

Ways that we have helped the players and teams we have worked with.

#01. Effectively predicting injury

We have tested numerous athletes across various sports. During our testing, we identified 38 athletes that had the potential for injury based on the tests and movement patterns. We ran their results. What we found was that we correctly predicted the future injury 38 times. We were able to help prevent the injuries from growing worse for those who stayed with the program. We also helped with a mid-season assessment for an NCAA team and identified key issues and helped them qualify for the NCAA D3 tournament.

#02. Raised performance

With some of our hockey players, we were able to have them gain in their skating stride efficiency and identify which side of the ice they would be more comfortable playing on. This was a huge help for coaches and the players loved seeing their performance get better and feel it get better.

#03. Great for Targeted Training

The athletes were able to execute programs that were developed for them to improve their bodies. The athlete receives a personalized training plan for them to follow based on the results of their testing. They can execute our program or the data can be given to their personal coach and their private workouts developed. This has happened with some of our D1 athletes.

#04. Same tech used by the biggest names in pro sports.

Your athletes are getting tested on the same equipment that multibillion-dollar sports leagues use to assess their athlete's health. This equipment is trusted by the pro sports leagues. The testing protocols are FDA-cleared it should be good enough for your athletes. It makes a stronger athlete across all sports. The earlier intervention we get the better long-term health we provide.
