KryptoByte to launch Security Token Offering

KryptoByte, the company seeking to transform stranded energy into digital assets, announces its intention to launch a Security Token Offering (“STO”) that will provide accredited and sophisticated investors access to institutional-grade energy projects through a fully digital, tokenised equity structure. The STO will be delivered through a UK platform.

The planned STO will represent KryptoByte equity as a real-world asset token, enabling a broader range of investors to participate in energy-to-compute opportunities, which have been traditionally reserved for institutional capital. The funds raised from the STO will be used to deliver KryptoByte’s business plan and will be deployed to secure the energy required for its digital strategy.

Sachin Oza, Co-CEO of KryptoByte, said: *“As a company built on a vision of fully digitised, transparent, efficient, and innovative infrastructure, it is only natural that our capital structure reflects the same ethos. By tokenising our equity on a UK platform, we are opening access to institutional-grade stranded energy projects. This STO represents the next step in forging a modern corporate-finance blueprint in the UK, leveraging proven tokenisation frameworks from other markets while digitising genuine real-world assets such as stranded energy – end to end.”*

As the UK and Europe advance their strategic agendas to develop data centres and AI compute capability, it is clear that reliable energy will be a key resource requirement. KryptoByte’s early development plans position it to help drive growth in this sector, making it an early mover in the space.

This initiative positions KryptoByte at the forefront of digital-asset capital in the UK, demonstrating how traditional assets can be transformed into compliant digital instruments.
