UNLEASHING XENOTECH'S VIPER ELECTRONICS

WITH THE RIGHT TECHNOLOGY *You Can Rule The Jungle*

Engraverschoice.com

Xenotech.com

Xenotech has developed an easy and cost effective way for you to significantly increase your existing system's engraving speed (up to 3 times) and put the total control of every job at your fingertips.

You can power your existing Xenotech engraving table at three times the current engraving speed (10 ips for 1313 and 1625, and 8 ips for 912, 2525, 2550, Viper® JE and GE).

The Xenotech Viper electronics plug in multiple engravers and utilize Ethernet communications which increases download speed and have a virtually unlimited job queue.

It's completely compatible with Xenotech's Engravelab™ print driver and shipped with XGW-32 professional engraving software.

The Viper's controller provides interpolation of all 4 axes simultaneously with on-board temperature, motor, and voltage diagnostics.

With the Viper Pendant, you have complete, touch-screen access to your engraving system. The hand-held key pad gives you the ultimate control to select jobs from the hard drive, engrave jobs (forward/reverse by character, line, plate, and job), check XYZ positioning and digital readouts, override engraving speeds, program the z axis, record job timing, and more.

Just unplug your existing electronics, plug in the Viper and install the Viper driver on your laptop or desktop computer. You'll be engraving with record productivity within the hour.
