

Long Term Rat Deterrence

We love animals of all kinds, but city rats can pose a danger to people, pets and trees. Rats use tree pits as an entry point to their system of interconnected burrows underneath the sidewalks.

Rats dig around almost every kind of barrier including gravel, concrete block and glass. Chemical and dry ice treatments are temporary and can be harmful to pets and plants.

"I wouldn't mind the rat race...if only the rats would lose once in a while."

--Tom Wilson

Galvanized steel mesh is a long term solution which is affordable, effective and environmentally responsible.

Positioned below the soil surface and anchored to the perimeter material, this mesh is invisible and leaves enough soil depth for most gardening.

Preventing access to their burrows makes your tree beds and planter boxes unattractive to our furry foes while having no negative impact to people, pets or the environment.
