Issue 5 | March 20, 2021

This newsletter, we got to talk with a longtime friend, activist and so much more, Phoenixsong Stellamaris. She's absolutely thrilled to be a part of this project having a shared passion for our mission and eagerly awaits the chance to work in whatever capacity she's needed. We share a dream of a future where human, animal and plant exists around each other without disruption. Her growing knowledge with horticulture will help us learn what we need in 3 Visions Farm and she's excited to get the chance to pick up more and meet others who will guide us. She sees that there's a shift needed in the human paradigm for all people in order to flourish; to live in a way that works in tandem not only to each other but with the ecosystem we share. A "thriving reality" in her words.

What is it that brought us to this point? The wild weather shifts, the melting of the ice caps and the collapse of the oceans sea life? Phoenixsong states that humans have upset the balance due to greed and lies fed by politicians. Since the industrial era, the overconsumption and overproduction has sped up the loss of ecosystems that once thrived in sustainable living. There were families ripped apart to work in the factories, cultures and land destroyed to make way for railroads, ranches and farms at the behest of consumerism and war. Our society carries those echoes today in the way that the mass production of commodities is not only done on a global scale but done with the same, if not worse conditions since the industrial era. Trash litters our oceans which leeches chemicals and the production of waste, be it gas or solid, climbs ever higher.

This kind of living is not sustainable. We're already experiencing the effects that our

carbon emissions have begun with the warming temperatures. Not only will this have an effect on the north and south poles glaciers but Phoenix also pointed out that it will disrupt the jet streams and ocean current with it. Whereas the

jet stream serves as a barrier for global temperatures by pushing cold air north and hot air around the equator, the ocean currents are the veins of the planet. As water gets colder, it gains density and will sink to the ocean floors within the north where salt and minerals settle. The moving current then carries it along the floors into warmer waters which rise, carrying with it the minerals to the surface. Yet as the waters today grow hotter, storms grow stronger and the currents become disrupted, throwing this cycle off course.

While this is by no means a small issue to face, it is one that is possible to combat but only with the help of like minded individuals. Phoenixsong will offer her suggestions to us on how to understand what the land is capable of when we reach it, since “You shouldn’t force the land to grow what it can’t.” Think about the soil, the minerals and native life within it. She reminds us that understanding what we’re going to be walking into, studying it, will be one of our most important steps and one to make when we put our feet to earth. 3 Visions Farm will get the chance to explore a different social construct as we get to find what that means for us; for the people reading this newsletter to the people who will join us later. To Phoenixsong, this will be creating a legacy to stand for the future of the living planet. To give power to a cause her heart is truly set in and leave a brighter future for generations to come.
