# History

In the late 1990s, Mirez Incorporated faced a tumultuous period as they struggled to keep pace with the rapidly evolving computer industry. From 1996 to 1997, the company released several computer models that failed to capture the market's attention. These models suffered from various issues, such as outdated technology, performance issues, and lackluster design.

However, everything changed for Mirez in 1998 when they forged a groundbreaking partnership with Razii Incorporated. Razii was renowned for its cutting-edge computer chips that could deliver high-quality graphics using significantly less processing power compared to competitors. This innovative technology was a game-changer in the industry.

Together, Mirez and Razii collaborated on developing the 98xx computer, a PC that pushed the boundaries of what was possible at the time. The 98xx computer, released on February 15th, 1998, boasted superior performance, stunning graphics capabilities, and sleek designs that appealed to tech enthusiasts worldwide.

The 98xx quickly became a sensation, earning acclaim for its revolutionary technology and setting new standards for computer performance and design. Mirez's partnership with Razii not only revitalized their position in the market but also solidified their reputation as leaders in the computer industry.
