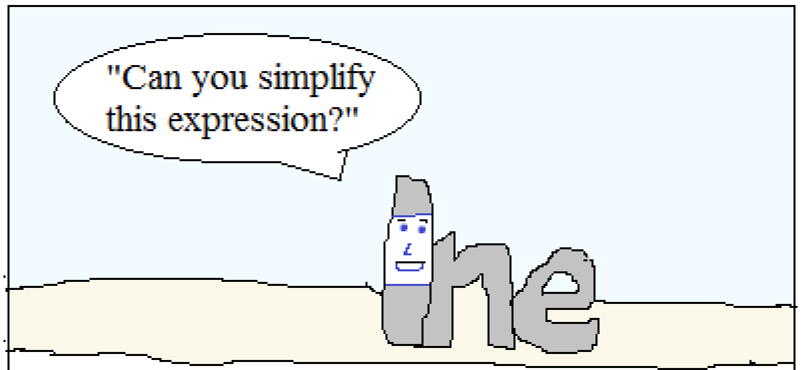
Logarithm and Exponents 2:

Solving equations



$$\log_2 3 \cdot \log_3 4 \cdot \log_4 5 \cdot \log_5 6 \cdot \log_6 7 \cdot \log_7 8$$

(Answer in the back)

Topics include change of base, inverses, inequalities, factoring, intercepts, graphing, and more

Example: $\log_4(x-1) = -1 + \log_4(x)$

$$\log_4(x-1) - \log_4(x) = -1$$

(Logarithm Quotient Rule)

$$\log_4 \frac{(x-1)}{x} = -1$$

(Change to Exponential Form)

$$4^{-1} = \frac{(x-1)}{x}$$

$$\frac{1}{4} = \frac{(x-1)}{x}$$

(Cross Multiply)

$$4x - 4 = x$$

$$\boxed{x = \frac{4}{3}}$$

Example: $\log_{\sqrt{a}}(5) = \log_a x$ find x:

$$\frac{\log 5}{\log(a^{\frac{1}{2}})} = \frac{\log x}{\log a}$$

OR

$$\frac{\log 5}{\frac{1}{2}\log a} = \frac{\log x}{\log a}$$

$$\log 5 = \frac{1}{2}\log x$$

$$\log 5 = \log\sqrt{x}$$

$$\boxed{x = 25}$$

$$\log 5 \cdot \log a = \log x \cdot \log\sqrt{a}$$

$$\frac{\log 5}{\log x} = \frac{\log\sqrt{a}}{\log a}$$

$$\log_x 5 = \log_a \sqrt{a}$$

$$\log_x 5 = \frac{1}{2}$$

$$\boxed{x = 25}$$

Example: $\log(\sqrt[3]{x}) = \sqrt{\log(x)}$

$$\log x^{\frac{1}{3}} = \sqrt{\log(x)}$$

(Logarithm Power Rule)

$$\frac{1}{3}\log(x) = \sqrt{\log(x)}$$

(Square both sides)

$$\frac{1}{3}\log(x) \cdot \frac{1}{3}\log(x) = \log(x)$$

$$\frac{1}{9}(\log(x))^2 - \log(x) = 0$$

$$\log(x) \cdot \left(\frac{1}{9}\log(x) - 1\right) = 0$$

$$\log(x) = 0 \qquad \frac{1}{9}\log(x) - 1 = 0$$

$$x = 10^0 \qquad \frac{1}{9}\log(x) = 1$$

$$\boxed{x = 1} \qquad \log(x) = 9$$

$$\boxed{x = 10^9}$$

Example: $e^{3x} = \left(\frac{7}{e}\right)^{x+1}$

$$e^{3x} = (7 \cdot e^{-1})^{x+1}$$

$$e^{3x} = 7^{(x+1)} \cdot e^{(-x-1)}$$

$$\frac{e^{3x}}{e^{(-x-1)}} = 7^{(x+1)}$$

$$e^{4x+1} = 7^{(x+1)}$$

$$\ln e^{4x+1} = \ln 7^{(x+1)}$$

$$(4x+1)\ln e = (x+1)\ln 7$$

$$4x + 1 = 1.946x + 1.946$$

$$2.054x = .946$$

$$\boxed{x = .461} \text{ approximately}$$

Check:

$$e^{(3 \cdot .461)} = \left(\frac{7}{e}\right)^{(.461+1)}$$

$$e^{1.383} = \left(\frac{7}{e}\right)^{1.461}$$

$$3.987 = 3.983 \quad \text{(approx.)} \checkmark$$

Example: $\log_7(x+5) = \log_7(x-1) - \log_7(x+1)$

$$\log_7(x+5) = \log_7\left(\frac{x-1}{x+1}\right)$$

(Logarithm Quotient Rule)

$$\frac{(x+5)}{1} = \left(\frac{x-1}{x+1}\right)$$

(Drop the logarithms)

$$(x+5)(x+1) = x - 1$$

$$x^2 + 5x + 6 = 0$$

$$(x+2)(x+3) = 0 \qquad x = -2 \text{ or } -3$$

However, logarithms cannot be negative... Therefore there is NO SOLUTION!

Example: $\log(4x) - \log(24 + \sqrt{x}) = 2$

$$\log_{10} \frac{4x}{(24+\sqrt{x})} = 2$$

$$\frac{4x}{(24+\sqrt{x})} = 100$$

$$4x = 2400 + 100\sqrt{x}$$

$$4x - 100\sqrt{x} - 2400 = 0$$

$$x - 25\sqrt{x} - 600 = 0$$

(let $A = \sqrt{x}$)

$$A^2 - 25A - 600 = 0$$

$$(A-40)(A+15) = 0$$

$$A = 40 \text{ or } -15$$

therefore, $\sqrt{x} = 40$ or -15

$\boxed{x = 1600}$ or ~~225~~

Check: $\log(4(1600)) - \log(24 + \sqrt{1600}) = 2$

$$\log(6400) - \log(64) = 2 \checkmark$$

$$\log(4(225)) - \log(24 + \sqrt{225}) = 2$$

$$\log(900) - \log(39) = 2 \times$$

Exponents and Logarithms

Example: Find $3^x = 21$

Method 1: Convert to logarithmic form...

$$3^x = 21$$

$\log_3 21 = x$ Then, input into a calculator... $x = 2.771244$

Method 2: Use the common log (base 10)

$3^x = 21$

$\log(3^x) = \log(21)$ "raise" both sides to the common log

$x\log(3) = \log(21)$ logarithm power rule...

$3^x = 21$

$\log_3 21 = x$ "Change of Base Formula"

$$x = \frac{\log 21}{\log 3} = \frac{1.3222}{.4771}$$

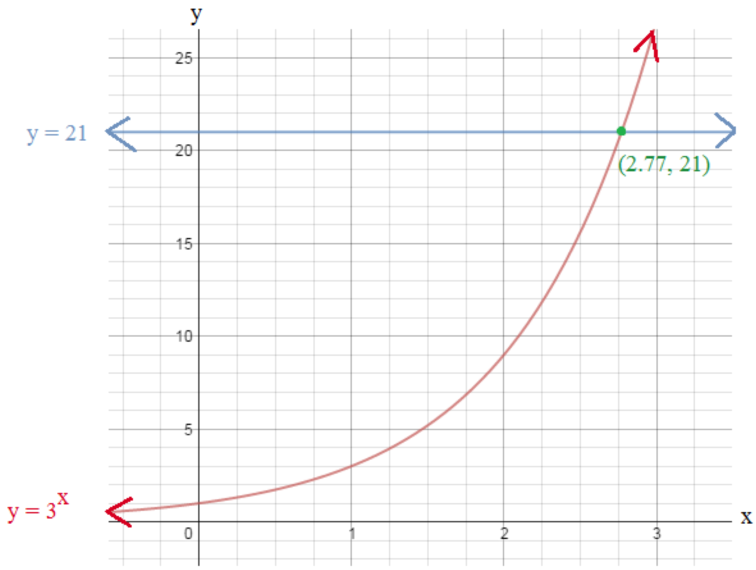
Method 3: Graphing each side

The intersection of

$y = 3^x$

and

$y = 21$ is the solution...



Method 4: Guess and check

$3^x = 21$ If $x = 2$, then $3^2 = 9$ Greater...

If $x = 3$, then $3^3 = 27$ Less...

If $x = 2.8$, then $3^{2.8} = 21.67$ Less...

If $x = 2.7$, then $3^{2.7} = 19.4$ Greater ...

If $x = 2.75$, then $3^{2.75} = 20.52$ Greater...

We've determined the answer is between 2.75 and 2.8

If $x = 2.77$, then $3^{2.77} = 20.97$

Example: $36 = 10\left(1 + \frac{.08}{4}\right)^{4x}$

NOTE: this is a model of a compounding interest function!
"how long will it take 10 to grow to 36 if compounded at 8% quarterly?"

Rule of 72: 72/8 = 9
it will take approx. 9 years to double...
10... 20 (9 years)... 40 (18 years)
so, the answer should be a bit under 18 years!

Let's see....

$\log 3.6 = (4x)\log(1.02)$

$.5563025 = (4x)(.00860017)$

$x = 16.17$ (approximately)

Example: Find the inverse of $g(x) = 2^{(x-4)} + 6$

Using $\log_2$

$y = 2^{(x-4)} + 6$ change $g(x)$ to y

$x = 2^{(y-4)} + 6$ switch x and y

$x - 6 = 2^{(y-4)}$ solve for y

$\log_2(x-6) = \log_2\left(2^{(y-4)}\right)$

$\log_2(x-6) = (y-4)\log_2 2$

$\log_2(x-6) = (y-4)(1)$

$\log_2(x-6) + 4 = y$

$g^{-1}(x) = \log_2(x-6) + 4$

Using log ($\log_{10}$)

$y = 2^{(x-4)} + 6$ change $g(x)$ to y

$x = 2^{(y-4)} + 6$ switch x and y

$x - 6 = 2^{(y-4)}$ solve for y

$\log(x-6) = \log 2^{(y-4)}$

$\log(x-6) = (y-4)\log 2$

$\frac{\log(x-6)}{\log 2} = (y-4)$

$\log_2(x-6) = (y-4)$

Example: Solve algebraically... Then, support your answer graphically.

$\log_3 x + 7 = 4 - \log_5 x$

$\log_3 x + \log_5 x = 4 - 7$

$\frac{\log x}{\log 3} + \frac{\log x}{\log 5} = -3$

$\frac{1}{.477}\log x + \frac{1}{.699}\log x = -3$

$2.10\log x + 1.43\log x = -3$

$\log x = -.85$

$x = .141$

therefore, $2^x = -1$ and 3

-1 is extraneous!

$2^x = 3$ → approx. 1.585

4) $e^x - 6e^{-x} = 1$

$e^x \cdot (e^x - 6e^{-x} - 1) = 0 \cdot e^x$

$e^{2x} - 6e^0 - e^x = 0$

$e^{2x} - e^x - 6 = 0$

let $A = e^x$

$A^2 - A - 6 = 0$

$(A - 3)(A + 2) = 0$

$A = -2, 3$

$e^x = -2$ or 3

-2 is extraneous, because e^x will never be negative.

$e^x = 3$

take natural log of each side

$\ln e^x = \ln 3$

$x \ln e = 1.0986$ (approximately)

$x = 1.0986$ (approximately)

5) $(\log_3 x)^2 - \log_3 (x^2) = 3$

$(\log_3 x)^2 - 2(\log_3 x) = 3$

$(\log_3 x)^2 - 2(\log_3 x) - 3 = 0$

$A^2 - 2A - 3 = 0$

$(\log_3 x - 3)(\log_3 x + 1) = 0$

$(A - 3)(A + 1) = 0$

$(\log_3 x - 3) = 0$ $\log_3 x = 3$ $x = 27$

$(\log_3 x + 1) = 0$ $\log_3 x = -1$ $x = 1/3$

V. Exponential and Logarithm inequalities

SOLUTIONS

Logarithm 2 Practice Test

1) $\ln(x+2)^2 > 3$

$\log_e (x+2)^2 = 3$

$e^3 = (x+2)^2$

$\pm\sqrt{20.08} = x + 2$

$x = -2 \pm\sqrt{20.08}$

2) $6^{n-1} < 11^n$

$(n - 1)\log 6 = n\log 11$

$n\log 6 - \log 6 = n\log 11$

$n\log 6 - n\log 11 = \log 6$

$n(\log 6 - \log 11) = \log 6$

$n\log(6/11) = \log 6$

$n = \log 6/\log(6/11)$ $\quad$ $n > -2.9560$

If n = 0,

then $6^{0-1} < 11^0$

$\frac{1}{6} < 1$ ✓

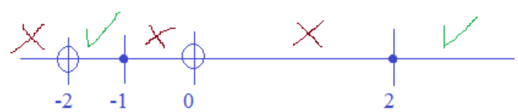
3) $\ln(x^2) \geq \ln(x+2)$

$x^2 > (x+2)$ $\quad$ assume terms are equal to determine the 'critical values'

$x - x - 2 = 0$ $\quad$ Then, test values in each region...

$(x-2)(x+1) = 0 \quad x = -1, 2$

(-2, -1] ∪ [2, ∞)



ln cannot = 0 or be negative...

4) $2\ln 3 - \ln(x+3) > \ln 6$

$\ln 3^2 - \ln(x+3) = \ln 6$

$\ln\frac{9}{(x+3)} = \ln 6$

$\frac{9}{(x+3)} = 6$

$6x + 18 = 9$

$x = -3/2$

Test x = -2

$2\ln 3 - \ln(-2+3) > \ln 6$?

$\ln 9 - \ln(1) > \ln 6$

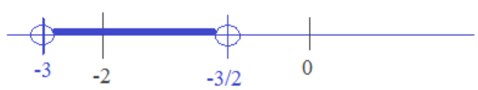
$\ln 9 > \ln 6$ YES

Test x = 0

$2\ln 3 + \ln(0+3) > \ln 6$?

$\ln 9 + \ln 3 > \ln 6$

$\ln\frac{9}{3} > \ln 6$ NO



So, x < -3/2... BUT, it must be greater than -3
(otherwise, ln(x + 3) is undefined)

$-3 < x < -3/2$

5) When is $\log_2(x-2) > \log_4(x)$?

(first, find where sides are equal...)

$\frac{\log_2(x-2)}{\log_2 2} = \frac{\log_2 x}{\log_2 4}$ $\quad$ use change of base formula

$\frac{\log_2(x-2)}{1} = \frac{\log_2 x}{2}$

$2\log_2(x-2) = \log_2 x$

$\log_2(x-2)^2 = \log_2 x$

$(x-2)^2 = x$

$x^2 - 5x + 4 = 0$

$(x-4)(x-1) = 0$

$x = 1, 4$

But, we eliminate 1, because $\log_2(x - 2)$ does not exist when x = 1

test x = 3....
and, the inequality does not work..

$x \geq 4$

VI. Miscellaneous Questions

SOLUTIONS

Logarithm 2 Practice Test

1) What are the intercepts? (x-intercept and y-intercept)

$y = \log_3 (x + 9) - 3$

y-intercept occurs when $x = 0$ (0, ?)

$y = -1$

(0, -1)

x-intercept occurs when $y = 0$ (?, 0)

$3 = \log_3 (x + 9)$

$x + 9 = 27$ $x = 18$

(18, 0)

2) The vertical asymptote is at $x = 2$ containing point (18, -5)

What is the function in the log form

$f(x) = \log_4 (x + A) + B$?

since asymptote is $x = 2$,

$f(x) = \log_4 (x - 2) + B$

then, to find B, substitute the point (18, -5)

$-5 = \log_4 (18 - 2) + B$

$-5 - B = \log_4 (16)$

$B = -7$

$f(x) = \log_4 (x - 2) - 7$

3) $\log_{10} 2 = .30$

$\log_{10} 3 = .48$

What is $\log_3 4$?

(no calculator)

$\log_3 (2)^2$

$2 \cdot \log_3 (2)$

$2 \cdot \frac{\log 2}{\log 3} = 2 \cdot \frac{.30}{.48} = \frac{.60}{.48} = 1.25$

4) Rewrite using base 5:

a) $y = 2(25)^{0.4x}$

$y = 2(5^2)^{0.4x}$

$y = 2(5)^{0.8x}$

Find $5^x = 2$

$\log 5^x = \log 2$

$x = \frac{\log 2}{\log 5} = .43$

$5^{.43} = 2$

$y = 5^{(0.8x + .43)}$ (approx)

b) $y = (4)^{-0.2x}$

Find $5^x = 4$

$\log 5^x = \log 4$

$x = \frac{\log 4}{\log 5} = .86$

$y = (5^{.86})^{-0.2x}$

$y = (5)^{-.17x}$ (approx)

5) Find the inverses: SOLUTIONS Logarithm 2 Practice Test

$f(x) = 4e^{(x+2)} + 16$

$y = 4e^{(x+2)} + 16$ switch x and y

$x = 4e^{(y+2)} + 16$

$x - 16 = 4e^{(y+2)}$

$\frac{x-16}{4} = e^{(y+2)}$

$\ln\frac{x-16}{4} = y + 2$

$f^{-1}(x) = \ln\frac{x-16}{4} - 2$

$h(x) = 3 - \log(2 + x)$

$y = 3 - \log(2 + x)$ switch x and y

$x = 3 - \log(2 + y)$ solve for y

$3 - x = \log(2 + y)$

$10^{3-x} = 2 + y$

$h^{-1}(x) = 10^{3-x} - 2$

6) Word Problems

A) You deposit $10,000 into an investment account that earns 7% interest.
How many years will it take to increase to $30,000?

a) Use the "rule of 72" to get an estimate...

"rule of 72" estimates it'll take 72/7, or approx. 10 years to double..
$10,000 to $20,000 will take 10 years...
$20,000 to $40,000 will take another 10 years...
Since we are looking for an estimate for $30,000, half-way, it takes approx 15 years...

b) Use logarithms to get an actual value....

$A = Pe^{rt}$

$30{,}000 = 10{,}000e^{.07t}$

$3 = e^{.07t}$

$\ln 3 = \ln e^{.07t}$

$t = \frac{\ln 3}{.07} =$ 15.69 years (approx)

B) A six year old savings account has $21,000...
It has been compounding interest continuously at 4%.

What was the original savings deposit?

$A = Pe^{rt}$

$21{,}000 = Pe^{(.04)(6)}$

$21{,}000 = P(1.27)$

$P = 16{,}519$

C) If 300 mg of a sample decays to 200 mg in 48 hours, find the half-life of the sample...

Step 1: Find the rate r

$A = Pe^{rt}$

$200\text{mg} = 300\text{mg}(e)^{r(48)}$

$\frac{2}{3} = e^{48r}$

$\ln\left(\frac{2}{3}\right) = 48r(\ln e)$

$r = -.008447$

Step 2: Find the half-life (t)

$A = Pe^{rt}$

$150\text{mg} = 300\text{mg}(e)^{-.008447t}$

$\ln\left(\frac{1}{2}\right) = -.008447t$

82 hours

SOLUTIONS

1) $3^x \cdot \frac{-4}{3^{x+1}} = 8$

$-4 \cdot \frac{3^x}{3^{x+1}} = 8$

$\frac{3^x}{3^{x+1}} = -2$

$3^{-1} = -2$

NO SOLUTION

2) $\log_5(x+3) = \log_5(x-1) + \log_3 9 + 6^{\log_6 2}$

$\log_5(x+3) - \log_5(x-1) = 2 + 2$

$\log_5 \frac{(x+3)}{(x-1)} = 4$

$\frac{(x+3)}{(x-1)} = 625$

$625x - 625 = x + 3$

$624x = 628$

$x = \frac{157}{156}$

3) $2\log_4(x) = \log_4(11x+4) - .5\log_4 9$

$\log_4(x)^2 = \log_4(11x+4) - \log_4 9^{.5}$

$\log_4(x^2) = \log_4 \frac{(11x+4)}{3}$

$3x^2 = 11x + 4$

$3x^2 - 11x - 4 = 0$

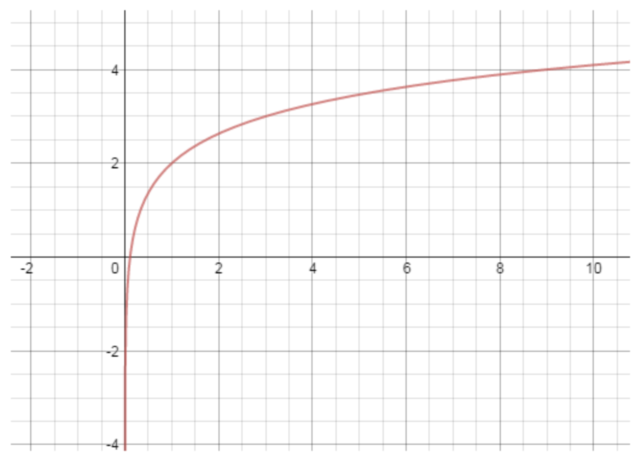
$(3x+1)(x-4) = 0$

$x = 4$ or ~~$-1/3$~~

ONLY $x = 4$

4) Graph $\log_3(9x)$ (hint: 9x is "9 times x")

$\log_3(9) + \log_3(x) = 2 + \log_3(x)$



Points include: (1, 2) (9, 4) and (1/9, 0)

5) $x + 7x^{(2/3)} + 10x^{(1/3)} = 0$

Use substitution

(choose the "smallest variable exponent")

Let $U = x^{(1/3)}$

$U^3 + 7U^2 + 10U = 0$

$U(U+2)(U+5) = 0$

$U = -2, -5, 0$

U = -2: $-2 = x^{(1/3)}$ → $x = -8$

U = 0: $0 = x^{(1/3)}$ → $x = 0$

U = -5: $-5 = x^{(1/3)}$ → $x = -125$

(plug in solutions to original equation to check)

$-8 + 7(4) + 10(-2) = 0$

$0 + 7(0) + 10(0) = 0$

$-125 + 7(25) + 10(-5) = 0$
