## Hoover Dam

At the time it was completed in 1935, Hoover Dam was the tallest and was the largest hydroelectric plant in the world until 1948. It required re-routing the Colorado River and constructing two Coffey Dams, rock barriers and diversion tunnels to keep the water level from cresting the top of the dam when discharging water at a rate of 200,000 cubic feet per second. The engineering proved good when the cofferdams, rock barrier and diversion tunnels handled the rushing flood water.

**ARTIST** Rising from a black, polished base, is a 142-foot flagpole flanked by two winged figures, which Norwegian born and naturalized citizen-Artist, JW Hansen, calls the Winged Figures of the Republic. They express "the immutable calm of intellectual resolution, and the enormous power of trained physical strength, equally enthroned in placid triumph of scientific accomplishment."

Surrounding this base is a terrazzo floor, inlaid with a star chart, or celestial map. The chart preserves for future generations the date on which President Franklin D. Roosevelt dedicated Hoover Dam, September 30, 1935. The plaque to commemorate the 96 men who died during its construction reads: "They died to make the desert bloom. The United States of America will continue to remember that many who toiled here found their final rest while engaged in the building of this dam. The United States of America will continue to remember the services of all who labored to clothe with substance the plans of those who first envisioned the building of this dam."

**HIGH SCALERS** Earning less than \$1.25 per hour, daring Native American men, former circus acrobats and sailors climbed ropes down the steep and crumbling canyon walls carrying 44 lb jackhammers and dynamite. It was their job to clear loose rock while carefully picking their way through live air hoses, electrical lines and bundles of drill steel. Necessity required them to improvise hard-boiled hats of tar covered cloth to survive rock falls. Eventually, commercially made hard-hats were issued. These men performed death defying feats daily. This includes one mid-air rescue of a Civil Engineer who slipped off the rim. Quick reflexes sent one High Scaler swinging out over the canyon to catch him by the leg. Joined by another scaler, the shaken engineer was pulled, unharmed, to safety.
