BACK BEACH - BLAIRGOWRIE

(KOONYA TO THE DIVIDE)

by Jack Ritchie

www.blairgowrie.co.nw

INTRODUCTION:

Olivia - Mark (cousins)

It was the rock fishing and love of nature which attracted many of the early settlers and visitors to the Sorrento Back Beach and it is interesting to reflect that one of the first rock fishermen must have been John Pascoe Fawkner, who, as a boy of eleven, was with his father at Collins first settlement in 1803.

The settlement at Sullivan's Bay was very close to the narrowest point on the Nepean peninsula - namely from Cameron's Bay to Koonya ocean beach - and Fawkner speaks of hearing the continuous roar of the breakers. However, in spite of the dangers from the heavy seas, he apparently spent many an hour catching crayfish and mutton fish on the reefs (1). The attractions on the ocean beach, less than half an hour's walk from the Camp, even kept the convicts away from Sunday service parades - until the threat of half rations ensured their attendance.

Fawkner and others of the settlement must almost certainly have done their fishing from the reefs at Fairy Dell at the west end of Koonya beach.

THE ABORIGINALS

However, there were already fishermen on the ocean when Collins arrived in 1803 and even today we can find plenty of evidence of their activities.

While the main camps must have been at positions where there was surface water, the aboriginals on the peninsula roamed right along the coast collecting shell fish and they have left numerous kitchen middens, both on the cliffs and sometimes in more sheltered positions behind the sandhills.

The middens or cooking areas consist of accumulations of broken shells - generally periwinkles, mutton fish and limpets - often mixed with traces of charcoal remaining from the fires. After cooking, the shells were broken to extract the fish and, in an undisturbed midden, one can sometimes find elongated "breaking stones", which were held in the hand and used as a hammer to break the shells against a flat stone anvil. There are some particularly large middens on the cliffs approaching Cape Schanck, but they could be found at many positions along the coast. Above Bridgewater there are distinct strata showing broken shells and charcoal running through the sand hammocks at the top of the cliff.

From the shells in the middens it is clear that the periwinkles must have been much larger and more numerous than they are today and one also gets a useful guide as to which of the shell fish are edible. A limpet does not look a very attractive proposition, for example, but, having seen the numbers in the middens, I decided to try cooking them and find the soft part of the fish has a quite distinctive flavour.

One point of interest is that Mr. J.C. Le Souef tells me that numerous emu egg shell fragments have been found recently in one of the middens, indicating there were emus on the peninsula at one time.

### GEOLOGICAL FEATURES

Anyone interested in detail in the geology of the Mornington Peninsula should refer to a very comprehensive report published first in 1950 by the Department of Mines (2), but there are a few points of particular interest in the Blairgowrie area to be mentioned.

Firstly, dune limestone occurs throughout the area, the beds near the surface being generally of the order of 5' or 6' in thickness and worked extensively in the early limeburning days.

In the sand dunes, particularly the dunes behind Wreckage Bay, there are well formed incrustations which appear like fossil trees. In the early 1920's I can remember these standing up to 3' in height in thickets over the dunes and one particular spot was described as "the desert of dry bones". Although these incrustations are still easily found, they have suffered extensive damage over the years from people walking over the dunes.

An incrustation is not a true fossil. It originates from a limestone shell built up around a tree buried in the sand and the tree subsequently rots away, leaving its form as a shell with a hollow centre. Such incrustations are only formed in lime bearing sands, such as those of Sorrento.

From the nature of the dune sandstones, fossils are rare, but just east of Spray Point there were bones embedded in the reef and described by T.S. Hall (3) as being of a giant extinct Kangaroo. Traces of these were still detectable a few years ago.

Perhaps the final point of interest is that at one time there was another entrance or tideway to Port Phillip through the Koonya Beach - Cameron's Bay neck. There is evidence for this in a deep scour hole in Capel Sound and the cliff formation at the west end of Koonya beach suggests that this is where it may have entered Bass Strait.

## LIMEBURNING

A fairly complete account of the early Limeburning activities in the Portsea - Sorrento - Rye area has been given by Hollinshed (4), his information being largely derived from the personal reminiscences of the late Mr. Harry Watts. My purpose here is to record what I know of the location of kilns in the Blairgowrie and Canterbury areas and to add a little to Hollinshed's paper of the personalities involved in working them - this being largely derived from the remembrances of Mrs. James Watson of Blairgowrie, Mr. and Mrs. Barney Cain and Mr. and Mrs. W. Hill, all of Rye. Unfortunately, when most of the kilns ceased burning, their structures were dismantled to provide either stone or bricks for building or road construction and little remains today to indicate their location, but some surrounding earthworks and the limestone surfaced tracks.

However, what is left is still of interest in giving some glimpse of a very different and colourful period on the peninsula.

While the main purpose of the limestone quarrying was for Limeburning, the stone was also used for road construction. Many of the roads around Sorrento, including the old Point Nepean road, were surfaced with limestone. They were glary and dusty in the hot weather and, as children in the 1920's, we always referred to the highway between Sorrento and Blairgowrie as "The White Road".

While many of the kilns have gone, the evidence of quarrying activities in the form of shallow holes and mounds remain throughout many parts of the scrub in the Back Beach area. In particular, they will be found south of the old Melbourne road and from St. Johns Wood road to beyond Canterbury Jetty road - all this land having been owned originally by the Cain family.

The limestone was close to the surface and the strata worked varied from 3' up to 5' or 6' in thickness. The stone was extracted with bars, picks and shovels or forks and loaded into heavy two wheel horse drawn drays. The impressions made by the heavy square-rimmed dray wheels could still be readily detected in many of the bush tracks in the 1920's.

Charging of the kilns was carried out with stone forks. These had numerous closely spaced tynes and screened out fine material. The screenings built up around the tops of the kilns.

The Cain family, who have played such a prominent part in the early history of the peninsula, originated from Owen Cain of "Tyrone", who apparently settled there in 1842. I understand that he kept a store at "Tyrone" and a number of the early limeburners quarried and burnt stone on his behalf, receiving stores and cash in exchange for the burnt lime. The lime was originally loaded from the beach into small craft between Whitecliffs and Canterbury Jetty and the track providing access from "Tyrone" to the beach was referred to as "the loading road".

The kilns were always constructed in the side of a hill and consisted of vertical shafts, lined with limestone and faced with hand made bricks, varying in diameter from perhaps 6' up to 8' or 10' and up to 25' or more in height. At the top was a flat loading platform, paved with limestone, and an access track up the hill for the drays. At the bottom of the shaft was a grate through which the burnt lime was raked to be bagged. The working floor in front of the grate was flanked by limestone wing walls holding back the earth and cut into the hill side. In one kiln I remember (see "D" below) these wing walls were buttressed with timber beams and the working floor area was roofed with galvanized iron sheets.

On the attached map have been marked the location of kilns in the Blairgowrie Back Beach area and the notes below refer to what I have been able to find of their history.

- (A) There were two or three kilns at the end of Canterbury Jetty road and just inside the Ocean Park boundary. While these were dismantled to provide materials for a building in Rye, the loading platform is still clearly defined, half the form of the shaft of one kiln and the track to a working floor which presumably served all the kilns. What remains is immediately on the south west corner of the junction of the present Canterbury Jetty road and Ocean Drive. There are also numerous holes remaining from quarrying operations in the vicinity and close by, at the junction of the old No.14 Life Saving Track, a square limestone lined well. This perhaps provided water for the lime carters and their horses.

According to Hollinshed, these kilns were worked from about 1888 by Hughes for Messrs. Campbell, Youle and Walker and the Canterbury Jetty was built in 1887 for shipping the lime. These kilns are said to have worked until about 1900 when another kiln ("C") at the end of Hughes road was opened and worked by Hughes' sons.

Amongst those that worked on the kilns at the end of Canterbury Jetty road was George Alexander Hill who later leased and worked a kiln ("D") near the bay end of St. Johns Wood road. There was quite a settlement in the 1880's and 1890's at the Canterbury Jetty road kilns and this was known as "Canvas Town". It apparently included some very colourful characters and amongst those limeburners and carters were included a fair number of Aborigines and Portuguese. Amongst those in the area at that time were Jim Ralph, Dan Doran and Joe Oliver ("Black Joe"). Several of them lived on there when the limeburning ceased. Jim Ralph had a hut just south-east of the Canterbury Jetty Road - Old Melbourne road junction.

On the opposite side of Canterbury Jetty road was Joe Oliver. He is described as a big wild man, very dark skinned, from Terra del Fuego off the southern tip of South America. He lived with a young girl said to have been his wife (?) and existed mainly by fishing off the rocks. He is said to have been a particularly successful crayfisherman and he supplied the Sorrento hotels. Mr. Barney Cain remembers him grinding his own flour in a stone pestle and mortar.

- (B) There was another small kiln at this point east of Canterbury Jetty road. For many years it was a prominent landmark and from a distance looked like a ruined castle on the skyline. We photographed it several years ago before the company sub-dividing the land took a road right through the centre of it.
- (C) At the end of Hughes road there was a kiln located, according to Mr. G.A. Watts, just above the lower parking area. I remember the loading platform of this just adjacent to the old No.4 Life Saving track in the late 1920's and there is still evidence of the operations in the limestone surfaced tracks approaching the site.
- (D) On John Cain's estate and in the hill just north of the present Byron street, Blairgowrie, there was a large and perfectly preserved kiln right up to the late 1930's. At this time the wing walls fell in and, when the land was subdivided after the war, the kiln shaft was filled in prior to erecting a residence on the site.

This kiln was leased and worked by Mr. G.A. Hill up to about 1916, although he did not originally build it. Mr. Hill with his family lived in a four roomed galvanised iron cottage close to where St. John Woods road now runs and immediately in front of the two ancient mulberry trees which still mark the site. These were still of majestic size as I remember them in the 1920's and Mrs. James Watson (daughter of Mr. G.A. Hill) says that they were old when she first lived there as a girl.

Mr. Hill also farmed this country under lease from Mr. Cain. The mulberry trees were part of an orchard and immediately behind them were two wells.

After limeburning stopped, Benjamin Stenigain of Rye used to cut ti-tree firewood which was shipped to Melbourne bakeries from the Canterbury Jetty. In the 1920's wood cutting was carried on throughout the Back Beach area to supply this trade.

DR. GEORGE GRAHAM

The story of the Blairgowrie Back Beach as a holiday resort starts with Dr. George Graham, a graduate in medicine from Dublin University, who first arrived in Perth in June 1853 as surgeon on the "Iabrina" with 320 emigrants.

On the voyage typhus broke out only two days after sailing, but thanks to Dr. Graham's efforts, there were only seven deaths on the ninety day voyage. On arrival in Perth Dr. Graham was complimented by the Immigration Agent and this letter is still in the possession of his grandson Dr. J.W.E. Graham.

Dr. Graham must have returned again to England as there is another testimonial to him signed by all the emigrants on the ship "Utopia" written off Adelaide and dated 9th July, 1858.

On settling in Australia, Dr. Graham lived for a short time in Adelaide and then moved to Melbourne where he practised from his residence at Church Street where a number of other famous medicos of the time also resided and gave the area the name "doctors hill". While in Melbourne Dr. Graham completed post graduate studies at Melbourne University and was the first to complete the M.D. Degree, which was conferred on him in 1862. There is a brass plaque commemorating Dr. Graham in the University Medical Library.

How Dr. Graham came to take up land at Sorrento we do not know; however, it was at the period when Sorrento was being first promoted as a holiday resort by George Coppin and others and we must assume that he became interested at about the time land was first being selected in the late 1860's. Be that as it may, the fact is that he selected Crown Allotments 59A and 59B between the Ocean Park and the old Melbourne road and immediately behind the beach now known as Fowler's. These allotments are covered by Crown Grants made on 21-7-1873 and 17-12-1873, but we believe Dr. Graham may have held them under Crown Deed prior to these dates - possibly back to about 1868-1870. There is evidence for this in a testimonial he supplied to 'A Guide in Sorrento' printed in 1876 (5), a copy of which is held by the Nepean Historical Society. Dr. Graham writes as follows:

"I have pleasure in stating that my family have resided periodically during the past six years on the Back Beach at Sorrento and have experienced the greatest amount of benefit by their sojourn there in the summer months. As the temperature is much lower than Melbourne, the effects of the north wind are not felt to be oppressive. As a residence for invalids, particularly children of a strumous or delicate constitution, I know of no other place in Victoria to equal it, more particularly on account of the water holding lime in solution in such quantities as renders it most beneficial to children whose bones are soft. One of my little ones was cured during the first month's stay at Sorrento".

The little one referred to was the late Mr. W.A.E. Graham who, as a child, was in irons for many years with bone trouble.

The dates of the Crown Grants and the testimonials lead us to conclude that Dr. Graham must have built on the Back Beach about 1870, although I believe the Flinders Shire Council Rate Books suggest the date may have been as late as 1875-6. He built a wattle and daub house on the Back Beach boundary of this land and on a rise behind the sand dunes with an extensive view across to the bay. On the flat below the house was the well lined with limestone and referred to in his testimonial. This well can still be identified.

The original house built by Dr. Graham forms half of the present house owned by the Fowler family.

Travelling to Sorrento must have been quite an undertaking in the 1870's. Dr. Graham used to speak of taking a vessel called the "Golden Crown" to Dromana and then driving by horse and trap along the beach. While in residence at Sorrento the Grahams had some help in the house from a local Irish woman, whose husband was a lover of the bottle. She is reported to have said "he was as comfortable to lie with as a porcupine".

Dr. Graham's neighbours as landholders in 1873 are also interesting. Crown Allotment 44 to the east running to the now St. John's Wood road was held by J.T. Harcourt. To the west C.A.50A was taken up by Judge G.B. Kerferd and C.A.50B by Dr. J.W. Gunst of whom there is more to say later. Kerferd had been one of the Law Officers in the Francis Cabinet of 1872, was later Attorney General and then appointed to the Supreme Court in 1885. As far as we know, he never resided at the Back Beach, but a prominent sand hill immediately behind his original allotment has been known by local residents for many years as Kerferd's hill.

Mr. Harcourt also never resided on his own land, but he almost certainly would have stayed with Dr. Graham. His testimonial also appears in the 1876 Guide to Sorrento as follows:-

"Of all the places visited by Victorians for pleasure, or as a resort to recoup from the exhaustion of town life (note - this was in 1876), or of the confirmed invalid, none, in my opinion, equals Sorrento".

Mr. Harcourt's address was - Cremorne Private Retreat for the Insane and Inebriate.

My own house is on portion of Mr. Harcourt's original allotment and some of my friends think that the address he gave is still an appropriate one.

The connection with Harcourt is clear from the Obituary to Dr. George Graham, in the Australian Medical Journal of 1893 (6). This states that he (Dr. Graham) was for some years medical officer of Mr. Harcourt's Private Lunatic Asylum and there he had the opportunity of exercising the special knowledge he had of mental disease. Mr. Harcourt's asylum was built on the site formerly known as Cremorne Gardens.

There are other points of interest concerning Dr. Graham's medical career. As indicated previously, he practised first in Adelaide, but then moved to Melbourne and settled in Richmond. The Australian Medical Journal (6) has this to say -

"Here (in Richmond) he was completely identified with its progress and he had become in fact one of its local institutions. Perhaps no practitioner ever more completely gained the confidence of those who came under his care - - - - - . He had the happy art of making his patients his friends - - - - - ."

Dr. Graham was one of the early members of the Medical Society of Victoria and he was one of the original promoters (8) of the establishment of a branch in Victoria of the British Medical Association. In 1883 he was its President.

In 1890 Dr. Graham sold his property at Sorrento to Mr. T.W. Fowler.

In 1893 he left Melbourne in the steamer "Thermopylae" to visit Great Britain and also to attend an International Medical Congress in Rome. He died suddenly during the voyage and was buried at sea.

"HENRY HANDEL" RICHARDSON

"Henry Handel" Richardson, famous Australian authoress of The Fortunes of Richard Mahony, was born in 1870 in Melbourne, her real name being Ethel Florence Lindesay Richardson. Her father, Dr. Walter Richardson, was a Dublin doctor who settled in Ballarat during the gold rush and made a substantial amount of money. He then retired and took his family, including Ethel then aged 4 years, on a trip to Europe. While away he lost his investments and had to start life again, embittered and alienated from society, as a general practitioner in Hawthorn, then Chiltern and finally Queenscliff. In Queenscliff, where he died, signs of madness had become obvious.

After his death his widow sent Ethel to P.L.C. as a boarder. "The Getting of Wisdom" first published in 1910, gives fictional treatment to her own childhood during this period. Laura of the book appears to be Henry Handel Richardson herself.

The point of particular interest here is the description in "The Getting of Wisdom" of a holiday spent by Laura at what could only be Sorrento and at a house, the description of which can only fit Dr. Graham's. At the time Laura would have been about 15 and as Ethel Richardson was born in 1870, this would place the date around 1885. Laura described the trip as follows:

"Old Anne was waiting on the jetty, having hitched the horse to a post; she had driven in, in the "shandrydan"\* to meet Laura. For the cottage was not on the front beach.-----; it stood in the bush, on the back beach, which gave to the open sea.

\*Note: Light two wheeled cart or any old, rickety conveyance

Laura took her seat beside the old woman in her linen sunbonnet, the body of the vehicle being packed full of groceries and other stores; and the drive began. Directly they were clear of the township the road as good as ceased, became a mere sandy track, running through a scrub of ti-tree - - - - -.

About a couple of miles out, the old woman alighted and slipped a rail; and having passed the only other house within cooee (I believe this would have been Dr. Gunst's house) they drove through a paddock - - - - -. Another slip rail lowered, they drew up at the foot of a steepish hill, beside a sandy little vegetable garden, a shed and a pump. The house was perched on the top of the hill - - - - -.

The four-roomed, weatherboard cottage - - - - - faced the bush; from the verandah was a wide view of the surrounding country. Between the back of the house and the beach rose a huge sand-hill, sparsely grown with rushes and coarse grass, - - - - -. When - - - - - you had laboriously attained the summit of the great dune, the sight that met you almost took your breath away; as far as the eye could reach, the bluest of skies melting into the bluest of seas, which broke its foam-flecked edge against the flat, brown reefs - - - - -."

In 1885 Dr. Graham still owned the property at Sorrento and it seems that with his interest in mental illness, he must certainly, in the small medical community of the 1880's, have known of Dr. Richardson. Furthermore they had both originally come from Dublin. It is not hard to conclude that Henry Handel Richardson's holiday at Sorrento could well have been arranged by Dr. Graham.

DR. J.W. GUNST

Dr. Gunst, who selected Crown Allotment 50.B. immediately west of Dr. Graham and Judge Kerferd, was a homeopathic doctor in East St. Kilda and doctor to my grandfather and his family. He also was the contributor of a testimonial in The Guide to Sorrento of 1876 and speaks of the benefit of the lime-impregnated well water in the treatment of "long standing diseases of the glands and bones". He said ---"----- when feeling broken-down in health from overwork, a few days at Sorrento gives me strength -----".

Dr. Graham and Dr. Gunst must certainly have been acquaintances and there is some suggestion that these two with Dr. James Blair, who built Blairgowrie, planned at one time to establish a Sanitarium at Sorrento.

The location of Dr. Gunst's house brings out an interesting point. The attached map shows it to be located close to the old Melbourne road, i.e. a considerable distance from either beach. It is believed the selection was based on a proposal to build a railway to Sorrento and the house would have been close to a projected Station.

I understand that Dr. Gunst's land first appears in the Flinders Shire Council Rate Book in 1870 and a house is added in 1875.

However, the reference in the 1876 Guide to Sorrento suggests to me that he may have built earlier. Certainly his reference to the well water suggests this. Dr. Gunst's house, now named Longford Cottage, is still there on the Melbourne road. His well, also, is still there in the hollow east of the house and holding water.

After Dr. Gunst's death, my grandmother, Mrs. F.H. Ritchie, and one of her daughters, who had previously spent holidays in Sorrento, stayed with Mrs. Gunst - this would have been about 1900. This daughter, Mrs. J.H. Irving, remembers being driven out from the boat by "old black Joe" in a two wheeled cart. I believe "old black Joe" was the Joe Oliver referred to earlier.

"Old Black Joe" described one wreck at the Divide on a wild night when they climbed down the western point to rescue the crew by basket on a rope - this would be the old rocket life saving apparatus. The story went that the last man was so drunk that he couldn't guide himself properly on the rope and was sucked by a wave out of the basket under the reef. I am certain this refers to the "Craigburn", a barque which was wrecked on 8th May, 1891.

From the Gunst's house it was necessary to walk into Sorrento for stores. Mrs. Gunst was apparently satisfied with a diet of potatoes and onions and there was a certain difference of opinion with my grandmother on the adequacy of this menu.

A year or so prior to 1900, a family of five - O'Donnells, friends of Mrs. Gunst - were washed in and drowned while fishing from the reefs east of Spray Point. I was always told as a boy that they failed to observe the first rule for a rock fisherman - NEVER FISH WITH YOUR BACK TO THE SEA.

The Gunst's house passed to the Montfort family who resided there for many years. Their name has been given to the beach west of Fowlers by local residents, although I think in the last century it was referred to as Gunst's beach.

#### THOMAS WALKER FOWLER

It was in 1890 that Dr. George Graham sold his property to Mr. T.W. Fowler - a giant of a man, 6'6" in height and broad in proportion - a man with high qualifications as an engineer and with wide interests.

Mr. and Mrs. Fowler are understood to have visited the Grahams at Sorrento in their courting days and, no doubt, the cushion bushes of the sand dunes contributed to the successful completion of this operation.

The small wattle and daub house originally erected by Dr. Graham had been supplemented with a second weatherboard house added on to the eastern end - legend says the second house was originally on the flat below the hill; we believe it was moved in Dr. Graham's day.

The house is still held in the Fowler family and on one of the doorways are marked the family heights over four generations. Towering above all and just below the lintel is the 6'6" mark of Thomas Walker Fowler.

An interesting historical relic in the house is a door and door handle, said to have come from the steamer "Alert" which foundered 28th December 1893 (9) off what would now be Gunnamatta or Rye beach and from which the sole survivor, Robert Ponting, was washed up near Jubilee Point. It was the loss of the "Alert" which it is believed resulted in the construction of the Life Saving track.

Mr. Fowler's interests covered an amazing wide field. He was Lecturer in Engineering at the University of Melbourne, for a period served as Shire Engineer of the Shire of Flinders and about 1913 had been appointed Engineer-in-Chief of the City of Hobart in Tasmania. After retirement he lived at Sorrento until his death in 1929.

During his years of retirement he erected a lookout platform at the back of the house and was most meticulous in his taking of daily weather readings and observations. He was also one of the first to realise problems of erosion of the sand dunes in the Ocean Park Reserve and was responsible for planting of marram grass over many of the dunes. This has only just been started again and current plantings still do not approach what was done in his day.

His interests were not, however, confined to the engineering field. The volumes of the Victorian Historical Magazine (10) show that he made a critical study of the history of charting of the Victorian coast line. In this work he crossed swords with Mr. Ernest Scott (later Professor of History at Melbourne University) the point particularly at issue being whether Captain Cook in naming Point Hicks really referred to what is now Cape Everard.

As Lecturer in Engineering, Mr. Fowler used to bring down parties of students for surveying exercises who camped in a shack on the flat below his house. It was on one of these occasions that the Octopus Pool at Bridgewater is said to have acquired its name. This pool is at the east end of the beach nestling under a towering rock with convenient ledges for diving and running right to the sand on one side. It is about 14 feet in depth. On this historic morning it was hot and the students had broken their surveying work for a swim. All had come out except J.G. McKinley, one of the McKinley family of Brighton, all renowned in their day as strong swimmers. Suddenly McKinley was seen sprinting for the side of the pool with, it turned out, an octopus in hot pursuit. He is said to have rolled out on the reef entangled with octopus, which in due course was despatched. The span over the tentacles is said to have been 12 feet - with a surveyor's measuring staff and not a fisherman's rule.

In the 1890's I understand it was always Mr. Fowler's practice to take down a cow with them for the Christmas holiday period. The cow was shipped to Sorrento on the "Charlotte Fenwick" and then led to the Back Beach. Who would think of a cow as an item of luggage for the Christmas holidays?

In the period 1900-1912 a number of families, who shortly after acquired land and built houses or camps in the area, either stayed with the Fowlers or leased their house for holidays. Amongst these were the Ritchies, Kirwoods, Mr. W.A.E. Graham, Mr. H.E. Prior.

Mr. W.A.E. Graham, a dentist, was a son of Dr. Graham. He bought the land originally owned by Judge Kerferd and in about 1912 Mr. W. Clark of Sorrento built "Coote Hill" for him. This is immediately west of Dr. Graham's original house (now Fowlers). In the first days of cars, Mr. Graham and his sons would drive down, leave the car at Mr. George Hill's farm (and lime kiln) and walk by bush tracks across to the Back Beach. "Coote Hill" is now owned by Mr. B.A. Graham.

#### THE LIFE SAVING TRACK

The story of the Life Saving Track along the ocean coast begins with two wrecks in the 1890's. The first was the barque "Craigburn" and the second, the small steamer "Alert".

Let us picture Friday afternoon, 8th May 1891, in the days when the limeburning at "Canvas Town" at the end of Canterbury Jetty road was still a thriving industry. It was a cold grey day, with a wild gale blowing from the south-west when the limeburners saw the four masted barque "Craigburn" loom up out of the mist and spray only two miles off shore. Her anchors had been thrown out in a desperate attempt to avoid being driven on to the reefs.

The "Craigburn", bound for New Zealand, had been towed out through the Heads, but the hawser slipped when she was only just outside. A factual account of what happened from a navigational viewpoint is given in "Shipwrecks at Port Phillip Heads" (11), which I do not propose to repeat in detail. It is sufficient to say that there was difference of opinion between the captain and pilot and assistance from three tugs was refused, as the captain considered the fees asked were exorbitant.

The vessel was off "Back Beach, Canterbury" (12) and all afternoon the limeburners watched from the cliff around the Divide. According to the Argus reporter of the day (14) many made no secret of their hopes for grog and plunder if the vessel was driven on to the reefs. As night approached, fires were lit around the top of the cliffs.

About 8.15 p.m., one boat left the ship and an attempt was made with fires to guide it in to the now "Blairgowrie Back Beach". Meanwhile, rockets had been fired and blue lights burned to attract the lifeboat from Queenscliff. A second boat got away, but after being nearly swamped was finally capsized in the breakers and the survivors scrambled over the reefs to the foot of the cliffs.

The Argus of 9-5-91 and 11-5-91 carried full accounts from eye witnesses, but the following report (3) gives a vivid picture:

"A number of men who were employed at the lime works saw the boats leave the ship and lit fires on the sandy beach to attract them - - - -. The men were watching the vessel from the cliffs, when above the roar of the waves was heard a man's cry - - - -. Presently the cry was heard again and, with the aid of a lantern, the boat's crew was found in a bay called The Divide. The men lit fires all along the brow of the cliffs, so that they could see into the waters of the inlets, and took the survivors to their houses."

By 11 p.m. on the Friday night, the "Craigburn" was bumping and next morning was broadside on to the reef and going to pieces.

The tragedy was certainly due, very largely, to disagreement between the pilot and captain and the refusal of the captain to pay a high towing fee when the hawser first slipped. However, once it became obvious that the vessel would go ashore there was a long delay before life saving gear arrived.

At this time the lifeboat was based on Queenscliff and there was no life saving apparatus kept at Sorrento. Although the "Craigburn" started firing distress rockets at 8.0 p.m., it was not until 11.0 p.m. that the lifeboat left Queenscliff and it then took until 2.30 a.m. on Saturday morning to reach Sorrento. A horse and dray then had to be found and, with Superintendent Dickson of the Sorrento police, there was a long slow trek over sand bush tracks to reach the Divide (13)

On arrival with the life saving equipment there was then further delay in setting up the tripod at the shore end and getting lines to the ship, on which 4 men still remained. Three, including the Captain, were brought safely to shore, but the Chief Officer, Muir, was sucked or washed out of the "bosun's chair" and drowned.

The Argus of Monday 11th May 1891 carried a leading article on the scandal of the wreck and included a plea for improved life saving service on shore.

Apparently there was no action to improve the position immediately, as 2½ years later the same delays arose in searching the coast for survivors of the "Alert".

The "Alert" was a small steamship carrying general cargo, mainly wattle bark, on a voyage from Metung to Melbourne. Again there was a strong south-westerly blowing and she was soon in difficulty after passing Cape Schanck. A full account will be found in "Battling with Waves and Lawyers" (9). Suffice to say that about three miles south-west of the Schanck "Alert" foundered, leaving the survivors clinging as best they could to whatever planks and debris remained floating.

There was only one survivor - Robert Ponting - washed up on the beach near Jubilee Point. It was not until he was found that anyone knew of the loss of the vessel. A search was immediately made for other possible survivors and, again, there was serious delay in reaching points on the coast, because the lifesaving equipment was located at Queenscliff.

A column in the Argus Monday 1st January 1894 (15) carried the following paragraph:

"The disaster brings into prominence the necessity for improving the means of communication between Sorrento and the Back Beach. New tracks are required, while it is evident that existing roads should be more closely connected with the shore."

It was as a result of the loss of the "Alert" that steps were taken, firstly to locate lifesaving equipment at Sorrento and, secondly, to cut a track to provide access to points along the coast.

At this stage, I have not been able to establish the date that the Life Saving Track was first cut, but Mr. G.A. Watts thinks that Constable Rawlings advised on its location and that the date was probably between 1900 and 1910. Rocket apparatus was provided and located in Sorrento, where, I believe, it is still housed and inspected annually. There is also an annual grant still made for the maintenance of the Life Saving Track. Mr. S.V. Kirwood remembers that, around 1910, the rocket apparatus used to be brought out for practice along the Back Beach.

In view of the loss of the "Alert" in 1894, it would not be surprising to find that a section of the track, at any rate, was established around the turn of the century, but it could well have been widened and extended later. As my aunts remember it about 1910, the signposts on the track were all freshly painted and appeared comparatively new. As I recall it in the 1920's, the signs were all still standing and we were familiar with its full length from No.1 (St. Pauls) up to No.16 (now Blairgowrie Ocean Beach).

The location of the Life Saving Track, with its various access tracks to the coast, is shown on the attached map. The main track ran behind the sand dunes and each access track was numbered, e.g. "Life Saving Track No.9". Other than the section between No.10 and No.12, where it entered private property, the track can still be followed by anyone familiar with the country.

It is one of my objectives to see if steps can be taken to re-open the Life Saving Track as a walking track only and to arrange for marking of points of historic interest along the coast.

### "THE CAMPS" 1900-1914

Mrs. F.H. Ritchie (my Grandmother) and her family had holidayed for several years at Sorrento in the 1890's, each year walking further east on the ocean coast, to escape the crowds!! Then Mrs. Gunst, widow of the family doctor, invited them to stay with her, which Mrs. Ritchie and her daughters did on two occasions about 1900 and 1901. It was a long walk from the Gunst house to the Back Beach and this led Mrs. Ritchie to look for something closer and to also see if she could buy some land. The Fowler's house was rented on several occasions and during this time Mr. D.O. Ritchie heard of and bought it on behalf of the family. Crown Allotment 44 is the land originally selected by Mr. Harcourt.

This land was then divided, one piece going to Mrs. F.H. Ritchie, one to Mr. William Kirwood, one to my father Mr. E.G. Ritchie, with Mr. D.O. Ritchie retaining the balance. Mr. William Kirwood was a brother of Mrs. F.H. Ritchie (who had been Miss Eliza Kirwood) and he had also been seeking land at the request of his son, Mr. S.V. Kirwood, who, with Messrs. Harry and Alec McKinley, had started camping in the area. They had established a semi-permanent camp near the site of Mr. Kirwood's present home, with three tents and boxes for storage of crockery etc.

In 1909 Mr. Alec Russell erected a "camp house" for the Ritchies and this was known as "Bridgewater Camp". It consisted of an unlined house with an eight bunk bedroom for the girls, a living room, kitchen and small room for Mrs. F.H. Ritchie. The men camped in tents. This house was first occupied at Christmas 1909.

Miss Jean Ritchie (now Mrs. J.H. Irving), her two sisters (Miss Enid Ritchie and Mrs. G. Weatherstone) and Miss Lizzie McKinley, firstly at the Fowlers and subsequently at Bridgewater Camp, were responsible for bringing down parties of girls, a number of whom were fellow students at the University Conservatorium. The early housekeeping records are interesting. At Christmas 1908 at the Fowlers, total cost including rent and food worked out at 1/2 per day each.

Meantime, Mr. Fowler had subdivided a portion of his land, one allotment being sold to Mr. H.E. Prior of Brown, Prior and Anderson, Printers. Mr. Henry Prior and a syndicate of friends - amongst whom were Messrs. Price, W. Chitty, P. Chitty, Gower and Baker- established "Watta-mola" (by the sound of the sea) camp essentially a bachelor establishment, but with selected girls welcome (judging by some of the early photographs). An account of the camp written by Mr. H.E. Prior and published in a printers' journal of 1909 gives an interesting account of travelling and camping at the time:

"This New Year, the "Call of the Wild", in the shape of an invitation to Camp Watta-mola near Sorrento, tempts a few of us - - - - .

A pleasant trip down the bay, but too long for the advanced ideas of one member who - - - - looks forward to the time when, during summer months, one will leave Melbourne at 5.30 p.m., have his evening meal at 7 p.m. in his seaside house at Sorrento, leave there at 8.0 a.m. and be at business in the city by 9.30 a.m.

There is much summer girl and summer boy on the Queenscliff and Sorrento piers and our cynic remarks how many present-day young men, instead of taking to gun and rod or other manly sports, hang about the piers and esplanades posing for effect and admiration. Yachtsmen are here also, too neat and trim to be overworkmanlike and various bands of town-lot campers, whose chief object seems to be roaming about in hordes and making the air resound with hideous noises. Vehicles are in great demand, but we secure an ancient looking concern drawn by a pair of mature steeds - - - - - .

A drive of about three miles over a road winding in and out the thickly clustering ti-tree and we reach Watta-mola prettily situated in a small clearing, surrounded by ti-tree, honeysuckles and sheoaks.

The dining room, an outdoor apartment, consists of a rood comprised of shingles and flattened kerosene tins and showing more roof angles than a Queen Anne Villa, with a number of boxes in tiers at one end to serve as cupboards - - - - - . The sleeping apartment is a much more pretentious structure, being weatherboard with galvanised iron roof, and contained six bunks."

Mr. Percy Chitty, one of the original "Watta-molas", kept a full record as a Watta-mola Log of the times and this, now in the possession of his son Mr. John W. Chitty, is full of interest.

The area, referred to in Sorrento at the time as "The Camps" was quite isolated at this time. The story goes that, on one occasion, Mr. Percy Chitty and a friend had been camping for 6 weeks at "Watta-mola" - living off the land by fishing and shooting. One morning Mr. Chitty's friend came running back, full of excitement from a shooting expedition, saying, "Perc I saw a man".

Mr. Fowler had also rented the shack, previously used for his parties of surveying students, to the Price family. One of them, Miss Nellie Price, was drowned on the Back Beach after going to the assistance of her sister, Miss Ethel Price, who got into difficulties while swimming. The Prices never returned after this tragedy.

About the same period, but further along the coast near No.12 Life Saving Track, a fishing camp had been set up by Messrs. Albert and Arthur Duckett of Edward Duckett & Sons, well known Melbourne hardware merchants of the time. Albert was short and known as "the little bloke", while his brother Arthur ("the big bloke") was a great sportsman - tall and very strong. The Ducketts were great fishermen and, as with all the other rock fishermen of the time, delighted in a uniform consisting of the most ancient and disreputable clothing. I can well remember my own father's fishing clothes, green with mildew and so stiff with salt that the trousers would almost stand up unaided.

The Ducketts used to store their camping gear with Ted Chomley, an old pensioner and rabbit trapper, who lived in James Cain's old house.

The Ducketts also remember "Black Joe Oliver" and gave him a wide berth when he was drunk, which was apparently not infrequent after he had sold his crayfish on the pier or to the Continental Hotel. Mr. Noel Duckett speaks of him living under the most primitive conditions with his wife, Eva, and, on one occasion, participating in the despatching of a whale on the Back Beach. He would bite the head off a fish as the quickest way of removing it from his hook.

#### THE FIRE - JANUARY 1910

On the Saturday of the Australian Day weekend at the end of January 1910, a fire sweeping through the scrub from the east burnt out the Ritchie's house (completed only a few weeks previously), Kirwoods and Watta-mola camps and threatened both the Fowler's and Gunst's houses.

At Bridgewater Camp four of the girls, Misses Annie Kennedy, Stella and Eileen Lewis and Ella McNeil, had packed ready to go on the afternoon boat. During the morning a message from Mr. Fowler told them not to worry about a fire at the back of Rye as he was watching it with his telescope.

As they were having lunch at Bridgewater, Ella McNeil exclaimed "where are those black smuts coming from?" - and, at that moment, Mr. and Mrs. Fowler burst in and said "get out at once, the fire is right on you". As they ran with their luggage and what bedding could be picked up, along the track to the Fowlers, the flames were licking along each side of them.

Miss Stella Lewis was a National Gallery student and her basket was filled with paints and too heavy to manage alone. Miss Kennedy dropped her own basket and came to her assistance.

After the fire had passed, the remains of Annie Kennedy's dress basket were found. Included in the basket was a crayfish she had packed to take home. Everything was burnt excepting the crayfish, which now perfectly cooked, reposed in the centre of the track.

Meantime, Messrs. E.G. and D.O. Ritchie, Percy Chitty, H. Prior and Miss E. Ritchie had come to Sorrento on the boat for the weekend. Approaching Sorrento, they saw the smoke and were informed there that the camps had been burned. They were able to get as far as Gunst's in the trap, where Miss E. Ritchie stayed and then went on to spend the rest of the afternoon beating out the smouldering ruins.

118.

"Bridgewater" was rebuilt during 1910 on the same site, as was Watta-mola camp. Shortly afterwards, Mr. William Kirwood built on his land and, on his retirement, lived at Sorrento.

Meanwhile, Mr. W.A.E. Graham had built "Coote Hill" and persuaded Mr. Henry Prior to build adjacent to him. Mr. Prior named his new home "Watta-mola" and the old camp below the Fowler's was dismantled.

### THE 1920'S

My own memory of the Back Beach goes back to 1920, when, at the age of 5, my father took me for the first of many holidays to Bridgewater Camp.

We would travel down on the "Weercona" and then drive out, loaded with stores and luggage, in Mr. Bill Clark's trap. Those were the days, when the steam tram still ran from the point above the pier to the Sorrento Ocean Beach.

The trip to the camp seemed to take hours; firstly, along the "White road" and then from the Hughes road corner, through deep black sand tracks with the horses struggling up each rise.

The daily routine at the camp did not vary. There was always fish for breakfast - great mountains of fried fillets of sweep, leather jackets, butter fish and so on. After breakfast, lunch and tea were packed and the rest of the day was spent on the beach at Bridgewater. In those days we had the beach completely to ourselves and the odd day picknickers were looked on as trespassers.

In the centre of the bay was a shallow cave, which was our headquarters and in which we kept clothing, cooking utensils and rough driftwood tables throughout the summer holidays. The whole day, irrespective of whether the tide was in or out, was spent at the beach: - swimming, fishing and exploring the coastline and reefs.

All the reefs and inlets carried names - most of them associated with fishing exploits - "shark's point", "the weedy crack", "Jimmy's point", "the face", "the crevice", "sprained ankle reef", "Ritchie's reef" and many more.

Most of our swimming was in the "octopus pool" where we all learnt to swim and dive. Costumes in the early 1920's were, of course, all neck to knee. I can well remember my own - a two piece outfit with horizontal black and white stripes, in which I fondly imagined I looked like a striped perch in the water.

In 1925 my father, E.G. Ritchie - then Engineer of Water Supply for Melbourne, built the first section of my present house, "Carramar" (in the shade of the trees). This was built by Mr. Harry Watts, famous in Sorrento history, and a year or so later he added a second wing, making its present L shape. At "Carramar", from 1925 onwards, we would spend six weeks at Christmas and the school holidays at Easter, May and September.

*Carramar - 55 Kirwood St  
Bjornie*

With cars and roads today the area is only a few minutes from Sorrento, but in the 1920's we were really quite isolated. The only contact with Sorrento was a bi-weekly visit by Mr. Jack Thorpe, a great character from Stringers Stores, who would deliver bread, groceries and meat. Milk was obtained from Mrs. James Watson, now of Blairgowrie and later from Mr. Reg. Dimmick, who farmed a property formerly owned by Mr. Ernie Holmes. Rabbits were bought from Ted Chomley.

Catering must have presented some problems. Butter for the holidays used to be taken down from Melbourne and preserved in brine and our only means of keeping food cold was a Coolgardie safe. My mother's records show that it cost about 8' per person per meal in those days.

Naturally, of course, we depended very largely on the sea. Invariably in the summer at least one meal would be fish and crayfish also was regularly on the menu. In May and September, we often found mushrooms in the bush - I can remember one fortnight in September when we had mushrooms every day. Later, when the track was opened along St. Johns Wood Road, Mr. George Hill's mulberry trees made their contribution to our diet.

Our nearest neighbours were the Kirwoods. Mr. William Kirwood had retired to Sorrento and, after his death, Mrs. Jessie Kirwood lived on there with her daughter for some years.

In those days she had a stable with a phaeton and a brown mare. Like most others there at the time, she was a keen fisherwoman and one of her favourite spots - a rock at No. 12 from which one can fish at high tide - has always been known to us as Aunt Jessie's rock.

In the late 1920's, Mr. P.L. Martyn, an old family friend of the Kirwoods, also built. Annual cricket and swimming competitions were held regularly between Carrmaar and the Martyns. Swimming in the Octopus pool and cricket in the Kirwood's horse paddock.

Further west, Mr. T.W. Fowler had retired to Sorrento and lived there until he died in 1929. It was his son-in-law, Mr. Eric W. Wills, who was responsible for a memorial plaque which has intrigued many visitors to Koreen point (Graham's reef).

Mrs. Wills (who had been Miss Madge Fowler) was a renowned fisherwoman and the memorial plaque referred to was inserted in the cliffs of Graham's reef, looking out over the fishing spots which she knew so well.

Mr. Wills was also responsible for the concrete "aquariums" built at the base of the cliff at the point. These were simply pools in which fish could be kept and then removed when needed. In the days before refrigeration it was a very practical way of keeping fish.

The construction of these was no mean feat. Mr. Wills would lay as much quick-setting cement as he dared between tides and then cover with a layer of plaster of paris. This would harden quickly and provide protection for a sufficient period until the cement set. Only a small section could be erected at a time.

Beyond the Fowlers was Mr. W.A.E. Graham at "Coote Hill" and then Mr. and Mrs. Prior at "Watta-mola". In the early 1920's Dr. J.W.E. Graham can well remember driving a jinker on shooting expeditions along the Life Saving Track, with morning tea and an exchange of rabbits for fish at Duckett's Camp.

Looking back it seems hard to believe that one could spend such long holidays, isolated with four or five neighbouring houses and no desire to visit the township of Sorrento. In fact, there was always something to do - fishing, swimming or cray fishing, walks along the coast on the Life Saving Track, trips to George Hill's limekiln and mulberry trees, possums to be caught and tamed as pets, shooting expeditions and competitions and so on.

Acknowledgements

This paper is very largely a collection of personal reminiscences and it could not have been done without the help of a number of people.

Apart from members of my own family, I would like to record my thanks to:-

- Dr. J.W.E. and Mr. B.A. Graham (Grandsons of Dr. G. Graham)
- Mr. Eric W. Wills (Son-in-law of Mr. T.W. Fowler)
- Mr. S.V. Kirwood
- Mr. Noel Duckett
- Mr. Gilbert A. Watts (of Sorrento)
- Mrs. James Watson (of Blairgowrie)
- Mr. and Mrs. Barney Cain (of Rye)
- Mr. and Mrs. W. Hill (of Rye)
- Mr. J.D. Doyle (Grandson of Mr. T.W. Fowler)
- Mr. J.W. Chitty
