Injury Prevention: Technology and Resources to Reduce Workplace Injuries

The increasing popularity of wearable tech within workplace health and safety is prevalent. There are several different types of wearables for safety and injury prevention available on the market. Each has their own unique characteristics and ability to help decrease risk. They range from fall detectors that feature an emergency panic button or pick up any vital sign in the environment, monitoring devices that sense heat or air pollution, instant video ergonomic apps, office posture correction sensors, trackers that publish the location of remote workers in case of emergencies, & endless others. This is the inaugural joint special meeting with **Waukesha Area Safety Council**.

Topics discussed include new trends at employers in regard to on-site, near-site, and technological workplace injury prevention. **Fun, Dad Jokes, and Bourbon Giveaways are Guaranteed!**
