POWER RE-DEFINED

- Ok so very short, Newton defines power as $\frac{W}{\Delta t}$ = P and that is okay, but he was missing a term and here is why;

POWER SHOULD BE DEFINED AS;

$$P = \frac{wF}{\Delta t}$$

- And so we have it that, Power is Explicitly work * force/Δtime. This is the Explicit definition of Power, I believe the other version is Implicit. Nevertheless, referencing any respects of power, that should be understood as an unbounded sin function;
- < Mapping that is;

$$c \in T : f_c : S \to T : \forall x \in S : f_c\left(x\right) = c$$

>

Furthermore, look at the components of this suggestive constant function of power, we have all components, we have a constant, we have time, we have "something external" we have for all subscripted at some x value, proceeded by, "something external" and then force as a constant of an x value. Which is how blood works. Consider all things constant and never-ending.

This is represented as an unbounded sin function. It should be understood as an inheritance, but I assure you only God who made heaven and earth can give power. Nobody can give you true power, and nobody can take it away. **Power is inherited through your blood.**
