Superior Growth, Rooted in Responsibility

Today's investors want something more. Institutions and high net-worth individuals seek investments that provide not only diversification, predictability, and liquidity, but an assurance of professional integrity and social responsibility. No alternative asset class delivers this elusive combination more than timber. Beyond Forestry captures and enhances timber's potential to offer investors a powerful opportunity.

We are a plantation management company skilled in growing high-quality teak. Our trees grow three times faster than traditional plantations, and that translates to superior investment returns. With three decades of experience, the world's most advanced forestry techniques and intelligent financial modeling, we produce valuable wood that the world needs, and the results investors covet. We manage the process from end-to-end, and we do it all while working in harmony with the earth we depend on.

A natural complement to diversified portfolios. [Read more >](#)

The World Needs Sustainable Timber Plantations

Natural forests provide diverse benefits to the planet and people. Yet unrestricted logging has decimated much of the world's timberland. A rising worldwide population and increased living standards have created an insatiable demand for wood and wood-based products. As these upward trends continue, the supply of timber continues to shrink. Worse, rapid deforestation around the world has been proven to contribute to global warming. Not only do living trees remove harmful carbon dioxide from our atmosphere; wood-based products use less energy to produce than substitute materials such as plastics and concrete. Hence, as trees disappear, the harmful effects on our environment are compounded.

Helping to meet the need

The only viable solution to the world's timber shortage is the massive expansion of managed timber plantations. Beyond their ability to supply much-needed timber, well-managed and sustainable plantations have many related benefits, including:

- Ensuring timber is sold for the most appropriate end use, thus reducing waste.
- Diverting logging away from natural forests and restoring lands that have been logged irresponsibly.
- Growing and harvesting trees more efficiently than would occur in natural forests, thus using far less land and resources to meet a certain demand.
- Adding more trees to the earth's surface to slow global warming through the carbon-reducing effects in our atmosphere.
- Providing employment and economic growth in areas where timber plantations are managed.

Through our intensive timber management process, Beyond Forestry is making a positive contribution to humanity and the earth itself. Our ability to produce trees three times faster than traditional plantations only compounds the benefits. We invite investors to join us in an extremely rewarding investment opportunity.

From Seedling to Sale, an End-to-End Process

Beyond Forestry is immersed in the plantation management process long before trees are even planted. We closely monitor every step to ensure rapid growth of high quality trees and a rewarding return on investment. Our intensive oversight and deep knowledge of the field enables investors to benefit from timber's strong growth potential.

Site Selection: Before establishing a new plantation, we diligently select the right farm in terms of optimal conditions, regarding soil, water access, temperature, precipitation and light. Access to ports and minimal risk of natural disasters is also taken into consideration.

Plantation Establishment: Plantation Establishment: Once an ideal site is chosen, the land undergoes intensive preparation including among others, land preparation (land clearing, subsoiling, plowing and disking), drainage and irrigation/fertigation systems. We then use a proprietary concept regime, which stands as a point of reference for indication for planting and proceeding operations.

Active Management: Our on-the-ground management team ensures proper irrigation and fertigation proceeding as well as the pruning, weed, insect and plagues control and that other silvicultural requirements are met. Beyond Forestry also manages the commercial thinning and "farming" operations to achieve optimal efficiency.

Return Management: In the business office, we work to ensure our longevity and profitability by negotiating long-term supply contracts and favorable shipping rates. In addition, we supplement the output of our forestry plantations with the production and marketing of plant-based energy sources such as biomass.
