CLEAN AGENT AUTOMATIC FIRE SUPPRESSION SYSTEM

Advanced Protection for Electrical & Electronic Equipment

The Clean Agent Automatic Fire Suppression System has been launched by us. It is specially designed to detect and suppress fires inside electrical panels and enclosed equipment areas before major damage occurs.

The system automatically detects heat or fire and instantly releases a clean agent gas that suppresses the fire without damaging electrical components. It consists of a pressurised clean agent cylinder which is connected to a heat detecting tracer tube. The tube is wound inside the entire panel. The tube is heat sensitive, if the temperature at a certain point crosses 70 °C then the tube bursts at that point. As a result, the clean agent will come out of the tube and extinguish the fire, automatically.

We at House of Safety provide installation and maintenance of the above system.

PRODUCT FEATURES

Feature	Benefit
Automatic Fire Detection	No need of Human intervention.
Instant Suppression	Rapid response minimizes damage
Non-Conductive Agent	Safe for electrical equipment, data servers, etc.
Residue-Free Operation	No cleanup or secondary damage
Compact Design	Easy installation inside panels
Reliable Performance	Continuous protection for critical systems
Low Maintenance	Cost-effective operation

APPLICATION AREAS

Suitable For:

- Electrical Panels
- MCC Panels
- LT & HT Panels
- Server Racks
- UPS Systems
- CNC Machines
- Data Centres
- Battery Rooms
- Marine Electrical Systems
