsibilities, I helped
11		develop systems and implement them for visual resource
12		management, which includes visual impact assessments.
13		Following that, I have 22 years of experience with
14		my own company created in 1996. We have focused on
15		visual resource management.
16		While we are in BC, and a lot of our work is
17		forests, we also have done Run of River Power, NLG
18		facilities, transmission lines. So there's a number of
19		applications that I have been involved in over these
20		years.
21		I completed a PhD at UBC in 2010, while still
22		running the company, and I looked at a methodology for
23		cumulative vulnerability along roadways.
24		The problem that we often have is fixed viewpoints
25		don't really address what is the collective effect as

Examined by Mr. Fitch

1 one travels. And also the limitations of those few 2 viewpoints, you can't really address it all. So my 3 system did come -- was helpful in that way. 4 As well, I did some teaching of GIS and VRM at UBC. 5 6 Now, back with Alberta, in 2084, '85 --7 Q. 1984 and 1985? Α. DR. FAIRHURST: Yes, thank you. 8 Q. 9 Okay. Α. DR. FAIRHURST: -- I did the early drafts of what 10 09:48 11 turned out to be the visual landscape management 12 strategies for Alberta. My successor was Terry Turner, 13 and he put it into a very beautiful package. While with RDI in 2003, I developed for the 14 15 Cumulative Environmental Management Association the 16 approach to planning for visual landscape called 17 "Visual Landscape System." 18 Q. And, Mr. -- or Dr. Fairhurst, I guess, the Cumulative 19 Environmental Management Association, or CEMA, that's a 20 body located in Fort McMurray that deals with the oil 09:49 21 sands: correct? It's the Wood Buffalo 22 Α. DR. FAIRHURST: Yes. 23 region. 24 They also looked at all resources. So there was 25 forestry, any resource that had some visual impacts --

h			=1
1		not just visual, sorry. It was all environmental	
2		impact.	
3		And what was great about that association was it	
4		was called "Cumulative Environmental." And I really	
5		speak to the cumulative effect.	
6		Now, my document, if I'm not wavering too far from	
7		my just my experience, is online. It's called	
8		"CEMA Online."	
9		Now, CEMA has come to an end. Its life has come	
10		to an end, but CEMA Online still exists. I'm very	09:5
11		pleased to see my document is still there, easily to	
12		find. "CEMA Online, Fairhurst."	
13	Q.	Thank you. Now, sir, you have provided a curriculum	
14		vitae which sets out your qualifications in greater	
15		detail, and that has been marked as Exhibit 137 at	
16		pdf page 17; is that	
17	Α.	DR. FAIRHURST: Yes, that's correct.	
18	Q.	correct? Sorry, you just have to let me finish my	
19		questions.	
20		Is that correct?	09:5
21	Α.	DR. FAIRHURST: That's correct.	
22	Q.	Yes. We just don't want to be speaking over each	
23		other, that's all.	
24		Sir, can you confirm that your CV is accurate to	
25		the best of your knowledge?	

1	Α.	DR. FAIRHURST: It is.	
2	Q.	And, sir, you can confirm that you were retained on	
3		behalf of the Clearview Group to carry out an	
4		assessment of the visual impacts of the proposed	
5		Sharp Hills wind farm project on the local community	
6		within which it will be located?	
7	Α.	DR. FAIRHURST: That's true.	
8	Q.	And, sir, you can confirm that you have prepared a	
9		report with two appendices, A and B, which have been	
10		marked as Exhibits 137, 136, and 135?	09:51
11	Α.	DR. FAIRHURST: Yes, I've seen them.	
12	Q.	And, sir, can you confirm that the report is accurate	
13		to the best of your knowledge?	
14	Α.	DR. FAIRHURST: It is accurate with some errata	
15		that I have determined.	
16	Q.	Okay, so that was my next question.	
17		You have some corrections you would like to make	
18		to your report?	
19	Α.	DR. FAIRHURST: Yes.	
20	Q.	All right. And so it might be helpful, Panel members,	09:52
21		if you brought up Exhibit 137, which is	
22		Mr. Fairhurst Dr. Fairhurst's report. Okay.	
23		So there, Dr. Fairhurst, we're looking at the	
24		first page of your report. Can you please proceed?	
25	Α.	DR. FAIRHURST: Now, on I'll bounce back and	

Examined by Mr. Fitch

- forth, depending on what I found. On page 8,
- 2 paragraph 4 --
- 3 Q. Okay. Just give them a moment to get there.
- 4 Okay. Are we in the right place?
- 5 A. It's hard for me to see.
- 6 It starts with "RDI tested." It's the bottom
- 7 paragraph.
- 8 What I found was of the 27 viewpoints tested by
- 9 RDI, I made an error of saying 24 had foreground wind
- 10 turbines. The "WTG" is just an acronym for wind
- 11 turbines in my report. And that should be 10. I had
- transposed a number that came from the number of
- turbines, rather than the number of viewpoints. So
- 14 instead of 24, it's 10.
- 15 Q. Okay, thank you.
- 16 A. DR. FAIRHURST: On page 9, Table 1, viewpoint 28
- or EDP Number 10. I had measured on a GIS 1370 metres
- 18 distance from the viewpoint. I re-measured it and
- found it to be 1321. And I believe this is the closest
- 20 turbine to a viewpoint established by EDP and possibly
- 21 the one spoken of by Mr. McDougall -- Mr. McDonnell as
- possibly being within the foreground. I don't have a
- 23 number to verify that that's the one he meant, but this
- is the closest I found.
- 25 Q. Okay.

09:53

Examined by Mr. Fitch

Α. DR. FAIRHURST: So it's 1321 metres instead of 1 2 1370, Table 1. 3 Q. And that's in the row 28, EDP 10; correct? Yes, that's correct. 4 Α. DR. FAIRHURST: 5 Q. Okay, thank you. Sir, I'm sorry, but I'm confused, 6 THE CHAIR: 7 because on the document I think it's 10 is 3440 and --MR. FITCH: Mr. Chair, you need to go down to 8 the bottom of the table, and what we're looking for is 9 the one that's actually 28. 10 09:55 THE CHAIR: 11 Not Number 10. 12 MR. FITCH: Well, it's then described as 13 EDP 10. 14 THE CHAIR: EDP 10. Okay. I'm looking at the 15 wrong column. That makes it clear now. Thank you. MR. FITCH: 16 Q. Okay. So that should be 1321, not 17 1370. 18 Α. DR. FAIRHURST: Yeah. 19 Q. Okay. 20 Α. DR. FAIRHURST: I mean yes. 09:55 21 On page 2 and page 15, we can flip between them --Well, let's start with 2. 22 Q. 23 Α. DR. FAIRHURST: Page 2. And the last paragraph of 24 the page. And, first of all, my measure of

415 kilometres, square kilometres, would require some

25

1		definition, which I intend to bring out in my statement	
2		and a reference to the map, which follows on the very	
3		next page, and perhaps it would be handy just to look	
4		at that map for	
5	Q.	Okay. So page 3 then.	
6	Α.	DR. FAIRHURST: Page 3. I have outlined in green	
7		a close-in zonation covering all wind turbines and	
8		following closely what I also called was "1 kilometre	
9		zone from roads." But we can discuss	
10	Q.	That's the purple area; right?	09:57
11	Α.	DR. FAIRHURST: Pardon?	
12	Q.	That's the purple area? The 1 kilometre	
13	Α.	DR. FAIRHURST: The purple zones, 1 kilometre.	
14		And I outlined 415 square kilometres and called it	
15		"east zone" and "west zone."	
16		So this I severely mixed up and must apologize,	
17		because it would tend to alarm, and I don't want that	
18		and never intended that.	
19		What happened was I said there would be five in	
20		the last back on page 2 and the last sentence, five	09:57
21		turbines per square kilometre, when in fact it was	
22		supposed to be one turbine for 5 kilometres. How that	
23		transposed, I cannot explain, but that led me to	
24		further and further getting into worse transposition	
25		for, at the very last one, a turbine for every 20	

Examined by Mr. Fitch

- hectares, when it actually should be one turbine for 500 hectares or one turbine for 1236 acres.
- That mistake, and I apologize, also showed up on page 15. And of course it showed up in my opening statement, which I will get to. So I will make that change or speak of that change when we get to that.
- 7 Q. Okay.
- A. DR. FAIRHURST: And in the June the 5th transcript
  there was five references to work done by RWDI when it
  should have been RDI. That was my work and that extra
  W got snuck in there somehow.

09:59

- 12 Q. There is another consultant in this matter called RWDI, 13 so I think that's what probably happened.
- 14 A. DR. FAIRHURST: Yes. Yes. But I didn't want
  15 anything to influence or take away from what we were
  16 trying to say there. Right.
- 17 Q. Okay. Then if that is all of the corrections you would 18 like to make to your report --
- 19 A. DR. FAIRHURST: Yes.
- 20 Q. -- sir, can you confirm that your report as corrected, 21 including the appendices, constitutes your evidence in 22 this proceeding?
- 23 A. DR. FAIRHURST: Yes, they are.
- Q. Okay. And, sir, can you confirm that you have reviewed the reply evidence prepared by Mr. McDonnell of WSP

i			a
1		Canada on behalf of EDP?	
2	Α.	DR. FAIRHURST: Yes, I have.	
3	Q.	And you can confirm that you have reviewed the	
4		transcript of portions of the hearing, including my	
5		cross-examination of Mr. McDonnell?	
6	Α.	DR. FAIRHURST: Yes, I did.	
7	Q.	Okay. So, sir, you have prepared an opening statement,	
8		you've alluded to it already, and that opening	
9		statement summarizes your report and provides your	
10		comments on Mr. McDonnell's evidence; right?	10:00
11	Α.	DR. FAIRHURST: It does.	
12	Q.	Okay. Please proceed with your opening statement then.	
13	Α.	DR. FAIRHURST: And is this being called up?	
14	Q.	There it is.	
15	THE	CHAIR: Okay, sir sir, just before you	
16		start, I think it might be helpful for us to ask you to	
17		define what "visual resource management" refers to and	
18		what the objectives are? I think it would	
19	Α.	DR. FAIRHURST: Yes.	
20	THE	CHAIR: help us to understand your	10:01
21		background a little bit better.	
22	Α.	DR. FAIRHURST: Thank you very much. That is	
23		really essential.	
24		"Visual resource management" is a term that looks	
25		at the visual landscape. It used to be called "visual	

Examined by Mr. Fitch

landscape management." Somehow it changed over into visual resource management, but really what it is is what people see in the landscape. And finding a way to manage change, whether it's forestry, or here we have wind turbines, that is compatible in the landscape.

That's a lot of my -- my work is visual impact assessment to find and design ways to achieve that compatibility. Now, part of that visual resource management is setting visual landscape objectives or visual quality objectives. That's a very big part of it.

10:02

In order that the proponent of change, which whatever resource it is, has some guidelines for the extent of change, that's going to be acceptable. So that would be visual quality objectives or VQOs. And we -- we determine this, firstly, by looking at the landscape, doing visual landscape inventories, rating various features, the feature itself by physical features. There are the viewing features, viewer related, are they concerned, how many, and it comes out, more or less, as a matrix for planning. And in BC, that actually is put right into the determination of available timber. The amount that is available every year is affected by -- in one, it's just one, aspect of planning, the visual quality objective. So

1		that's a big part of it.	
2		So it's it's a whole process from, first of	
3		all, identifying the values out there, setting	
4		objectives with public input to come up with	
5		restraints, or there's other areas that are less or no	
6		constraint. And then guiding the industries towards	
7		their level of change that will be acceptable.	
8		I think would that be fine to start with?	
9	THE	CHAIR: Yes, sir, that's fine. Thank you.	
10		That's very helpful for us. So if you want to	10:04
11		proceed	
12	Α.	DR. FAIRHURST: Yes.	
13	Q.	with your opening statement. Thank you, please do.	
14	Α.	DR. FAIRHURST: Now, I began to try and read this	
15		document, and it sort of seemed long and tedious. So	
16		what I'm going to do is, in the first opening	
17		statement, I have six paragraphs. Who is actually	
18		moving this ahead? I have six paragraphs, just	
19		numbered 1 to 6, and I'll try to keep you in there's	
20		six paragraphs.	10:05
21		And then the second half, I get to a review of	
22		Mr. McDonnell's reply evidence. There I've already	
23		numbered them.	
24		And I would like to make it as brief as I can,	
25		because you have this in front of you, and just hit the	

Examined by Mr. Fitch

highlights. So it may not look what's in front, but if you scan it, these things will jump out at you.

So, first of all, I visited the Sharp Hills area in November of 2017. I conducted a field familiarization and I was taken around by the Krokers, and they very kindly pointed out stopping points or viewpoints that they felt were missed by EDP in their original analyses. And most of these, I think all of these, but most, were at farms that they knew the owners and felt they should be included.

So I did 27 viewpoints, find at the end of it, and initially three of the viewpoints -- and I would prefer to call them "observation points" because the view is inferring something else, I think, in people, like a

So, if I may, I started to use a -- I may not have consistently used it, to call them observation points in this opening statement.

prospect, an important gathering point.

There were three initially foreground observation points located with the Krokers, and that formed 11 percent of the final total. So the foreground was very underrepresented. And when I got back and did my map work, I identified another 11. Four of them were already EDP viewpoints, which were in the middle ground. And middle ground is -- foreground is, in this

10:06

1		sense, is 0 to 1 kilometre distant. So on either	
2		side or around a viewpoint.	
3		A middle ground is 1 to 8. And that's	
4		conventional fairly conventional. It is definitely	
5		conventional in BC, fairly conventional with a little	
6		rounding error in the States.	
7		And of those 11, I had identified 7 new ones,	
8		which were actually about a quarter of the total. And	
9		these I purposely located on roads, easily accessible,	
10		but close to wind turbines, because that, to me, was	10:08
11		underrepresented in the mix.	
12		So, of course, I measured the proximity of all 83	
13		of the proposed turbines and to the observation points.	
14		And, also, along the road corridors that interconnect	
15		in the community, which is shown on in my main	
16		report. And I don't want to just leave it right now,	
17		but I might be	
18		So that that brings us to the end of my	
19		paragraph Number 1.	
20	Q.	If I could just stop you there. You mentioned numbers	10:09
21		of foreground views. So if we can just kind of get	
22		clear on that.	
23		So, ultimately, you looked at 27 different	
24		observation points. How many of those total in your	
25		work are foreground?	

Examined by Mr. Fitch

10:10

1	Α.	DR. FAIRHURST: Ten.
2	Q.	What percentage is that?
3	Α.	DR. FAIRHURST: It's 37 percent.
4	Q.	Okay. Thank you. Carry on.
5	Α.	DR. FAIRHURST: 63 percent are mid-ground,
6		identified by both EDP and during my field tour with
7		the Krokers.
8	Q.	Okay, thank you.
9	Α.	DR. FAIRHURST: RDI, or me I produced did
10		all the work visual simulations from all 27
11		viewpoints. I used a Vestas three-dimensional model
12		that appeared to be comparable, and I placed it into my
13		software not mine but the one I use called
14		"Visual Nature Studio," and set the scale to
15		200 metres. The 3D object had its one blade turning
16		towards the top, so that top was 200 metres.
17		Unfortunately, there was no vegetative cover data.
18		I usually apply that in recognition that usually
19		vegetation, particularly where there's forests, can do
20		a lot of screening. And screening just being would
21		be obscuring the view if it's close to the road, say,
22		or even if it's if it's further back, but it's
23		covering whatever is being looked at.
24		So there was no vegetative cover from the Alberta
25		government, AltaLis. So I did two things. So I

1		matched it with my photo Panoramas, which I took in the	
2		field, and those panoramas are 360 degrees, and I broke	
3		it along the roadway, and then I my visual	
4		simulations were also 360 degrees, in each case taking	
5		normal lens frames and automatically pasting them	
6		together in the software type different software,	
7		but the same effects. And I broke it out from the main	
8		roadway, north-south, east-west, and that gave me good	
9		orientation, good control.	
10	Q.	Sir, just a follow-up question. You mention that you	10:13
11		produced your visual simulations using the Vestas	
12		three-dimensional model. I take it that's something	
13		you got off the Vestas website?	
14	Α.	DR. FAIRHURST: No. I was not very good at that,	
15		so I got it off an online 3D model maker.	
16	Q.	Okay. And can you confirm that what you looked at was	
17		described on whatever website it was as a Vesta 136	
18		3.45 turbine?	
19	Α.	DR. FAIRHURST: I used two models. One for	
20		Visual Nature Studio was the one that I got online.	10:14
21		And then I used a wind farm planning software called	
22		windPRO, which had that 1 that one you just	
23		mentioned embedded in the software. I think it said it	
24		was the 2010 version. And that was, for all I could	
25		see, the correct one.	

Examined by Mr. Fitch

10:15

1		So there's two softwares. One that I used sort of
2		as counterbalance to the Visual Nature Studio, the
3		counterbalance being it, the windPRO, was able to do a
4		photomontage.
5		So, for instance, when I was at Jorgensons' bins
6		photo, I could bring the turbines in, cut them into the
7		photo for photo realism. That was rather missing,
8		unfortunately, from the Visual Nature Studio one.
9	Q.	Okay, but, again, just to be clear, the turbine that
10		you simulated is the Vesta 136 3.45 megawatt; correct?
11	Α.	DR. FAIRHURST: In the windPRO version.
12	Q.	Okay. Thank you.
13	Α.	DR. FAIRHURST: It is the close approximation set
14		to 200 metres in the Visual Nature Studio application.
15	Q.	Got it. Okay. Thank you.
16	Α.	DR. FAIRHURST: Was there would it be helpful
17		to look at some photos?
18	Q.	Yeah, why don't we. So you've been talking about your
19		simulations. Sir, your report is Exhibit 137, and then
20		you have two appendices to your report, which were
21		marked. I think Appendix A is 136 and Appendix B is
22		135. Do you want to direct the Commissioners to one of
23		those?
24	Α.	DR. FAIRHURST: Yes, I would like to. 136, I
25		believe, page 3.

Examined by Mr. Fitch

- 1 Q. Okay.
- 2 A. DR. FAIRHURST: Okay. So that on top is my photo
- panorama, and on back -- on bottom is my Visual Nature
- 4 Studio rendering.
- 5 Q. Okay.
- 6 A. DR. FAIRHURST: The point I would make here is
- 7 that a lot of the Sharp Hills landscape is very bare.
- 8 It's beautifully bare, but bare. And so there was a
- fairly easy correlation to what you're looking at as
- far as what might be screened and what not -- what
- 11 might not be screened.
- 12 Q. So, in other words, looking -- comparing the photo to
- the simulation beneath it, it's not like the simulation
- has somehow omitted a bunch of screening vegetation.
- 15 A. DR. FAIRHURST: In this case no.
- 16 Q. Right.
- 17 A. DR. FAIRHURST: Closer -- and we look at another
- one, there is more screening. And which one did I have
- there? But before I move on, I'll just say the bottom
- 20 rendering of panorama has directional degrees marked
- off in -- well, I guess they're almost every one, but
- five little bars.
- So in the centre we're looking south. On the left
- we're looking east, and on the right we're looking
- 25 west. So that's a lot of view.

10:18

			1
1		And when I I should mention that we will talk	
2		about Mr. McDonnell's approach, which says you	
3		should human eyes should only be looking	
4		120 degrees, but it's obvious to see and say that the	
5		human isn't constrained to that. They will move their	
6		eyes, their head, and their body. So either half a	
7		panorama or the 360 if it's interesting them, they	
8		will they will absorb that.	
9		Another point to make with this simulation, all of	
10		my wind turbines were facing east. I did not have wind	10:19
11		information to make those adjustments. So in the	
12		centre, you can see that it's a side profile, while at	
13		either end it's the broad profile.	
14	Q.	I'm sorry. In the centre side, when you say "broad,"	
15		you mean you're looking directly at it?	
16	Α.	DR. FAIRHURST: Well, you see the full front on	
17	Q.	Front on.	
18	Α.	DR. FAIRHURST: back on, whichever it happens	
19		to be.	
20	Q.	Okay.	10:20
21	Α.	DR. FAIRHURST: And we will get to a discussion on	
22		colour of turbines a little later, but we could do it	
23		right now.	
24	Q.	As you wish.	
25	Α.	DR. FAIRHURST: I was criticized for these	
l			

			=
1		turbines in Visual Nature Studio being dark. What	
2		happens is if the sun is from the south, there's no	
3		illumination, and there's a tendency also to just	
4		darken. I will get into a full discussion on how much	
5		is white or dark, greater or lesser contrast and is	
6		that a particular problem in the credibility of my	
7		work.	
8		We could look at page 7. A barren I mean, a	
9		bare landscape. At that time the stubble was golden,	
10		and it is really an appealing landscape.	10:21
11		Off to the left is New Brigden and the bins.	10.21
12	Q.	Those are the Jorgenson bins you referred	
13			
	Α.	DR. FAIRHURST: Jorgenson bins.	
14	Q.	to earlier. Yeah.	
15	Α.	And we see in the next page okay, first of all,	
16		there is a frame that I put around each picture or the	
17		photography and also the simulation. And that's	
18		40 degrees, a normal picture roughly a normal	
19		picture view, a 35 millimetre camera view. And then I	
20		enlarged it	10:22
21	Q.	Sorry. And those are the boxes or the outlines, square	
22		outlines	
23	Α.	DR. FAIRHURST: The boxes, yes.	
24	Q.	on the left side; yes? Okay.	
25	Α.	DR. FAIRHURST: Yes. And you can see that it's	

Examined by Mr. Fitch

- 1 40 degrees down below just by counting the degrees.
- 2 Q. Okay.
- 3 A. DR. FAIRHURST: The next page. Okay. So we know
- 4 that -- we knew already from the photo that this box
- 5 was going to look at the Jorgenson bins. And we had --
- I think there's a reference to one of the EDP
- 7 simulations of the same site. That was called
- 8 Location 3. I think we --
- 9 Q. The exhibit is on the top.
- 10 A. DR. FAIRHURST: Oh, yeah. Exhibit 76, pdf 7.
- 11 Q. Okay. Just give everyone time to get there.
- 12 A. DR. FAIRHURST: It's okay. You don't need to go
- 13 right away, unless...
- 14 Q. Let's have a look. Otherwise it may not make sense.
- 0kay, so now we're looking at Exhibit 76, pdf 7.
- 16 You're saying that's basically the same view?
- 17 A. DR. FAIRHURST: Yes. And I'll show you, when I
- did windPRO, that there's the similarity.
- 19 You'll notice also, because of the angle of the
- sun versus this southeast view towards these turbines,
- 21 the wind turbines are dark.
- I will show you another viewpoint of mine where
- the wind turbines are bright white. But, still, I'll
- contend that, in different conditions, the bright white
- has the highest contrast. Say, dark clouds behind it.

10:23

Examined by Mr. Fitch

1 Okay. So we're going to bounce back, if I can 2 find my way -- okay. We were at --3 Q. Was it -- I think we were at Exhibit 136, pdf 8. 4 Α. DR. FAIRHURST: Okay. So that little inset is 5 something I did with windPRO. And I also did one for 6 nighttime viewing with some navigation lights. 7 Unfortunately, all of them had to come on or off at the I also then did an animation. And we 8 same time. 9 picked that up, hopefully somewhere. Q. Right. So if we go to Exhibit 190, pdf 29. Go down, 10 10:25 11 please. 12 So there's a -- is that the right page, 13 Dr. Fairhurst? 14 Oh, sorry. It's referenced --Α. DR. FAIRHURST: 15 Q. It's near there for sure. Sorry, I got the wrong page reference. It's pdf 31. Sorry. 16 17 So just to set this up for the Commissioners, you 18 were asked by EDP certainly, and perhaps also by the 19 AUC, to provide links to an animation --20 DR. FAIRHURST: Yes. Α. 10:26 21 Q. -- in your main report you said you had done. So the question I have for the AUC is if we click on the link, 22 23 are we going to be able to pull up the animation? 24 DR. FAIRHURST: This just requires two things. Α. Ιf 25 it hasn't been done yet, it requires the link on the

1	bottom to get the p	olayer. And I hope there's no no	
2	wall that will prev	vent it.	
3	Yes?		
4	UNIDENTIFIED SPEAKER:	There's five videos?	
5	A. DR. FAIRHURST:	Sorry, I don't hear you.	
6	THE CHAIR:	She said there are five videos.	
7	A. DR. FAIRHURST:	Every five?	
8	UNIDENTIFIED SPEAKER:	She asked if it's five videos.	
9	A. DR. FAIRHURST:	Yes. Yes, it is.	
10	THE CHAIR:	Okay. So she's got them up now.	10:27
11	I'm assuming		
12	A. DR. FAIRHURST:	You need the player first.	
13	THE CHAIR:	Josephine can open them up.	
14	A. DR. FAIRHURST:	Yeah, our hope was that the player	
15	may have been down	loaded when we filed the information	
16	so it could be view	wed.	
17	THE CHAIR:	Why don't I suggest it's time for	
18	the morning break.		
19	MR. FITCH:	Sure.	
20	THE CHAIR:	Why don't we try and sort out our	10:27
21	technological chal	lenges. I guess we're not as	
22	technological savvy	y as I thought we were, but	
23	MR. FITCH:	Certainly the lawyers are not.	
24	THE CHAIR:	why don't we try and sort that	
25	out during the brea	ak, and then you can resume after the	
11			11

Examined by Mr. Fitch

1 break, sir, and we will be able to see them at that 2 time, we hope. 3 Α. DR. FAIRHURST: I hope. 4 THE CHAIR: So with that, let's take our break 5 and we'll be back at about 10 to, assuming we can sort 6 it out. Thank you. 7 MR. FITCH: Thank you. 8 (ADJOURNMENT) THE CHAIR: 9 Thank you, everyone. Welcome back. Please be seated. 10 10:53 11 Well, it seems that we've sorted out all our 12 technical snafus. I just wanted to get the word snafu 13 onto the record. And I believe we're going to ask that 14 these videos be refiled in the form of an MPEG so that 15 they'll be much easier access for any interested 16 parties. That's fine, and we will do that. MR. FITCH: 17 18 THE CHAIR: All right. 19 Q. MR. FITCH: So, Mr. -- Dr. Fairhurst, sorry. I keep calling you "Mr." -- just before we pull up the 20 10:54 animation, just so that we all kind of remember where 21 we're at, we had been looking at views of the Jorgenson 22 23 grain bins. We looked at your simulation and we also 24 looked at the simulation that EDP had done. And now 25 we're going to look at the same view, essentially, but

Examined by Mr. Fitch

animated; is that correct? 1 2 Α. DR. FAIRHURST: Well, it's a photomontage that I 3 prepared using -- sorry. A photomontage that I 4 prepared using windPRO and set to -- set into motion. 5 And the glitch was I used their own software to run the animation, and I will have to rerun the animation into 6 7 an MPEG or whatever is the best way to, but I will do that on the weekend. 8 9 Q. All right. But we can call up the animation now, as I understand it. 10 10:55 11 If we could do that, please. 12 All right. 13 Α. DR. FAIRHURST: So this is essentially the same as 14 the EDP location 3. And I pointed out that there is 15 some similarity in the greyness between the two. if you look closely, there is a white bar on the right, 16 17 which is the full illumination of a white tower. 18 Q. And what direction are we looking? 19 DR. FAIRHURST: Southeast. Α. 20 Q. Thank you. 10:56 21 Α. DR. FAIRHURST: And in this case, for the windPRO, 22 the turbines are facing the camera. Next --23 24 THE CHAIR: Sir, just before you move on now,

this is purely informational for us, this is looking at

25

4		the leaveneer bine	. is that minht?	
1	_	the Jorgensons' bins		
2	Α.	DR. FAIRHURST:	Yes.	
3	THE	CHAIR:	Do you know where the Jorgensons'	
4		landing strip is rel	ative to this view?	
5	Α.	DR. FAIRHURST:	I don't.	
6	MR.	FITCH:	Well, I do, if you would permit me	
7		to put it on the rec	ord.	
8	THE	CHAIR:	I will permit you.	
9	MR.	FITCH:	The Jorgenson airstrip is	
10		essentially immediate	ely adjacent to the bins on the	10:56
11		south. So the bins	are just north of the airstrip.	
12	THE	CHAIR:	So in this view it would be this	
13		side of the bins sor	t of in front of where that scrub	
14		brush I don't kno	w if it's scrub brush, but I'll	
15		call it scrub brush.		
16	MR.	FITCH:	Right. Yes, I believe that	
17		follows.		
18	THE	CHAIR:	All right, sir. Thank you.	
19		That's helpful.		
20	Α.	DR. FAIRHURST:	The next animation is a nighttime	10:57
21		view with aviation 1	ights. And in this case they all	
22		come on or all come	off, or turn on or turn off. I	
23		couldn't vary them a	s the capability to do and just set	
24		the outside outsi	de ones with hazard lights rather	
25		than all.		
ì				il .

1		So there would be more of a flash, and a variable	
2		flash, as one would you would see, in this case,	
3		five, four turbines flashing at different times	
4		throughout the night. That was the same image. I just	
5		darkened it. And the turbines would probably be	
6		darker.	
7		Now, just to show that there is whiteness in these	
8		turbines, I have the next one.	
9		And so there's a high contrast in this	
10		orientation. I forgot to check the exact direction,	10:58
11		but they're probably south facing. And the model used,	
12		once again, was the correct model probably from 2010,	
13		as I looked in the software. So there may be some	
14		variance as far as the base goes and that kind of	
15		thing.	
16	Q.	And do I understand correctly, Dr. Fairhurst, you	
17		mentioned that the simulation that we're looking at	
18		right now, the animated simulation, the turbines appear	
19		light, and you speculated that it's because they're	
20		south facing.	10:59
21		So is the idea that the software you input the	
22		direction and then the software essentially decides	
23		where the sun is going to be coming from?	
24	Α.	DR. FAIRHURST: No, you set the sun.	
25	Q.	You set the sun.	

Examined by Mr. Fitch

- A. DR. FAIRHURST: In this case, it was the height of -- the height of the sun, say June the 21st at 1:00, and in my other images it had defaulted to winter sun.

  So it was low on the -- it was low, and I was getting more grey. That was not a manipulation, I would have to say. I would like to have seen it brighter, but
- Q. All right. So you don't consciously choose to colour them light or dark. What happens is you input an assumption about where the sun is, and then the model processes that, and they look lighter or darker depending on that input information.

that's what came out of that.

A. DR. FAIRHURST: Yes. There's a solar ephemeris in both of them that chooses -- or places the sun at the exact place at time of day and day of year. And this was summer and the others were winter. There may have been some distinction if I had done summer with the others too.

- Q. All right. But just to be clear, what we're looking at are snow-covered fields. So you might want to clarify. You said they were summer, but the image is winter. Is there an inconsistency?
- A. Probably.

7

19

20

21

22

- Q. Sorry, you're going to have to speak into the mic.
- 25 A. DR. FAIRHURST: I wanted to show not -- and I

11:00

1		would say that bright white is legitimate in this case,	
2		but I also wanted to show primarily that these turbine	
3		models are white are white rather than some grey	
4		that I had chosen to try and, for some reason, make it	
5		brighter on the horizon. I can say that the bright	
6		white is the greatest contrast.	
7	Q.	Okay. Carry on.	
8	Α.	DR. FAIRHURST: That would be all that I want to	
9		do with that.	
10		And I would return to my opening statement. I	11:02
11		just wanted to glance onto that paragraph 4, "RDI found	
12		24 wind turbines"	
13	Q.	You can just carry on and start reading if you want.	
14	Α.	DR. FAIRHURST: "within the foreground distance	
15		zone." And that's the distance zone that literature	
16		finds to have the greatest visual vulnerability of	
17		visual impact.	
18		I also created a 1-kilometre zone along roadways	
19		that had turbines near. So I found there were 18 road	
20		segments within the community, easy access roads,	11:03
21		totalling 88 kilometres from which 64 of the	
22		83 turbines would be situated within 1 kilometre.	
23		Do we need to see that map again? Those were the	
24		purple lines. Do you want to just no, I'll carry	
25		on.	

Examined by Mr. Fitch

- 1 So despite Mr. McDonnell's criticism that I had no
- zone, I have two zones -- two types of zones. I would
- 3 have to go back to the map again.
- 4 Q. All right. Well, why don't we do that? So that's
- 5 Exhibit 137 --
- 6 A. DR. FAIRHURST: Page 3.
- 7 Q. -- yes, 3.
- 8 A. DR. FAIRHURST: Okay. The purple along roads is
- 9 that 1-kilometre width occupying the majority of the
- 10 buffers -- I mean, the turbines. Around that,
- 11 encompassing that is a green thick line, and it kind of
- 12 zigzags back and forth. And I have an east zone and a
- west zone. And that brings all the -- all the turbines
- 14 together within the zone and still leaves some outlying
- views -- viewpoints or observation points outside of
- that. But that's that 415-kilometre -- square
- 17 kilometre zone that I had marked off.
- I also had the 5 K, that squiggly outside of the
- 19 nearest turbine zone.
- 20 Q. That's in blue? The 5 K is the blue line?
- 21 A. DR. FAIRHURST: The blue and then a purple, I
- guess.
- Q. And the 10 K is purple?
- 24 A. DR. FAIRHURST: Purple. So that would take us to
- questions of, well, how far are we supposed to be

11:04

Examined by Mr. Fitch

looking? Over the low rolling landscape, the 200-metre 1 2 maximum vertical height of the blade would be easily 3 seen close in, but the -- and I haven't tested how far 4 that zone might be before they begin to diminish, but 5 other studies, and I think a rather important study, page 40 of -- let's see. It's just the wind turbine 6 7 visibility and visual impact threshold distances in western landscape carried out by trained professionals, 8 9 including landscape architects for the Bureau of Land Management. This I referenced in my original report. 10 11:07 11 But the blade height tip was 18 metres average. 12 Q. Sorry, 118 metres? 13 Α. DR. FAIRHURST: 118 metres average. And just so the record is clear, you're talking about 14 Q. 15 an article that I think was sponsored or somehow the 16 Bureau of Land Management in the United States was 17 involved. This was the article that I put to 18 Mr. McDonnell when I was questioning him, and it's been 19 entered as an exhibit? 20 Now, I don't -- they said Α. DR. FAIRHURST: Yes. 11:07 21 the zone of most vulnerability is 16 kilometres distance in similar terrain in the wide open plains of 22 23 the U.S. 24 So, Dr. Fairhurst, if I could just interrupt you. Q. 25 going to show you Exhibit 254, which is an article

Examined by Mr. Fitch

			1
1		titled "Wind Turbine Visibility and Visual Impact	
2		Threshold Distances in Western Landscapes."	
3	Α.	DR. FAIRHURST: Yes.	
4	Q.	For the record, when you were discussing a moment ago	
5		this study by the Bureau of Land Management, you're	
6		referring to Exhibit 254; is that right?	
7	Α.	DR. FAIRHURST: Okay. Yes, I am.	
8	Q.	Okay, thank you.	
9	Α.	DR. FAIRHURST: Thanks.	
10		It helps a little bit more to say on that, in	11:08
11		reference to another reference that McDonnell	
12		Mr. McDonnell has raised, and I'll state it in this	
13		order, and I will get to that.	
14		In Figure 2 on page 7 of is it my report?	
15	Q.	Yes. So that would be Exhibit 137.	
16	Α.	DR. FAIRHURST: Yes.	
17	Q.	Pdf 7.	
18	Α.	DR. FAIRHURST: Go to that one. Oh, there it is.	
19		There's a cross-section that I did with a 200-metre	
20		vertical height, vertical blade, and heights of	11:09
21		vegetation of I just used 15 metres, I believe. I	
22		used some smaller ones also. But at 200 metres that's	

thousand metres, which is what, 11 point -- I can't read it here. But as we slide along, the effectiveness

the -- it's sort of a 45-degree right up to a

23

24

25

1		of intervening screening is very low for they could	
2		be structures. They could be, 15-metre height, tree	
3		clumps. The turbine towers over the landscape.	
4		They also have a total sweep of over 14,000	
5		square metres, which is 1 and a half hectares,	
6		approximately, each as they rotate. They're slow, so	
7		it's not a solid mass, but they do occupy that sweep.	
8		And that's noted in the specifications.	
9	Q.	Thank you.	
10	Α.	DR. FAIRHURST: Is this part of it, an exhibit?	11:11
11		This is	
12	Q.	Yes. There is I don't think that specific document	
13		you're referring to, but there is in evidence	
14		information about the turbine and its specifications.	
15	Α.	DR. FAIRHURST: Okay. We're moving on to that	
16		last paragraph, paragraph 7, "visual landscape system."	
17	Q.	So we're back on your opening statement then?	
18	Α.	DR. FAIRHURST: Yes.	
19	Q.	0kay.	
20	Α.	DR. FAIRHURST: Now, that's the one that I built	11:12
21		for CEMA in 2003. I had seen it used in a	
22		environmental impact assessment by Golder for Suncor, I	
23		believe, in 2007. So it has had some applications.	
24		And I had determined there's a lot of terminology	
25		here which is kind of mind boggling if you don't really	

1		see how it's derived.	
2		I had my form as on page 14 of Exhibit 137, I	
3		believe.	
4	Q.	Would you like us to call that up?	
5	Α.	DR. FAIRHURST: Yes.	
6	Q.	Okay. So Exhibit 137, pdf 14. Okay. Carry on.	
7	Α.	DR. FAIRHURST: Right. So I went through I	
8		better look at this much closer. And I won't spend	
9		much time on it. Page 14.	
10		But the document that I related it to defines all	11:13
11		of these features and why we might come to these	
12		conclusions, and in this case I did only one	
13		classification form, and I was thinking that, on	
14		average, close-in turbines, looking at the landscape	
15		itself, its vegetation, water, colour, adjacent	
16		scenery, scarcity, land use modification, I came up	
17		with "moderate attraction." That was the first	
18		category. And I did an override here because the form	
19		says if land form modification, well, it's	
20		harmonious, yes. But did I override the slope? I did.	11:14
21		Okay. I raised the slope, not the of the	
22		terrain, but because if you think of that cross profile	
23		of a turbine, that's creating a new slope close in. It	
24		may disappear out of sight further back, and I	
25		acknowledged that. But this form like, this is just	

1	the first go at using it for wind wind farms, and I	
2	think it works. So I came up with "moderate."	
3	For observability there's foreground and middle	
4	ground. Focal, in-direct line. When you travel a	
5	road, that is your focus. You can turn your head and	
6	look around, but you're kind of grabbed it doesn't	
7	have to be channelled by big trees or anything, or big	
8	hills. You're looking ahead, and there's an expectancy	
9	of what you're looking at.	
10	Viewing frequency, many opportunities, because	11:15
11	that's a daily occurrence. A fair number of people who	
12	have high concern.	
13	And duration, many opportunities.	
14	So I came up with a high observability, and then a	
15	matrix gave it high significance for landscape.	
16	Then risk, I did there's low uniform diversity,	
17	low uniform topography. Colour contrast is low	
18	uniform. Illumination can be from the front or side.	
19	But there was this slope that was gentle. And, once	
20	again, supposed to take off minus 10, but I think I	11:16
21	brought it closer to the centre to give it moderate.	
22	So the answer, existing integrity is very high.	
23	And that's where I stopped. But in my conclusions	
24	I came up with another matrix that gave an answer.	
25	So you got the existing integrity, landscape	

Examined by Mr. Fitch

integrity, but what are you going to do with it? This could serve to guide what should be done there as an objective.

So this was on page 25 of the document that I cited, the visual landscape system, which is not in the works. And I would like to see it in the works, but that's up to you.

I took the -- for risk was moderate and significance was high. So that gave a Class 2, high, which had the same terminology. And that was page 14, was it? "High" was minimal alteration to be evident, subordinate, well designed, high landscape conformity. And that's where I left it.

If you want to use this kind of approach in planning -- and I did see that Golder did for Suncor, so I was quite impressed -- there would be keeping things subordinate and minimal alteration evident.

Now, obviously somebody is going to say, well, that's that working agricultural landscape and -- but what I experienced alteration of the fields, it may be all industrialized, but it is done in a way of high conformity. It just fits the land, obviously, and I saw no jarring factors.

And even if a skiff of snow, the golden stubble was added to it, the shape of these ways these fields

11:18

Examined by Mr. Fitch

i <del>-</del>			<b>a</b> l
1		get ploughed and seeded. It was great.	
2		So that's my application of visual landscape	
3		system.	
4	Q.	Okay. So maybe if we could just summarize, then, you	
5		used this visual landscape system rating form, or VLS	
6		rating form, and you determined that the existing	
7		landscape integrity for the area is high; correct?	
8	Α.	DR. FAIRHURST: Yes.	
9	Q.	And you also concluded that there is a high landscape	
10		significance rating; correct?	11:20
11	Α.	DR. FAIRHURST: Yes, high significance.	
12	Q.	Yes.	
13	Α.	DR. FAIRHURST: And existing is high, the risk is	
14		moderate, but that just brought it down one point.	
15	Q.	Right. And then what's your conclusion about what the	
16		wind farm will do to the landscape integrity and the	
17		landscape significance?	
18	Α.	DR. FAIRHURST: Well, I don't think it can fit in	
19		the near ground. I could say that the height, the	
20		numbers, and the distance all work to a rather a	11:21
21		very significant impact.	
22		And I don't leave it there. I say this system	
23		needs to look at all values, tradeoffs, and I wrote	
24		those down consultation, design, and planning. If	

25

there is a -- I have no idea if there is a better place

i			<b>a</b>
1		or if the fewer numbers I have not looked at fewer	
2		numbers. I just say that the effects along the road	
3		where the majority of turbines will be experienced on a	
4		daily basis, and nightly, will be very strongly felt by	
5		the community.	
6		That's how I conclude that.	
7	Q.	All right, thank you. So then I think then you have a	
8		few specific points you want to make in terms of	
9		responding to Mr. McDonnell's reply evidence?	
10	Α.	DR. FAIRHURST: Right. I have eight points to	11:22
11		make, and a lot of this I've already led us through	
12		earlier so I don't have to make it too long.	
13		Mr. McDonnell accused me and my report of bias	
14		towards the foreground, to show things over the kind	
15		of the way that he thought they would be viewed in the	
16		middle ground from farms, in that nature, and I did	
17		purposely select those close observation points.	
18		So there was that total of 37 percent, including	
19		the three with the Krokers, versus the 63 percent in	
20		middle ground, and it's still a fairly low proportion.	11:23
21	Q.	So then the majority of your views are not, in fact,	
22		foreground; is that correct?	
23	Α.	DR. FAIRHURST: Okay, the majority of the views	
24		are not in the foreground	
25	Q.	Correct. Yes.	

Examined by Mr. Fitch

1	Α.	DR. FAIRHURST: or within foreground distance	
2		of one or more turbines.	
3	Q.	Okay. Thank you.	
4	Α.	DR. FAIRHURST: So there is not a bias per se. It	
5		was more of a balance that I tried to create.	
6		Mr. McDonnell in Point Number 2 could you bring	
7		up those do you have the evidence I mean, my	
8		statement?	
9	Q.	Sorry, what oh, so the opening statement, please.	
10	Α.	DR. FAIRHURST: Down to Number 2 now. I disagree	11:25
11		with Mr. McDonnell, that the only views that matter are	
12		from a person's residence, which just happen to be in	
13		the middle ground, 2 kilometres to 8 kilometres away.	
14		And I've said this already, viewing opportunities	
15		from local community roads can be a significant daily	
16		occurrence.	
17		Mr. McDonnell also insisted that the way it's done	
18		is you take a balance of, you know, here's one at	
19		8 kilometres, here's one at 3 and a half, so you kind	
20		of average off or you provide all the those	11:25
21		simulations, but you cannot you cannot address just	
22		one. You have to think of how they all weigh out.	
23		So I have always been used to addressing the best	
24		case, which is also the worst case, and I can't the	
			ll .

best opportunity, viewing opportunity, which might just

25

1		happen to be the highest impact opportunity, so	
2		best-worst, and I don't do the average. I never have.	
3		Mr. McDonnell has not conducted a visual impact	
4		assessment that says landscape architects are able to	
5		appraise them. I would say, with experience or	
6		practice, training, you see much more, you are able	
7		with that experience, you're going to be able to carry	
8		out and assess.	
9		He insisted that he was not assessing my visual	
10		impact assessment, just the simulations, but he went to	11:27
11		lengths to condemn my application of the CEMA visual	
12		landscape system. This was done by me in the absence,	
13		recognized by Mr. McDonnell, that there is no VIA	
14		procedure in Alberta.	
15	Q.	And by "VIA" you mean "visual impact assessment"?	
16	Α.	DR. FAIRHURST: Yes, thank you.	
17	Q.	0kay.	
18	Α.	DR. FAIRHURST: Mr. McDonnell criticized my use of	
19		the word "community" and "community roads." I found	
20		a I found a Wikipedia definition that seems to hit	11:28
21		well. If I may read it. (as read)	
22		"A community is a small or large social	
23		unit who have something in common, such	
24		as norms, religion, values, identity.	
25		Communities often share a sense of place	

Examined by Mr. Fitch

1	that is situated in a geographical	
2	area."	
3	Sharp Hills is also part of Special Areas Number 3 and	
4	4. In 1938 these were created during the hardship of	
5	the time, and they say on their website: (as read)	
6	" transformed into a strong and	
7	progressive region in southeast Alberta.	
8	The area holds an amazing balance of	
9	rich opportunity, quiet living, so it	
10	deserves a special name for this"	11:29
11	their statement "breathtaking land."	
12	And I haven't seen much mention of special areas or what	
13	kind of planning or zonation they do but that exists.	
14	Number 5. Mr. McDonnell claimed compatibility of	
15	wind farms with the working agricultural landscape. He	
16	cited Vissering 2011, an East Coast woman, who qualified	
17	her landscapes compatibility because it has rolling	
18	hills and great diversity.	
19	He said, even with that, visual impacts would	
20	typically occur between 5 and 8 miles, and suggested 10	11:30
21	would be a good guideline for the western part of the	
22	country. But she had conversations with those who	
23	conducted the BLM study, which we just referred to, and	
24	said, actually she would recommend a new distance of	
25	40 kilometres or 25 miles because of the open terrain,	
		l

Examined by Mr. Fitch

dry air, larger wind projects.

The working agricultural landscape of Mr. McDonnell already has high compatibility of all components. The wind turbines are unlikely to succeed in merging, particularly in the foreground, and quite likely not in the mid ground. BLM said individual wind turbine generators are very large structures incorporating visually conspicuous, reflective surfaces, obviously non-natural geometry that contrasts strongly with natural landscapes.

11:31

And I just have three more to go. Mr. McDonnell assessed several attributes of my simulations. As I said, we, I, rigorously and consistently built these from a composite; a 48-millimetre lens, individual camera frame type simulation, to emulate the 35-millimetre camera lens, 360 degrees, and we've looked at the 5-degree intervals. Some aberrations, such as one turbine close up, actually bent, unfortunately. I do not try to portray these in a worse light. It was just a factor of the images joining like this together.

11:33

The colour he didn't like. You've seen that I have used white turbines, but they get shaded. And the BLM in their studies suggested that colour and geometry, both the whiteness or the darkness of the turbines against the backdrop and the vertical lines were major

Examined by Mr. Fitch

contributors to visibility at all distances.

On my way, somewhat lost, from Calgary to Oyen on my visit, I came across a wind farm right beside the roadway I was travelling, and I noticed the bright white of turbines in the sun, but just behind, and not very far, it was almost right next to it, a dark turbine. And these were having shade cast by the clouds. In the sun there was bright white turbines in the greatest contrast. And I've tried to pick these up by my photomontages and animations, which we've seen.

11:34

Number 7, the photomontages referred by

Mr. McDonnell and the VNS simulations can describe
similar visibility when vegetation is minimal in height
and distribution. There were Figures 2 and 6 in the
McDonnell memo which showed rather similar -- a lack of
screening. And when turbines are close, the intervening
fence posts, power poles, farm structures are still
subordinate relative to these turbines. Even
high-tension towers are probably only 50 metres in
height and static, and the small pump jacks do have
repetitive movement but are dispersed and very small in
the landscape, that kind of thing.

11:35

The grain bins provide an essential function. You may have higher contrast because of their colour: white.

Examined by Mr. Fitch

1		So I sort of conclude here that unlike the U.S.	
2		Bureau of Land Management's findings, Mr. McDonnell	
3		states that turbines will blend with the sky, can	
4		provide visual interest and animated presence in a	
5		static landscape and symbolic harnessing of the wind.	
6		His end points, and maybe I'm a little tough on him, and	
7		maybe I shouldn't even say it, but they seem contrived.	
8		I think it was all leading to one end point.	
9		In my opinion, passive, cultivated integrity of the	
10		Sharp Hills landscape needs no enhancement of movement	11:3
11		from incompatible turbines.	
12		And that's the end of my what was supposed to be	
13		brief opening statement.	
14	Q.	Dr. Fairhurst, maybe just one follow-up question, which	
15		may be of interest to the Commission. It's often said	
16		that visual impacts are subjective.	
17		I take it what you've tried to do is provide an	
18		objective assessment of visual impacts?	
19	Α.	DR. FAIRHURST: There's the formal esthetic	
20		system, which visual impact assessment is one of, which	11:3
21		is identified by scholars in the United States and	
22		studied, is one that is set to be objective and hard	
23		measures rather than the other one, which is more	
24		dealing with emotional response of people.	
25		My intention was to set it out with strict	
			ĬĬ

Examined by Mr. Fitch

controls and see where it leads me. I never contrived and would never do that in my professional life or for my company. I never set out to prove something that wasn't there. I just was reading it as it is, as it comes out, and the numbers.

One of the things I hadn't addressed was, okay, so there's -- you see way down on the road there may be more things kind of intervening that I didn't account for. I say that this is a way of addressing that cumulative effect as one might travel down the road. One might not see all of those wind turbines at once, but it also says there is a -- as you might travel things, may open up and there they will be. And so it looks, at first glance perhaps, more overwhelming than it really is, but it serves that other purpose of cumulative effect.

Q. Okay. So just the final question then following up from that. As a practitioner in the area, what is your response if someone says to you, "ah, all of those visual impacts, they're just subjective"? As a professional working in the area, what's your response to that?

A. DR. FAIRHURST: I say there's very little
subjectiveness. I've heard that throughout my 28
years. But when you approach analysis on a systematic

11:39

Cross-examined by Ms. Oleniuk

h			<b>=</b> 1
1		basis and, yes, we do include, say, a measure of	
2		social concern, high, medium, and low. Does the people	
3		travelling the highway have high concern? Do people	
4		kayaking along a lake have greater concern? Do fewer	
5		numbers few people in a year who have high concern,	
6		there's a slot that can be put in.	
7		Now, we may not have exactly measured that, and we	
8		may make some assumptions.	
9		So that is the one element that goes into it that	
10		is somewhat subjective. Everything else has a	11:42
11		measurement: the distance zone, the height of the	
12		terrain, as said in the VLS, the risk. It's all	
13		objective. And that's what I follow.	
14		And, by the way, that visual landscape system was	
15		built from amalgamation of systems in BC, Alberta, USA,	
16		and Britain. So it stands well supported.	
17	Q.	Thank you, Dr. Fairhurst.	
18	MR.	FITCH: Mr. Chair, that concludes the	
19		direct evidence of this witness panel. Mr. de Haan and	
20		Dr. Fairhurst are now available for questioning.	11:43
21	THE	CHAIR: All right. Thank you, gentlemen.	
22		Ms. Oleniuk, whenever you're ready.	
23	MS.	OLENIUK: Thank you, chair.	
24	MS.	OLENIUK CROSS-EXAMINES THE PANEL:	
25	Q.	Good afternoon or good morning. It feels like	
I			

# Cross-examined by Ms. Oleniuk

1	afternoon,	but	it's	still	morning.	

- 2 My name is Terri-Lee Oleniuk, and I'm one of the
- 3 lawyers working for EDP. So I just have a few
- 4 questions with respect to your evidence, and I think
- 5 I'll start first with Dr. Fairhurst.
- 6 So, sir, just the first thing. I know you talked
- 7 a lot about the visual landscape system or VLS that you
- 8 developed for CEMA?
- 9 A. DR. FAIRHURST: Yes.
- 10 Q. So my understanding, again, is that that was developed
- 11 specifically for the Wood Buffalo area?
- 12 A. DR. FAIRHURST: Yes, that's correct.
- 13 Q. And my understanding is that Wood Buffalo is a boreal
- forest; is that right?
- 15 A. DR. FAIRHURST: Yes. And open land with the
- oil sands developments.
- 17 Q. Right. Where the mines are?
- 18 A. DR. FAIRHURST: Yeah.
- 19 Q. Yes, okay. And in your opening statement, you
- 20 indicated that you had adapted the VLS rating form for
- 21 wind farms; is that correct?
- 22 A. DR. FAIRHURST: For this particular application.
- Q. Okay. And you don't need to get into it, but I'm just
- 24 wondering if that -- the method by which you adapted it
- is anywhere in your report?

11:43

Cross-examined by Ms. Oleniuk

- 1 A. DR. FAIRHURST: Yes.
- 2 Q. Can you point me to where it's described, the
- 3 adaptations that you did?
- 4 A. DR. FAIRHURST: Well, on the -- maybe I was poor
- in describing it, but on the form itself, I said
- 6 override, meaning the slope probably was undervalued
- 7 when it came to putting a 200-metre maximum height
- 8 turbine.
- The viewing slope becomes what you're looking at,
- 10 not the -- not the terrain below. So there was some
- overrides that I put in. If I didn't explain that, it
- was quite possible.
- 13 Q. And the next thing I just had a question about, and you
- indicated as well in your opening statement, you talked
- about there being no visual impact assessment procedure
- in Alberta. Do you recall that?
- 17 A. DR. FAIRHURST: Yes.
- 18 Q. Okay. My understanding is BC, where you're from, I
- 19 understand does, in fact, have a procedure specific to
- 20 evaluating the visual effect of turbines?
- 21 A. DR. FAIRHURST: They did a public perception
- 22 study. They don't have a system yet. They studied --
- I don't know the number of people. They took them out
- in the field and said what is your -- what is your
- response in the various situations? But they didn't

11:45

Cross-examined by Ms. Oleniuk

- 1 have -- they don't have guidelines.
- 2 Q. Okay. And that's the -- that's what's referenced in
- 3 your report?
- 4 A. DR. FAIRHURST: Yes.
- 5 Q. Okay. And I just -- I'm not sure if I necessarily need
- 6 to pass this out, but when I was preparing for this
- 7 hearing, I came across -- and I already provided this
- 8 to your counsel -- a visual effects assessment
- guidebook for wind energy developments in British
- 10 Columbia. Are you familiar with that publication?
- 11 A. DR. FAIRHURST: I would have to look at that.
- 12 Q. Okay. So I take it the answer is no, you're not
- familiar? I'm just curious if you're familiar with it.
- 14 A. DR. FAIRHURST: I withhold an answer until I check
- 15 that out.
- 16 Q. So, sir, I don't intend to ask you any questions about
- 17 it. My question was just relating to whether or not
- 18 you were familiar with the guidance that exists in BC.
- 19 A. DR. FAIRHURST: Okay. Mr. Fitch told me that this
- was being sent out. I said just by the -- just a quick
- look at the cover I thought it was a visual perception
- study of wind farms, so I did not review this.
- Q. Okay, that's fine. And my next question just relates
- 24 to -- I think what you refer to as the subjective
- 25 aspect of visual impact assessment.

11:46

Cross-examined by Ms. Oleniuk

			īl
1	Α.	DR. FAIRHURST: Yes.	
2	Q.	And if we can just turn to page 4 of your report, which	
3		is Exhibit 137.	
4	Α.	DR. FAIRHURST: Hmm hmm. Yes.	
5	Q.	And it's just the second paragraph here that we have on	
6		the screen. Do you have that up in front of you?	
7	Α.	DR. FAIRHURST: Yeah.	
8	Q.	Okay. And on page 4 here, in the second paragraph you	
9		indicate: (as read)	
10		"Symbolic aesthetic qualities, such as	11:
11		those contributing to meaning and	
12		function, cannot be measured by	
13		quantitative methods and generally rely	
14		on soliciting public opinion."	
15		Do you see that there?	
16	Α.	DR. FAIRHURST: Hmm hmm.	
17	Q.	And then you refer to a "level of concern," in quotes.	
18		And you further indicate here that you did not seek	
19		public opinion except those views expressed during the	
20		field tour by Sheldon and Kelly Kroker?	11:
21	Α.	DR. FAIRHURST: Yes, that's correct.	
22	Q.	And I just want to confirm whether you spoke to any	

 $\,$  Q. And I just want to confirm whether you spoke to any

other individuals besides the Krokers?

24 A. DR. FAIRHURST: None. They were my only two

contacts there during our field tour.

Cross-examined by Ms. Oleniuk

- 1 Q. Okay. And I note, as well, that you reference the 2 Special Areas Board in your opening statement.
- 3 A. DR. FAIRHURST: Yes.
- Q. And I guess you mentioned you only spoke with the
  Krokers when you were there, but did you have any other
  opportunity to speak with Special Areas about their
  permitting process?
- 8 A. DR. FAIRHURST: No. I have not.
- 9 Q. Okay. Despite the fact you didn't speak with the
  10 Special Areas Board, did you have an opportunity to
  11 review their land use order, which controls the use and
  12 development of land and buildings within special areas
  13 and has a specific section regarding wind turbine
  14 projects?
- 15 A. DR. FAIRHURST: I did not.
- 16 Q. I'm just going to ask you a few questions, sir, with 17 respect to the simulations --
- 18 A. DR. FAIRHURST: Yes.

20

21

22

23

24

25

19 Q. -- some of which we talked about today.

I'm not a visual impact expert, but I did read a little bit about it in preparing for this hearing. And one thing I noted, and you can tell me if you agree with this or not, is one guidebook -- it was actually the BC one -- indicates creating technically accurate simulations is critically important, so any

AMICUS REPORTING GROUP 11:49

Cross-examined by Ms. Oleniuk

- 1 manipulations that would either exaggerate or minimize
- 2 the visual impacts of a proposed project must be
- 3 avoided?
- 4 A. DR. FAIRHURST: Yeah.
- 5 Q. Do you agree with that statement?
- 6 A. DR. FAIRHURST: Yes.
- 7 Q. Okay.
- 8 A. DR. FAIRHURST: Of course. What I accomplished
- 9 was technically accurate. It had its limitation of no
- 10 provision of forests or vegetative cover that I could
- 11 put into the model. It was technically accurate. It
- matched with the photo panoramas that I took, and,
- therefore, I had confidence in its use.
- 14 Q. Okay. If we could just pull up Exhibit 136. And this
- is one of your simulations. And I just want to explore
- with you, sir, the meaning of "technically accurate."
- 17 If we could just go to pdf 23, I think. Okay, perfect,
- this is the one.
- 19 And so just -- again appreciating that I'm not an
- 20 expert in this area, my understanding of what you're
- 21 trying to portray on this page is essentially the top
- 22 photograph is meant to depict what the site looked like
- at that time when you were there; is that right?
- 24 A. DR. FAIRHURST: Yes, that's it.
- 25 Q. Okay. And then the simulation immediately below it is

11:51

Cross-examined by Ms. Oleniuk

- meant to represent what it will look like after the project is constructed; is that correct?
- A. DR. FAIRHURST: It represents the turbine position and height with the qualification that I make. It's to be looked at together with the photo to get a sense of what's -- how it all fits together.
- Q. Okay, sir. So I guess my question would be, then,
  wouldn't it just be more representative to have put the
  turbines into the top photo with all of the remaining
  landscape, vegetation, poles --

11 A. DR. FAIRHURST: Oh, yes.

- 12 Q. -- bins?
- A. DR. FAIRHURST: That's why I did the windPRO one that we just looked at, in particular the Jorgensons' bins.

Now, if you look at -- beyond the bins or on the right-hand side, it's an open landscape. There's also very few, maybe two, turbines in the far, far distance. So that's more of an accurate depiction of what the

20 future could look like.

- Q. So you're saying the right-hand side of the bottom image is more accurate?
- A. DR. FAIRHURST: I'm just saying that's an accurate -- if there's no intervening screening, that's accurate.

AMICUS

REPORTING GROUP

11:53

Cross-examined by Ms. Oleniuk

- 1 Q. Okay. Because I see a pole on the right-hand side in the top picture.
- 3 A. DR. FAIRHURST: Hmm hmm.
- Q. Okay. So that would be something that would still be there, presumably, after the project; right?
- 6 A. DR. FAIRHURST: Oh, yes.
- Q. Okay. Just one other quick question about the tool
  that you used for this, the software program. It
  allows you, presumably, to insert turbines. Does it

not allow you to insert bins and fences and poles and

11 power lines? Is that a software limitation?

- 12 A. DR. FAIRHURST: Yes. This is not the use of 13 photomontages, the Visual Nature Studio.
- 14 Q. Okay.
- 15 A. DR. FAIRHURST: You have to add those separately.
- Sometimes I add some elements just for scale, but in
- 17 this case I left that open and left it to refer back
- and forth between the photo and the simulation.
- 19 Q. Okay. So you could have added them in. You just chose

20 not to?

21 A. DR. FAIRHURST: You can add them, but the level of

- detail is probably not going to be very accurate.
- There is no stock image of the bins or -- there is
- 24 stock images of houses. You can add fences, but that
- is -- is all further effort to -- to accomplish what

11:54

1	the	comparison	already	has	accomplished

Α.

Q. Okay. Thank you. And just my final question for you, sir, and this is in your report, and you also referenced it in your opening statement as well. And you recommend placing the turbines at much greater distances from the community. And you gave your -- or you recited the Wikipedia definition of community.

But I guess I'm just wondering, sir, in this case and in this specific context of your recommendation, what do you define as being the community? Are we talking about Sedalia? New Brigden? Are we talking about the individual farmhouses that are throughout the area?

I guess where are you recommending -- like, what are you recommending in here when you say they should be placed farther from the community?

Well, first of all, I didn't have DR. FAIRHURST: any specific recommendation on distance. I don't know that distance. I don't know. But I do know that it is all of the above or whatever -- sorry, what you just It is farms. It's people. It's people moving through this network of roads, which is rather cohesive, and identified by this -- partly by the Clearview Group, but also there's -- there's the rest of the people. People are the viewers.

11:57

	1	Q.	Okay.	Thank	vou.	sir.
--	---	----	-------	-------	------	------

2

3

4

5

6

7

8

9

10

Just turning to you, Mr. de Haan, I have some questions. So the one thing I was just going to ask, when I first read your report I noted that you didn't make the AUC Rule 1 independent witness declaration, which is to provide opinion evidence to the Commission that is fair, objective, and non-partisan. But you did confirm in your, I think, information request response through EDP that you do acknowledge this duty; is that correct?

11:58

- 11 A. MR. DE HAAN: That is correct.
- 12 Q. And I assumed you've endeavoured to do that with 13 respect to your report in this proceeding?
- 14 A. MR. DE HAAN: That is correct.
- Q. Okay. I understand, Mr. de Haan, that you act for both proponents of wind power projects as well as interveners who have concerns with wind power projects; is that right?
- A. MR. DE HAAN: I'm involved with wind power
  projects from a proponent's perspective, and this is a
  project where I'm involved from an intervener's
  perspective, that's correct.
- Q. Okay. And regardless of whether your client is a proponent or an intervener, whether they're for or against a particular project, I assume you always

- strive to give evidence that's independent, fair, objective?
- A. MR. DE HAAN: Yeah. I try to provide accurate assessments of the noise impact.
  - Q. Okay. Thank you, sir.

And so I just want to understand, we've talked a lot -- my friend did during his cross-examination of Ms. Drew, and you did as well in your opening statement -- with respect to some of the assumptions that were made in the context of the noise impact assessment completed in this proceeding and some other projects, recent projects that the Commission is looking at.

And so what I want to understand a little bit is how your criticisms of the noise impact assessment in this proceeding, and specifically some of the assumptions compared to your practice in a recent NIA that you authored -- and so I provided this excerpt to my friend as an aid to cross. I'm not sure if you need it right now.

21 A. MR. DE HAAN: Yeah.

Q. And so, first, if we could just turn up Exhibit 258.

And this was an aid to cross that was provided by my friend and which was just filed on the record yesterday, I believe. And that's a two-page excerpt

11:59

Cross-examined by Ms. Oleniuk

- from the noise impact assessment for Capital Power's
  Whitla project, and it's dated October 19th, 2017.
- And so, Mr. de Haan, I noted in your curriculum

  vitae that you didn't indicate that you worked for

  Stantec, but when I reviewed this report, your name was
- 7 A. MR. DE HAAN: Yes, that could be. I've been involved with parts of the Whitla wind power project, that is correct.

Is that correct?

on it.

6

- 10 Q. Okay. And so, again, just my understanding, and just
  11 if you can confirm for me, I didn't provide the
  12 signature page for this, but my understanding is that
  13 you're one of the two acoustic practitioners that's
  14 listed on this NIA; is that correct?
- A. MR. DE HAAN: I don't have the signature page, and I'm specifically asking for that because my involvement with the Whitla project has ended before the final report was filed.
- 19 Q. Okay. I didn't provide it, sir, because I just -- I
  20 assumed that you knew what reports you authored.
- 21 A. MR. DE HAAN: Well --
- Q. Do you want to take a moment just to check if you authored this one?
- A. MR. DE HAAN: There are specific Whitla reports, and the most recent report, and I believe it is from

12:02

12.02

Cross-examined by Ms. Oleniuk

1 March this year, but I'm not certain, that's the one 2 that's on the record and that's the one I'm not 3 involved with. However, I have been involved with the 4 Whitla project as a subcontractor to Stantec before. 5 That is correct. So I guess, sir, maybe just to sort of speed things up. 6 Q. 7 I guess perhaps you can advise, maybe after the break or subject to check, my understanding is that you and 8 Jonathan Chui, authored this report? 9 Α. MR. DE HAAN: Mr. Chui authored the report. 10 Ι 12:04 11 was involved. I did -- or I did the field program for 12 third-party facilities and I reviewed the report. 13 Q. Okay. 14 Α. MR. DE HAAN: Later on I assisted him with a 15 few -- with the selection of information requests from the AUC. 16 17 Q. Okay. So you did work on this report. That's helpful. 18 And just, again, understanding this impact 19 assessment is one that was done for the proponent? Ιt 20 was done for Capital Power? 12:04 21 Α. MR. DE HAAN: Correct. 22 Q. That's correct. Okay. And, again, just to be clear, 23 we talked about this as well last week, but the 2017 24 noise impact assessment was done before the Commission

instituted a technical meeting on the three Forty Mile

25

Cross-examined by Ms. Oleniuk

- 1 projects and asked the proponents to agree to common
- parameters; correct?
- 3 A. MR. DE HAAN: Correct.
- 4 Q. If we can turn up your report in this proceeding, which is Exhibit 138, and pdf 45.
- We just have it on the screen here. And the first dash point that's listed here indicates your view that
- 8 the study area, again for the RWDI noise impact
- 9 assessment, should be expand to include all facilities
- 10 within at least 4.5 kilometres from a receptor? That's
- 11 your recommendation; correct?
- 12 A. MR. DE HAAN: That is correct.
- 13 Q. Okay. And if we can just turn up the aid to cross that
- I just passed you, the one that's the noise impact
- 15 assessment aid.
- 16 A. MR. DE HAAN: Which one are you referring to?
- 17 The one from October 19th, 2017, or the one from just
- 18 **October 2017?**
- 19 Q. Yes. So the one -- one of them is a noise impact
- 20 assessment and the other one is an environmental
- 21 evaluation.
- 22 A. MR. DE HAAN: Sure.
- 23 Q. So the noise impact assessment, please.
- 24 A. MR. DE HAAN: Okay.
- 25 Q. And, again, just looking to this -- this report, that I

12:05

Cross-examined by Ms. Oleniuk

- understand you did the third-party work for? 1 2 MR. DE HAAN: Α. Correct, yeah. 3 Q. And the second paragraph in here, and if you can just 4 confirm this for me, my understanding is that for your report, for Capital Power, you identified facilities 5 within 3 kilometres of the project area; is that 6 7 correct? MR. DE HAAN: We got -- I got a map from Stantec 8 Α. with the assignment to look at the third-party 9 facilities in the study area. I criss-crossed the 10 12:06 11 study area in and outside the 3-kilometre buffer and I looked at both of the facilities that -- or the 12 13 potential facilities that were included on the map and 14 I looked what I could and count -- and counted on -- by 15 driving through the study area and around the study area and what I could find. 16 Okay. So just to confirm again, it was a 3-kilometre 17 Q. 18 radius that was included in this noise impact 19 assessment? 20 MR. DE HAAN: In the materials that were Α. 12:07 21 provided to me, it was a 3-kilometre buffer, but I criss-crossed -- I also criss-crossed outside this area 22 23 to look at potential facilities that were present.
  - Okay. And did you indicate that you did that Q. additional work anywhere in this noise impact

24

25

Cross-examined by Ms. Oleniuk

1	assessment?
	assessillerie:

- 2 A. MR. DE HAAN: How do you mean "did you
- 3 indicate"? I provided -- every facility that I
- 4 encountered on that field trip, I inspected that to see
- 5 if there were any noise sources or a way it could be
- 6 reasonably expected to become active again in one way
- or another or overgrown. And I provided my findings in
- 8 the term of measurements and map locations and all that
- 9 good stuff to Stantec.
- 10 Q. Okay. If we can just go back -- oh, we still have your
- 11 report here.
- 12 A. MR. DE HAAN: Yeah.
- 13 Q. And we're still on pdf 45. And at the bottom of the
- page, it's the fourth bullet from the bottom. And this
- one indicates -- again, this is going back to
- 16 Sharp Hills -- your view that there's a significant
- 17 number of waterbodies in the study area --
- 18 A. MR. DE HAAN: Correct.
- 19 Q. -- that should be considered as acoustically reflective
- 20 surfaces?
- 21 A. MR. DE HAAN: Correct.
- 22 Q. And then you also make references to roads and tamped
- ground; that's correct?
- 24 A. MR. DE HAAN: Yes.
- 25 Q. And I understand this to be a criticism of the RWDI

AMICUS
REPORTING GROUP

12:08

Cross-examined by Ms. Oleniuk

12:10

1		report?	
2	Α.	MR. DE HAAN: Correct.	
3	Q.	Okay. And then further back in your report, I don't	
4		think we need to turn to it, but you essentially	
5		recalculate the noise impact, and you include	
6		waterbodies, roads, and other tamped surfaces	
7	Α.	MR. DE HAAN: Hmm hmm.	
8	Q.	with a ground factor of 0. That's correct?	
9	Α.	MR. DE HAAN: Correct. Facility terrain.	
10	Q.	Sorry, what was the last part?	12:09
11	Α.	MR. DE HAAN: The last part was that we included	
12		facility terrain where visible as tamped ground as	
13		reflective.	
14	Q.	Okay, thank you. And if we can just turn back to	
15		Exhibit 258, which was the aid to cross that we were	
16		just talking about. And so this is the Whitla noise	

MR. DE HAAN: Yeah. 18 Α.

impact assessment excerpt.

17

- And I think it's just the table at the bottom of that 19 Q. 20 page that's on the screen. There we are.
- 21 MR. DE HAAN: Yeah. Α.
- 22 Q. Okay. And, again, turning back to the one that you did 23 for Capital Power. If I look at Item 6 here, it 24 indicates you used a ground absorption of 0.5. Do you 25 see that there?

Cross-examined by Ms. Oleniuk

- 1 A. MR. DE HAAN: Yeah. Stantec used a ground 2 absorption factor of 0.5. That is correct.
- Q. Again, you referenced Stantec, but to confirm, this was work that you did, your name was on this report?
- 5 A. MR. DE HAAN: I reviewed the report. I didn't model it. I just did a third-party noise assessment.
- 7 I reviewed the report and I assisted with some IRs.
- 8 Q. Okay.

20

21

22

23

24

25

- 9 A. MR. DE HAAN: So I didn't model this.
- 10 Q. Okay. But you were the quality reviewer I think is
  11 what I have you down as?
- 12 A. MR. DE HAAN: Reviewer of the report; that is correct.
- Q. Okay. And in here there doesn't seem to be any mention of any areas that were included with the ground absorption of O, so there doesn't seem to be any reference to waterbodies, wetlands, tamped ground, roads, anything like that. Is that fair?
- 19 A. MR. DE HAAN: No. That is correct.

I would like to add that during my field trip, I did not encounter any waterbodies except a large waterbody just outside of the study area to the west, off the top of my head. Nothing compared to what I encountered during my field trip recently to the Sharp Hills area.

12:10

Cross-examined by Ms. Oleniuk

- 1 Q. Okay. That leads me right to my next question.
- 2 If you could pull up the other aid to cross that I
- 3 passed you, and this is the environmental evaluation
- for Whitla. And if we turn to the fourth page I
- 5 provided you, there's a map. Do you see that map,
- 6 Mr. de Haan?
- 7 A. MR. DE HAAN: Are you referring -- sorry, are
- 8 you referring to this map?
- 9 Q. Yes, I am.
- 10 A. MR. DE HAAN: Okay.
- 11 Q. Okay. And my understanding, and you can correct me if
- 12 I'm wrong, is this is a map representing the Whitla
- project area, and it indicates there's a -- the
- 14 reference in here indicates it's native prairie
- 15 grassland and wetlands in the local assessment area.
- 16 Does that look right to you?
- 17 A. MR. DE HAAN: Yes, it does.
- 18 Q. And if we just turn to the next page in the aid to
- 19 cross, which is the Table 7-2, and that's the extent of
- 20 land cover type in the local assessment area. Do you
- 21 have that, sir?
- 22 A. MR. DE HAAN: Yeah.
- 23 Q. Okay. And if we look at the land cover type --
- 24 A. MR. DE HAAN: Hmm hmm.
- 25 Q. -- the first is "cultivated," then "developed," then

12:11

Cross-examined by Ms. Oleniuk

"native prairie," then "tame pasture," and then we get 1 2 into two rows, which I understand are meant to 3 represent waterbodies, wetlands, that type of thing? 4 Α. MR. DE HAAN: I'm an acoustician, so I don't 5 know what it means ephemeral waterbody or temporary graminoid marsh or seasonal or semipermanent graminoid 6 7 I don't know what it means. I take it to marsh. indicate marsh, and that's all it is to me. 8 Okay. 9 Q. So you wouldn't -- as an acoustical 10 practitioner, you wouldn't take this to mean that this 12:13 11 would be representative of marsh and wetlands in the area? 12 MR. DE HAAN: 13 Α. I don't know. I just told you 14 that when we -- when I conducted that field visit that 15 I didn't encounter any waterbodies in the Whitla study And this is the first time I see this. 16 area. 17 Q. The reason I ask those questions, sir, and 18 you're probably -- you probably already figured this 19 out, is because the third column here talks about 20 percentage of local assessment area. 12:13 21 Α. MR. DE HAAN: Yeah. And by my math, again, I understand marsh to be 22 Q. 23 wetland. And if we're looking here, it looks like 24 there's 5.5 percent of the first type of marsh and

7 percent of the second type of marsh?

25

Cross-examined by Ms. Oleniuk

- 1 A. MR. DE HAAN: Correct.
- 2 Q. And my understanding is that those two add together to
- 3 be 12.5 percent of the area as some type of wetland?
- 4 A. MR. DE HAAN: I agree on your math.
- 5 Q. Okay. And, sir, do you recall off the top of your
- 6 head -- you mentioned that you read the transcripts of
- 7 my friend's cross-examination of Ms. Drew, there was
- 8 quite a bit of discussion about the percentage area of
- 9 wetlands in Sharp Hills. Do you remember that?
- 10 A. MR. DE HAAN: Yeah, I remember that.
- 11 Q. It is your recollection, Mr. de Haan, that the number
- is actually less than 12.5, which is the number that's
- represented in this environmental evaluation by
- 14 Stantec?
- 15 MR. FITCH: Just for the record, the number of
- 16 12 percent was for Class 3 and above, and I don't think
- there's any percentage number for all wetlands that
- would encompass seasonal and ephemeral. So if we're
- 19 going to put this sort of contention to the witness,
- 20 let's be accurate.
- 21 A. MR. DE HAAN: Would you repeat the question,
- please?
- 23 Q. MS. OLENIUK: Sure. So my question was is it
- your recollection, then, when my friend was
- cross-examining Ms. Drew that the number I think of

12:14

Cross-examined by Ms. Oleniuk

wetlands in that situation was 12.5 percent? 1 2 your recollection for Sharp Hills? Sorry, is it your 3 recollection that it was less than 12.5 percent? 4 Α. MR. DE HAAN: I recall a percentage of 12.7, but 5 I may be off. 6 Q. Okay, that's fine. And just another question, and this 7 is with respect to the modelling that was conducted for the NIA. Just going back again to your report --8 9 Α. MR. DE HAAN: Which NIA are you referring to? Your criticism of the modelling that was done for the 10 Q. 11 Sharp Hills NIA.

12 A. MR. DE HAAN: Okay. So you're referring to the modelling for -- by RWDI?

- 14 Q. Correct.
- 15 A. MR. DE HAAN: Okay. Sure.

Q. Yes. I'm not sure we need to turn up your report, but essentially my understanding is that you criticized the use of the ISO 9613 standard for modelling noise from wind farms because, in your view, it has the potential to underestimate noise; is that right?

21 A. MR. DE HAAN: Well, according to the

22 peer-reviewed literature, there is a significant chance

that ISO 9613 underestimates the noise impact under

stable -- more or less stable atmospheric condition.

25 That is correct. And I share that -- I share that

12:15

- 1 view.
- 2 Q. Okay. And I assume that's the reason, sir, in your
- 3 evidence that you use the CONCAWE model for some of
- 4 your calculations? Is that part of the reason?
- 5 A. MR. DE HAAN: Well, since the ISO 9613 method
- 6 doesn't accurately represent the noise impact on the
- 7 stable atmospheric conditions, we included calculations
- 8 using CONCAWE to represent those stable atmospheric
- 9 conditions. At that point, we didn't know how frequent
- 10 they occur in the study area. Later we learned that
- 11 stability Class E is representative of that study area,
- 12 and we conducted some calculations with the use of
- 13 CONCAWE from meteorological settings. That is correct.
- 14 Q. Okay. And, again, if we can just go back to the Whitla
- noise impact assessment, which is Exhibit 258.
- 16 A. MR. DE HAAN: Yeah.
- 17 Q. And, again, when this noise impact assessment was
- 18 conducted for Capital Power, my understanding is that
- the standard that was used was ISO 9613; is that
- 20 correct?
- 21 A. MR. DE HAAN: Correct.
- 22 Q. Okay. And was CONCAWE used for any part of this noise
- impact assessment?
- A. MR. DE HAAN: Not to my knowledge, no.
- 25 Q. Okay. So just to be clear, this noise impact

12:17

Questioned by Mr. Mousseau

- 1 assessment used the same calculation standard and
- 2 software essentially that the RWDI NIA used; is that
- 3 correct?
- 4 A. MR. DE HAAN: Yes. They both used Cadna and
- 5 they both used ISO 9613, and Stantec used a ground
- 6 absorption factor of 0.5.
- 7 Q. Okay. Thank you, sir.
- 8 MS. OLENIUK: Those are my questions, Chair.
- 9 THE CHAIR: Thank you very much. We'll move
- on to any questions from Commission counsel. I believe
- it's Mr. Mousseau, and you're just going to ask your
- 12 questions from there, sir, as opposed to rearranging
- 13 the room?

16

- 14 MR. MOUSSEAU: I'm going to stay seated, if
- that's okay with everyone.

## MR. MOUSSEAU QUESTIONS THE PANEL:

- 17 Q. I'm going to start with you, Dr. Fairhurst. I don't
- have a lot for you, but I would like you to turn to
- 19 Exhibit 136, and we're going to start at pdf page 7.
- 20 And I think we've looked at this before. This is -- on
- 21 the top, it's a photomontage of the Jorgenson bins, and
- on the bottom is your simulation of that; do I have
- 23 that right?
- 24 A. DR. FAIRHURST: Yes, you have it. That's correct.
- 25 Q. And now I'm going to move to the next page, which is

AMICUS
REPORTING GROUP

12:18

Questioned by Mr. Mousseau

- pdf page 8. And before I jump in there, sir, maybe

  I'll explain who I am and what I'm doing here, if that

  might be helpful.
  - So I'm the Commission's counsel. So I work for the Alberta Utilities Commission. And my questions, again, are to try and fill in any gaps or holes that I might perceive in the record so that when the Commission gets to making its decision it's going to have the information it needs to make that decision.
- 10 A. DR. FAIRHURST: Yes.

4

5

6

7

8

9

- 11 Q. So in terms of my questioning, there's not much of an agenda here. I'm just trying to figure out what I perceive might be gaps or something that I might have missed. So -- if that's helpful?
- 15 A. DR. FAIRHURST: Yes, it is.
- 16 Q. Okay. Looking at pdf page 8, I see your simulation 17 sort of dominating this page, but then there's a 18 photomontage done by windPRO and a day and a night 19 view.
- 20 A. DR. FAIRHURST: Yes.
- Q. I guess my question is, sir, if you could create a photomontage with wind turbines superimposed on the picture using windPRO --
- 24 A. DR. FAIRHURST: Yes.
- 25 Q. -- why do you use the simulations? Is there a benefit

12:19

Questioned by Mr. Mousseau

1		to having the simulations if you can actually
2		superimpose them on a photograph?
3	Α.	DR. FAIRHURST: The simulations allowed me to
4		address the 27 viewpoints in 360-degree views
5		consistently, and the photomontages are more of a
6		they are photo work with somewhat less control on
7		position. You position from the known control points
8		and distance and also a narrow field of view.
9		So if we're looking at the 360-degree view, it
10		becomes more of a unwieldy task to complete 27
11		360-degree views. And I agree with you, that's that
12		works well.
13		It also provided me the opportunity to see what
14		might be ahead, as one travels the road. The photo
15		montage is set. It's a set viewpoint. It doesn't
16		allow for any movement one way or the other and it
17		doesn't account for that movement to make differences
18		in the views. So that's why I am familiar with visual
19		landscape VNS, and preferred that outcome.
20	Q.	Okay. And just so I understand it, you can't somehow
21		stitch those windPRO photo montages together. I notice
22		the one we're looking at on pdf 8, that's a 40-degree
23		view; is that right?
24	Α.	DR. FAIRHURST: For this particular one?
25	Q.	Yes.

12:21

12:22

----

Questioned by Mr. Mousseau

- 1 A. DR. FAIRHURST: Yes.
- 2 Q. Okay. And could you stitch that together with adjacent
- 3 views from windPRO?
- 4 A. DR. FAIRHURST: Yes. It's a time-consuming
- 5 process.
- 6 Q. Okay. But, from your perspective, does one better
- 7 portray ultimately what visitors to the area will see
- 8 as compared to the other? Is one more realistic?
- 9 A. DR. FAIRHURST: Of course. With that windPRO one.
- 10 Q. Okay. But, ultimately, I take it you decided to use
- 11 the simulations because it could give you a broader
- sweep and you could do more of them in the time that
- 13 you had? Is that fair?
- 14 A. DR. FAIRHURST: I believe I was under some time
- 15 constraint, and that gave me the whole concept of
- positioning of those turbines.
- 17 Q. Okay. Thank you, sir.
- 18 Okay, Mr. de Haan, I'm going to move on to you.
- 19 And the first thing I'm going to pick up on was a
- 20 discussion that you had earlier with Mr. Fitch, and it
- 21 related to the 1 decibel uncertainty that was
- incorporated into the RWDI model?
- 23 A. MR. DE HAAN: Okay.
- Q. Okay. And my understanding was that that 1 decibel
- 25 uncertainty was incorporated because at the time when

12:24

Questioned by Mr. Mousseau

- the original NIA was prepared, there was no sound power guarantee. Is that your understanding as well?
- A. MR. DE HAAN: That is my sum -- that is my understanding, yes.
- Q. Okay. And did it make sense, then, to build in some uncertainty to take into account the fact that you didn't have a sound power guarantee on that particular model?
- 9 A. MR. DE HAAN: We don't do it, and neither do my
  10 colleagues like at Stantec do it. There is a certain
  11 uncertainty with any sound power level that you have.
  12 Uncertainty in the -- of course, by both equipment,
  13 operating conditions, a whole set of things.

14

15

16

17

18

19

20

21

22

23

It doesn't make sense to me to incorporate an uncertainty for one specific source, the wind turbines, and not for the other sources. And I don't think that adding a 1 dB uncertainty would make up for differences in modelling, for instance, not including the waterbodies that are present.

- Q. Right. And we'll get there, sir. But is it fair to say that the impact of adding the 1 dB uncertainty, is it going to introduce conservatism or reduce conservatism in terms --
- A. MR. DE HAAN: All other things being equal, so the rest of the model being equal, it would introduce

12:25

Questioned by Mr. Mousseau

conservatism because you would get to a higher number to compare to the PSL. So all things equal.

3

4

5

6

7

8

9

10

11

12

13

14

Q. Okay. Thank you, sir. I would like to take you to Exhibit 179, pdf page 57. That should come up. If we can just scroll down a bit, there at (b). I'm going to read something to you and then I'm going to ask you a question. It's ISO 9613-2 defines an area of interest around each noise source, so source region, and around each receptor but defines the rest of the area as middle region, and all areas are included in the calculation.

And I was just hoping, sir, that you could explain at a high level how ISO 9613 uses these areas of interest when calculating noise levels.

- 15 A. MR. DE HAAN: Yeah, that is correct.
- 16 Q. No -- okay. I want you to help me understand how the
  17 model uses those three regions -- yeah, those three
  18 regions when it is calculating noise levels. How do
  19 those all get worked in?
- A. MR. DE HAAN: Okay. The source region is
  defined and is depending on the height of the source.

  Then the model calculates in the propagation path
  between each source and each receptor the ground factor
  between each source and each receptor. It considers in
  the calculation the ground factor for the source region

12:27

Questioned by Mr. Mousseau

- and the region as defined on height. It calculates the 1 2 ground effect in the receptor region along the 3 propagation path. And if there is no overlap between 4 source region and the receiver -- the receptor region, 5 there's a middle region. And then it take that's into 6 account. 7 Q. Okay. MR. DE HAAN: Does that answer your question? 8 Α. Am I clarifying enough? 9 Q. Not that I'm not an independent mind, sir, but if you 10 12:29 11 could help me understand how ground attenuation factors 12 in or is worked into those three regions. 13 Α. MR. DE HAAN: Okay. 14 When you're looking at it from ISO 9613. Q. 15 MR. DE HAAN: ISO 9613 then calculates the Α. 16 ground absorption in octave bands -- for each octave 17 band -- for both the source region and the receptor 18 region and for the middle region. 19 Does that answer it? Maybe you could rephrase the 20 question, because I'm not sure if we're connecting. 12:29 21 Q. Okay, sir, I'll try it this way. Considering the
- 21 Q. Okay, sir, 1°11 try it this way. Considering the
  22 height of wind turbines in general, do you think ground
  23 factors or ground attenuation plays a significant role
  24 in noise modelling for attenuating the sound from wind
  25 turbines to nearby dwellings?

Questioned by Mr. Mousseau

A. MR. DE HAAN:	Yes, I think it does.
-----------------	-----------------------

Ground attenuation in general, in connection with the sound waves with the ground, depend on grazing incidents. Sound waves kind of strike the ground when they connect with the ground.

If there is no grazing incidents, but a more steep incidence, there's more reflections. In the acoustic literature, I think it was C. M. Harris that said -- they mentioned percentage of 30 percent. So if the angle of incident is 30 percent or more, there is no grazing incident and the ground is essentially reflective.

Other references -- I think it's -- well, other references mention 20 percent. And that area around the wind turbine acts as completely reflective ground, and that is not considered as such in ISO.

If you take those percentages -- if you take the 30 percent, for example, it would -- and turbine height has a height of roughly 130 metres, and you get to an area of several hundred metres around the turbine, where the sound waves will just reflect independent of it being in general, the ground would be classified as absorptive or as reflective.

And if you think of it, I think in my opening statement I described -- we described -- noise source

12:30

Questioned by Mr. Mousseau

1 measurements close to the source and the propagation in 2 a half circle of the facility terrain because the sound 3 waves bounce from surface -- from the facility terrain 4 towards the microphone. 5 So propagation in a half sphere, that's consistent with that. Did I --6 7 You did, sir. Thank you. Q. Α. MR. DE HAAN: Thank you. 8 9 Q. Yesterday I provided Mr. Fitch with an aid to cross-examination, which is a table of my own making. 10 12:32 11 So if there's errors in it, they're mine alone, sir. 12 And what this table does -- and do you have it with 13 you? 14 Α. MR. DE HAAN: No. Actually I have an updated 15 table, but that's --And I take it you updated it to include the CONCAWE 16 Q. 17 results for --18 Α. MR. DE HAAN: Ε. 19 Q. Yeah, the Class E. 20 Α. MR. DE HAAN: Yeah, that is correct. 12:32 21 Q. I haven't done that to the ones I'm passing out but I 22 could --23 Α. MR. DE HAAN: Sure. 24 -- incorporate that into my questions, sir. So maybe Q. 25 I'll hand this to you.

Questioned by Mr. Mousseau

- 1 A. MR. DE HAAN: Yeah, sure.
- 2 Q. And, Mr. de Haan, what I tried to do with this table is
- 3 to get all the results or all the NIA results that we
- 4 had so far in the proceeding relating to receptors that
- 5 were approaching or in excess of 40 dBA nighttime,
- 6 based on the information I had when I prepared it. We
- 7 know that since then you've provided this additional
- 8 modelling that deals with the Class E, and we'll get to
- 9 that.
- But did you have a chance to review the table,
- 11 sir?
- 12 A. MR. DE HAAN: Yeah, I did.
- 13 Q. And to the best of your knowledge is it accurate?
- 14 A. MR. DE HAAN: Yeah, I think it is.
- 15 Q. Okay. That's helpful. Now, before I jump in, sir, I
- had a question relating to Exhibit 138, which is your
- evidence, and we're going to go to pdf page 41,
- 18 Table 5.
- 19 A. MR. DE HAAN: Yeah.
- 20 Q. And that's entitled "Nighttime Noise Impact According
- 21 to ISO 1996-2." Can you just tell me what ISO 1996-2
- 22 is?
- 23 A. MR. DE HAAN: One moment.
- That is an error. It should be ISO 9613-2. Sorry
- about that.

12:34

Questioned by Mr. Mousseau

- 1 Q. That's fine. And I understand that sometimes those
- titles are used interchangeably. Is that fair?
- 3 A. MR. DE HAAN: No, that's not correct.
- 4 ISO 1996-2 is a different standard.
- 5 Q. Okay. So --
- 6 A. MR. DE HAAN: It is intended to be ISO 9613-2.
- 7 Q. Okay. That's helpful, sir.
- 8 A. MR. DE HAAN: Again, apologies.
- 9 Q. And if I take you to the table and I compare RWDI's
- 10 revised results using a ground attenuation of a factor
- of 5 with no uncertainty -- and for ease of reference I
- think that's shaded in blue -- and I compare that to
- 13 your results using the ISO 1996-2 --
- 14 A. MR. DE HAAN: Sorry, that should be, again,
- 15 **9613**.
- 16 Q. Right. So 9613. So that's shaded in orange, or peach.
- 17 A. MR. DE HAAN: Hmm hmm.
- 18 Q. Right? For all receptors but R35, the difference
- between the two ranges between .2 and .8 decibels. Is
- 20 that fair?
- 21 A. MR. DE HAAN: I think the last one of 35 is 1.2.
- So it ranges between .2 and 1.2.
- 23 Q. Right. And I said with the exception of R35, because
- we're going to talk about R35 a bit separately.
- 25 A. MR. DE HAAN: Okay. Sure.

12:35

Questioned by Mr. Mousseau

1 Q. And, sir, would you attribute the differences between 2 these results to your inclusion of the ground attenuation factor of 0 for hard surfaces? 3 4 Α. MR. DE HAAN: Yeah, I think so. 5 Q. Okay. That's helpful. And were there any other differences that might 6 7 account for that difference between your modelling and Ms. Drew's modelling? 8 9 Α. MR. DE HAAN: Our model settings were identical, but we used the sound power level for the turbines fell 10 12:37 11 20 metres per sec. And while the overall sound power 12 level is identical, there's a slight shift to the lower 13 frequencies in the spectrum we used. 14 Q. Okay. And, sir, something I was trying to understand a 15 little better was, in your model, for all areas other than I think it was water, tamped surfaces, and roads, 16 17 you used a mixed ground attenuation factor of .5. 18 Α. MR. DE HAAN: Right. 19 Q. But for those areas you used a ground attenuation 20 factor of 0. 12:37 21 Α. MR. DE HAAN: Correct. 22 Q. Can that act to double count or somehow change the 23 impact to the noise assessment? Because my 24 understanding is that the .5 ground attenuation mixed

ground factor is supposed to take into account a large

25

Questioned by Mr. Mousseau

area where you have a mix of hard and soft surfaces. 1 2 Is that fair? 3 MR. DE HAAN: No, that is not completely Α. 4 accurate. What you do in your model is you define 5 reflective areas, if you want to, and you assign appropriate ground factor to those specific area. 6 7 the lakes and the marshes in our model and the tamped surfaces. 8 9 Then you can set an overall ground factor that applies to the rest of the -- so the not specific 10 12:38 11 So the rest of the -- so the model takes that 12 propagation path into account, looks what it encounters 13 and says, aha, this is not a specific area defined as 14 such, so for this area the overall ground attenuation 15 factor of .5 applies. If that is stacked on -- and that is not stacked 16 17 on top of each other. They're independent. 18 Q. But my understanding was that for porous ground, 19 which I think includes agricultural ground, you model 20 that at 1. Is that fair? 12:39 21 Α. MR. DE HAAN: According to the standard 22 ISO 9613, agriculture land counts as sound absorptive. 23 So it would be any ground that is agricultural land. 24 And there's a lot of that in the study area.

However, for wind turbines it has been shown --

25

Questioned by Mr. Mousseau

1 it's known that ISO does not accurately predict results 2 using that ground factor for the -- so the -- let's 3 refer to that as the real ground factor that you would 4 recognize when you're in the field. To make ISO 9613 5 work for wind turbines, we have to fiddle with the 6 ground factor. That's recommended in the peer-reviewed 7 literature. I think I referred to that in my opening statement 8 9 as recommendations to either use a ground factor of 0, so fully reflective, even if it is agricultural land, 10 12:40 11 and you would think as an -- you would think that it's 12 fully absorptive; or to artificially increase the 13 height of the receptor to mitigate the ground effect. Either way, for wind turbines, ISO 9613 overestimates 14 15 the ground impact if you model it as reality. Okay, sir. I want to move on now to comparing RWDI's 16 Q. results using the ground attenuation factor of .5 17 18 versus the CONCAWE results for Class E wind conditions. 19 MR. DE HAAN: For Class E or Class F? I believe Α. 20 that what you have here is Class F. Correct? 12:41 21 Q. Right. But, sir, you today filed a new table for Class 22 Ε. 23 Α. MR. DE HAAN: Yeah. That's correct. 24 Is that fair? Q. 25 MR. DE HAAN: Yeah, that's fair. Α.

Questioned by Mr. Mousseau

- 1 Q. When I look at that table, it looks as though, using
- 2 Class E, you're predicting exceedances at Receptor 14?
- 3 A. MR. DE HAAN: That is correct.
- 4 Q. Receptor 19?
- 5 A. MR. DE HAAN: Yeah.
- 6 Q. Receptor 25?
- 7 A. MR. DE HAAN: Correct.
- 8 Q. And Receptor 32?
- 9 A. MR. DE HAAN: Correct.
- 10 Q. Okay. And if I look at those... Sorry, I've got to
- 11 pull the spreadsheet I created while you were talking.
- 12 Just give me two seconds.
- And when I look at those, the changes range from
- 14 about negative 0.9, so the -- sorry. If I look at the
- changes as a result of this new modelling, I note that
- for some receptors you're actually modelling below what
- 17 you had modelled for --
- 18 A. MR. DE HAAN: ISO.
- 19 Q. -- ISO?
- 20 A. MR. DE HAAN: Right.
- 21 Q. And then, for some, you're modelling above. And for
- the ones that you're modelling above, they range
- between about 1 dB and about 2.3 dB. Is that fair?
- 24 A. MR. DE HAAN: Yeah, I think that's fair.
- 25 Q. Okay. And I take it, sir, these changes are a result

12:42

Questioned by Mr. Mousseau

of the way CONCAWE models meteorological conditions? 1 2 The only differences Α. MR. DE HAAN: Yeah. 3 between our ISO 9613 model that does not include 4 meteorological settings and the CONCAWE model is that the CONCAWE -- is that the CONCAWE model includes 5 meteorological settings. It includes a wind direction 6 7 of about 315 degrees. That's the most prevalent wind direction in that area, according to evidence filed by 8 9 the proponent. The new evidence is stability Class E, and the wind speed is 3 metres per second. 10 12:44 11 So it -- the difference between ISO 9613 and 12 CONCAWE is that CONCAWE looks at the wind direction, 13 which takes a downwind direction from a certain angle 14 only into account, whereas ISO 9613 assumes that all 15 sources -- or all receptors are downwind from all noise 16 sources. Okay. That's helpful, sir. I want to discuss briefly 17 Q. 18 Receptor 35? 19 MR. DE HAAN: Α. Okay. 20 Q. Okay. And you pointed this out where you sort of saw 12:44 21 the greatest variation in terms of slight changes to the model, and I'm wondering if you can help me 22 23 understand why you're seeing those variations, 24 particularly at Receptor 35. 25 MR. DE HAAN: I cannot answer that without Α.

Questioned by Mr. Mousseau

- analyzing the specific contributions from Receptor 35.
- 2 I'm sorry.

9

21

- 3 Q. Okay, sir, but if --
- A. MR. DE HAAN: This is just -- if you have your model settings correct, the model will predict the noise impact and we have not analyzed for each specific receptor why these differences are what they are, other than the answer that I already provided, the CONCAWE
- 10 Q. Okay, sir. Could it have something to do with the 11 proximity of a third-party facility?

settings and reflective ground areas.

- It could be that one of the 12 MR. DE HAAN: Α. sources is more dominant. But there is no difference 13 14 in model calculations in either standard for 15 calculations closer to a receptor or further away from 16 a receptor. The model just looks at the difference, 17 and there are no differences in the way the model 18 handles situations with small relative -- small 19 distances between noise source and a receptor or a 20 large distance. It just takes the distance into
- Q. Right. But would it be fair to say that using a ground attenuation factor of 0 at that facility versus a mixed ground attenuation factor of .5 for the whole area would impact the results; is that right, sir?

account on what it encounters on its propagation path.

12:45

1	A. MR. DE HAAN: If R35, if it is, to a large	
2	extent, dominated by the third-party facility that is	
3	not too far away from it, then, yes, that is that is	
4	correct.	
5	Q. Okay. Thank you, sir.	
6	MR. MOUSSEAU: Mr. Chair, it's quarter to. I can	
7	keep going. I'm going to say I probably have another	
8	half hour.	
9	THE CHAIR: I think maybe we should maybe take	
10	our break. I'm wondering if we just take a short	12:47
11	break, though, to give the court reporter a bit of a	
12	break, let her get a stretch break in, and then come	
13	back and then complete the rest of your questioning and	
14	any questions that the Commission Panel might have, go	
15	to any redirect that Mr. Fitch might have, and then	
16	we'll be ready to take a lunch break and maybe wrap	
17	that into the time that the counsel need to prepare	
18	their oral argument.	
19	Does everybody agree that that would be a good way	
20	to proceed?	12:47
21	All right. Given that, let's just take a short	
22	break. We'll come back at 1, and then let Mr. Mousseau	
23	complete any questioning that he has. Thank you.	
24	(ADJOURNMENT)	
25	THE CHAIR: Welcome back, everyone. Please be	

# CLEARVIEW GROUP PANEL 6 Questioned by Mr. Mousseau

			1
1		seated.	
2		And we'll return to examination by Mr. Mousseau.	
3	Q.	MR. MOUSSEAU: Okay. Mr. de Haan, if I could get	
4		you to turn up Exhibit 179, and I'm going to go to	
5		pdf page 40. If we could scroll down to the	
6		paragraph that starts with "Noise propagation." And	
7		about halfway through that paragraph, sir, you state:	
8		(as read)	
9		"ISO 9613 is only equivalent to CONCAWE	
10		for stability classes A-C (unstable	13:0
11		daytime conditions) and not for classes	
12		D-G (neutral to extremely stable	
13		conditions) for the conditions included	
14		in the test case."	
15		And just before we jump into this conversation, if you	
16		could briefly explain what a stability class is.	
17	Α.	MR. DE HAAN: Okay. Maybe I should first state	
18		that I'm not a meteorologist, I'm an acoustician. But	
19		noise propagation is dependent on atmospheric	
20		stability. And depending on atmospheric stability,	13:0
21		noise propagates better or less well.	
22		It is my understanding that you can kind of	
23		categorize atmospheric stability in several classes,	
24		Guildford classes. Class A is the most unstable one	
25		and Class G is the most stable one, and it depends on	

Questioned by Mr. Mousseau

1	solar	radi	iation,	ter	nperatui	^e	inversion,	wind	speed,	а
2	number	of	that,	but	that's	my	understand	ding.		

Again, I'm not a meteorologist. I only know that noise propagates well, very well on stable conditions and less well under unstable conditions.

- Q. Okay. So when you stated that ISO 9613 is only equivalent to CONCAWE for stability classes A to C, can you explain what you meant by that?
- A. MR. DE HAAN: Yes. If you go to my report, I believe that's Exhibit X0138, and you move to page 26, and that's Table 3. Sorry, that should be page 28. A little bit further down.

What we did is, because this whole discussion about stable and unstable, we put the software to a simple test. We modelled a wind turbine, like they are being proposed, in a northwesterly direction. We modelled a receptor at ground level of 1.5 metres -- several hundred metres away from that turbine. On the top of my head, roughly 800 metres. And we only used an average ground factor, so we didn't include anything special there. And we just let the software calculate what the noise level from that one -- from that one turbine would be on the same receptor under those different conditions.

As we calculated it using ISO 9613, without any

13:03

Questioned by Mr. Mousseau

1	meteorological settings, but with the same overall
2	settings as used in the NIA, so with a temperature of
3	10 degrees, 70 percent humidity, et cetera, we came to
4	a sound level of 33.6 from that single wind turbine,
5	and then we applied stability classes according to
6	CONCAWE, first A and then B, et cetera, et cetera.
7	And you can see that the results for CONCAWE
8	stability Class A for that single wind turbine are
a	identical to ISO: same for stability Class B 33 6: the

10

11

12

13

14

15

16

17

18

19

25

13:05

It was just a simple test to find out what stability class kind of equals ISO. And it's a limited test because it only involves one source and -- but just, you know, let's put it to a test. Let's see what happens.

same for stability Class C -- sorry, stability Class C

starts to go up, 36.4, and the rest is all 36.4.

- Q. Okay, sir. Then just so I understand, your conclusion that 9613 is only equivalent to CONCAWE for stability Classes A to C is only based on this assessment?
- A. MR. DE HAAN: Yeah. And it should be -- if I
  read it right, it should be Classes A and B. Yeah,
  that's all. I couldn't find any references, any
  comparisons in the peer-reviewed literature, otherwise
  I would have used those.
  - Q. Okay. And, sir, in its evidence, and you can turn it

# CLEARVIEW GROUP PANEL 6 Questioned by Mr. Mousseau

r.			=
1		up if you want, but I don't think you need to, RWDI	
2		states that: (as read)	
3		"ISO 9613 integrates the effect of	
4		Pascoe Guildford Class E and F stable	
5		atmospheric conditions."	
6		Do you agree with that statement?	
7	Α.	MR. DE HAAN: No, I don't agree with that. If	
8		you turn back to the comparison table you made, this	
9		one I don't have an exhibit number on it and you	
10		compare the results with CONCAWE and the results that	13:07
11		we provide and the results of ISO, you see that for a	
12		number of instances, the predictions are higher. And	
13		for a correct comparison, you should compare our ISO	
14		calculations because they incorporate all the ground	
15		the reflective areas that we used to the CONCAWE	
16		calculations because they have the very they have	
17		everything the same in the model except the	
18		meteorological settings.	
19		So based on the table that I just referred to	
20		that's still up on the screen, and based on the	13:07
21		comparison, I have to disagree with that.	
22	Q.	Okay, sir. And when you're talking about Class E	
23		stability conditions, like, can you describe physically	
24		what sort of conditions you're talking about?	
25	Α.	MR. DE HAAN: Again, I'm not a meteorological	

Questioned by Mr. Mousseau

1 So I could -- they are described in the expert. 2 CONCAWE report that I referred to in my evidence. Αt 3 the top of my head, but it is -- it occurs during 4 nighttime hours, a low level -- a low wind speed, but that's about it. I don't have the information, sorry. 5 Any idea whether that would be above or below the 6 Q. 7 cut-in speed for the turbines? MR. DE HAAN: The CONCAWE wind speed is defined 8 Α. 9 at a level of close to the ground, where the hub height wind speed is at 132 metres. Wind conditions can be 10 13:09 11 way different there as has been shown repeatedly. included in my evidence, but I don't -- I don't know 12 13 the cut-in wind speed of the wind turbines by heart, 14 but I will say that it could occur that there's very 15 low wind speeds at ground level and very different, 16 higher wind speeds at turbine height, even complete 17 wind direction. 18 VanDenBerg in his thesis, sound of high wind, 19 demonstrated that. 20 Q. Okay, sir. I do have some questions about your use of 13:10 21 iNoise --22 Α. MR. DE HAAN: Sure. 23 Q. -- to create your ISO -- well, its 9613 results. And 24 can you briefly explain what iNoise is? 25 MR. DE HAAN: iNoise is a software package that Α.

Questioned by Mr. Mousseau

1			त
1		incorporates so it's acoustical prediction software	
2		that incorporates ISO 9613. Its calculation core is	
3		identical it's the same calculation core as	
4		predictive software for ISO 9613. It's identical. And	
5		the software is certified by that quality assurance	
6		ISO ISO 17 and some more numbers.	
7	Q.	17543, sir?	
8	Α.	MR. DE HAAN: That's it.	
9	Q.	Okay. And looking at the iNoise website, I notice it	
10		has got three versions: It's got a free version, a pro	13:11
11		version and enterprise version. Which version did you	
12		use, sir?	
13	Α.	MR. DE HAAN: I used enterprise.	
14	Q.	Okay.	
15	Α.	MR. DE HAAN: But the only differences between	
16		several possibilities that you have are the size of the	
17		model, the amount of sources or the amount of objects	
18		you can include. The calculation core is no is no	
19		different. But we use the enterprise version.	
20		I provided a number of plots, and the licence is	13:11
21		printed on the bottom of the page. So you can so	
22		you can see it there.	
23	Q.	Okay. And, sir, if I I'm looking at Exhibit 179,	
24		and it's pdf page 46, and I'm going to look at	
1			ll .

paragraph (c). And there you state: (as read)

25

# CLEARVIEW GROUP PANEL 6 Questioned by Mr. Mousseau

h			ai .
1		"iNoise supports the optional features	
2		of using a meteorological correction	
3		according to CONCAWE by following the	
4		procedures for calculation of the	
5		meteorological corrections according to	
6		CONCAWE instead of 9613. The	
7		meteorological corrections Cmet,	
8		according to 9613, is replaced by the	
9		factor K4 according CONCAWE based on the	
10		following parameters, wind speed, wind	13:12
11		direction, and atmospheric stability	
12		Class A to G. And it should be noted	
13		that, in calculations according to ISO,	
14		a meteorological correction Cmet is	
15		typically omitted."	
16		And, sir, my question was does this mean that ISO 9613	
17		using iNoise allows you to model atmospheric conditions	
18		in a manner similar to CONCAWE?	
19	Α.	MR. DE HAAN: Yes. It replaces ISO 9613 is	
20		intended to provide a long-term average noise impact.	13:13
21		And long term could mean average over a year.	
22		To do that, you can apply, if you want to, average	
23		meteorological conditions, or even conditions based on	
24		statistical patterns for weather.	
25		In Alberta, typically, the meteorological settings	

h———			īi .
1		in ISO 9613 are omitted. So you don't do any	
2		meteorological condition. It's just pure downwind.	
3		So instead of the factor in ISO 9613, let's call	
4		it 0 for now, you add the atmospheric conditions	
5		according to CONCAWE at the end of your calculations.	
6		So the rest of the propagation calculation is	
7		identical, but then it applies that CONCAWE correction	
8		K4 according to the CONCAWE record.	
9		And maybe I should add that those I read I	
10		obviously read the CONCAWE report, and the way they	13:14
11		quantify those corrections is by comparing measurements	
12		from facilities under neutral atmospheric conditions to	
13		measure to identical measurements for the identical	
14		facility on the different meteorological stability	
15		classes.	
16		And that and that way they arrived at the	
17		special correction and that's how they applied it with	
18		the software.	
19	Q.	Sir, I'm just trying to understand when it says that	
20		the meteorological corrections Cmet according to	13:15
21		ISO 9613 is replaced by the factor K4, I just want to	
22		know whether omitting meteorological correction would	
23		increase or decrease the modelling results?	
24	Α.	MR. DE HAAN: You mean in ISO 9613?	
25	Q.	Yes.	

			1
1	Α.	MR. DE HAAN: It would it would decrease the	
2		reported noise impact. So it would you would get	
3		the noise levels without the average meteorological	
4		correction and at the end, then the meteorological	
5		correction is applied to account for average	
6		meteorological conditions in that area, and it reduces	
7		the noise impact, depending on what the average	
8		meteorological conditions are.	
9		Such a correction I have seen corrections of	
10		roughly 1 dB. But this correction is typically not	13:16
11		used in Alberta, so it's typically omitted. So Cmet in	
12		this paragraph (c) is basically 0.	
13	Q.	Okay, sir. Just jumping back again to the results that	
14		you provided using CONCAWE for stability Class E.	
15	Α.	MR. DE HAAN: Okay.	
16	Q.	And we can go back to the table I created, and you have	
17		an updated table	
18	Α.	MR. DE HAAN: Yeah.	
19	Q.	I think that you created for yourself. My question	
20		is when preparing the CONCAWE Class E results with	13:16
21		RWDI's results for a ground attenuation of .5 with no	
22		uncertainty, at some of the residences, the CONCAWE	
23		predicts an increase and, at some, it predicts a	
24		decrease. Can you help me understand why that happens?	
25	Α.	MR. DE HAAN: Yes, I can. So ISO assumes	

1		downwind propagation from all directions. So if you	
2		just imagine that the receptor is in the centre of a	
3		circle and there's wind turbines or other noise sources	
4		all around it. What ISO 9613 does it assumes that all	
5		wind turbines will radiate noise in towards the	
6		centre of the circle. That's a condition that, in the	
7		real world, cannot occur.	
8		What CONCAWE does it	
9	Q.	Can I stop you there, sir?	
10	Α.	MR. DE HAAN: Sure.	13:17
11	Q.	Does that make a model does that make it more or	
12		less conservative?	
13	Α.	MR. DE HAAN: That depends on the layout of the	
14		model. It depends if there's sources on all sides of a	
15		receptor or not.	
16		But if you compare the long-term measured results	
17		for wind turbines against predictions in ISO 9613, in	
18		the peer-reviewed literature, it says that under more	
19		or less stable atmospheric conditions that frequently	
20		occurred during nighttime hours, ISO 9613 frequently	13:18
21		under-predicts the noise impact; hence, our fiddling	
22		with settings in the model, like the ground factor.	
23		So where you would think that it's conservative	
24		assumption, that it calculates downwind towards all	
25		receptors, it depends on (a) atmospheric stability;	

1		(b) the layout of the noise and, (b), the layout of	
2		the noise sources.	
3		So I can't provide you with the straight yes or no	
4		answer. Sorry. It depends.	
5	Q.	That's helpful, sir. And when we look at the modelling	
6		you provided just using CONCAWE and then the more	
7		specific modelling you used for CONCAWE for Class E,	
8		which of those two should the Commission be referring	
9		to when it's should it be looking at both or should	
10		it prefer one result one set of results over the	13:19
11		other as being more representative?	
12	Α.	MR. DE HAAN: I think CONCAWE calculations are	
13		more representative of the stable atmospheric	
14		conditions.	
15	Q.	I'm asking you to choose between your two CONCAWE	
16		results. So the	
17	Α.	MR. DE HAAN: Well, according to the evidence	
18		filed by the proponent, stability Class E is	
19		representative for group for the atmospheric	
20		conditions in this area because it occurs more than	13:19
21		20 percent of the time. And I believe the cutoff,	
22		according to Rule 12, is 10 percent. And I understand	
23		that to mean that 10 percent of the time you could	
24		exceed PSL due to unforeseen stuff like atmospheric	
25		like, very stable atmospheric conditions or other	

1		non-representative conditions, but at the cutoff of	
2		10 percent. So anything that occurs up to 90 percent	
3		of the time should be considered representative. And	
4		that's, in this case, according to the evidence, Class	
5		E.	
6	Q.	That's helpful, sir.	
7		I'm going to jump now to third-party facilities.	
8	Α.	MR. DE HAAN: Sure.	
9	Q.	And I'm going to start with the difference between I	
10		guess the radius that you use and the radius that	13:20
11		Ms. Drew used. And I understood that you used a radius	
12		of industry sources of 4.5 kilometres, whereas Ms. Drew	
13		used a radius of 3, but extended it out to 5, where she	
14		encountered facilities that might contribute more than	
15		20 dBA.	
16		Is that your understanding as well?	
17	Α.	MR. DE HAAN: There is some confusion about	
18		that, but looking from a you should look from a	
19		perspective a receptor perspective, and I understand	
20		from the transcript that RWDI did that, and then you	13:21
21		should look a certain distance out to include all	
22		potential all facilities that might potentially	
23		affect the noise impact at each receptor.	
24		And my my suggestion for at least for 4 and	
25		a half kilometres was based on the presence of the	

			1
1		facility in the study area and included in the NIA	
2		report by RWDI, having a sound power level of, top of	
3		my head, close to 115. It would be something like 113	
4		or 114 dBA.	
5		If you do some calculations, you will get to a	
6		sound level from such a facility of 20 dBA at the	
7		receptor at a distance of 4 and a half kilometre.	
8		So if they and there is some confusion in the	
9		document, but if they included facilities up to	
10		5 kilometres, then I'm fine with that.	13:21
11	Q.	That's helpful, sir. Thank you. I have a few	
12		questions, sir, on infrasound, and I'm going to take	
13		you back to Exhibit 179, and we're going to go to	
14		pdf 55.	
15		And so we are going to be looking at	
16		paragraphs (b) and (c).	
17	Α.	MR. DE HAAN: Sure.	
18	Q.	Okay. And I'm looking at the last sentence in	
19		paragraph (b), where you state: (as read)	
20		"Infrasound is typically not measured,	13:22
21		however, during a comprehensive sound	
22		survey and may therefore go undetected."	
23		And the last sentence at paragraph (c), where you say:	
24		(as read)	
25		"Considering the nature of infrasound	

# CLEARVIEW GROUP PANEL 6 Questioned by Mr. Mousseau

1		levels exceeding the audibility	
2		threshold may generate noise	
3		complaints."	
4		I'm just wondering if you can comment on the audibility	
5		threshold for infrasound.	
6	Α.	MR. DE HAAN: The audibility of infrasound is	
7		relatively high, but the difference between	
8		perceiving the difference in sound level between an	
9		infrasound level just at the hearing threshold and a	
10		little bit above it is relatively condensed.	13:23
11		So the sound that you hear when you hear	
12		infrasound goes from barely audible to annoyance to	
13		just an outright nuisance pretty quick, far more far	
14		faster in a far more condensed way, so the dynamic is	
15		much less than in the more audible range, around	
16		500,000 hertz.	
17	Q.	When you're talking about infrasound that is	
18		undetected, are you talking about infrasound from a	
19		wind turbine that may be below the audibility	
20		threshold? Is that what you're getting at there?	13:23
21	Α.	MR. DE HAAN: Well, regular microphones do not	
22		pick up infrasound. Infrasound is sound below	
23		20 hertz, and most sound level meters don't go go to	
24		20 hertz. So they might not pick it up.	
25		And predictions in ISO, according to ISO and	

Questioned by Mr. Mousseau

1		CONCAWE, typically include only 31.5 hertz. So it's	
2		in a regular noise assessment, it's typically not	
3		assessed in a numerical way.	
4	Q.	That's helpful, sir.	
5		I do want to talk a bit about wind shear, and	
6		we're getting close to the end, sir. And there was	
7		some discussion about wind shear between myself and	
8		Ms. Drew and between Mr. Fitch and Ms. Drew, and I just	
9		wanted to know what your understanding of wind shear is	
10		and its role in noise prediction.	13:24
11	Α.	MR. DE HAAN: Right. Well, wind shear is the	
12		difference in wind speed measured at different heights.	
13	Q.	And, sir, is it fair to say or can you comment on	
14		whether there's from your perspective, any	
15		connection between wind shear and atmospheric	
16		stability?	
17	Α.	MR. DE HAAN: To my knowledge, there is. But,	
18		again, I'm not a meteorologist. To my to my	
19		knowledge, unstable conditions, because there's a much	

13:25

There is a graph in the evidence that I provided, copies of a presentation for -- a CONCAWE spring conference in 2010. And maybe I can find it.

more layered atmosphere, can blow up there and can be

eerie quiet down here, but it could also be the other

20

21

22

23

24

25

way around.

Questioned by Mr. Mousseau

It's in an appendix somewhere. No, that's not it. 1 2 I'll try once more, and then I'll call it a day. 3 Okay. I can't find it. But it includes a graph where 4 you see the difference at the same time of wind speeds 5 measured at a height of 1.5 metre and measured at hub 6 height at 65 metres in that instance, and you see 7 differences all the time. You see positive differences. So where the wind speed at 1.5 metres is 8 9 way lower than up there, but you also see it the other way around. 10 13:27 11 Q. Okay, sir. And my final question, and it picks up on a 12 question I asked Ms. Drew, and it deals with 13 post-construction noise surveys. In the event that the Commission decides to approve some or all of the 14 15 project, are there locations where you would recommend 16 that post-construction noise surveys be conducted? 17 I haven't prepared for that MR. DE HAAN: Α. 18 question, but I would argue that at least New Brigden 19 and Sedalia should be included and potentially some other receptors that are close to the PSL. 20 13:27 21 Q. Okay, sir. And when you say "close to the PSL," should 22 we be looking at your CONCAWE results for Class E? 23 Α. MR. DE HAAN: Well, I think if you look at my 24 results for CONCAWE Class E, that it would be hard for 25 the Commission to permit the project, but that's not a

Questioned by Mr. Mousseau

1 one.

16

17

18

19

20

21

22

23

24

25

Yeah, I would like at the receptors with the highest noise impacts.

- 4 Q. Thank you, sir.
- I would like to add to the results 5 Α. MR. DE HAAN: 6 for CONCAWE Class E. These are valid for a specific 7 wind direction. So for a complete assessment for those atmospheric conditions, there should be calculations 8 included for different wind directions. And since a 9 wind direction is defined as plus or minus 45 degrees 10 11 or certain -- or specific direction in degrees, on the 12 top of my head, it would involve another set of 13 calculations to get to a total of eight numbers for a 14 specific receptor to get to the highest one to be the 15 representative conditions.

Q. Sir, is that a reasonable exercise when you're doing an NIA? Or would you simply rely on 9613 for the NIA's perspective because it tries to average those, maybe?

Is that a fair way to put it?

A. MR. DE HAAN: The way I understand it, is the intent is that the PSL should not be exceeded on the representative conditions. And by averaging it, you would kind of go from the noise impact during a specific night to a long-term average, and that would be different from Rule 12.

AMICUS REPORTING GROUP

13:28

1		To answer your question of is it a reasonable	
2		exercise to demand in an NIA, all I had to do to	
3		provide you with numbers, to provide you with results	
4		for CONCAWE Class E to Class F is change a couple of	
5		settings in the model and hit the calculation button.	
6		So to include results for a total of to include	
7		the total wind rose of 360 degrees, you would have to	
8		hit that button seven times, and that's not a big	
9		exercise. It's more numbers, but I can't make it	
10		simpler than that.	13:30
11		So I don't so I don't think it's an	
12		unreasonable exercise. I think it's very overseeable.	
13	Q.	Right. But then okay, but just so I understand what	
14		you're recommending, how would you then treat those	
15		numbers? Would you then have to look at meteorological	
16		data for the year to determine how often the wind is	
17		blowing at that level from that direction?	
18	Α.	MR. DE HAAN: Well, the way Rule 12 defines it	
19		is that if it occurs more than 10 percent in a	
20		particular season, then it's representative.	13:30
21	Q.	Okay. But if all eight directions I'm just	
22		struggling with how you amalgamate or average	
23	Α.	MR. DE HAAN: Well, if all eight directions	
24		occur more than 10 percent of the time. So you cover	
25		more than 80 percent. And then you look at the highest	

Questioned by Mr. Mousseau

- 1 number, because, of course, more than 10 percent.
- 2 Q. Okay, sir.
- 3 A. MR. DE HAAN: Is that helpful? It's just a
- 4 suggestion. It's up to the Commission to decide how to
- 5 go about these things.
- 6 Q. And when you're trying to determine representative
- 7 conditions, is it -- do you just simply rely on
- 8 anything above 10 percent of the time or are there
- 9 other factors that you take into account when you're
- 10 trying to figure out representative conditions for a
- 11 project area?
- 12 A. MR. DE HAAN: Well, I would -- I would think I
- would refer to Rule 12 for representative operating
- 14 conditions for the wind turbine. They are defined as
- 15 the maximum operating conditions. And I would think
- 16 that in Rule 12 it is included that if conditions occur
- more than 10 percent of the time in a particular
- season, that they should be looked at. And I think
- 19 that pretty much covers it.
- 20 Q. That covers it for me, sir.
- 21 A. MR. DE HAAN: Thank you.
- 22 Q. That's perfect.
- 23 MR. MOUSSEAU: Thank you very much. Thank you
- for answering my questions.
- 25 Mr. Chair, those are my questions.

13:31

1	Oh, however		
2	THE CHAIR:	There's late breaking news?	
3	MR. MOUSSEAU:	No, Mr. Anderson is anxious to get	
4	some exhibits on s	ome numbers for some exhibits, so	
5	I've been given a lis	t.	
6	THE CHAIR:	Oh, ye of small faith, sir. I was	
7	just going to turn to	that.	
8	MR. MOUSSEAU:	I will check my list against	
9	yours, sir.		
10	THE CHAIR:	I was going to start with the	13:32
11	Whitla Wind Project E	nvironmental Evaluation Report,	
12	and that will be Exhi	bit 284.	
13	EXHIBIT 284 - W	HITLA WIND PROJECT	
14	ENVIRONMENTAL E	VALUATION REPORT	
15	THE CHAIR:	And then I believe the only	
16	document we have left	to mark is the AUC aid to	
17	questioning that Mr.	Mousseau handed out, and that	
18	would be Exhibit 285.		
19	EXHIBIT 285 - A	UC AID TO QUESTIONING	
20	THAT MR. MOUSSE	AU HANDED OUT	13:32
21	MS. OLENIUK:	Actually, Chair, I think there was	
22	two aids to cross tha	t I presented to Mr. de Haan. One	
23	was the environmental	evaluation for Whitla, which you	
24	already marked, and t	he second would be the second part	
25	of the excerpt of the	noise impact assessment for	

i			
1		Whitla.	
2	THE	CHAIR: Okay, now I'm confused.	
3	MS.	OLENIUK: So the first one I can't see	
4		the writing from here.	
5	THE	CHAIR: Come on, you can see it from	
6		there. It's the Whitla Wind Project Environmental	
7		Evaluation Report. So there was that one.	
8	MS.	OLENIUK: Correct. And then there was an	
9		additional one that was passed out as well that	
10		indicated it was a noise impact assessment. We were	13:33
11		looking at both of them.	
12	THE	CHAIR: I think we didn't get it in paper	
13		form. It was probably uploaded and brought up on the	
14		screen.	
15	MS.	OLENIUK: No. So there was two excerpts	
16		from the Whitla NIA. The first one was Mr. Fitch's aid	
17		to cross, which was marked as an exhibit, and we pulled	
18		it up onto the screen, and then there was a second	
19		excerpt that I presented as an aid to cross. I think	
20		Mr. de Haan	13:34
21	THE	CHAIR: I believe you, but we don't appear	
22		to have it up here.	
23	MS.	OLENIUK: I'm going to blame Mr. Mousseau	
24		for that.	
25	THE	CHAIR: It was 258 that had been uploaded,	

1		if I'm not wrong. Is that the one?	
2		I just want to make sure that we know what we're	
3		talking about. I thought the other one was number 258.	
4		The other one that you referred to was already in the	
5		system.	
6	MS.	OLENIUK: It is, but there was an additional	
7		page that I included as a second excerpt to that Whitla	
8		NIA.	
9	THE	CHAIR: Okay. Well, as long as	
10		Mr. Anderson is on the same page with you, we'll mark	13:35
11		it as Exhibit 286. How about that? Even though I'm	
12		confused, apparently staff isn't, as to where that	
13		document lives.	
14		EXHIBIT 286 - ADDITIONAL PAGE INCLUDED	
15		AS A SECOND EXCERPT TO THE WHITLA NIA	
16	MR.	MOUSSEAU: And we have one more.	
17		Dr. Fairhurst's opening statement, I don't think we	
18		gave that an exhibit number either.	
19	THE	CHAIR: Looking to Mr. Fitch. I thought	
20		he asked for it or did it but if we didn't give it to	13:35
21		him	
22	MR.	FITCH: I did not ask for it. We marked	
23		one of them. I believe we marked one opening statement	
24		as an exhibit.	
25	THE	CHAIR: We definitely marked	

Questioned by Ms. Collins

1		Mr. de Haan's.	
2		I'm just going to look to Mr. Anderson and make	
3		sure that we do need one more.	
4		Yes, we do. All right. 287. It's easy to get	
5		confused with all the exhibit numbers. I'm clearly	
6		proof of that.	
7		EXHIBIT 287 - DR. FAIRHURST'S OPENING	
8		STATEMENT	
9	THE	CHAIR: All right. So, with that,	
10		hopefully having gotten everything appropriately	13:36
11		marked, we'll turn to any questions from the Commission	
12		Panel. I'm just confer with my colleagues here.	
13		We'll start with questions from Commissioner	
14		Collins.	
15	MS.	COLLINS QUESTIONS THE PANEL:	
16	Q.	Good afternoon, panel. Dr. Fairhurst, I have one	
17		question for you. And I was just wondering, there is a	
18		240 kV transmission line that runs north through south	
19		through the project. It passes by a number of the	
20		turbines. And I don't recall any of your visual	13:36
21		assessments incorporating the overlay of the 240 kV in	
22		with your renderings. Can you kind of give me a little	
23		background why, or did you not think that was relevant?	
24	Α.	DR. FAIRHURST: They were visible in the photos.	
25		And I addressed that issue as they were static and no	

Questioned by Ms. Collins

1 more than I think it was -- I think 50 metres. 2 So, yes, they are there and they cross the roads. 3 You can see them in the distance. 4 However, I still think the turbines are dominant 5 where they are close in. That's all I have. as far as I went with them. I know at one time that 6 7 was the big issue. I mean, not necessarily here at -in that area, but I have worked on power lines and the 8 effects of that, and they are -- they can be 9 significant. 10 13:38 11 They were addressed in -- as I said, in the 12 They are of a lesser scale. 13 Q. And I'm referring to the transmission line itself, not 14 the lower voltage power pole. Is that correct? 15 DR. FAIRHURST: Yes. Α. And just a follow-up question. In your opinion, is the 16 Q. 17 visual impact of any of the turbines reduced or 18 enhanced by the existence of the transmission 19 infrastructure in close proximity, or is it just not 20 relevant because it's so much -- in your opinion, it's 13:38 Is that a fair assessment? 21 only 50 metres? 22 Α. DR. FAIRHURST: Well, of course, distance makes a 23 difference. And I do agree that a large power in the 24 foreground can overwhelm a turbine in the background. 25 I accept all that. But my analysis took -- and I can

# Questioned by The Chair

			1
1		see that there is a blending of objects in the view	
2		that can somewhat offset the effects of a turbine.	
3		But, in my assessment, when I found that nearly	
4		all of the turbines could come within 1 kilometre of	
5		the 88 kilometres of roads that I identified, I feel	
6		that they are the dominant object. And the	
7		transmission line's static. They will settle in by	
8		comparison.	
9	Q.	Okay. Thank you.	
10	Α.	DR. FAIRHURST: Thank you.	13:40
11	MS.	COLLINS: Those are all my questions,	
12		Mr. Chair.	
13	THE	CHAIR: Thank you very much.	
14	THE	CHAIR QUESTIONS THE PANEL:	
15	Q.	And I'll start with you, Dr. Fairhurst, because you	
16		already have the mic.	
17	Α.	DR. FAIRHURST: I do.	
18	Q.	And I have perhaps one question for Mr. de Haan.	
19		So you indicated at one point that your objective	
20		in the work that you do is to find acceptable	13:40
21		alterations to a landscape or a viewscape. Did I hear	
22		that right?	
23	Α.	DR. FAIRHURST: That would be pretty correct.	
24	Q.	Okay. And I think I also heard in some questioning	
25		from Mr. Fitch that there are objective criteria for	
Ì			ll .

# Questioned by The Chair

13:41

1		what's acceptable. And I understood from your
2		presentation that the VLS rating form that you used, I
3		believe it's Exhibit 137, pdf 14 we can maybe pull
4		that up so we all know what I'm talking about that
5		that constitutes, from your perspective, the objective
6		criteria. Is that a fair
7	Α.	DR. FAIRHURST: Yes, biophysical
8	Q.	understanding
9	Α.	DR. FAIRHURST: viewing distance and
10		significance and risk.
11	Q.	All right, sir. And is that sort of an some sort of
12		an industry standard objective criteria, sort of along
13		the lines that something like ISO 9613 would be when
14		we're talking about noise, or is this really objective
15		criteria that you have created?
16	Α.	DR. FAIRHURST: No, I didn't create them. I
17		borrowed from existing systems in BC, the US, Alberta,
18		that guidebook, and the UK. I researched the BLM, the
19		US forest service. They are all honing in on the same
20		aspects: Biophysical, viewing distance, and I don't
21		have that in front of me, but that's a type of thing,
22		the biophysical aspects.
23	Q.	So it sounds, sir, like, because you borrowed from a
24		bunch of different approaches to a VLS, that you've
25		sort of kluged together the perspective of a number of

# Questioned by The Chair

			il
1		different practitioners to come up with this. Is that	
2		a fair assessment of what you've done?	
3	Α.	DR. FAIRHURST: I'm sorry, what word did you use	
4		to say I	
5	Q.	Kluged. That was perhaps not a good word. You have	
6		combined into your approach approaches that have been	
7		used by a number of other practitioners in BC and so	
8		on. Is that what you've done?	
9	Α.	DR. FAIRHURST: I have combined and been	
10		influenced by the similarities that you find in these	13:4
11		various systems.	
12	Q.	Okay. So what you end up with in your form, then is	
13		there an argument that's not really an industry	
14		standard for an objective? It's your interpretation of	
15		what an objective should be? It really is your	
16		objective?	
17		I'm not trying to beat you up on this. I'm just	
18		really trying to understand where you got your	
19		objective criteria from.	
20		So is it really your objective criteria based on	13:4
21		objective criteria that have been used by other	
22		practitioners? Is that a fair way to look at what	
23		you've done, sir?	
24	Α.	DR. FAIRHURST: It is an assimilation of these	
25		approaches to make a workable assessment process, and	
		<b>"</b>	il

Questioned by The Chair

1 that was for the Wood Buffalo region	of	CEMA
--	----	------

2 Q. Okay, sir, and that's a way better word than kluge.

So the last question that I have for you, sir, is there may be a view that, well, it's not -- there is no industry standard, it's not really an objective criteria, it's your objective criteria and we understand where it came from.

What can you tell us that would give us some comfort that we should object -- that we should object -- that we should accept the objective criteria that you have used? What can you tell us?

A. DR. FAIRHURST: Well, the system itself, the visual landscape system, is a fairly weighty document.

And you can track its -- you can track its literature review and you can track each part of this, but it is a legitimate approach.

Now, this was adopted, well, tentatively, by various levels of CEMA. I was with the aesthetics working group, and that was my hired purpose, to come up with that document. It has been in effect and used in at least one environmental impact assessment.

I have a -- I cannot say more, but that is mine still. It is with CEMA. It exists online. And it's a system that I find very workable.

Q. All right, sir. Thank you. And just one other

13:45

Questioned by The Chair

1	question that comes to mind, because this Commission is
2	often faced with the challenges of trying to site wind
3	farms and applications that come to us.

A. DR. FAIRHURST: Yes.

4

7

8

9

24

25

- Q. In your view, where is a wind farm an acceptablealteration to the landscape or the viewscape?
  - A. DR. FAIRHURST: I would say it's an acceptable alteration in a place that has already been zoned and there is preparation for it to be there.

If there is no zonation -- and so you have high -high value zones, high wind -- high wind zones, these are identified. I can't speak for parts of the population area, I don't know enough, but just like in -- well, the visual landscape system was setting objectives and it is to be part of a tradeoff system or a zonation system, that there could be heavy development, moderate, or light, or none. But I just see that that does not exist, as far as I know, the Special Areas -- and I regret I did not learn until today that they actually have some plans -- by setting development objectives and zoning for those, or saying here's a high intensity area, here's a low intensity I do feel, and I don't know where these are, in BC, and including that wind farm assessment process that Mr. Fitch had told me yesterday about, and, to his

13:48

Questioned by The Chair

1 chagrin, I did not get to it, but I was aware of it.

In BC they zone. They have visual quality objectives. They have a large system of setting throughout the province visual quality objectives. And those -- those are word terms like preservation, retention, partial retention, modification, maximum modification.

They also come up with intensity by that VQO. So the intensity would be much greater in a modification zone, or maximum modification zone, than a partial retention or retention zone.

13:51

So that gives the proponents the ability to say, well, I'm going to stay out of this area. It is just -- it seems it's going to be too restrictive for me to get the number of wind turbines that I need. So they are. And the maps exist provincially, not for necessarily wind, but it was visual quality objectives, period, typically guiding forestry intensity over the many years to say where are we going to go.

13:52

And here, including the -- what I did with the minor adaptation of that visual landscape system, found that the numbers crunched down to high sensitivity and restricted -- restriction on dominant alteration should be subordinate.

Q. All right, sir. Thank you.

# Questioned by The Chair

1		And then I just have one question for Mr. de Haan.	
2		In the work that you've done, you've come up with five	
3		turbines, so R14, R19, R25, R32, and R35A, that in the	
4		analysis you've done may exceed the permissible	
5		nighttime PSL under at least certain conditions. What	
6		are you recommending the Commission do about those five	
7		turbines given the results of the analysis that you've	
8		done?	
9	Α.	MR. DE HAAN: I understand I understand that	
10		you're referring to receptors and not turbines.	13:53
11	Q.	Maybe that's where I went wrong. That's right. I'm	
12		thinking of specific receptors. Okay. What should we	
13		do about those?	
14	Α.	MR. DE HAAN: At those receptors, the PSL is	
15		predicted to be exceeded more than 20 percent of the	
16		time. And I don't think that's in line with Rule 12,	
17		at least the way I understand Rule 12. And I don't	
18		know another solution to that than refusing the	
19		application.	
20	Q.	So would you refuse the entire application on the basis	13:54
21		of those five, or would you recommend making some	
22		adjustments, or would you recommend doing	
23		post-construction monitoring and perhaps putting into	
24		place certain rules with respect to the turbines that	
25		would affect the PSL at those five receptors?	

Questioned by The Chair

	It's unclear to me what you're asking us to do?
Α.	MR. DE HAAN: Okay. It's what Mr. Mousseau
	provided to me, it's nine receptors. And R35
	represents a community. I believe it's Sedalia. I
	believe it's Sedalia. So it represents more
	residences. Actually it represents a small hamlet.
	Some of the other ones may represent more
	residences as well. I've seen during my field trip

Some of the other ones may represent more residences as well. I've seen during my field trip several farms that were pretty close together, like two or three houses, or something.

I have no information seen in the whole procedure to see that some specific turbines are responsible for the exceedance. And I certainly did not do that kind of analysis. So I can't really recommend on that, like putting what kind of restrictions in place.

For those nine receptors representing a large number of houses, it could be -- it could be that -- and I think they're very spread over the area. So I think there's a large number, but it's just a thought. It's not an analysis. A large number of turbines responsible, sometimes a combination of turbines already present, third-party facilities.

In part of my evidence I concluded that not all relevant third-party facilities may be included. So I can't recommend to limit the number of turbines to a

13:55

Re-examined by Mr. Fitch

1 specific number of turbines or anything. 2 But like the exceedance under representative 3 conditions, for example R14 is in my -- I think it's 4 pretty substantial. It's predicted under the representative conditions to be well over 41. 5 The same applies to R16, R19, R25, and R32 and R35. So the 6 7 exceedance is up to 3 dB. That's a lot. 8 THE CHAIR: All right, sir. Thank you. 9 think that's all the questions we have. I'm just looking at my colleagues, who appear to have no more. 10 13:57 11 I don't have any more questions, so, with that, 12 we'll return to any redirect that you might have, 13 Mr. Fitch. 14 MR. FITCH: Thank you, Mr. Chair. Until about 15 five minutes ago, I had none. MR. FITCH RE-EXAMINES THE PANEL: 16 17 Q. Dr. Fairhurst, I just want to see if I can pursue the 18 idea that the Chair was trying to explore with you 19 about how can the Commission have confidence that, you 20 know, the objective criteria that you set out in your 13:58 21 rating form, VLS landscape unit rating form, it should 22 be adopted, I think is the way he put it. There was a 23 talk about the fact that your approach consists of 24 either a combination or assimilation of approaches in 25 the United States, the United Kingdom, British

Re-examined by Mr. Fitch

			=1
1		Columbia, and Alberta.	
2		So maybe another way to go at this is for me to	
3		ask you are the approaches in any of those other	
4		jurisdictions, that is the US, the UK, and BC, are	
5		they, in any material way, different or inconsistent	
6		with your approach?	
7	Α.	DR. FAIRHURST: I would say no. I came up with	
8		some different acronyms and names. Sorry, landscape	
9		integrity versus or objective landscape integrity	
10		versus visual quality objective, but essentially	13:59
11		they're built on the same values, such as vegetation,	
12		water, colour, adjacency. They use the same values.	
13	Q.	They being these other jurisdictions?	
14	Α.	DR. FAIRHURST: Yes.	
15	Q.	0kay.	
16	Α.	DR. FAIRHURST: I gave them different names,	
17		probably to make it harder to learn.	
18	Q.	Thank you.	
19	MR.	FITCH: That concludes my redirect.	
20	THE	CHAIR: Thank you very much. Thanks	13:59
21		to you both for spending a good part of the day with us	
22		today, responding to any questions they have and	
23		adding helping us to fill out the record. So with	
24		that, and with our thanks, you are released.	
25		And, Mr. Fairhurst, I couldn't help but notice you	

1		actually have a gaming computer like my son's.	
2	Α.	DR. FAIRHURST: This is off the record.	
3	THE	CHAIR: That's fine, sir. You don't have	
4		to respond.	
5	Α.	DR. FAIRHURST: I was worried when I got this, but	
6		it was the memory or the graphics that I use all the	
7		time.	
8	THE	CHAIR: That makes perfect sense, sir. It	
9		is a very powerful laptop. My son has got one that was	
10		worth a significant cost just so he could game with it.	14:00
11		I'm thinking you're sitting on planes gaming the whole	
12		time.	
13	Α.	DR. FAIRHURST: I don't game. I'm sorry.	
14	(PAN	NEL STANDS DOWN)	
14 15	`	NEL STANDS DOWN)  CHAIR: So with that, we're going to break	
	`		
15	`	CHAIR: So with that, we're going to break

15 16 17 18 19 20 21 22	`	CHAIR: So with that, we're going to break for the lunch, but I just wanted to get views from counsel about next steps. We wanted to complete oral argument and reply by the end of the day, even if we have to go late. This is the day we need to try to wrap up and close the record.  So in terms of timing, can you both give me some indication about how much time you need to prepare, at	14:01

	indication of how much time you need, we'll try to
	accommodate you as best we can.
MS	OLENIUK: Thank you, Chair. As you probably
	maybe assumed, we have been working on argument over
	the last few days and I think we'll be able to wrap it
	up over the lunch break and be prepared to deliver it
	when we get back.
THE	CHAIR: Mr. Fitch?
MR	FITCH: Well, it's 2:00 now. I guess
	normally we would take an hour. You know, at this
	point, I don't know that there's a lot more that can
	really be done in terms of last-minute frantic
	preparation. So I would say 3:15 would be fine, just
	an extra 15 minutes.
THE	CHAIR: All right. We'll come back at
	3:15 and hear the oral. And then we'll take another
	break to give you at least some opportunity for reply,
	and then we'll do reply, and then hopefully be able to
	wrap up the day.
	So with that, we'll see you all back here at 3:15.
	Thank you.

P	.M. Session
(	PROCEEDINGS RECOMMENCED AT 3:15 P.M.)
Т	HE CHAIR: Welcome back, everyone.
	Before we start, I'm going to warn you that I have
	a hard stop at approximately 7. I'm hoping we'll get
	through everything by that time. This is in no way
	intended to restrict you in any way with respect to the
	time that you want to take or with respect to the time
	you think you need to prepare. But if we start bumping
	into a situation where we don't think we can conclude
	by then, we might have to explore a different type of
	an approach. But it's not the Supreme Court. I don't
	have lights. You can take as much time as you like.
	And with that, I'm going to invite Ms. Oleniuk to
	start with her oral. Thank you.
M	S. OLENIUK: Thank you, Chair. I'm pleased to
	be here to present final argument on behalf of the
	applicant, EDPR, in its application to construct,
	interconnect, and operate the Sharp Hills wind farm.
	During my submissions today I will refer to the
	Sharp Hills wind farm as "the project" and the
	applicant as "EDPR."

As the Commission knows, EDPR's application has been filed pursuant to Sections 11, 14, 15, and 18 of the *Hydro and Electric Energy Act*, or HEEA, and in accordance with AUC Rule 7 and 12.

EDPR respectfully submits the project and the information it has provided in support of the project during the course of this proceeding demonstrates that the approval of the Sharp Hills wind farm is in the public interest, having regard to the project's compliance with regulatory requirements and consideration of the social, environmental, and economic effects of the project. And I will discuss the reasons for this conclusion in greater detail in my submissions.

The development of wind energy projects in Alberta is consistent with the government's climate leadership plan, which calls for up to 30 percent of annual electricity generation to come from renewable sources by 2030. It is estimated that meeting such a target will require up to 5,000 megawatts of new renewable energy projects to be built in the province.

With a capacity of nearly 300 megawatts,

Sharp Hills will significantly contribute to the

achievement of that goal and assist with the intended

reduction of emissions of over 600,000 tonnes of

15:17

greenhouse gases annually from Alberta's electricity sector.

Further, since the project is located far from many of the existing and proposed wind farms in the province, it will provide diversification benefits to the Alberta interconnected electric system.

Commissioners, during the course of this proceeding you have heard concerns about EDPR's relatively limited presence in Canada and suggestions that EDPR's status as a subsidiary of a large and experienced developer of renewable energy infrastructure is somehow a negative thing. As EDPR has explained, its parent company is the fourth largest owner/operator of wind energy facilities in the world. Present in 12 countries and operating over 10,000 megawatts of wind energy projects, it has the experience and expertise to responsibly construct, operate, and maintain the project in the public interest of Albertans.

While it is true that the turbines proposed for the project have the highest tip height that the Commission has ever been asked to approve, respectfully, there is nothing unique about this fact.

Since Canada's commercial wind energy industry began right here in Alberta more than 20 years ago,

15:18

turbine technology has continued to develop and the Commission has been asked to approve larger and larger turbines as the technology has progressed.

As described by Mr. LoTurco, EDPR's reasons for selecting the Vestas V136-3.6 megawatt turbine model were closely tied to the nature of the wind resource in the project area, including wind shear and the wind speed at hub height, and the ability to generate a greater amount of electricity using a smaller number of turbines.

15:19

By generating more power at a lower cost with fewer turbines, EDPR has been able to minimize landscape disturbance, both in terms of the number of turbines and the extent of the collection systems and access roads required for the project.

Indeed, from an environmental perspective, the selection of turbines with larger individual nameplate capacity is an important mitigation measure relative to project impacts on birds and bats.

Further, the overall potential impacts from bird and bat collisions are reduced for a given project when the same amount of power can be generated using a smaller number of turbines.

It has been suggested that this application will require the Commission to choose between competing land

uses. EDPR respectfully submits this is not the case.

As you heard, the special areas are a region with a proud heritage of energy production and resource extraction coexisting with agriculture, and the project will contribute to that tradition.

Project infrastructure will utilize a minimal land footprint while harvesting the abundant wind resource in the area, enabling coincident use of the land for agriculture, ranching, oil and gas activities, aviation, and hunting.

EDPR has put significant time and effort into designing a project that complies with technical, environmental, and social constraints to ensure current land uses can continue into the foreseeable future.

Based on a thorough assessment of these constraints, EDPR is confident that the project has been designed in a manner that, one, protects human health by operating within the noise limits prescribed in AUC Rule 12; two, minimizes effects on the environment and wildlife by avoiding native habitats and maximizing the setback of turbines and project infrastructure from key habitats and environmental features; and, three, is compatible with existing land use and infrastructure.

By complying with all applicable provincial and

15:21

municipal guidelines and setbacks, as well as voluntarily adhering to federal aviation guidelines, the project has been designed to ensure acceptable project effects and interactions with current human use in the area.

Mr. Chair, I will now provide a brief review of the legal framework the Commission is operating under in consideration of this project.

When considering an application for a power plant and associated infrastructure, the Commission is guided by Sections 2 and 3 of the HEEA and Sections 17 of the *Alberta Utilities Commission Act*. Section 2 sets out the purposes of the HEEA.

The purposes applicable to the project include:

To provide for the economic, orderly, and efficient development and operation in the public interest of the generation of electric energy in Alberta; to secure the observance of safe and efficient practices in the public interest in the development of hydro energy and in the generation of electric energy in Alberta; and, finally, and importantly, to assist the government in controlling pollution and ensuring environmental conservation in the development of electric energy generation in Alberta.

Section 3 of the HEEA requires the Commission to

15:22

also have regard for the purposes of the *Electric* 1 2 Utilities Act when assessing whether a proposed power 3 plant and associated infrastructure is in the public interest under Section 17 of the Utilities Commission 4 5 Act. The purpose of the *Electric Utilities Act* include 6 7 the development of an efficient electric industry structure, and the development of an electric 8 9 generation sector guided by competitive market forces. The Commission's public interest mandate is found 10 within Section 17 of the Utilities Commission Act. 11 12 which states that: (as read) 13 "The Commission must consider whether 14 the construction and operation of the 15 proposed power plant is in the public interest, having regard to the social 16 17 and economic effects of the plant and 18 the effects of the plant on the environment." 19 20 Previous Commission decisions have confirmed that a 21 determination of whether a project is in the public 22 interest requires the Commission to assess and balance 23 the negative and beneficial impacts of the specific

15:23

15:23

The existence of regulatory standards and

project before it.

24

25

guidelines and the proponent's adherence to these standards are important elements to consider in deciding whether potential adverse effects are acceptable. Two such regulatory standards are AUC Rule 7 and 12, and I will discuss EDPR's compliance with these shortly.

Where such thresholds do not exist, the Commission must be satisfied that reasonable mitigation measures are in place to address the impacts. To the extent EDPR has yet to receive approvals for the project required pursuant to other applicable provincial or federal legislation, EDPR has committed to applying for and obtaining them in due course.

Before speaking to the evidence in this proceeding, I would like to turn to an evidentiary matter that warrants discussion in the context of this application, expert independence and the treatment of expert witnesses.

At the outset of the proceeding, my friend presented the EDPR consultant witnesses with a number of excerpts from news articles, press releases, as well as from the websites of their respective consulting firms, and CanWEA with a view to demonstrating that the witnesses had only ever been retained by developers and were paid by wind power developers with the intimation that this somehow affected their ability to provide

AMICUS REPORTING GROUP

15:24

independent and objective opinion evidence.

My friend went on to bring a motion for EDPR's consultant witnesses to be dismissed from the hearing on the basis that they lack the necessary independence and objectivity required by Section 19 of Rule 1.

You dismissed this motion, noting that the Clearview Group had not established that the EDPR consultant witnesses did not meet the threshold test for admissibility of expert evidence; namely, that the expert must provide evidence that is fair, impartial, and non-partisan.

15:26

The Commission also noted that pursuant to the Supreme Court of Canada's decision in White Burgess, the burden is on the party opposing the admission of expert evidence to show that there is a realistic concern. The expert's evidence will not be impartial when they attest to that fact, as each of the EDPR witnesses has done pursuant to Section 19.1(d) of AUC Rule 1.

15:26

The Commission further noted with respect to the White Burgess decision that a mere employment relationship between an expert witness and a party to a proceeding will not constitute an interest or connection to the proceeding that renders the expert unable to provide objective evidence. Indeed, the Supreme Court of Canada acknowledged in that case that, quote: (as

1	read)	
2	"Experts are generally retained,	
3	instructed, and paid by one of the	
4	adversaries."	
5	End quote, in a proceeding.	
6	Prior to issuing its ruling on the motion, the	
7	Commission made reference to the directions set out in	
8	Bulletin 2016-07. In this procedural direction, the	
9	Commission explains that the value to be ascribed to the	
10	evidence of experts whose independence or qualifications	15:27
11	are challenged is a question of weight. The Commission	
12	will assess the professional qualifications, specialized	
13	knowledge, expert experience, relevant publications,	
14	industry recognition, independence, and the objectivity	
15	of the witness based on that witness's curriculum vitae	
16	and oral evidence presented at the hearing.	
17	With this procedural direction in mind, we will	
18	make submissions regarding the weight that the	
19	Commission is urged to accord to each of the expert	
20	witnesses' testimony and evidence as we deal with the	15:27
21	specific subject matter of their evidence.	
22	Turning now to project issues and impacts, starting	
23	with noise. EDPR commissioned a noise impact	
24	assessment, or NIA, for the project that was completed	
25	by Ms. Drew of RWDI. In addition, RWDI reviewed and	

responded to the evidence of the Clearview Group's expert Mr. Hank de Haan of dBA Noise Consultants.

EDPR submits that the project NIA was conducted in accordance with all requirements of Rule 12. As required by the rule, the maximum noise emitted when the wind turbines operate under the planned maximum operating conditions for both daytime and nighttime was modelled.

The results of the NIA indicate that the project will comply with the permissible sound levels specified in Rule 12, having regard to ambient noise level and contributions from third-party facilities, as well as the contribution from the project.

Rule 12 specifies that NIAs must be prepared using models that meet accepted protocols and international standards, such as ISO 9613. The NIA for this project was prepared using the ISO 9613 standard, which has been accepted internationally as an appropriate standard to be used for the modelling of various noise sources, including wind turbine noise.

The ISO 9613 calculation standard integrates the effect of stable atmospheric conditions on downwind sound propagation such that Mr. de Haan's use of specific downwind parameters in the CONCAWE model is unwarranted.

15:28

Indeed, on cross-examination, Mr. de Haan acknowledged that he has utilized the ISO 9613 standard when completing a recent NIA for a proponent of a wind power project, specifically capital power's Whitla project on which he worked as a quality reviewer.

A great deal of attention was paid to the ground attenuation coefficient or ground factor utilized for the purposes of the project NIA. As the Commission is aware, a ground factor of 0.7 was selected for the project, having regard to the mixed prairie landscape and degree of vegetation in the project area.

15:30

A ground factor of 0.7 has been used by other practitioners in Alberta, including projects that have been constructed and for which compliance with AUC Rule 12 has been proven. An uncertainty of 1 dBA was added to the turbine sound power level to account for the fact that the turbine had not yet received IEC certification at the time the NIA was completed. This uncertainty was maintained even after certification was received in order to provide for additional conservatism in the NIA results.

15:30

You heard Mr. de Haan admit today in response to questions from Commission counsel, that using a 1 dB uncertainty for the turbine sound power would introduce conservatism into the NIA, all else being equal.

My friend spent a lot of time during his questioning of Ms. Drew identifying examples of NIAs in which other practitioners have used a ground factor of 0.5, with or without using a ground factor of 0 for mapped areas of tamped ground. However, it is not clear what the significance of these different approaches is, having regard to the fact that Mr. de Haan stated a number of times during his remarks today that practitioners are advised by peer-reviewed literature to fiddle with the ground factor when using ISO 9613 for wind turbines.

15:31

In response to an undertaking request from the Commission, RWDI provided the Commission with the results of the NIA using a ground factor of 0.5 rather than 0.7. The results of this modelling demonstrate that the project will continue to comply with the permissible sound levels specified in Rule 12 when a ground factor of 0.5 is used without the 1 dB uncertainty and including at two-storey receptors.

15:32

On cross-examination, Mr. de Haan acknowledged that at least for some receptors modelling using CONCAWE and a ground factor of 0.5 indicated lower sound levels than that determined using ISO 9613.

However, EDPR respectfully request that should the Commission decide to rely on the project NIA using the

0.5 ground attenuation factor, it would be more appropriate to do so without adding the 1 dBA uncertainty to the turbine sound power level, having regard to the fact that the sound power for the Vestas V136-3.6 has now been IEC certified.

The use of a 0.5 ground factor is similarly conservative to the parameters used in the existing NIA, such that the application of a 1 dBA uncertainty would be overly conservative and not representative of planned operating conditions for the project.

Mr. de Haan's evidence advocates for a further reduction in the ground factor to 0 for areas within the project area mapped as being reflective, which includes wetlands, roads, and tamped ground.

EDPR notes that in a number of instances the level of a conservatism advocated by Mr. de Haan does not align with the reality of the project area. For example, the suggestion that marshes should be considered completely reflective is unreasonable, given the large amount of vegetation contained in and around the marsh.

In addition, Mr. de Haan acknowledged during cross-examination that a global ground factor of 0.5 was used for the Whitla NIA on which he worked. While Mr. de Haan stated that he had not personally observed

15:33

wetlands in the Whitla NIA study area, the percentage of wetlands in that study area appear to be greater than or at least very similar to the percentage of wetland coverage in the project area.

EDPR is confident that the modelling completed by RWDI is conservative and accurately predicts the noise levels that will be associated with the project. To ensure this is the case, EDPR has committed to undertaking a post-construction noise study at select and suitably representative receptors to confirm the project's compliance with Rule 12.

With regards to the specific receptors identified by Mr. Mousseau during cross-examination of Ms. Drew, EDPR notes that all of those receptors, with the exception of Sedalia, have turbine contributions above ambient noise levels and are appropriate for post-construction noise monitoring.

With respect to the Sedalia receptor, we note that any compliance monitoring would need to determine the turbine contribution separate from any third-party facility contribution, as the closest turbine to Sedalia is approximately 2.6 kilometres away.

As such, turbine contributions are estimated to be less than ambient and the cumulative sound level is driven by the compressor station north of the receptor.

15:34

Turning now to visual impacts. EDPR acknowledges that members of the Clearview Group are concerned about the visual impacts of the project, particularly having regard to the height of the proposed turbines. The Clearview Group retained Ken Fairhurst of RDI Resource Design to prepare a number of visual simulations of the project, as well as a visual effects assessment that purports to quantitatively and objectively demonstrate that the project will adversely affect the visual quality of the project area and local community.

15:35

With respect to the visual landscape system that Dr. Fairhurst used to assess the existing landscape integrity and significance of the project area for the purposes of his impact assessment, Dr. Fairhurst admitted that this was the first occasion in which his VLS system had been used for wind farms. He also acknowledged that it is not an industry standard approach but, rather, a combination of approaches from practitioners in a range of different jurisdictions.

15:36

You heard from Mr. McDonnell during the course of the hearing that the visual simulations prepared by Dr. Fairhurst are unrealistic and do not follow industry standard protocols for the preparation of visual simulations.

With respect to the locations of the visual

simulations and the turbine views they depict, you heard my friend walk Mr. McDonnell through each of the 42 visual simulations prepared by EDPR's consultant WSP for the project, noting the number of visualizations that depicted turbines in the foreground, middle ground, and background of the simulation. EDPR notes that none of the Clearview Group members in the project area will have turbines in their foreground views.

As described by Mr. LoTurco when preparing visual simulations for the purposes of open houses, EDPR directed WSP to select locations that would be representative of the viewscape most likely to be experienced by individuals that had filed statements of intent to participate in the proceeding or who had otherwise expressed concerns about the project. In addition, locations were selected having regard to the fact that members of the public are likely to routinely view turbines from roadways within the project area.

The length of view from a road is much shorter than that experienced when spending extended periods of time at a residence near the project area. Turbines will rarely be visible in the foreground from roadways, and, as such, Mr. Fairhurst's decision to prepare the majority of the simulations on the basis of a few road-based foreground views is not representative. In

15:37

addition, when assessing visual impact and the accuracy of a visual simulation, as you heard from Mr. McDonnell, it is important to consider the permanency of the view being depicted.

The visual simulations prepared by RDI were not realistic representations of the project in any way.

Many of the simulations excluded various existing landscape features that may serve to turbine visuality and contrast, such as trees, utility poles, transmission lines, distribution lines, fence posts, and grain bins. They present the turbines as dark against a white sky, which maximizes contrast, resulting in an inaccurate depiction of the project.

While Mr. Fairhurst clarified in his opening statement that these existing landscape features would still be subordinate to the turbines when viewing them in the foreground, this is importantly not the case when viewing the turbines from the middle or background.

During the portion of the hearing in Oyen,
Mr. McDonnell explained some of the concerns with the
accuracy of RDI's visual simulations as follows: The
topography is not modelled. A lot of the things in the
landscapes, vertical elements such as posts or signposts
or other power lines or things like that were not part
of the rendering. Vegetation was not part of the

15:38

rendering, other than sort of a symbolic figure for grass that might be occurring in the ditch. The roadways were not rendered. There was no texture shown in it. It didn't really approach reality in any sense.

In fact, earlier today, you heard Dr. Fairhurst admit the significant limitations in the software used to develop his simulations. He acknowledged that photomontages, such as those Dr. Fairhurst prepared using the windPRO software work well and are more realistic than his simulations.

15:40

While EDPR appreciates the time constraints that are associated with participating in hearings such as this one, we respectfully submit that it is inappropriate to suggest that the simulations are representative of the visual impact of the project that will be experienced by the community.

The visual simulations prepared by WSP should be preferred over those prepared by RDI for a number of reasons, particularly because they adhere to industry standard protocols, which emphasize the importance of accurately depicting the existing environment when simulating a proposed development.

15:40

The existing environment in WSP's simulations are photo realistic rather than computer generated. As described by Mr. McDonnell, photo realistic...

1	THE CHAIR: We'll take a short break while	
2	they try and fix that. I'm sorry. We'll be back as	
3	soon as we can.	
4	(ADJOURNMENT)	
5	THE CHAIR: Welcome back. It looks like we've	
6	got that back up and working, so please continue.	
7	MS. OLENIUK: Thank you, Chair.	
8	There's a saying that technology is a useful	
9	servant but a dangerous master. I think that's a	
10	particularly appropriate saying.	15:48
11	As described by Mr. McDonnell, photo realistic	
12	simulations should be representative of the landscape,	
13	viewsheds, and scale from which they will most often be	
14	seen.	
15	EDPR respectfully submits that the visual	
16	simulations prepared by RDI are inaccurate and	
17	misleading in a number of respects and that the	
18	Commission should place limited weight on the visual	
19	effects assessment prepared by Dr. Fairhurst.	
20	Dr. Fairhurst admitted at a number of points	15:48
21	during his opening statement and direct evidence this	
22	morning that there were inaccuracies and points that	
23	needed to be corrected, both in his report and in his	
24	visual simulations. For example, Dr. Fairhurst	
25	described how bright sun from June 21st was used to	

depict turbines on a winter landscape.

Dr. Fairhurst also acknowledged that there were no visual quality objectives established by the provincial government in the project area, as has been done in other jurisdictions, like British Columbia, and that he had not reviewed the Special Areas Board land use order, which does address the issue of points of visual significance in the project area and may indeed address the zoning concern that Dr. Fairhurst identifies as important to assess when siting wind power projects.

15:49

I would now like to move on to address the environmental issues that were raised during the hearing. I will start with a discussion of the natural environmental siting conditions for the project, followed by effects on wildlife, particularly waterfowl.

Before moving into this discussion, however, it is important to keep the overall context in mind. Unlike most other developments, wind power projects have a small terrestrial footprint and emit little to no pollution into our air or water.

15:50

As you know, Alberta Environment and Parks, or AEP, has issued two renewable energy referral reports to EDPR, both of which concluded that the project posed a low to moderate risk to wildlife and wildlife

habitat. These referral reports were issued based on AEP's review of the environmental evaluations and post-construction monitoring and adaptive management plan prepared by EDPR's professional and independent biologists, the underlying surveys and studies, which were designed in accordance with AEP policy and in close consultation with AEP.

When the Clearview Group questioned AEP's conclusion, having regard to the fact that it not completed any independent study of the project area, AEP representatives affirmed the conclusions reached in the referral reports and its decision not to participate in this proceeding.

Survey adequacy. During the hearing in Oyen, each of Mr. VanDerZee, Dr. Jones, and Dr. Whidden described the numerous types of wildlife and vegetation surveys completed in support of the 2016 and 2017 environmental evaluations. In particular, Mr. VanDerZee described in detail how EDPR had coordinated its study plans directly with AEP from the beginning of project development, approximately two and a half years ago, and how this consultation will continue throughout construction and operation of the project.

The company's wildlife survey and environmental assessments efforts in the project area embody the

15:50

early and often approach to consultation with the applicable regulatory authority, which EDPR submits is a proactive, transparent, and responsible approach for a developer, particularly having regard to AEP's jurisdiction over the assessment of potential impacts caused by the construction and operation of wind power projects in the province.

As described by Mr. VanDerZee, we've worked with AEP collaboratively, diligently. We've modified wildlife study plans. We've made substantial amendments to the project in accordance with their direction.

EDPR respectfully submits that it is evident surveys undertaken in support of the environmental evaluations were adequate to enable AEP to assess the potential risk posed by the project to wildlife and wildlife habitat. The survey approach for the environmental evaluations, including the number of locations required for each type of survey, the determination of what is a relevant and representative subset of land use types, topographical features and species abundance were all factored into the design of the project in consultation with AEP.

While Mr. Wallis suggested that it would be the terrain around various survey locations would be too

15:52

hilly to permit detection within the diameter of that survey area, Dr. Jones noted EDPR's experts would have micro-sited each survey location to allow for maximum visibility.

While there was much discussion during the hearing regarding the extent to which the 2011 wind wildlife guidelines, the 2011 land use guidelines for the grassland and parkland areas, or the 2017 wildlife directive should apply to the project, EDPR relied on direct engagement with AEP to determine how to appropriately adhere to regulatory guidance in the province.

EDPR respectfully submits this level of consultation is particularly appropriate in Alberta's evolving regulatory environment. Indeed, the timing of project development was such that each of the 2011 guidelines and 2017 directive apply to different aspects of the project's lifespan.

In summary, the evidence is clear that the consultation undertaken with AEP ensured that the baseline wildlife surveys completed provided AEP with sufficient information to evaluate the potential project risk to wildlife.

EDPR sited the project in a manner that minimized the area of wetlands and native grassland that would be

15:53

disturbed by project infrastructure. In fact, 82 percent of the project footprint is located on previously disturbed or modified habitats.

Notwithstanding this fact, the Clearview Group alleges that EDPR did not do enough to avoid wetlands when siting project infrastructure and that it failed to adhere to the Alberta Wetland Policy and the setbacks recommended by the 2011 wildlife guidelines. As articulated by Mr. VanDerZee during the hearing, EDPR submits that the concept of avoidance needs to be viewed in the context of all constraints on the siting of project infrastructure so as not to render an area sterile for development.

In addition to wetlands, EDPR sited the project to avoid sharp-tailed grouse leks and other wildlife features such as raptors nests to ensure compliance with Rule 7 and to accommodate landowner considerations as much as possible.

While EDPR acknowledges that having regard to the wide range of setbacks under consideration, it was not possible to design the project in a way that avoided the 100-metre buffer from all Class 3 wetlands. EDPR emphasizes that the project layout was designed in close consultation with AEP and that the project will comply with the requirements of the 2017 wildlife

15:54

directive applicable to stages 3 and 4 of the project; that is, mitigation during construction and operation, as well as post-construction monitoring and adaptive management.

As acknowledged by Mr. Wallis during cross-examination, AEP retains discretion under both the 2011 wildlife guidelines and the 2017 wildlife directive to consider and accept alternatives to the recommendations outlined in those documents, including the relaxation of setbacks on a case-by-case basis.

In the circumstances of the project, AEP determined that the recommended wetland setback was not required for all wetlands or all project infrastructure and provided a referral report identifying the project as having a low to medium risk for wildlife, having regard to that determination.

EDPR notes that criticisms specific to the Alberta Wetland Policy are unwarranted at this time, as the policy applies in the context of applications for authorizations under the Water Act. Pending detailed engineering and micro-siting of project infrastructure, EDPR has yet to confirm whether Water Act authorizations will be required. In the event such authorizations are required, EDPR will abide by the Alberta Wetland Policy and all other directions

15:56

received through consultation with AEP.

As identified in the 2017 referral report, EDPR is committed to reclaiming all temporary workspaces in order to reduce permanent impacts to wetlands and will take actions to further avoid impacts within the 50-metre micro-siting allowance where feasible should the project be approved by the Commission.

Turning now to native grassland. EDPR acknowledges that Turbine 9 is located on native grassland. However, it is important for the Commission to recall that throughout the project development and siting process EDPR considered and took active steps to limit impacts on native grasslands. Through iterative amendments to the project footprint, EDPR progressively reduced the number of turbines and amount of project infrastructure located on and near native grasslands.

Previous iterations of the project proposed siting three turbines and associated infrastructure from four turbines on native grasslands. As the Commission is aware, Turbine 9 is on native grassland. However, this location was effectively dictated by special areas noise compliance considerations. EDPR notes that Turbine 9 is located only 130 metres within the property line of the native grassland parcel on which it is located and further notes that it has committed

15:57

to co-locate the collection line and access road for this turbine in order to reduce impacts on native prairie.

EDPR also notes that the use of a larger and higher nameplate capacity turbine for the project has enabled it to reduce the number of turbines for the project and the amount of associated project infrastructure that would otherwise be located on native grasslands.

With respect to concerns raised regarding the adequacy of surveys for rare plants in the project area, EDPR notes surveys were designed to focus on identifying those areas with potential overlap of project infrastructure with native vegetation types. Along with all environmental analysis undertaken for the project, survey methods were reviewed and approved by AEP.

Having regard to the foregoing, EDPR respectfully submits that elimination of Turbine Number 9 from the project layout is not warranted. EDPR has committed to investigating micro-siting adjustments using minimum disturbance techniques and to reclaiming and restoring any disturbed native grassland areas in order to minimize and mitigate project impacts.

EDPR acknowledges the challenges associated with

15:58

reclaiming native grassland and expressed its willingness to develop a reclamation and restoration plan for the project for AEP approval prior to commencing construction. Any such plan would identify specific reclamation success criteria for impact of native grassland and would be provided to the Commission for review.

Finally, as stated by Mr. O'Connor and Mr. LoTurco during the hearing, EDPR is willing to investigate native prairie offsets for any residual native prairie impacts experienced at Turbine Number 9, which represents a commitment far in excess of any mitigation requested by AEP.

With respect to potential impacts on wildlife, specific concerns have been raised regarding sharp-tailed grouse, bats, and waterfowl, in particular. At the outset of this discussion, it is important to note that EDPR has prepared a post-construction monitoring and adaptive management plan, which has been reviewed and accepted by AEP.

As identified in the AEP consultation material filed by EDPR in response to information requests from the Clearview Group, AEP issued information requests to EDPR relative to this plan and requested various amendments prior to its approval.

16:00

EDPR has taken care to minimize the impacts of the project on sharp-tailed grouse, including the stripped application of AEP's 500-metre setback for leks from wind turbines and minimizing construction activities during peak lekking periods for non-turbine project infrastructure within the setback.

Indeed, members of the Clearview Group have also acknowledged EDPR's willingness to relocate project infrastructure, having regard to the identification of leks in the project area.

While Mr. Wallis advocates for an 8-kilometre setback from known sharp-tailed grouse leks, he also admitted during cross-examination that the U.S. guidelines that reference this setback are voluntary and expressly state that they are not intended to restrict the installation of turbines within the 8-kilometre setback.

Acoustic bat monitoring surveys for the project recorded an average of 0.59 migratory bat passes per detector night during the spring, and 0.54 migratory bat passes per detector night during the fall, both of which fall below the 1.00 migratory bat pass threshold set by AEP for potentially acceptable risk. Indeed, AEP evaluated the project as having low bat fatality risk.

16:01

While EDPR acknowledges Mr. Wallis's suggestions with respect to the use of radar for future bat detection, EDPR submits that the methods set out in its AEP-approved post-construction monitoring and adaptive management plan are sufficient to adequately assess and respond to bat fatality issues should they arise.

Further, Mr. Wallis acknowledged that radar has been employed at wind-powered projects with mixed results.

A number of concerns were expressed during the hearing regarding the potential effects of the project on waterfowl. EDPR does not disregard the importance of the project area to waterfowl, nor does it take the position that the project will not impact waterfowl to a certain extent. These facts were acknowledged and discussed in both environmental evaluations prepared for the project. However, EDPR takes issue with the magnitude and geographic extent of the impact alleged by the Clearview Group and Dr. Petrie.

Dr. Petrie's report suggests that the size and orientation of project turbines will have a barrier effect causing waterfowl to avoid the entire project area.

Dr. Petrie retreated from this hard line position in his opening statement noting that the use of habitat

16:02

within the project area by ducks, swans, and geese may be reduced but acknowledged that the project will not represent a complete barrier to movement.

As you heard from Dr. Jones, based on his experience working in and around large-scaled wind energy developments, there is no generalized barrier or displacement effect associated with such developments in North America.

Dr. Jones' review of the literature on this subject, including the peer-reviewed studies and the literature reviews cited by Dr. Petrie in his report, suggests that the evidence for a generalized barrier effect and/or displacement effect is highly equivocal.

You heard Ms. Macnab question Dr. Petrie regarding some of the numbers of waterfowl breeding pairs per square kilometre in the area of the province in which the project is located. And you also heard that Dr. Petrie was unable to confirm the manner in which some of those numbers were derived. Similarly, Dr. Jones was unable to determine the basis for many of the figures referenced in Dr. Petrie's evidence and IR responses regarding displaced waterfowl without assuming full exclusion of waterfowl within the 500-metre area Dr. Petrie describes as an avoidance zone.

16:04

As outlined in the expert report of Dr. Jones, the conclusions set forth in Dr. Petrie's report are not supported by the scientific literature he cites. Those studies cited by Dr. Petrie do not support the assertion that wind power projects result in widespread avoidance by waterfowl, particularly not the 500-metre avoidance zone identified in Dr. Petrie's report. Conversely, many of the studies Dr. Petrie cites document waterfowl use well within that distance.

16:05

Even if the Commission were to accept that the 150-metre and 500-metre exclusion and avoidance zones identified by Dr. Petrie actually exist, which EDPR argues would be incorrect and inappropriate, Dr. Petrie fails to acknowledge that the spacing of turbines and turbine rows in the project are sufficiently large to permit the movement of waterfowl within and through the project area. Indeed, Dr. Petrie did not cite any literature to support his conjecture that larger turbines will result in a larger avoidance effect for waterfowl.

16:06

There is nothing in the evidence before the Commission to suggest a linear response to turbine size, particularly having regard to the increased space between turbines associated with the project that uses a smaller number of large turbines.

Dr. Petrie makes reference to setback
recommendations by Danish researchers in the report he
filed in this proceeding as well as in his opening
statement. In particular, Dr. Petrie states that:
(as read)
"Danish researchers advocate that IWTs,
or industrial wind turbines, not be

or industrial wind turbines, not be placed within 1 kilometre of waterfowl roosting areas."

And he cites Stelling and Petrie.

In EDPR's view, it is notable that Dr. Petrie elected not to cite the document he coauthored with Mr. Keith Stelling in his opening statement. The unpublished document, which is available online, makes reference to personal correspondence with one Danish researcher, and no studies in support of the proposition were provided in response to information requests from the AUC regarding the applicability of the referenced Danish research to species and landscapes in Alberta.

The Clearview Group and Mr. Larry Kaumeyer, in particular, suggest that the Commission should be guided by the Saskatchewan Ministry of Environment's decision not to approve the Chaplin wind energy project when considering EDPR's application.

EDPR notes that, other than the testimony of

16:06

Mr. Kaumeyer, there is no evidence on the record of this proceeding to demonstrate why a comparison to Chaplin is relevant or appropriate.

The location proposed for Chaplin was surrounded by four nationally and globally recognized important bird areas, located in close proximity to habitat used by shorebirds identified as species at risk, and consisted of landscape features that funneled for birds and bats. None of these circumstances are similarly present in the Sharp Hills wind farm project area.

16:08

Prior to leaving our discussion of environmental issues, I would just like to draw the Commission's attention to the following observations: First, the concerns expressed by Mr. Wallis in this proceeding focus more on his perceived failings of AEP than the proponent.

EDPR has complied with all applicable environmental standards and regulations in close consultation with AEP. Any concerns the Clearview Group may have regarding the decisions of AEP or other regulators with jurisdiction over the project should have no bearing on the Commission's assessment of whether the project complies with applicable regulatory standards and is in the public interest.

Second, it is notable that, of the four

Clearview Group witnesses that spoke primarily about environmental impacts during the hearing, three appear to be primarily concerned about the potential impacts of the project on the abundance of certain wildlife for hunting purposes.

While EDPR acknowledges that hunting is a social value, an important part of life for many people, it also notes that the evidence you heard during the proceeding indicates that hunting resources have increased in recent years.

For example, Mr. Ross made the following comments regarding the abundance of geese: (as read)

"There's a real problem with the numbers that we have with our geese. Their numbers have increased spectacularly and they're destroying the habitat around the Hudson Bay and every year they've increased the bird limits to shoot them because they're trying to control the populations."

Similarly, Mr. Kaumeyer notes that there has been a significant growth in the number of waterfowl in the region, to the point that the length of the hunting season has increased. EDPR submits that the evidence demonstrates that hunting in the project area will not

16:09

be negatively impacted by the project.

The Commission heard evidence about the private airstrips in the project area and the extent to which they are used by Clearview Group members. My friend has suggested that the issue of aviation in this proceeding is a complex one, and I respectfully disagree. The evidence is straightforward, as are the guidance documents.

It is important to note that there are no airport zoning regulations in the vicinity of the project, nor any provincial or municipal restrictions on the use of land in proximity to the private airstrips. That is the first point both experts appear to agree on.

As recommended, as agreed to by both Mr. Sutherland and Mr. Hatcher, Transport Canada's aerodrome standards and recommended practices, TP312, fifth edition, contain recommended safety standards that aerodrome operators are encouraged to follow. However, the TP312 recommendations are not enforceable against anyone except operators of certified airports. The standards in TP312 are not required to be met by anyone, including the Nesses and the Jorgensons, who operate the airstrips. This appears to be the second point the experts agree on.

Notwithstanding this fact, EDPR has applied the

16:10

obstacle limitation surface, or OLS, standards described in Section 4.1 of TP312 to the airstrips in the project area to ensure continued safe operation of the private airstrips. As you heard, the standards set out in TP312, including the OLS, are sufficient for all aircraft regardless of size.

As I discussed with Mr. Hatcher, Transport Canada's definition of OLS indicates it is a surface that establishes a limit to which objects may project into the aerodrome space so that aircraft operations at the aerodrome may be conducted safely.

16:11

Mr. Chair, if you protect OLS, which EDPR has done, operations at the airstrips may be conducted safely. For this reason, EDPR's confident that it has taken sufficient steps to ensure the safe operation of the airstrips to the extent they are used now and into the future.

EDPR wishes to assure the Commission that it is not being put in a position where it is necessary to prioritize one land use over another. The project has been designed to coexist with airstrip use and in a manner that maintains safe conditions for pilots in compliance with Transport Canada's guidance.

In direct response to questions from Commissioner Phillips, Mr. Sutherland expressed his opinion that the

Commission would not be putting pilots in harm's way should you approve the project. By protecting the OLS, EDPR has enabled safe arrivals and departures to and from the airstrips. The OLS has been applied equally to both ends of the airstrips and provides a standard surface of protection from obstacles out to 2.5 kilometres off each end of the runway.

EDPR is confident that this measure will address the concerns expressed by Mr. Len Jorgenson, who emphasized the importance of a safe approach and departure when flying into any airstrip. In addition, it is notable that during cross-examination Mr. Hatcher agreed that EDPR's intent was to protect the OLS such that there was no infringement in that regard.

The Clearview Group disagrees that EDPR's proposed turbine layout is consistent with the setbacks established by TP312 because turbines have been sited within the outer surface, which is an area 45 metres above the aerodrome that extends a horizontal distance of at least 4 kilometres from the runway. However, EDPR submits that this argument is based on a fundamental misunderstanding of the applicable Transport Canada regulations and guidance.

As you heard from Mr. Sutherland, the outer surface was an area defined in the fourth edition of TP312,

16:13

which was replaced and superseded by the fifth edition of that document in 2015. Specifically, Mr. Sutherland explained that the term "outer surface" is not used in standards anymore. It's called an "outer identification surface." And the reference made, even in the Clearview Group's evidence, referred to TP312 fifth edition.

The outer identification surface is not a limitation surface. It's been taken out of that definition, and it's intended for a different purpose: to identify obstacles to see what impact they have, as opposed to limiting them.

The concept of the outer surface continues to be referenced in Transport Canada's guidance document for land use in the vicinity of aerodromes, TP1247 E. This is because TP1247 has not been updated since 2014 and, therefore, continues to reference the contents of the fourth edition of TP312.

Regardless, EDPR submits that the continued reference to an outer surface in TP1247 should be of no consequence for the Commission's assessment of whether the project has been sited to safely coexist with airstrip use.

First, as described by Mr. Sutherland, TP1247 is not a regulatory document, it is a guidance document.

16:14

As agreed to by Mr. Hatcher during cross-examination, it is a publication designed to assist planners and legislators in becoming familiar with issues related to land use in the vicinity of aerodromes. Like TP312, there is nothing in TP1247 that indicates it is enforceable or otherwise binding on a party.

Second, the current addition of TP312 includes the outer surface in the definition of obstacle identification surface, or OIS. The OIS is used to identify obstacles that may require assessment and inclusion in instrument approach procedures or any visual circuit procedure associated with the instrument approach procedure.

It is important to note that there are no instrument approach procedures associated with any of these private airstrips. It does not create any prohibition or other limitation with respect to the placement of structures in the vicinity of airstrips, which fact was acknowledged by Mr. Hatcher during cross-examination.

Further, EDPR notes that various objects are currently located within the OIS for the Clearview Group airstrips, including transmission towers and transmission lines, highways, trees, and grain bins, and that pilots using visual flight rules are presumably

16:16

able to adjust their procedures accordingly.

Mr. Hatcher identified a concern regarding the impact of turbulence caused by wind turbines on aircraft. However, EDPR notes that Transport Canada has not issued any guidelines regarding this issue, which Mr. Hatcher acknowledged during cross-examination.

Transport Canada's release of TP1247 evidences the fact that the agency has turned its mind to the interaction between aircraft and wind turbines and, as such, the fact that no such guidance has been issued suggests that any turbulence that does exist is likely to pose any significant risk.

With respect to the concerns raised regarding the impact on the project of aerial spraying, EDPR notes that aerial spraying is not common or frequent in the project area. During the course of three participation PIP rounds, EDPR was not made aware of any aerial spraying operations in proximity to the project, and the submissions of the Clearview Group indicate that aerial spraying is a very rare occurrence. Mr. Ness stated that it has only been used twice in the last ten years on his lands, and Mr. Sheldon Kroker stated that aerial spraying is a one in 10- or 15-year event.

Regardless, EDPR has committed to consult with landowners and aerial applicators to discuss proposed

16:17

locations and timing of spraying activities and associated safety considerations in the event such activities are proposed.

EDPR respectfully submits that the evidence presented by Mr. Sutherland regarding aviation matters should be preferred over that of Mr. Hatcher. While Mr. Hatcher is clearly an experienced pilot with expertise in visual flight rules, he does not appear to be familiar with the guidelines that are at issue in this proceeding, and, indeed, his report is based on an out-of-date version of TP312.

16:19

In conclusion, notwithstanding the fact that TP312 does not impose any restrictions on entities such as EDPR, which are not aerodrome operators, EDPR made significant efforts to voluntarily include OLS setbacks in accordance with the fifth edition of TP312 as part of its project design. By doing so, EDPR ensured that the airstrips could continue to be used safely by aircraft pilots. The Commission is, therefore, not in a position where it needs to choose between competing land uses, as turbines and airstrip use can safely coexist within the project area.

16:19

EDPR heard the concerns of Mr. Barry Wagstaff and other members of the Clearview Group regarding the potential impacts of shadow flicker. Mr. Wagstaff

indicated he will experience 12 to 13 hours per day of shadow flicker in the summer months and 7 to 8 hours per day during the winter months. However, EDPR wants to assure the Wagstaffs that their residences are well outside the eight-hour per year contour of the shadow flicker map commissioned by EDPR which was available to stakeholders through the PIP.

Property values. During the course of the hearing, you heard a number of Clearview Group members express concerns about the potential effects of the project on property values. Indeed, EDPR received these concerns during the PIP as well as through statements of intent to participate and submissions filed as part of the Clearview Group's evidence in this proceeding. Having regard to these concerns, EDPR advised in its reply evidence that it had not identified any reliable information that indicates that properties surrounding wind projects suffer a loss and property value, and specifically had no information that the project would have any impact on property values.

Operations and safety. EDPR is committed to the safety of those in the vicinity of its operations, including residents, employees, and contractors. In the very unlikely event of a wind turbine fire, the fire-monitoring sensors located in the affected turbine

16:20

will trigger fire alarms at both the onsite operations and maintenance centre and the remote operation centre to enable immediate response.

As indicated in its application and PIP materials, EDPR has initiated consultation with the fire chief and deputy director of emergency operations for the Special Areas Board and is committed to developing a site-specific emergency response plan prior to commencing construction of the project. As part of the emergency response plan, firefighting and detection equipment will be available in all project buildings and staff vehicles.

In addition, EDPR will maintain an up-to-date list of residents in the project area, which will be used to notify nearby residents of fire or other emergency situations.

Decommissioning and reclamation. EDPR is committed to fully decommissioning the project at the end of its operational life. As discussed by Mr. LoTurco during the hearing, EDPR expects to follow the deconstruction for resale method of decommissioning in the future, such that decommissioning costs can be covered by the salvage value of project infrastructure including the large quantities of steel which comprise the turbine towers.

In addition, EDPR has committed to establishing a

16:21

decommissioning fund relative to all properties on which project turbines are located. This fund provides additional comfort to participating landowners that funds will be available at the end of the project's operating life for decommissioning and abandonment costs.

In addition, EDPR acknowledges that following the proclamation of the *Renewable Electricity Act* in March 2017 and the resulting amendments to the *Environmental Protection and Enhancement Act*, EDPR is statutorily required to obtain a reclamation certificate from AEP in accordance with the conservation and reclamation regulation at the time the project is decommissioned.

Finally, EDPR notes it will develop and submit a decommissioning plan to the Special Areas Board in connection with its application for development permits in connection with the project.

EDPR is confident that all costs for decommissioning the project will be available at the end of its operating life and is committed to complying with the statutory reclamation requirements in place at the time of decommissioning.

I'm going to move on to discuss the public consultation undertaken by EDPR and the participant

16:23

involvement program, or PIP, designed for the project in accordance with Rule 7.

Given the nature of the project, EDPR did not have any powers to compel or take the land rights required for the project without the consent of the participating landowners.

While you heard from some landowners that they decided not to participate in the project, which is their right, a number of landowners expressed an interest in doing so, such that EDPR was able to secure over 49,000 acres of land through lease and option agreements and secure an additional 16,000 acres of land through setback waivers, enabling EDPR to maintain a further buffer between project infrastructure and non-participating parcels.

EDPR developed its PIP with the intent of building trust, credibility, and respectful relationships with landowners and other stakeholders potentially affected by or interested in the project, and with the intent of meeting or exceeding the notification and consultation requirements set out in Rule 7.

EDPR conducted an open, transparent, and thorough public consultation process and respectfully disagrees with the criticisms raised by some Clearview Group members about the PIP.

16:24

As stated by Mr. LoTurco, what I can say is that we have run three rounds of the participant involvement program to identify concerns. We've made adjustments. We have come back with the best information that we could return to all interested entities and we've tried to make the project better as a result. And so I think that's what I can say that we've done, and I think it's been a pretty rewarding process for us.

There was a great deal of discussion during the hearing regarding different views in the communities about the project.

As you heard from Mr. Fitch during his cross-examination of Dr. Jones, reasonable experts and scientists may disagree. I believe the same statement applies to landowners as well. Reasonable people can, and often, disagree.

You heard suggestions from the Clearview Group that more landowners within the 2 kilometres of the project boundary oppose the project that are participants in it. However, when assessing the community context, it is important for the Commission to consider that only 7 of the individuals that testified at the hearing on behalf of the Clearview Group have full-time residences within 2 kilometres of the project boundary and none who reside within 1.75 kilometres.

16:26

A number of the individuals that testified at the hearing were not members of the Clearview Group and many others do not reside anywhere near the project area or only do so on a seasonal or activity-specific basis.

In addition to concerns about visual impacts, property values, and the other issues that I have already discussed, EDPR made note of the following specific concerns raised by Clearview Group members in their evidence and in their remarks before the Commission last week.

16:26

A number of Clearview Group members are speculative about the economic benefits the project represents, particularly the number of jobs it will create relative to the oil, gas, and coal industries and the economic implications of retiring coal-fired power plants in the province, such as the Sheerness generating station.

16:27

While EDPR appreciates the differences in the amount of direct employment available from different types of energy facilities and the fact that there are concerns about the implications of government policy, these are unfortunately not the types of concerns that EDPR or, with respect, the Commission, are able to address. EDPR was, however, always open to providing information relative to these concerns throughout the course of its PIP.

In addition, EDPR notes that the tax revenue that will be paid by EDPR to the Special Areas Board, the payments to participating landowners, and the operations and maintenance jobs associated with the project are each stable sources of revenue and resources that are not subject to volatile commodity prices in the same way as the oil and gas or coal industries are.

EDPR also heard concerns about construction noise on livestock from Ms. Juanita Wagstaff in particular.

EDPR's committed to conduct construction activity between the hours of 7 a.m. and 10 p.m., except in unusual circumstances, and will consult with landowners regarding the timing of activities to minimize disruptions to the greatest extent possible.

EDPR is of the view that a fair and wholistic assessment of the negative and beneficial impacts of the project supports a finding that it is in the public interest and will provide for the economic, orderly, and efficient development and operation of the generation of electric energy in Alberta.

The project's installed capacity of approximately 300 megawatts of renewable electricity will generate power to close to 160,000 homes in Alberta and will contribute to emissions reduction targets set out in Alberta's climate leadership plan and under the

16:28

Renewable Energy Act to achieve 30 percent of annual electricity in the province from renewable sources by 2030.

As one of four projects selected in the first round of renewable electricity program, the project will assist the province in reaching its commitment to increase renewable electricity generation, diversifying the provincial energy mix, and securing affordable electricity prices for Alberta consumers. In this way, approval of the project will help achieve one of the key purposes of the HEEA, controlling pollution and ensuring environmental conservation in the generation of electric energy in Alberta.

At the outset of the hearing, you heard how the project is expected to generate a significant number of employment opportunities, including up to 300 jobs during the construction phase and approximately 15 to 20 direct and permanent jobs during the 20- to 30-year operational life of the project. EDPR intends to work with local contractors for road maintenance, clearing, vegetation management, catering, and other services throughout the life of the project, ensuring long-time investment in the community.

The project represents a highly significant capital investment in the special areas and will contribute to

economic development in the region. Participating landowners will be able to diversify the sources of income for their families and spend additional income in the community. Property taxes that will be paid to the Special Areas Board will increase overall annual tax revenue, enabling investment in local infrastructure, such as schools, local roads, and other municipal government services. The benefits created by the project are therefore not limited to participating landowners, but extend to all members of the community.

16:31

Further, as you heard from Mr. LoTurco and Mr. O'Connor, EDPR has been involved in a number of community initiatives over the last three to four years, has donated to local organizations as part of its first round of social investment in the special areas, and looks forward to continuing to contribute to similar organizations and causes in the future through future rounds of community donations.

16:31

In conclusion, EDPR has taken care to design and site the project in a manner that avoids or minimizes potential negative effects to the greatest extent possible and is committed to mitigating any residual effects in accordance with applicable regulations.

Having regard to the beneficial social, environmental, and economics of the project as I've

1	described, the applicant submits that the positive	
2	effects of the project clearly outweigh any potential	
3	negative impacts and respectfully request the Commission	
4	approve the application and grant the requisite power	
5	plant approval and substation permit and licence.	
6	Subject to any questions the Commission may have,	
7	those are my submissions.	
8	THE CHAIR: Thank you. I'll just confer and	
9	see if we have any questions for clarification.	
10	Seeing as we have none, I'm just going to check in	16:32
11	with the court reporter, if she wants to have a little	
12	break before we allow Mr. Fitch to start.	
13	I thought that might be the case. Let's just take	
14	about ten minutes, and then we'll invite Mr. Fitch.	
15	Thank you.	
16	(ADJOURNMENT)	
17	THE CHAIR: Welcome back. Please be seated.	
18	Mr. Fitch, whenever you're ready, please proceed.	
19	MR. FITCH: Thank you, Mr. Chair and Panel	
20	members. I want to begin by thanking you for a fair	16:45
21	and efficient hearing, but mainly I want to begin by	
22	saying what an honour and privilege it has been for	
23	Mr. Baldasaro and I to have been able to represent our	
24	client the Clearview Group. Truly a group of wonderful	
25	people, I'm sure you would agree, having heard from	
l		l

many of them last week.

And I have to say, it is a real shame that we're doing closing here in Calgary instead of Oyen. You saw the turnout last week. People are very passionate about this, and I know they would have wanted to be here.

I want to particularly acknowledge Sheldon and Kelly Kroker, who are here. They've been my main point of contact for months now on this file and they've been a tremendous support, and they're just two of the greatest people I've ever met. So there you go.

Sir, this project, of course, is in Special Areas 3 and 4, and it truly is a special area, this Sedalia, New Brigden area. It's a farming and ranching community, but it -- it's teeming with wildlife. I was amazed how much wildlife we saw driving back and forth everyday between Oyen and Sedalia.

It's in the middle of nowhere, so to speak, seemingly empty, yet home in fact to a close-knit, thriving community. It's a part of the province thought of, by us city slickers, as being flat and dusty and dry, but, in fact, it's rolling, dotted with ponds and sloughs and wetlands in the prairie pothole region of North America, as you heard, and we'll be talking more about that.

16:46

It's an area of I think understated but real beauty, a quiet and peaceful area where, as Kelly Kroker said, noise travels far. It's an area that's rooted in history and in community, stretching back five generations. You heard Mr. Wagstaff talk about his great-great-great-grandfather, if that's right, homesteading it 115 years ago. And all of this is under threat by this project, by the tallest turbines ever proposed in Alberta, turbines taller than any operating anywhere in North America, by a proponent that has proved to be tone deaf to the concerns of local people and a local community.

16:48

It is the submission of the Clearview Group that the Sharp Hills wind project will have a dramatic impact on the landscape, it will have a significant impact on wildlife, and it will have and, indeed already has had, a profound impact on the community, dividing it among participating and non-participating landowners. This is a precedent-setting application.

16:49

There have been many wind power projects we know that have been approved by the AUC in the last several years. To a jaded outsider, it can appear like it's a foregone conclusion; that it's just a rubber stamp.

But having regard to the size of these turbines and this unique area that basically no one has ever

heard of, we submit this application is different and the AUC can and must take the opportunity to draw a proverbial line in the sand, that it will not simply rubber stamp any old wind project that comes along.

This one is too big and too impactful, and it is the submission of the Clearview Group that the application should be denied in whole or at least in part, that is, in relation to certain turbines, and I'll get into that later.

The outline of my argument will be as follows. I'm going to start by talking about tower height and visual impacts. I'm then going to move to the environment, the impacts on the environment, and decommissioning and reclamation. Third, I'm going to deal with noise impacts. Fourthly, aviation and the impacts on the local airstrips. And then last, but really not least at all, the impacts on the community, social effects, which this Commission is statutorily bound to have regard to in carrying out its public interest mandate.

So to begin on tower height, the record is clear that if approved these turbines will be the tallest ever built in Alberta. The hub height is 132 metres, the rotor diameter is 136 metres, for a total height of 200 metres.

16:50

I'm going to refer to certain exhibits, so I'm going to ask that we call up Exhibit 147, pdf 3. While we're doing that, you have heard members of the Clearview group talk about the fact that at 200 metres, or 650 feet, these turbines will be taller than the Calgary Tower. And EDP has implied that it's somehow unfair to compare the height of these proposed turbines to the Calgary Tower. But it's not unfair. It is simply a fact. When you look at this graphic that Mr. Ross had done, it's actually shocking how tall these towers are.

16:52

I'm sure some of you, like Mr. Baldasaro and I, drove home from the hearing and came into the city from the east, and you can see the Calgary Tower, which will be shorter than these turbines, from like at least 20 kilometres in the distance, and it's surrounded by the buildings of downtown.

These towers will be plunked down, 83 of them, on a landscape primarily horizontal from a visual perspective. So the impact, the visual impact, of these turbines will be far worse than the Calgary Tower.

16:52

Members of the Clearview Group have repeatedly and consistently expressed that this is one of their biggest concerns, the fact that the height of these

1 turbines is unprecedented.

In its reply evidence in response to this concern, EDP referred to a letter that I received from Alberta Environment Protection, which characterized the size of these proposed turbines as being "typical of most current wind projects across the province." End of quote. That's what AEP said. And I'm submitting that is simply not true. And I can't for the life of me think why AEP would say something like that.

And I would suggest it is completely disingenuous of EDP to rely on an incorrect statement made by AEP.

EDP knows better than anyone that the size of their turbines are unprecedented in this province.

I went through in cross-examination with EDP other recently approved and pending wind farm applications in Alberta. The gist of all of that is as follows.

Bull Creek, which I think was from 2014, a hub height of 85 metres, rotor diameter of 103 metres, total height of 136.5 metres. 65 metres shorter than these turbines.

Next, Grizzly Bear Creek, which I believe was from 2016, hub height of 91 metres, rotor diameter of 116.8 metres, total height of 149.4 metres. So more than 50 metres shorter than these turbines.

Halkirk 2, approved very recently by this

16:53

Commission, hub height of 95 metres, rotor diameter of 110 metres, total height of 150 metres.

Then there are the pending projects, the ones that we went through in evidence. There's three of them. Firstly, the RES Forty Mile project, hub height of 101.5 metres, rotor diameter of 132 metres, total height 167.5 metres. So 33 metres, approximately, shorter than these turbines.

Suncor Forty Mile, hub height of 90 metres, rotor diameter of 116 metres, total height 148 metres.

Again, over 50 metres shorter than these turbines.

And, lastly, Capital Power Whitla, hub height of 105 metres, rotor diameter of 136 metres, total height 173 metres. So 27 metres shorter than these ones.

The fact is the Sharp Hills turbines are significantly taller, 50 to 65 metres, than most recently approved major wind farms in this province, and they are also materially taller by 25 to 50 metres, approximately, than the other currently applied-for major wind farms in Alberta. And that's just fact.

In the submission of the Clearview Group, it should be self-evident that these unprecedentedly tall turbines cannot in any way be integrated into the landscape of the Sedalia, New Brigden area, and they will have a massive visual impact.

16:55

Unfortunately, in previous wind farm cases, proponents have argued, and this Commission has accepted, that visual impacts are largely subjective, and, therefore, they have been dismissed, these concerns. So, as a result, the Clearview Group retained RDI, Resource Design Inc., Mr. Fairhurst, who is a practitioner of visual impact assessments to do an objective assessment of the impact.

His report is Exhibit 137. You heard him talk about it this morning. His simulations are Exhibits 135 and 136.

His conclusion is that the existing landscape integrity of the area is high, and that's based on landscape attraction and observability. In other words, it's a beautiful area, and you can see a lot. And he concluded that the area has high landscape significance.

Now, my friend got into this and talked about how, you know, you shouldn't believe what Mr. Fairhurst had to say, but, in my submission, those are essentially self-evident propositions. There's nothing far reaching about what Mr. Fairhurst said.

He went on to say that this project, these
200-metre turbines, all 83 of them, will cause the
landscape integrity to drop significantly and that the

16:57

alteration of the landscape by the turbines will be dominant, and they will have low or very low landscape conformity. And, again, I submit to you this ought to be self-evident. And I don't think those fundamental points, in my submission, were ever seriously challenged by EDP.

Indeed Mr. McDonnell did not even critique
Mr. Fairhurst's assessment. He just really critiqued
the actual simulations. His whole report was, well, my
simulations are more realistic than yours. That was
basically what Mr. McDonnell said. But Mr. McDonnell
doesn't even do visual impact assessments. He's not a
VIA practitioner. By contrast, Dr. Fairhurst is a
leading and an established VIA practitioner.

Mr. McDonnell accused Dr. Fairhurst of being biassed to the foreground, but of the 43 simulations done by Mr. McDonnell's firm, WSP, only one was in the foreground. All the rest were mid-ground or background. And I suggested to him, and I'm submitting to you, that the bias here is on Mr. McDonnell's part and EDP's part in that they put out visual simulations which clearly downplayed the visual impact of this wind farm by only looking -- by only presenting to members of the public, not just those who had expressed concerns, but to all members of the public in the area,

16:59

only mid and background views.

You heard Mr. Fairhurst say that of all his observation points, in fact only 38 percent are foreground. That's not evidence of bias to the foreground.

Mr. McDonnell said you should only consider views from residences. Dr. Fairhurst, while he was very polite, I'm going to be less so, I think he basically said that's ridiculous. Members of the local community travel on these roadways every day and they will be exposed to these foreground views every single day. And it is valid and appropriate to include those views in a visual impact assessment.

Mr. McDonnell claims that the literature supports the compatibility of a "working agricultural landscape with wind turbines," but the article he cited was set in, as I understand it, the northeast of the United States, in an area with rolling hills and great diversity, and even then his opinion, as Dr. Fairhurst testified today, was qualified. But we're not in the northeastern United States, we're in the west. And, as you heard Dr. Fairhurst say, the literature that's actually relevant is that the United States Bureau of Land Management article looked at five different turbines in Wyoming and Colorado and concluded that it

17:00

will have large, I think was the way they put it, large visual impacts out to 40 kilometres. And that's Exhibit 254.

Perhaps the most absurd proposition put forward by Mr. McDonnell was that turbines with their moving blades can "animate" an otherwise static environment.

Well, as you heard Dr. Fairhurst say, I don't think this landscape needs animating, thank you very much.

The fact is these massive turbines will have a massive visual impact, and to pretend otherwise is delusional and, I would submit, worse. It's just willful blindness.

Environment. It is the submission of the Clearview Group that EDP has ignored guidance documents prepared by the Government of Alberta in relation to the siting of wind projects. I hope the irony has not been lost on the Commission that this impetus of shifting to renewable energy, which is driven by a concern for the environment, seems to be resulting in the disregard by the proponent of environmental standards set by the Government of Alberta.

To disregard environmental guidelines in siting a wind project, is -- it's, well, ironic, as I said. But yet this is precisely what has occurred in this case.

17:02

And EDP, I think their principal argument or defence in this regard is to say we got our referral reports from AEP, so therefore it doesn't matter. And, you know, from our perspective, Mr. Chair, there is a fundamental problem with the way the environmental effects of wind projects are assessed in Alberta.

You have the AEP, the wildlife management branch of AEP, carrying out reviews that are desktop, they just simply look at what's presented to them by the proponent. They provide these referral reports. They essentially won't answer any questions about the referral reports. They won't come to hearings to -- to AUC hearings to talk about it, even though the roles and responsibility document agreed to between the AUC and the AEP expressly provides that that can happen.

And then, of course -- and I don't blame EDP -- but, of course, they're going to come to the AUC and say we've got a referral report.

It is impossible for an intervener in a proceeding like this to meaningfully challenge or test those referral reports in the absence of any witnesses from AEP. The system is flawed.

And, in any event, the test that this Commission must apply is not whether AEP has provided a referral report. The test is whether the project is in the

17:04

public interest, having regard to its environmental effects.

So there are these guidelines. You heard a lot about them, the 2011 guideline, the wildlife guidelines, and the 2017 wildlife directive, and they speak to best practices, so as to ensure that wind development is carried out in a responsible manner.

The Clearview Group asks how can a project that is run in violation of so many aspects of these guidelines be in the public interest? It's not. And I'm going to start with environmentally significant areas, or what are referred to as ESAs.

As you know, ESAs are areas that have been identified as being of ecological, hydrological or geological importance. The ESA designation does not confer any special protection, but it is obvious, and the whole point of them is that they are to be used for planning purposes so as to allow projects to be sited so as to avoid ESAs. That's just common sense.

So what is the point of identifying ESAs if we're going to ignore them once they have been identified?

EDP has not avoided ESAs in siting this project. In fact, we submit the evidence is that there has been little attempt at avoidance. Fully 14 percent of the project footprint directly overlaps environmentally

17:05

significant areas. EDP acknowledges this and there will be residual effects to ESAs, but concludes, ah, those residual effects are "not significant." But this conclusion is based on, don't worry, at the end of the day, we will reclaim the site, everything will go back to the way it was. So that's why the effects are not residual.

This opinion, this position, is also contingent on the belief that siting portions of the project on previously disturbed agricultural land may not actually impact the integrity of ESAs. But we know that buffers are established around areas like wetlands because there is risk, real risk, that putting projects too close to the ESAs will have an impact. That's why buffers exist.

Siting turbines and access roads on -- in areas that are buffer areas will impact the surrounding -- or the adjacent environmentally significant areas. And the evidence in this proceeding is that there are five turbines, 27, 28, 29, 30, and 31, that fall within such buffer zones. And it is the submission of the Clearview Group that these turbines should be re-sited.

Turbines, and not just the turbines, but access roads are all located within or immediately adjacent to a high-risk wildlife zone.

17:07

The 2017 wildlife directive for Alberta wind energy projects specifically recommends avoiding areas identified as being high risk. EDP has failed to meet that with respect to those five turbines.

As I said before, wildlife, the area is teeming with wildlife. The expert evidence and the lay evidence both support this.

You heard Mr. Kaumeyer say that in the fall you can find fields with 15,000 geese in this area. You heard him say that goldfinch paint the trees outside his home yellow as they migrate through his yard. Mr. Ross gave evidence that the area is known for its abundance of waterfowl. He noted the large concentrations of prairie chicken, which is the common name for sharp-tailed grouse, Hungarian partridge, owls, hawks, and recently eagles.

There's a healthy and growing elk and moose population. There's a healthy antelope population. Mr. Ross described the area as some of the best mule deer hunting in southern Alberta. All of this evidence is uncontradicted.

The bird migrations noted by Mr. Kaumeyer and Mr. Ross have not been accounted for in the very limited survey work performed by EDP. In fact, it was Mr. Kaumeyer's evidence that much of the bird migration

17:09

he observes takes place at night as he sits out on his deck, as the geese travel between Dry Lake to the west of the project area and Grassy Lake to the east.

This type of bird activity clearly was not observed by EDP in its surveys, and, as such, we submit the survey results that form part of the evidence before you, that they grossly underestimate the number of wildlife in the area.

Mr. Wallis confirmed this in his evidence. He noted as an example that the results of the bat survey are dramatically different from the surveys conducted in relation to the nearby Lanfine project near Bull Creek. This raised a red flag for Mr. Wallis, you heard him say, and it should raise a red flag for the Commission as well.

And despite the fact that their wildlife surveys were clearly inadequate, EDP still detected over 9,000 birds in the area representing 85 different species, and the most common were waterfowl and songbirds. I'll get to waterfowl later. Of these, 19 are species of management concern. Of the 89 raptors observed, 4 of the 7 species are species of management concern.

During the spring 2016 survey, 23 percent of all birds were observed in flight flying within the rotor sweep area. 40 percent of the raptors observed in

17:11

flight were flying within the rotor-swept area.

Because of this, EDP could hardly deny that the project

will result in mortality to a number of species.

So the project will kill birds, it will kill bats, and likely other wildlife, but don't worry, EDP says, not in sufficient numbers to affect their population. But without proper surveys of the area, how do we know that? We don't.

And troublingly, EDP has failed to account for the uncontradicted evidence of Mr. Kaumeyer that the area is quite often blanketed in fog in the fall. So you will have large flocks of birds migrating through the area at times completely blind to the existence of these turbines. Mr. Kaumeyer predicted at such times the area will be a killing zone.

Now, as part of its mitigation strategy, EDP has committed to a post-construction monitoring plan, but the specific details of the plan have not yet been determined. However, EDP says it will look for bird carcasses underneath the turbines to see if their predictions are correct. Yet, EDP acknowledged under cross-examination the difficulty of locating birds in grassland beneath a 200-metre tall turbine. It also acknowledged that coyotes and other scavengers in the area may prevent carcasses from being found.

17:12

Moreover, the commitment is time limited, for three years. So if there is a spike in fatality any time after that, say in five years, we'll never know. No one will be looking. And this notwithstanding that the project will be in place for a generation at least.

Similarly, no one will be monitoring to find out whether birds are simply avoiding the area. There will be no ability to determine whether this project is contributing to a larger population decline.

You heard a lot from Mr. Wallis about the need for adequate surveys. At a minimum, additional wildlife surveys are required prior to construction to determine whether the residual impacts of the project are indeed not significant as EDP says. We need a reliable baseline. Construction should be contingent upon the results of surveys. We need to be confident that the anticipated impact truly is not significant before approval is granted for the project.

You heard both Mr. Wallis and Mr. Kaumeyer, who testified that he was the past chair of the Delta Waterfowl, that radar is increasingly being used as a device. And, yes, Mr. Wallis did acknowledge that it's not perfect and has some shortcomings, but it's better than the tools that we've had to date.

So construction, in our view, should be contingent

17:14

or conditional upon the implementation by EDP, not just of curtailment measures, but also the permanent use of radar detection.

Mr. Wallis gave evidence, and I don't think anyone would disagree with this, that bird and bat fatalities can be reduced by slowing or stopping turbines during peak migration periods. Radar can help detect approaching flocks. So permanent implementation of radar, along with curtailment measures, will go a long way to providing this Commission and our clients with some measure of comfort and should be a condition of project approval. If implemented, this could significantly help to minimize fatalities, particularly in the event of fog during migration.

And to the extent these concerns that have been overstated, what is the harm? If EDP is correct, the need for curtailment will be minimized or potentially eliminated. So if birds don't actually use the area, they won't have to curtail or stop their turbines. So there's really no hardship to EDP and potentially great benefit to the environment.

Finally, the Clearview Group submits that any approval should be conditional upon post-construction carcass monitoring continuing for the duration of the project. How will we know there's an issue if no one

17:16

is even bothering to watch?

I now want to move to native grass.

Mr. Wallis's evidence is that native grassland is threatened in Alberta. Again, I don't think there's really any controversy about that. Through human activity, it has become fragmented and degraded. In fact, it is among the most threatened biogeographic regions in the Canadian plains. And as more is lost, the remaining parcels become more important to protect.

Despite clear guidance to the contrary from AEP, 18 percent of the project is located on native grassland. So native grassland has not been avoided. Neither, we expect, have rare plants, but we don't really know because, again, EDP survey efforts have been limited and we don't really know what the baseline is for rare plants. How do you know there are rare plants or rare ecological communities if you don't look?

EDP, again, has deemed the residual impact on native grassland and rare plants as "not significant." And, again, we submit this assertion does not hold up to scrutiny.

Reclamation is unlikely to be successful with respect to native grassland and plains rough fescue.

As observed in the 2017 wildlife directive for Alberta

17:18

1	energy wind projects, quote: (as read)	
2	"There is an inability to recreate some	
3	unique vegetation community types, for	
4	example, rough fescue grasslands, post	
5	disturbance resulting in permanent	
6	habitat loss which can negatively impact	
7	wildlife and wildlife habitat."	
8	Again, I don't think any of that is particularly	
9	controversial, and EDP acknowledged as much in its	
10	environmental evaluations. It states, quote: (as read)	17:20
11	"Reclamation practices are unlikely to	
12	achieve a state consistent with	
13	pre-construction conditions."	
14	The fact is once someone said last week, once you	
15	break the native prairie I think it was Mr. Wallis	
16	it never you just can't put it back again.	
17	So EDP's assurances about reclamation are entirely	
18	hollow when it comes to native grass. And there's no	
19	plan. They just say we'll come up with one in the	
20	future. There's no information about how revegetation	17:20
21	of native grass will be undertaken, what species will be	
22	used, and how it could realistically be achieved given	
23	the dismal track record of reclaiming native grass.	
24	And this is particularly troubling because there	
25	just aren't examples in the literature of successful	

restoration of rough fescue grassland. And that's from Mr. Wallis's report.

And, moreover, as noted by Mr. Wallis, reclamation of native grassland and rough plains fescue, if it's to succeed at all, will take years.

The vague post-construction monitoring proposed by EDP is, frankly, laughably short term in terms of its duration and highly unlikely to be successful.

For the foregoing reasons, the Clearview Group submits it is clear that Turbine 9 must not be approved in its current location.

Micro-siting, which was my friend's suggestion in her argument, will not do the trick. It will still be on native grassland.

I'm going to move now to wetlands and waterfowl. Sharp Hills wind farm, as we've heard frequently in the past week, is located in the prairie pothole region of North America. This region is characterized by small shallow wetlands, which are clearly visible from roadways throughout the area. We all saw them last week.

As you heard from Dr. Petrie, the prairie pothole region is the most important waterfowl breeding area in North America for ducks. Over 50 percent of all North American ducks are hatched in the prairie pothole

17:21

1 region.

Dr. Petrie also testified, and again I don't think there's any controversy about this, that the Sharp Hills project area is located along the central flyway where millions, literally millions of waterfowl migrate during spring and fall. You heard Dr. Petrie characterize it as being "international significance." And that's not seriously in dispute.

You heard Dr. Petrie talk about the annual waterfowl breeding population and habitat survey undertaken since, I think he said, the forties or the fifties by the Canadian Wildlife Service and the U.S. Fish and Wildlife Service. This is the largest wildlife survey conducted anywhere in the world on an annual basis.

According to that survey, that annual survey, the waterfowl breeding density for this area, the Sharp Hills area, is the second highest in Alberta. Dr. Petrie testified that waterfowl breeding densities in proximity to the turbines in the project area is even higher because of the high density of wetlands in the Sharp Hills project area. The density is 10.6 wetlands per square kilometre, which is above -- well above average for the stratum -- that's the term used in the survey -- that Sharp Hills is located in.

AMICUS REPORTING GROUP

17:23

So you heard Dr. Petrie testify and it's in his report, that while breeding densities in Stratum 27, the specific stratum we're talking about, is 18.5 -- sorry, 18.15 breeding pairs per square kilometre in the project area owing to this higher density of wetlands. It could be up to 25 breeding pairs per square kilometre, which Dr. Petrie characterized as being very high. Even Mr. VanDerZee talked about the, quote, "sheer magnitude of the wetlands in the area."

So this is critically important habitat. Large portions of the prairie pothole regions have been drained or degraded already. This area is unique in that it remains largely intact.

So you have this prairie pothole region that provides critical breeding and staging habitat for waterfowl and you have it located right in the middle of a migratory flyway.

So Dr. Petrie, in his report and in his evidence, stated very clearly that for waterfowl, the chief concern is not collision with turbines, it's avoidance. And avoidance means essentially the loss of highly productive habitat because the birds are no longer using it. And this, as I said, is critically important breeding, feeding, and staging habitat.

And contrary to what my friend would have you

17:24

believe, this is supported by all of the literature.

Dr. Jones in his reply evidence attempted to discredit Dr. Petrie's report by looking at all the articles, went through each one cited by Dr. Petrie, and he tried to distinguish them on various grounds, but, on any fair reading, they all, every one of them, support the basic point that waterfowl avoid wind turbines.

The reason Dr. Jones said he disagreed with Dr. Petrie is that he interpreted Dr. Petrie to be saying that this project would be something like a physical barrier, like a wall, that birds would fly up to it, turn around, and go back south again. And, of course, that's not what Dr. Petrie said. And what he clarified in his direct evidence is that the barrier effect, as he put it in his report, means that because waterfowl will avoid the project area, there will be a substantial reduction of the habitat on which the -- which can be utilized by the waterfowl because they're going to be flying around the wind farm.

So specifically in his report he talked about the literature supporting the concept that there is what he called an exclusion zone of around 150 metres around wind turbines. And there are larger zones around turbines of approximately 500 metres, which he called avoidance zones.

17:26

So Dr. Petrie's evidence is that for the 83
Sharp Hills turbines, the small exclusion zone alone constitutes 586 hectares of high quality habitat, contains 66 wetland basins, 42 hectares of -- specifically of wetland habitat. This will be a major loss of usable habitat for waterfowl.

With respect to the larger avoidance zone that he talked about, that is more than 5,000 hectares encompassing 533 wetland basins and 868 hectares of wetland habitat.

This is area that is great habitat that is currently used by waterfowl that will be avoided, which is not to say there won't be the odd duck or goose or swan in there, but, on a population basis, they will be avoiding the area and so they will lose this high-quality habitat. This will impact feeding, and, in

EDP has acknowledged that 36 percent of the project footprint is within 100 metres of the closest wetland, despite all guidance to the contrary from the provincial government. So that would fit within Dr. Petrie's 150-metre exclusion zone.

turn, it will impact breeding and ultimately population.

24 of the 83 turbines are within the 100-metre wildlife buffer; more than one quarter.

And with regard to the figure of 36 percent being

17:28

1	within 100 metres of the closest wetland, this figure is	
2	likely low because it does not take into consideration	
3	temporary wetlands. And you heard very clearly from	
4	Dr. Petrie that temporary wetlands are critically	
5	important, particularly in an area like this.	
6	I'm going to quote from Dr. Petrie's testimony,	
7	transcript Volume 4, beginning at pdf 893. Dr. Petrie	
8	said:	
9	"So Class 1 and 2 are seasonal and	
10	ephemeral, like temporary wetlands. And	11:24
11	so if you go on that landscape now,	
12	they'll all be dry, you know, unless	
13	you've got a really wet year, which this	
14	is not. So those Class 1 and 2 wetlands	
15	are the first wetlands in the spring to	
16	thaw out and have water and they're the	
17	first ones to have an emergence of	
18	insects.	
19	So they're critically important at	
20	that time of year for not just waterfowl	11:24
21	but several different species of birds	
22	and shorebirds to get the protein and	
23	calcium needed, and fat reserves, one	
24	for egg laying but also for migration.	
25	So a lot people don't realize that	

they're as important as they are,
because if you go out on the landscape
now, some of them are dry depressions
and other ones have even been farmed
through, which is fine, because they
served their purpose already. But when
we lose those wetlands or compromise
those wetlands, we really compromise our
waterbird populations."

So 36 percent of the project footprint within 100 metres of wetland, that's Class 3 wetlands and up. If you include Class 1 and 2, these critically important wetlands Dr. Petrie talked about, who knows how large the figure is. Well, I can tell you one entity that doesn't know, and that's EDP.

Whichever figures are used, there are extensive infringements or impingements on setback buffers, including wetland buffers, prescribed by AEP. So this does run contrary to clear guidance from AEP set out in the 2011 wildlife guidelines for Alberta wind energy projects, set out in the 2011 recommended land use guidelines for protection of selected wildlife species and habitat within grassland and parkland natural regions of Alberta, and, lastly, the 2017 wildlife directive for Alberta wind energy projects.

17:30

h	
1	Indeed, the 2011 directive notes: (as read)
2	"For major wetlands providing habitat
3	for large numbers of migrating or
4	breeding waterfowl, the setback may need
5	to be greater."
6	This is clearly an area of major wetlands. It provides
7	habitat for a large number of migrating and breeding
8	waterfowl. The setbacks not only shouldn't be impinged
9	upon but arguably should even be larger.
10	The Alberta Wetland Policy effectively becomes
11	meaningless if the default is to build in and adjacent
12	to wetlands simply when it is convenient for the
13	proponent. Wetlands are a public resource and need to
14	be treated in the public interest.
15	The Alberta Wetland Policy clearly states that
16	where avoidance is deemed impracticable and a negative
17	wetland impact is likely to occur, wetlands of higher
18	relative value should require stronger evidence of
19	effort to avoid.
20	We are dealing here with an area of high quality
21	wetlands. Where is the strong evidence of avoidance
22	attempts? There is no such evidence.
23	So, in our submission, this project fundamentally
II .	

17:32

17:33

needs to be revisited by EDP so that turbines are

re-sited to respect these important wetland buffers that

24

25

are recommended in all of the guidance documents prepared by the Alberta government. At the very least, we submit the 24 turbines located within the 100-metre wetland buffer should be relocated, along with the associated impinging access roads and underground collector lines.

I now want to finish environment by talking about decommission and reclamation. The starting point is that there is no plan. The plan or the proposal, whatever you want to call it, is essentially "trust us." "When it comes time, we will do it." "At some point in the future, we will prepare a plan and even later on into the future we will carry out that plan."

And I question how, in light of this, can anyone come to these findings of no significance, adverse effect. There is no evidence, zero, actually supporting that decommissioning and reclamation will be carried out in a manner so as to eliminate residual impacts. It's all "We've committed to do this," "Trust us, we'll do that."

You, Commissioners, need actual evidence to base your public interest decision on, and there is no such evidence. There's no plan. It's just "Trust us, we'll do it."

The second point I would like to make is one that

17:34

of course is of great concern to my clients and landowners in the area, which is what if, as happens with industrial facilities, particularly mines, what if EDP is long gone by the time decommissioning and reclamation is required? And what if the last man standing, so to speak, doesn't have the resources to carry it out? Bankrupt or in receivership?

EDP says it will deal with that situation by placing money in escrow to cover the cost of turbine decommissioning and reclamation in the event the company no longer exists in the future. Again, sounds good, but it seems, to the Clearview Group, that there are several catches here.

The first is we don't know, and therefore the Commission doesn't know, how much money in fact is going into this escrow fund. I gather this is something that's part of the contractual arrangement between the landowners and the company. So, Commissioners, you don't know if there's going to be enough money in that fund.

Secondly, as we understood it, the money won't be actually placed in escrow for 15 years. So if something happens before then, whatever, we're out of luck.

Thirdly, and I think most importantly, we know, because EDP testified to this, that the money in escrow

17:36

is not going to be enough to cover the cost of decommissioning and reclamation. Instead, EDP says that the balance will be paid for by the scrap value of the turbines and that this will cover any shortfall.

Well, this raises a number of additional concerns. How can anyone forecast the market for scrap metal 25 years from now? No one, not EDP and not the Commission, has any way of knowing whether the scrap value of the turbines will be enough at the critical time to actually pay for decommissioning and reclamation. EDP has acknowledged it has no ability to forecast whether the project will still be required in 25 years due to changing market conditions, so how on earth can they be counted on to predict the market for scrap metal 25 years into the future.

Secondly, and this of course is the greatest concern to landowners, is who is going to pay for this? So there's money in escrow. Will landowners be expected to pay for turbines to be disassembled out of their own pocket or this fund and then hope that there's enough money in the value of the scrap metal to cover the total cost? It is hard to imagine, if not completely unimaginable, a landowner taking on the risk of decommissioning a Calgary Tower sized turbine, much less two, three, four, or five.

17:37

So whose responsibility in the event of receivership or bankruptcy is it to deal with decommissioning and reclamation? What legal entitlement will landowners have to scrap metal in the event of a bankruptcy?

So the problem is, again, this is one of the cases where it's all vague commitments, no plan. And these concerns are not far-fetched.

You heard Mr. Ross talk about the fact that we have an orphan well epidemic in Alberta right now. And he should know because he makes his living in the oil and gas industry. And he asked what I thought was a very important question: Do we really want to make the same mistake twice?

Decommissioning and reclamation has to be addressed at the front end. There has to be provision made to ensure that it's going to happen and going to happen in a way that will actually reclaim the land to as close as possible a state that it is in today.

It is the position of the Clearview Group that it should be a condition of project approval, should approval, in fact, be granted, that EDP fully fund cost of decommissioning and remediation, and that the full amount of this cost should be placed in some kind of an account to make sure that it's actually there if and

AMICUS REPORTING GROUP

17:39

1 when needed.

I'm going to talk now about noise. I think I can be relatively quick on this subject because I think by the end of the hearing, the positions of the experts were pretty clear. So I think I can get through this fairly quickly.

So obviously a noise impact assessment for the project was prepared by Ms. Drew of RWDI. Everyone knows that the results of a noise impact assessment are dependent on the inputs into the model.

It is the submission of the Clearview Group that, on several key inputs or parameters, RWDI appeared to consciously choose to be less, not more, conservative.

Ms. Drew tried to characterize this as, quote,

"realistic conservatism." End quote. But the truth is is that realistic means being less conservative.

So what are these key inputs? Well, the one we heard a lot about is the ground factor and the fact that Ms. Drew used 0.7 instead of 0.5.

Secondly, still on ground factor, there is the issue that 0.7 was applied to the entire study area instead of separately modelling highly reflective surfaces like water, notwithstanding the high percentage of water and wetlands in the area.

Remaining on ground factor, again  $0.7\ was$  applied

17:40

by RWDI to the entire study area instead of separately modelling highly reflective surfaces like tamped ground at third-party energy facilities.

Fourth, there was the problem of the selection of the third-party facilities, and, in particular, the fact that RWDI's noise impact assessment excluded a number of potential noise sources by only including pumping wells.

Next, the issue of receptor height, the NIA did not include second storeys whereas Mr. de Haan was very clear, the noise impact is greater.

And then, finally, noise propagation conditions.

The NIA done by RWDI did not consider stable atmospheric conditions, notwithstanding they are apparently representative in the area.

So these problems with the NIA were all identified by dBA Noise Consultants, Mr. de Haan, who was retained by the Clearview Group to carry out a review of the noise impact assessment. And his report is Exhibit 138.

So having made all of those findings, identified those shortcomings in the NIA, dBA carried out its own calculations at a selection of receptors, 16 to be exact. And this is in Exhibit 138.

So basically keeping all other inputs the same,
Mr. de Haan used what in our submission is a more
appropriate ground factor of 0.5 instead of 0.7 and he

17:42

used 0 for water and for third-party energy facilities.

And the result is his modelling shows that the PSL may be exceeded at 6 dwellings.

He just looked at 16, and of the 16 he looked at, the PSL may be exceeded at 6 dwellings. And that's the nighttime PSL of 40 dBA.

Mr. de Haan also carried out calculations taking into account stable atmospheric conditions, and in his report he looked at stability Class F, and the result of those -- of that modelling exercise was of the 16 -- the sample of 16 that he modelled, 11 exceeded the PSL, the nighttime PSL of 40 dBA.

And then, as you know, we heard about it this morning, as a result of the reply evidence filed by EDP that stated stability Class E, not F, is representative of conditions in the area, Mr. de Haan reran his model using stability Class E, and five exceedances are predicted.

So it's our submission that, you know, you have three different ways when Mr. de Haan did modelling and showed between 5 to 11 exceedances of the 16 that he looked at. We submit that RWDI's noise impact assessment is not, in fact, conservative and almost certainly under-predicts noise from the turbines and that there is a very real risk of non-compliance with

AMICUS REPORTING GROUP

17:44

1 Rule 12.

And, of course, whose problem does it then become? Well, it becomes my clients' problems because they're out there living with these turbines that are exceeding the PSLs in Rule 12.

So to begin on the ground factor of 0.7 instead of 0.5, the evidence is quite clear. At basically every recent AUC wind farm application that at least we have evidence about in this proceeding, and that includes Bull Creek, Grizzly Bear Creek, Halkirk 2, and then the three that are currently being proposed for the Forty Mile area, that's the RES Forty Mile, Capital Power, Whitla, and Suncor Forty Mile, all of them, every one uses a ground factor of 0.5, not 0.7.

With respect, Ms. Drew is an outlier on this issue. And it was interesting -- I took Ms. Drew through this -- that for Suncor Forty Mile, she did -- that is, RWDI did -- the noise impact assessment and she initially used her 0.7 that she's used at Sharp Hills. But then when the Commission said no, we want the three proponents to agree on a common parameter, it changed. And now the RWDI NIA for Suncor Forty Mile uses 0.5 instead of 0.7, which Ms. Drew characterized as, well, that was just done for expediency. Well, I submit that hardly installs -- or instills confidence. And I think

AMICUS REPORTING GROUP

17:45

that's why the AUC, through its counsel, asked Ms. Drew to remodel using the ground factor of 0.5.

So, in our submission, it's clear that the ground factor, the general ground factor, should be 0.5.

And the remodelled results are interesting. And I'm going to ask that we call up Exhibit 273. Go down a couple of pages. We should be dealing with the -- this doesn't look right. Oh, there we go. Okay, let's go down to the next page, please.

It's hard to see, but one of the interesting things about these remodelled results is that the -- if you ignore the uncertainty column and you just look at what it was before and what it is now, so before was 0.7, now is 0.5, the increases in the predicted noise levels are quite dramatic at some of these -- at some of these receptors. I can't really see it very well, but I know that the first three or four of them, there are increases of like 3 or 4 decibels.

And this is interesting, I submit, because Ms. Drew would have you believe that using this "uncertainty factor of 1 decibel" introduces some great level of conservatism into her model, but the fact is changing the ground factor from 0.7 to 0.5 created increases significantly greater than 1 decibel. So her allegedly conservative uncertainty factor really wasn't

17:47

1 conservative at all.

The bottom line, in most recent wind farm applications, the proponents have used 0.5 as a ground factor and, most importantly, this Commission has accepted it as being reasonable.

So next, in terms of the ground factor being applied to the entire study area instead of being separately modelled, this again, in our submission, is an example where RWDI consciously chose to be less conservative than other NIA practitioners. We know that at Grizzly Bear Creek 0.5 was used generally and 0 was used for water and wetlands, and at Halkirk 2, same, 0.5 generally and 0 for water and wetlands. And, again, that was accepted as reasonable by the AUC.

Mr. de Haan fairly acknowledged that using an average ground factor for an entire study area may be appropriate in conditions where the propagation between the source and the receptor is comparable. So it's basically all the same. But that is clearly not the case here.

We heard it many, many times, but the evidence is that 12 percent of the project area is in wetlands and a lot of that is not marsh, a lot of it is open water.

And then there's this whole issue of whether that includes Class 1 and 2 wetlands. I don't think it does,

17:49

although, having reviewed the evidence, it is not clear to me, but I don't think it does. I think it's just Class 3 and above.

So knowing all of that, we submit there was ample evidence for an NIA practitioner who really wanted to be "realistically conservative" that in this case using a ground factor of 0 for water would be appropriate.

And, again, Ms. Drew attempted to say, "Well, a lot of these wetlands are marshes," and the suggestion of course was that the vegetation associated with the marshes is more absorptive, but that justification, with respect, doesn't fly. You heard Mr. de Haan this morning quote from one of the acousticians' manuals, basically saying that the foliage of trees and shrubs provides only a small amount of attenuation and only if it is sufficiently dense to completely block your view. And anyone who drove around the project area last week knows that's not what we're dealing with here in the project area.

So, again, the fact is a practitioner who was truly interested in being conservative would have modelled water separately as a reflective surface in light of the high percentage of the project area that is in wetlands, including open water.

So the last point about the ground factor is

17:51

whether it was conservative to not separately model highly reflective surfaces like tamped ground at third-party energy facilities. And you recall when I was cross-examining Ms. Drew about this, I put to her the text of ISO 9613, which is very clear. Hard ground includes "tamped ground." And it uses as an example ground such as often occurs around industrial sites. So ISO 9613 says that should be modelled as 0 because it's highly reflective.

And the wisdom of treating hard ground around facilities as reflective, so using 0 ground factor, has been demonstrated by Mr. de Haan. He both modelled and measured noise from the Baytex 9-29-35-5 West 4 facility, and the modelled results using a ground factor of 0 perfectly matched the measured results; whereas the modelled results using the ground factor of 0.7 resulted in an under-prediction of noise by 1.7 dBA.

If being "realistically conservative" means striving to be accurate, you have your answer. You should be using the ground factor that ISO 9613 says you should use for tamped ground and you should do the sort of thing that Mr. de Haan did, which demonstrates that that's the right approach. It is the conservative approach; not the approach taken by RWDI.

With regard to the selection of third-party

17:52

facilities and the fact that only pumping wells were included, again, we submit this was clearly not a conservative choice made by RWDI. Again, to use this concept of whether it's realistically conservative, all it does is it presents you a snapshot in time, what's actually pumping right now. The fact is wells are brought on and taken off production all the time.

It is a gross generalization, in our submission, on RWDI's part to assume that a well that is suspended now will not at some point be brought back on production. Wells are sold and purchased all the time. Often a new owner will re-enter to drill to a deeper zone and then start producing. Wells are taken off production when prevailing gas or oil prices are not economic and then they're brought back on again when the economics improve. Wells are drilled, but they may sit suspended for sometimes long periods of time because, for whatever reason, there's not available pipeline capacity. And there are many other reasons why wells are drilled but sit suspended. It doesn't mean they're abandoned. So this, again, was not a conservative assumption to make.

With respect to receptor height, in her reply evidence Ms. Drew acknowledged that 4.5 -- so that's the proxy for a second storey -- may be used for post-construction monitoring in the event of a

17:54

complaint. She also acknowledged that some practitioners in Alberta choose to use a receptor height of 4.5 metres in an NIA. She simply chose not to. Again, she could have but did not. She chose the less conservative option.

She also tried to downplay the significance of this by saying only three receptors have two storeys. But of course two of those receptors are the hamlets of Sedalia and New Brigden. The fact is there are at least six residences within the project boundary that have second storeys. Again, not a conservative choice.

With regard to noise propagation conditions and RWDI's failure to consider stable atmospheric conditions, notwithstanding that they are apparently representative in the area, dBA, in an effort to actually be conservative, looked at what the results would be if you modelled stable atmospheric conditions. And of course, as you heard from both experts, ISO 9613 can't do this because it's got these sort of baked-in

So dBA used this other model that you can input meteorological data into, and that's the CONCAWE model. And it is an accepted model used around the world, just like ISO 9613. And, as I've indicated, he modelled a selection of 16 receptors, initially using a stability

17:56

17:56

meteorological conditions.

Class F, and he had 11 exceedances. And then when through the reply evidence it came out that perhaps stability Class E is in fact representative, as you heard today, Mr. de Haan remodelled, and we still have five exceedances.

So, again, you know, we realize that every practitioner can choose which model they want to use. But if you know, as RWDI apparently did know, that stable conditions are representative in the area, the conservative thing to do would be to try to model them. RWDI chose not to.

17:57

So with regard to noise, RWDI clearly was not conservative, realistically or otherwise. As I've indicated, dBA, when it changed just a few things, the ground factor and the atmospheric condition, three different times came up with exceedances: 6 initially, then 11, then 5.

I think what you can conclude from that, Mr. Chair, is that there are numerous conservative scenarios different from those modelled by RWDI which result in PSL exceedances. And the result of that is that the AUC cannot, in our submission, rely on the RWDI noise impact assessment and determine that Rule 12 will be complied with.

And, Mr. Chair, you asked Mr. de Haan today, well,

what do we do with that? What are you recommending that we do? Well, firstly, you know, Mr. de Haan is here as an expert. I don't think it's his job to tell you what you should do with his evidence, but what I want to submit is the wrong thing to do with that evidence is to simply say, ah, we'll approve them and you can just do post-construction monitoring.

If that's the answer, you know, don't worry, if there's an exceedance, we'll catch it in post-construction monitoring, then what's the whole point of this exercise? Because you could do that without hearing from any noise expert. It could just simply be a rule of the AUC that you get your approval -- you don't even need to file an NIA, but, proponent, you need to understand that you have to do post-construction monitoring. And if you exceed the PSL, then you're going to have to fix it.

So that's essentially what you would be doing here. There's, in my submission, compelling evidence that the PSL will be exceeded at a number of residences. It's not sufficient to simply say post-construction monitoring is the answer.

The answer, in our submission, is to tell EDP to do what it should have done in the first place, to design the project in a manner such that it actually complies

17:59

with Rule 12. That's what you should tell EDP based on this evidence.

Aviation. Three members -- as you heard last week, three members of the Clearview Group have airstrips in the Sharp Hills project area: Jim and Larry Ness and the Jorgenson family. You heard the testimony of Chris and Len Jorgenson and Jim Ness. The testimony was clear, unchallenged, and we can run through the facts quite quickly. The airstrips are active and they are used today.

18:01

With respect to the Jorgenson airstrip, it was built in 1975 by their father Ralph. It was built using tractors with blades and earth movers so that there's a crown on it to ensure proper drainage. It's a grass strip in the southwest quarter of Section 34, Township 31, Range 4, west of the 4th. It's oriented in a east-west direction and it's 2300 feet long. It was used on a weekly, if not daily, basis by Ralph Jorgenson from 1975 to 2010. Since then it has been used by Len Jorgenson and, in fact, was used the night before he gave testimony to get here, and it had been used by Mr. Jorgenson two weeks prior to that as well.

18:01

The strip is maintained by Chris Jorgenson cutting the grass twice a month. I asked Mr. Hatcher to comment on the quality of the strips, and he basically said the

Jorgensons' grass strip is one hell of a nice grass strip.

Mr. Len Jorgenson owns a plane. It's actually his father's old plane. In response to information requests from both the EDP and the AUC, Len provided estimates that there's an average of 67 flights annually, and that was based on him looking back at his father's logbooks dating back to 1984, which indicated 2255 takeoffs and landings since 1984. Len testified that when he flies to the farm from Springbank where he keeps his plane, he approaches from the south-southwest.

18:02

He testified that when he flew in the night before giving evidence, he started his descent at Youngstown, 30 miles southwest of New Brigden. He testified that between Youngstown and New Brigden, he dropped from a cruising altitude of 7500 feet to the target altitude of 1500 feet, which is the altitude he was at. And that's 1500 feet, of course, above ground level. That was the altitude he was at when he did his windsock check basically and did the circuit.

18:03

With regard to the Ness airstrips, Jim Ness testified briefly on behalf of he and his brother Larry. His testimony is that he has been flying 40 years. Larry has been flying that long, if not longer, because, according to Jim, Larry's grass strip was constructed in

1972, 46 years ago, and it is 2500 feet long with an orientation of north-northwest to south-southeast.

With regard to Jim's airstrip, he built that grass strip in 1978, and it has an orientation of northwest to southeast.

Both of the Ness airstrips were built with a grader pulled by a tractor to level and crown, again so that there would be runoff of water. They were seeded to grass, maintained in a similar way.

With regard to current use, by way of response to information requests, Larry Ness estimates 150 takeoffs and landings a year at his strip, and Jim estimates 80 at his strip.

Between them, Jim and Larry own eight or nine planes, stored in six different hangars, five at Larry's place and one at Jim's place. And you heard Jim testify that he has two -- that they, that the brothers, have two friends who store planes at Larry's -- in one of Larry's hangars.

None of these three strips are registered with Transport Canada, but all three are registered with the Alberta Aviation Council, which means that they appear on public maps that pilots can use for reference.

Finally, contrary to EDP's evidence, all the strips have windsocks. And contrary specifically to what

18:04

Mr. O'Connor testified under oath, it is not true that there has been no windsock at the Jorgenson airstrip for the past four years. You heard that directly from Chris Jorgenson.

So those are the basic facts about the airstrips, but I think it will be useful now if we can pull up Exhibit 106 and go to pdf 37. And just scroll down, please. No, too far. There we go. Perfect. Thank you.

So we can see in Section 18 -- sorry -- yes,
Section 18, the Ness Ranches Ltd. strips, there's
actually two of them. The main one used by Larry Ness
is the north-northwest, south-southeast trending strip.
There's water around it, as you can see.

And then if we go down to Section 1, there's a northwest to southeast oriented strip, and that is Jim Ness's strip. And you can see that -- if we can go back up to the Larry Ness strip, you can see that the nearest turbines are 90 and 91 to the southeast, and 53A and 54 to the south -- sorry -- to the west-southwest.

And then if we go back town to Jim's strip, you can see Turbines 62 to 64, the three of them, to the west, and 90 and 91 to the northeast.

So now if we go to pdf 17. Sorry, pdf 38. My apologies. Go down. Farther. There we go. No, a

18:06

little bit up. 1 2 So you can see the Jorgenson airstrip. It runs 3 east-west. And you can see that in the vicinity of that 4 airstrip, there are Turbines 75 -- 74, 75, 76, and 77 to 5 the south-southeast. 6 Now, if we can go to pdf 17, the same document. 7 And just magnify that, please. So in the first column under the red column, that's 8 9 where you'll see information about the -- I think that's the Larry Ness strip at the top there, Number 1. And 10 11 you can see that the nearest turbine is Turbine 90, and 12 it's 2435 metres from the Larry Ness strip. 13 And if you go down to the third row, that's the 14 Jim Ness strip, you can see that the nearest turbine to 15 the Jim Ness strip is Turbine 64, which is 2393 metres. And then the Jorgenson strip is Number 6, towards 16 17 the bottom of the table. And the nearest turbine to the 18 Jorgenson strip is Turbine 75, and it is 1693 metres 19 from the Jorgenson strip. So those are the basic facts about the strips, 20 21 which turbines are nearby, and how close the turbines 22 are. 23 More generally, in response to an undertaking 24 request made by Commission counsel, EDP testified that

18:08

18:09

there are 21 -- of the 83 turbines in the project area,

25

there are 21 within 4 kilometres of these three strips.

There are 11 within 4 kilometres of the Jorgenson strip, and that's Turbines 71 through 77, 84, 85, and 86, and STW 4. So 11 turbines within 4 kilometres of the Jorgenson airstrip.

With regard to the Jim Ness strip, there are 6 turbines within 4 kilometres of it, and those are Turbines 53, 54, 63, 64, 65, and 66.

And with regard to the Larry Ness strip, there are four turbines within 4 kilometres of it, and those are Turbines 90, 91, 92, and 93.

So I now want to talk briefly about something you heard about from both Mr. Sutherland and Mr. Hatcher, and that's the circuit. You heard Mr. Hatcher testify that the circuit is the standard traffic pattern used at aerodromes around the world under visual flight rules. So that, of course, would be for aerodromes like this where there's no instrument approach. And it's used when aircraft are approaching and landing at the aerodrome.

Mr. Hatcher testified that pilots are taught to fly the circuit. The circuit can either be left-hand or right-hand, but the evidence is clear that the standard and preferred circuit is the left-hand circuit because most planes have two seats in the cockpit and the pilot

18:10

sits in the left-hand seat, so the left is convenient because it's like driving a car, you just look out your window and you have unobstructed vision. Whereas if you're doing the right-hand circuit, you have to look across the cockpit to the other side of the airplane.

You heard Len Jorgenson compare doing the right-hand circuit to like driving a right-hand drive car in a left drive jurisdiction like North America. You heard Len Jorgenson say that he flies the left-hand circuit whenever possible, and that in fact he flew the left-hand circuit the night before to get to the hearing.

Now, the experts, Mr. Hatcher and Mr. Sutherland, disagreed on several matters, but they had one point of agreement: The turbine layout proposed by EDP will affect the ability of pilots to do a left-hand circuit into all three of these airstrips. Mr. Sutherland, again in response to questions from Commission counsel, testified with respect to the Jim Ness airstrip, that if you're travelling northwest onto that strip -- and maybe we can go back to pdf 37, the same document.

Pdf 37 of that document. All right. And if we can go down and off. We need to see more. There we go.

And can we make it smaller?

So Mr. Sutherland, not Mr. Hatcher, Mr. Sutherland

18:12

testified that if you're travelling northwest Turbine 64
will impede your ability to do the left-hand circuit.

So you'll have to do the right-hand circuit instead. So that's with respect to the Jim Ness strip.

With respect to the Larry Ness strip, again

Mr. Sutherland testified that if the pilot is flying
south-southeast, they won't have the ability to do the
left-hand circuit, they'll have to do the right-hand
circuit instead.

If we go to the next pdf, please, 38. Thank you.

And with regard to the Jorgenson strip, again Mr. Sutherland, not Mr. Hatcher, testified that if you're travelling west Turbine 66 and 67 will impede your ability to do the left-hand circuit; you'll have to do the right-hand circuit instead.

I asked Mr. Hatcher, "Do you agree with all of that?" He said he did. I asked Len Jorgenson whether he agreed with that, and he said, "I do but I would also add Turbine 75." So Len Jorgenson, the actual pilot that actually uses that airstrip, has told you that he believes Turbine 75, 76, and 77 will impede his ability to do the standard, normal, left-hand circuit into his farm's airstrip.

And then you recall I asked Mr. Hatcher, and Mr. Jorgenson, Len Jorgenson, about Len's normal way of

18:14

1	getting to the airstrip, which is he leaves Springbank	
2	and he flies and I think he said New Brigden is	
3	30 miles north of Springbank. So he flies east and then	
4	he approaches from the south-southwest. I asked	
5	Mr. Hatcher to assume that Len was flying towards his	
6	airstrip as normal from the southwest. And I asked him	
7	specifically: "Is this turbine layout going to be a	
8	problem?" Mr. Hatcher answered, "Yes." When I asked	
9	him why, he said, quote: (as read)	
10	"It's going to do a couple of things.	18:15
11	One is it's going to, as it's laid out,	
12	it will negate him joining a normal	
13	circuit."	
14	So we just talked about it. (as read)	
15	"The other problem we have is that these	
16	turbines are especially high and if he's	
17	approaching from the southwest or the	
18	south, as he often does, they're going	
19	to actually form a barrier and he's	
20	going to have to come over the aerodrome	18:16
21	at a higher than desirable altitude and	
22	then he's going to have to lose a bunch	
23	of altitude to join the traffic	
24	pattern."	
25	I asked Len whether he agreed with that. He said he	

ī <del></del>		1
1	did. And then he added the following critical point,	
2	this is Len Jorgenson: (as read)	
3	"When we talk about altitudes in the	
4	small aircraft, winds aloft can have a	
5	huge impact on your ability to maintain	
6	a constant altitude. As an example, on	
7	my flight out last night it was quite	
8	windy between Calgary and New Brigden,	
9	and it was not uncommon for me to be	
10	losing or gaining 2 or 300 feet in	18:16
11	altitude while trying to maintain a	
12	level flight. And that's a factor you	
13	have to deal with as a pilot.	
14	Controlling your altitude is a continual	
15	challenge."	
16	Len Jorgenson also testified that on a hot summer day	
17	the climb capability of his aircraft is low. So he	
18	expressed the concern about climbing over tall obstacles	
19	on a hot summer day.	
20	Len Jorgenson testified that his general feeling as	18:17
21	a relatively low-hours pilot, as he put it, is that he	
22	is simply, quote, "not comfortable with this at all"	
23	end quote. He said with respect to Turbine 75 to 77,	
24	quote, "This is a very serious concern for me." End of	
25	quote.	

1	So then I asked Mr. Hatcher about the Larry Ness	
2	strip, and he said: (as read)	
3	"Well, again, we have turbines that are	
4	fairly close to the traffic pattern.	
5	They're not quite as close as the	
6	Jorgenson strip."	
7	And maybe we should go back to 37, please, pdf 37.	
8	That's good.	
9	But the type of aircraft that the Nesses fly,	
10	because of the rough conditions, they tend to be smaller	18:17
11	and lower horsepower. "Tail-dragger airplanes" as Jim	
12	Ness called them. They do not have a great climb rate,	
13	and that could be a problem trying to get out of those	
14	strips and go anywhere. (as read)	
15	"And in particular, if we were landing	
16	and taking off in a more southerly	
17	direction and trying to do a left-hand	
18	circuit, we're going to have wind	
19	turbines as a barrier. And even if we	
20	were to switch to a right-hand circuit,	18:18
21	we have Turbines 5e and 54 that are	
22	going to produce an impediment."	
23	So that's what Mr. Hatcher said about the Larry Ness	
24	strip. Then I asked him about the Jim Ness strip, and	
25	his evidence was, quote: (as read)	
1		l

		_
1	"On the one" that's labelled Ness	
2	Ranches, so that's the Jim Ness strip,	
3	" it has a different orientation. It	
4	goes northwest-southeast, and if I was	
5	departing in a northwest direction, I'm	
6	sort of aimed at those two wind	
7	turbines, 53 and 54. And there are a	
8	couple of concerns about that. One of	
9	them is the airplane is in a low energy	
10	state. I'm downwind of the wind	18:19
11	turbine, and that's not a wonderful	
12	situation because they create a lot of	
13	turbulence.	
14	The other problem is I may have	
15	difficulty climbing above them, and I'm	
16	sort of boxed in on this airstrip.	
17	Really, any direction I turn, there's a	
18	wind turbine. So it leads to an unsafe	
19	situation. There's no real clear way	
20	out and it's going to be like an	18:19
21	obstacle course."	
22	That was Mr. Hatcher's evidence.	
23	And this, I think, might be a good point for me to	
24	maybe discuss the difference what I would consider	
25	the fundamental difference between Mr. Hatcher and	
1		

Mr. Sutherland as expert witnesses.

Mr. Sutherland is an airport expert. Mr. Hatcher is a flying expert. He's a pilot. Mr. Hatcher -- or Mr. Sutherland said, well, I grew up at airports and I had a private pilot's licence a long time ago. But that's not his area of expertise. His area of expertise is airports, which I would submit is really the least relevant point in this whole consideration because no one is saying that any of these three airstrips are airports. They're clearly not. They're grass strips.

18:20

So Mr. Sutherland's expertise about airports is, frankly, neither here nor there in relation to these airstrips.

So I want to return to -- I mentioned that when Len Jorgenson was giving evidence, he flew in the night before from Springbank. I remember he said his target altitude before landing was 1500 feet. So that would be less than 900 feet above turbines that are 650 feet tall. So this brings me to the first area in which Mr. Hatcher and Mr. Sutherland disagree, and that's the safe level of clearance over obstacles like wind turbines.

18:20

Mr. Hatcher said it's a 1,000 feet. You want to be at least 1,000 feet over these sorts of obstacles.

Mr. Sutherland said it's 500 feet. And the difference

1	between those two opinions comes from an interpretation	
2	of Section 602.14(2) of the Canadian aviation	
3	regulations.	
4	Mr. Sutherland, in his reply evidence, cited	
5	paragraph (b) of that section. And basically it says	
6	that you need to be flying at least 500 feet from any,	
7	quote, "person, vessel, vehicle or structure."	
8	Mr. Hatcher, by contrast, relied on paragraph (a)	
9	which says that when you are flying over a, quote,	
10	"built-up area, you need to be 1,000 feet above the	18:21
11	highest obstacle located within a hazard distance of	
12	2,000 feet."	
13	So Mr. Hatcher's interpretation basically is this:	
14	You develop 83 200-metre tall turbines. That means	
15	there's now a built-up area around these airstrips. If	
16	you're going to fly over those turbines, you've got to	
17	be 1,000 feet. And this is how he put it in his	
18	evidence. (as read)	
19	"When we have a collection of these tall	
20	obstructions, by definition, you know,	18:22
21	that's going to be a built-up area. I	
22	wouldn't teach anybody I wouldn't	
23	counsel anybody to fly less than	
24	1,000 feet above windmills because it is	
25	a safety issue. So, therefore, we need	

		Ī
1	to be 1,000 feet above them. We've got	
2	to be 2,000 feet horizontally away from	
3	them. All of that, you know, with the	
4	exception of takeoff and landing	
5	because, of course, we do have to get	
6	the airplane to the ground, but that's	
7	where, I guess, Mr. Sutherland and I	
8	disagree. And certainly I would never	
9	train anybody to fly over windmills at	
10	less than 1,000 feet."	18:22
11	The submission of the Clearview Group is that	
12	Mr. Hatcher's evidence on this point well, should be	
13	clearly preferred to Mr. Sutherland's. Mr. Hatcher is	
14	the pilot, Mr. Sutherland is an airport guy.	
15	If Turbines 74 to 77 are approved, Len Jorgenson is	
16	going to have to fly over those turbines at less than	
17	1,000 feet. Either that or he has to go up higher and	
18	then he's got a much greater and more rapid descent to	
19	get down to his landing altitude.	
20	So now I want to deal with the other area of	18:23
21	disagreement between Mr. Sutherland and Mr. Hatcher, and	
22	that's the relevance and application of Transport Canada	
23	Document TP1247.	
24	Mr. Sutherland was quite categorical about this.	
25	He said TP312 governs, it has done away with the outer	
II		l .

surface of 4,000 metres, which is the radius around an airstrip. Instead, what now governs is 2500 metres from either end of the airstrip. That is what has been, quote, "voluntarily applied" by EDP to these airstrips.

So to begin, let's just talk about what are these documents exactly? Well, TP312, which is in evidence as Exhibit 175, is titled "Aerodrome Standards and Recommended Practices." And if we could call up Exhibit 175, please. I need to go down one more page just to identify the document. Can we shrink the image?

18:24

18:25

All right. So there it is, Aerodrome Standards and Recommended Practices. So now can we go down a page or two to the Table of Contents. That's good.

The point here is look at the Table of Contents of this document. You will see that it deals with all kinds of things. It has zero relevance to these grass airstrips: Aprons, taxiways, that sort of thing.

Now, Mr. Sutherland says, ah, but this is a regulatory document whereas TP1247 is not. Well, that's true, but it's not relevant. And the reason it's not relevant is because it's only mandatory for certified aerodromes, i.e. airports. So it's not -- it's just a recommended practice for an uncertified aerodrome and an unregistered aerodrome, like the Ness and the Jorgenson

1	aerodromes, but 99 percent of what's in there just	
2	simply don't apply to a grass airstrip.	
3	So TP312, yes, it's a regulatory document. All	
4	that means is that Transport Canada actually has	
5	jurisdiction over an aerodrome operator. Of course, you	
6	know, right now, there's no jurisdiction with respect to	
7	these grass airstrips because they're unregistered and,	
8	frankly, Transport Canada probably doesn't know about	
9	them, but that's not the point.	
10	The point is that 1247, by contrast, is titled	18:26
11	"Aviation, Land Use in the Vicinity of Aerodromes."	
12	That's the title of TP1247, and it's in evidence in a	
13	couple of different places. I've been referring to	
14	Exhibit 38.	
15	On the first page, I guess it's the introduction of	
16	the document, it states that: (as read)	
17	"It is designed to assist planners and	
18	legislators at all levels of government	
19	in becoming familiar with issues related	
20	to land use in the vicinity of	18:26
21	aerodromes."	
22	It goes on to say that: (as read)	
23	"Land use around aerodromes can have	
24	significant impacts on safety at the	
25	aerodrome and can negatively impact	

operational viability of the aerodrome
to the detriment of the local community
that depends upon it."

As I said, Mr. Sutherland was very strong on the fact that this is only a guidance document. But the question is to whom does this document provide guidance? Well, it provides guidance to planning authorities and, in this case, a body like the AUC, because essentially what you're here to do is to decide whether to approve a development. And we know from Section 619 of the Municipal Government Act that if you approve this project, the municipal approvals, or, in this case, the approval by this Special Areas Board is effectively a rubber stamp because Section 619 of the Municipal Government Act effectively gives paramountcy to a decision of the AUC.

So if you approve this, you're essentially approving a development in the vicinity of an aerodrome. So this is the critical document that you should be looking to for guidance. It's not been repealed. It's still in effect. Mr. Sutherland acknowledged that.

So you are precisely the type of body who should be paying attention to TP1247. And it's all about safety. It's so that someone like the Commission can be satisfied that, in approving a development, it's not

18:27

going to compromise the safety of an aerodrome.

And it's particularly relevant to wind farms because the evidence is, and it's right in the document, TP1247, the ninth edition from 2014, was specifically revised to take into account new land uses like wind farms.

So, far from being outdated, this document in fact was specifically revised to address wind farms. And it applies to all aerodromes: certified, uncertified, unregistered. It applies to the Ness and the Jorgenson strips. And the reason it does is because it's fundamentally about safety.

So why is this a big issue? The reason is because Section 1.3 of TP1247 -- so if we could go to Exhibit 38 and turn to pdf 9 -- 10, sorry.

Okay. So this is kind of the core of the disagreement between Mr. Sutherland and Mr. Hatcher, because this is where in TP1247 Transport Canada is talking about this concept of an outer surface, which, as you can see, it establishes the height above which it may be necessary to take one or more of the following actions, and the first is to restrict the erection of new structures which would constitute an obstruction.

And then it talks about what the dimensions of an outer surface are, and the key one for the purposes of

18:29

this proceeding down just above the graphic -- so if we go down a little farther on the page there -- is basically this is where the 4,000 metres comes from. The 4,000 metres is recommended as a horizontal distance from the aerodrome reference point. So it's effectively a 4,000-metre circle around the centre of the aerodrome.

So our position is simple. The guidance that TP1247 provides is that you should not be erecting tall structures within this area of 4,000 metres around the central reference point of an aerodrome. And we know that in fact, as proposed, the project will have 21 turbines within 4,000 metres of these three strips.

Now, as I said, Mr. Sutherland is absolutely adamant that this part of 1247 is, quote, "outdated." And his theory -- because that's what it is; it's based on his interpretation of the document, it's not a fact, as he would have had you believe -- is that TP1247 is outdated because TP312 was revised in September 2015, that's when the fifth edition, which is the current edition, came into effect, and that it has abolished reference to this 4,000-metre outer surface, horizontal outer surface.

So let's go now to TP312, which is Exhibit 175.

And I would like to begin by having us turn to pdf 57.

So this is the beginning of Chapter 4 of TP312.

18:30

1	It's entitled, as you can see, "Obstacle Management."	
2	And there's a definition of obstacle limitation surface	
3	there which basically says that an OLS defines the air	
4	space around the runway to be maintained free of	
5	obstacles.	
6	Now, you heard Mr. Sutherland testify that there's	
7	no longer an outer surface, that it's now been included	
8	in this category of what he called an OIS, or obstacle	
9	identification surface.	
10	So let's go to pdf 70. In 4.3.2, Section 4.3.2,	18:33
11	here's where TP312, not 1247, talks about the obstacle	
12	identification surface. And you'll see I can't read	
13	that so I'm just going to grab my own copy. Give me one	
14	moment.	
15	Section 4.3.2.3 on pdf 70 of TP312, Exhibit 175,	
16	under the title "Characteristics": (as read)	
17	"The outer obstacle identification	
18	surface comprises a common plane	
19	established at a constant elevation of	
20	45 metres above the ARP extending	18:34
21	horizontally through 360 degrees to a	
22	distance of 4,000 metres."	
23	You can go to pdf 71, please.	
24	There it is depicted graphically, an OIS measured	
25	4,000 metres from the centre point of a runway or an	

aerodrome, and it's identified as an obstacle
identification surface.

If we can go to pdf 74 now. Go down to the bottom table. You'll see again a reference to an outer ID surface for non-instrument, i.e. visual flight, radius 4,000.

So with all due respect to our airport expert,

Mr. Sutherland, the concept of a 4,000-metre area around
an aerodrome where you don't want to be erecting
obstacles has not, I repeat "not," been abolished in
TP312. He's just wrong about that.

The thing he's right about is that the term "outer surface" is not used in the fifth edition of TP312, but the 4,000-metre horizontal buffer for aerodromes is, indeed, still part of TP312. There simply is no merit, none, to this suggestion that TP1247 is somehow outdated.

As a final point on this case, you heard some discussion during the evidence about the Collingwood case. If we can call up Exhibit 162, please.

So this was a -- same evidence. You can read it for yourself, but basically this was a case heard by the Ontario Environmental Review Tribunal. You can see it's from October 2016; that is, the decision is from October 2016. So that's well over one year after TP312

AMICUS
REPORTING GROUP

18:35

was revised in September of 2015. And basically it was a case about turbines in proximity to two aerodromes.

If we can go to pdf 6, please.

You'll see the name Charles Cormier. We don't need to go through it all, but you'll see that there were 13 different aviation experts called to give evidence in this case.

Go to pdf 9. If we go down, beginning at paragraph 17, the Ontario Environmental Review Tribunal begins its discussion there of TP1247. And it takes about five or six paragraphs of the decision.

Now, the Ontario Environmental Review Tribunal did not specifically address Section 1.3 of TP1247, but when you read that decision, and I urge you to do so, that review tribunal clearly considered TP1247 to be a valid document still providing up-to-date guidance to planners on how specific land uses may affect aerodromes.

So, again, I submit there is no merit, none, to Mr. Sutherland's adamant position that you should not pay any attention to TP1247, that it's somehow outdated. That's just not correct.

So to summarize then, EDP's argument on aviation rests entirely on Mr. Sutherland's position that TP1247 apply, because they've said it's 312 that applies and we have voluntarily applied those setbacks, therefore it's

18:37

safe. That's their entire case on aviation.

I submit, again, it's clear that Mr. Sutherland is wrong. There is no inconsistency between TP312 and 1247, there is no merit to the suggestion that 1247 is outdated. It remains a valid document that should guide a body like this Commission with power to approve a development in the vicinity of an aerodrome.

The second point I want to make, concluding on this issue, is that leaving aside 1247 and 312, the most important evidence you heard about this was the evidence from Len Jorgenson and Mr. Hatcher about the fact that those four turbines, 74 to 77, immediately south essentially of the Jorgenson airstrip, they're just too close to be safe. Mr. Hatcher, who is the real pilot here, was clear and categorical about that.

Finally, we brought up in our cross-examination the fact that EDP has offered a larger setback to Jim and Larry Ness than they have to the Jorgensons. It was a decision they made when they were consulting with the Ness brothers. And there is simply, from a safety perspective, no justification for treating the strips differently.

If EDP wants to give an added 1.5-mile buffer to the Ness brothers, they owe it to the Jorgensons to give them the same buffer. But our primary position is, at a 18:39

minimum, at a bare minimum, Turbines 74 and 77 can't be located where they're located. It's simply not safe. And if we are correct, as we submit we are in relation to the ongoing relevance of the 4,000-metre buffer, there's a real problem here because we have 21 turbines, 21 turbines, located within that buffer. And that puts this Commission in a very, very difficult position.

Sorry for taking so long, Mr. Chair, but I'm getting close to being done. I'm done on aviation. I want to now talk about the impact on the community. These are social effects of a project that you're statutorily bound to take into account.

You heard the evidence from 15 members of the Clearview Group who reside in and make their living farming in the Sedalia, New Brigden area. You also heard the evidence of Mr. Ross and Mr. Kaumeyer, who while not being full-time residents have been coming to the area for decades to hunt. They love it so much they now own property in the area and they're passionate about it.

These are all honest, genuine people whose participation in this proceeding has been motivated by a single purpose: To protect their beloved community. They are third, fourth, and fifth generation farmers who deeply love their land and their community.

18:41

1	You heard from Nelson Hertz, who has a two-year-old
2	son who is doing everything in his power to make sure he
3	can return to the community that he grew up in so that
4	he can farm and then his son can farm.
5	You heard from Wyatt Simpson, who is 19 years old,
6	who also wants to be able to stay and carry on his
7	family's multi-generational farming operation.
8	They all told you in one way or another in their
9	own words how deeply, deeply concerned they are about
10	this project and how it is dividing the community.
11	Contrast all of that with the evidence of EDP's
12	panel. You have Mr. LoTurco from Toronto. You have
13	Mr. VanDerZee from Portland, Oregon. The only one in
14	Alberta is Mr. O'Connor, and Mr. O'Connor was
15	essentially the face of the project in the communities
16	of Sedalia and New Brigden.
17	And this is always difficult, but you heard several
18	members of the Clearview Group essentially accuse
19	Mr. O'Connor of having lied to them.
20	You heard Coleen Blair, and this is at
21	Transcript Volume 3, pdf 175, put it I think most
22	simply. Quote: (as read)
23	"Mr. O'Connor made many visits to our
24	house. At first we were very interested
25	in hearing about the project, but, as
	$\blacksquare$

18:42

1	time progressed, we decided the project
2	was not in our best interest. We never
3	gave any indication that we would be
4	signing up our land, and our neighbours
5	knew of our intentions. It came to our
6	attention that Mr. O'Connor told one of
7	our neighbours that he had a firm
8	commitment from us to sign for the
9	project as well as some of his other
10	surrounding neighbours. This was a
11	complete and bald-faced lie. When my
12	husband asked Mr. O'Connor about this,
13	his answer was that he had no control
14	over how other people interpreted what
15	he said."

There were several other Clearview Group witnesses that basically gave you the same story, and this is a story which EDP chose not to challenge on cross-examination or to deal with by way of rebuttal evidence.

You also saw examples at the hearing of the way Mr. O'Connor answered questions. So I put it to him on cross-examination whether he didn't think the fact that the majority of the communities against the project meant, as my clients feel, that it has divided the community. Mr. O'Connor said absolutely not, he didn't

18:43

agree, and he referred to 50 families of participating landowners. And when I asked him, well, how many of those 50 families actually reside within the project area, he said the vast majority. So I wanted him to be a little more precise than that, so I asked him to get back to me by way of undertaking. So his first response was, well, it's actually 22 of 33 residences within 2 kilometres of turbines who are project landowners.

And I continued to press him on it. And, finally, where we got to was if you use the project boundary buffer, and I don't know why you wouldn't, within 2 kilometres of that line, 14 of 36 are project landowners. In other words, the other 22 are not.

So from the vast majority of 50 families, it went down to 22. And then it went down to 14. It was like pulling teeth for me to actually finally get that admission.

I'm going to say that Mr. O'Connor seemed to express skepticism throughout -- it's reflected in the materials, almost bordering on disbelief that the Ness brothers and the Jorgensons actually used these airstrips in any meaningful way.

The point is, there is more than one way to divide a community. One way is to propose unprecedently large turbines in a quiet, remote, close-knit community.

18:45

Another way is in doing so to adapt -- or adopt a combative and arrogant attitude that basically says "Those of you who don't support the project, you're being ungrateful, you should just get over it."

Your role, Mr. Chair, is to consider whether this project is in the public interest, and you are expressly -- this Commission is expressly directed to consider social effects, not just how many birds or bats might be killed and how many jobs will be created. The Clearview Group submits that the social effects of this project on this multi-generational community will be severe and long-lasting. Multi-generational, almost certainly.

So, in conclusion, the Clearview Group invites the Commission to draw a line in the sand here. You cannot simply rubber stamp every single wind farm proposal that comes along. This one is unprecedented in terms of the height of the turbines and, in our submission, its location in a really unique area of Alberta, that,

At the very least, we submit you should deny this project in total. At the very least, we submit there are certain turbines that you should deny. And the first of those, of course, is Turbine 9. It's on native grass, it hasn't been avoided, and there were no real

18:46

18:47

again, hardly anyone has even heard about.

1	reasons given why that's the case.	
2	We submit that you should deny those turbines, and	
3	those are Turbines 27 to 31, that encroach on wildlife	
4	and wetland buffers.	
5	And we definitely submit that you should deny those	
6	turbines that are too close to active airstrips. There	
7	are 21, as I've just said, within 4 kilometres of those	
8	strips. There are and then, in particular, we have	
9	74, 75, 76, and 77, those four turbines, that are just	
10	too close to the Jorgenson airstrip.	18:48
11	In our submission, this project isn't a run of the	
12	mill windmill project. This is unprecedented. We ask	
13	you to draw the line here and tell my clients, but, more	
14	importantly, the world, that not every single wind farm	
15	that gets applied for in this province will get approved	
16	as a matter of course. This is the one that should not	
17	get approved.	
18	So we ask respectfully the Commission deny the	
19	application.	
20	And those are my very lengthy submissions, and I'm	18:49
21	happy to answer any questions.	
22	THE CHAIR: Thank you very much, sir. We	
23	don't have any questions for clarification.	
24	Ms. Oleniuk, it is now about 11 minutes to 7. I	
25	am, unfortunately, going to time out. I'm wondering	

1	whether you're amenable to doing your reply in writing	
2	within some reasonable time frame. The other	
3	alternative is to try and find a schedule a time	
4	when we could come back here so you could do it here,	
5	but I don't know what works best for you, and I'm	
6	looking for some input from you.	
7	MS. OLENIUK: Chair, we're definitely amenable	
8	to providing our reply in writing. That's fine.	
9	THE CHAIR: What kind of time frame do you	
10	think would be reasonable?	18:50
11	MR. FITCH: Mr. Chair, while Ms. Oleniuk	
12	consults with her client, I have to say this I know	
13	I'm the problem because I took so long, but this gives	
14	me concern because oral reply, in my view, is quite	
15	different from written reply because, frankly, you got	
16	to get up you know, you've been making notes, it	
17	shouldn't take too long. A written reply essentially	
18	allows Ms. Oleniuk to pore over the transcript and do a	
19	considerably more thorough job of reply than she could	
20	ever possibly anyone could ever possibly do now.	18:51
21	I don't think, in the circumstances, that's	
22	actually fair.	
23	THE CHAIR: Well, sir, my	
24	off-the-top-of-my-head response is this Commission has	
25	gone to great lengths to accommodate you, to	

1		accommodate your witnesses, and we've kind of ended up	
2		where we are because we have done a lot of	
3		accommodating.	
4		So I'm not really inclined to acquiesce to your	
5		concern that it might potentially give Ms. Oleniuk an	
6		advantage because she's going to do it in writing.	
7		Is there any way we can deal with that and still	
8		allow her to do it in writing by putting some sort of a	
9		page limit on it or something like that?	
10	MR.	FITCH: I would suggest a page limit and a	18:52
11		time limit. The time limit should be short.	
12	THE	CHAIR: We haven't heard from her what her	
13		suggested time limit is, so perhaps we'll start there.	
14	MS.	OLENIUK: Thank you. I think Friday would	
15		be reasonable. And I suggest that, just for the simple	
16		fact that I have a commitment tomorrow. I am driving	
17		to Jasper for five hours, so I'm not going to really	
18		have an opportunity to deal with this. So I think	
19		Friday would be appropriate.	
20	THE	CHAIR: Mr. Fitch, would that be	18:52
21		acceptable to you?	
22	MR.	FITCH: Yes, that's fine.	
23	THE	CHAIR: Very well.	
24		Page limit. Can I have suggestions from both of	
25		you with what you think would be a reasonable or fair	
ll .			I

	page limit?		
мс	OLENIUK:	We'll certainly keep it to less	
113.		, ,	
	than less than te	n pages, double spaced.	
THE	CHAIR:	Mr. Fitch, does that work for you,	
	sir?		
MR.	FITCH:	Fine. Thank you.	
THE	CHAIR:	All right. I think that's	
	probably a fair saw-	off on that whole situation.	
	Given that, I g	uess we've completed at least the	
	evidentiary phase, t	he argument phase. We'll see the	1
	reply by the end of	the week.	
	And with that, w	we're going to adjourn. I would	
	like to thank you al	l for taking the time that you have	
	taken to spend with	us, to help us complete the record	
	and to give us your	perspectives.	
	As always, I wo	uld like to thank our staff, I	
	would like to thank	legal, and I would like to thank	
	the court reporters,	who always do a really fine job	
	for us, and I think	we've really pressed them here.	
	So with that, I	'm going to adjourn and we'll	1
	obviously, once we se	ee reply, issue our decision in due	
	course. Thank you a	ll very much.	
(PR	OCEEDINGS ADJOURNED AT	6:54 P.M.)	

1	<u>Certificate of Transcript</u>		
2			
3	We, the undersigned, hereby certify that the foregoing		
4	pages <u>1019</u> to <u>1303</u> are a complete and accurate transcript
