

THERMAL CONDUCTING CEMENTS
FAMILY-OWNED & OPERATED SINCE 1954

TRACIT Heat Transfer Compounds

Applications & Benefits

For six decades, Chemax TRACIT heat transfer compounds have proven to be essential for use on steam, electric, and fluid heat tracing systems for maximizing heat transfer rates and improving thermal efficiency.

The primary purpose of TRACIT cements is to improve the heat transfer between two surfaces by increasing the contact area and eliminating the air flow. Heat is now transferred directly to the pipe wall by conduction. **Only one TRACIT line is required to maintain pipe temperature, where 3-5 bare (convection) tracers would normally be needed.**

Due to the excellent adhesive properties of these mastics, they can be applied to any clean surface.

Advantages

User-Friendly: TRACIT heat transfer compounds are pliable and have a putty-like consistency, which allows for easy application by mortar trowel.

Durable: Compounds can withstand considerable mechanical and thermal shock, and will last for the life of the installation.

Fire-Resistant: Compounds will not burn or support combustion.

Safe: Chemax mastics are non-hazardous.

Reliable: Over 60 years of proven performance.

Low-Cost: TRACIT mastics cost far less than jacketed systems and provide an equivalent heat transfer with steam tracings.
