

Differences between **CLEANING, SANITIZING AND DISINFECTING**

Cleaning

REMOVES

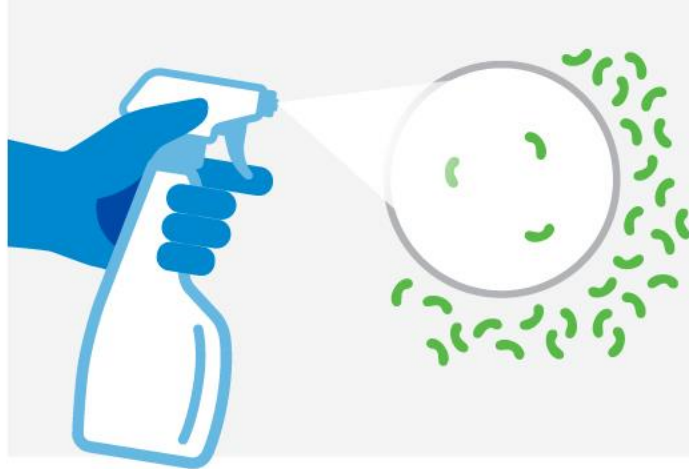

SOIL from a surface but
does not kill any organisms.

Sanitizing

REDUCES

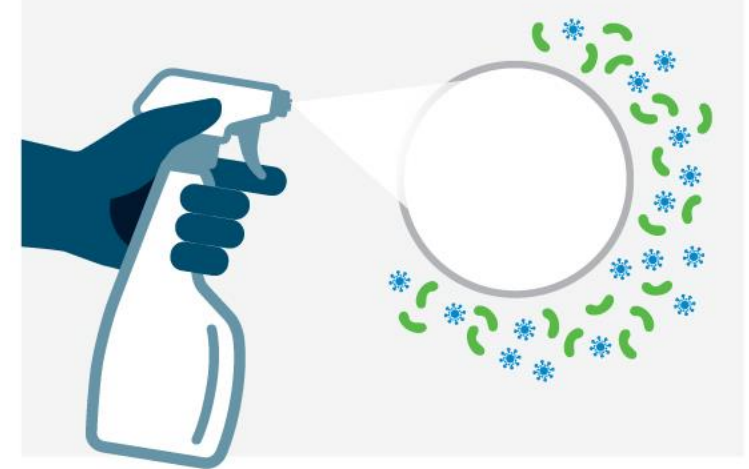

the number of **BACTERIA** in
the environment, significantly.

Disinfecting

DESTROYS

or irreversibly inactivates
BACTERIA AND VIRUSES.*

Sanitizers and disinfectants are regulated by the U.S. Environmental Protection Agency (EPA) and are used to manage public health risks. It is a violation of Federal law to use these products in a manner inconsistent with labeling.

*See product label for specific organism claims
