Social Development Dimension The CRPD acknowledges the correlation between impairment and increased risk of poverty. The Convention is considered a tool for development (OHCHR, 2014f) because of its stand-alone provision on international cooperation (Article 32), which stresses the role of the international community for the mutual implementation of the CRPD, and implicitly underpins inclusive and accessible development to people with disabilities as a means for the realization of their rights. To do that, the CRPD suggests, on one side, to mainstream the rights of person with disabilities in all development actions and, on the other, to foresee disability-specific measures for capacity building (Della Fina, 2017). Article 32, together with Article 11, attributes three important aspects to development and humanitarian policy, making them binding under international law:

(a) A Human Rights-Based Approach to development and humanitarian aid. Both people living in poverty and persons affected by armed conflicts or natural disasters shall not be treated as objects of charity or welfare but as rights-holders; thus, their opinions must be listened and duly taken into account in every related decision-making process.

(b) Mainstreaming disability in international cooperation to overcome the segregationist structures implemented by traditional disability policies.

(c) The importance of the active and equal participation of OPDs (Degener, 2017). In its General Comment and Concluding Observations, the Committee has cited both the 2030 Agenda for Sustainable Development and the Sendai Framework for DRR as examples of international cooperation.

Good Governance The CRPD, with its provision on active and informed participation and meaningful consultation of every individual in decision-making, creates an environment conducive to "good governance," intended to achieve human development through the guarantee of human rights and with a due regard to the rule of law (Rothstein, 2012). In its General Comment No. 7 (UN Committee on the rights of Persons with Disabilities (CRPD), General comment No. 7, 2018), the Committee has affirmed that an "*active and informed participation of everyone in decisions that affect their lives and rights is consistent with the human rights-based approach in public decision-making processes, and ensures good governance and social accountability*" (para. 2). For the CRPD, inclusive participation and consultation is a fundamental requirement of good governance. In fact, with regard to Article 13 (access to justice), the Committee states that the right of persons with disabilities to participate on an equal basis with others in the justice system includes "*various capacities… as part of the democratic system that contributes to good governance*" and that "*close consultation with persons with disabilities through their representative organizations is key in all processes to enact and/or amend laws, regulations, policies and programmes addressing participation of persons with disabilities in the justice system.*"

CRPD and Inclusive DRR and CCA

The CRPD vulnerability paradigm, its social development dimension and good governance aspects, and its main principles constitute practical guidance to effectively reduce societies' vulnerabilities in the long term as it demands a real commitment toward persons with disabilities that is regularly reviewed.

As discussed above, disaster risk is socially constructed: Disasters are never natural as they are the product of the human interaction with the environment. Hence, reducing the vulnerability and the exposure of the population is key to decreasing the risk of disasters. Persons with disabilities are disproportionately exposed to disasters, emergencies, and conflict situations as society fails to accommodate their different layers of preexisting vulnerabilities even in "normal times." Section "The Need for a Human Rights-Based Approach to DRR and CCA" has also framed DRR as a human rights issue. It was then highlighted that IHRL is relevant for DRR measures as it provides a normative evaluation framework for policy formulation and implementation, enhancing empowerment and accountability while tackling vulnerabilities. IHRL is also conducive to a people-centered approach to disaster governance, which is more effective in the protection of individuals compared to a top-down approach. Section "Human Rights: The Normative Nexus Between Climate Change, Disasters, and Development" has shown that DRR is deeply entrenched with Sustainable Development and Climate Change Adaptation as they share substantive goals and principles. At the UN level, disability is considered both a human rights and a development issue and the CRPD acknowledges this link and recognizes international cooperation and development, including DRR, as tools for the implementation of the Treaty, provided that they follow a human rights-based approach (HRBA) that mainstreams disability and allows for the active and meaningful participation of every person.

The CRPD is thus conducive to "socially inclusive" DRR and CCA measures, which are more efficient than top-down approaches (Le Masson & Lovell, 2017a) in tackling the deep-rooted inequalities that make a society vulnerable to disasters, in understanding why some persons are more excluded than others, and in valuing the diverse characteristics and capabilities of individuals, by recognizing the right of every individual to benefit from and to participate in all phases of Disaster Management. Viewing DRR under a social development lens means not only to promote the full and effective participation of excluded people, by valuing and respecting them, but also to provide and to grant equal opportunities. For instance, in society where women are marginalized, those DRR measures supporting income-generating opportunities to increase women's resources and resilience to disasters incorporate a vulnerability paradigm and follow a social development perspective. Therefore, DRR must cross-cut different sectors to fully embrace a development lens: It must address the conditions that support exclusion, poverty, the access to limited resources, and to promote education, so that in the long-run, systemic inclusion in DRR will tackle social inequalities in a sustainable manner, contributing in reaching poverty eradication in line with the Sustainable Development Goals (SDGs). Thus, inclusive DRR first identifies who the marginalized individuals and groups are in society; second, it recognizes the causes of exclusion; and, third, it involves stakeholders to ensure resilience and accountability in risk governance (Le Masson & Lovell, 2017b).

In this context, legal and social protections are fundamental to protect excluded groups from discrimination and abuses. The protection of persons in the event of disasters is currently regulated by international nonbinding frameworks and national legislations. The CRPD vulnerability paradigm and its discrimination framework not only provide a strong legal framework for persons with disabilities in disaster scenarios through reasonable accommodation and universal design, but also offer guidance for deep transformative changes to tackle systemic discrimination and to foster capacity building more broadly.

The CRPD can be distilled to offer helpful and practical tips on how to apply an HRBA in real practice by following its "twin-track approach" to DRR: empowering people with disabilities by building individual capacity and reducing vulnerabilities, on the one hand; while, on the other hand, developing inclusive DRR policies to increase awareness of people' needs and capabilities and to improve the preparation and training of disaster practitioners.

According to Article 11, the CRPD must be implemented in situations of armed conflicts, natural disasters, and humanitarian emergencies, by including the needs and voices of persons with disabilities in all stages of Disaster Management. The CRPD elements highlighted in the previous sections could represent a way to effectively reduce vulnerability in the long term (Kelman et al., 2017a), providing a practical guide to make DRR inclusive as it requires a commitment to persons with disabilities, and to review it regularly. This approach involves persons with disabilities in positions of leadership and decision-making processes because they are in the best position to give recommendations on how to be inclusive, to raise awareness on issues that persons with disabilities face, in particular with regard to DRR agencies and organizations, and to build as much as possible using universal design principles (Njelesani et al., 2012c).

Monitoring the Implementation of DRR in Times of Soft Law

The ILC Draft Articles on the Protection of Persons in the Event of Disasters

As of today, the field of DRR is regulated mainly by soft law instruments such as the 2015–2030 Sendai Framework for Disaster Risk Reduction (SFDRR). Considering the intensification in the number, and consequences, of disasters, and an international inclination to improve the institutional and operational effectiveness of humanitarian assistance delivery, in 2007 the International Law Commission introduced the topic of the protection of persons in the event of disasters in its agenda, appointing Mr. Eduardo Valencia-Ospina as Special Rapporteur. In 2016, the Commission completed the second reading of a full set of 18 Draft Articles and recommended the UN General Assembly to elaborate a framework convention based on them (International Law Commission (ILC), 2016). To reach a wider consensus and to tackle issues not consolidated in the practice (Bartolini, 2017), the ILC has followed a dual approach in the elaboration of the Draft Articles. It has tried both to codify the already existing practice and doctrine and to foster its further development, although there is no specification on the nature of each article (Murphy, 2016).

The Draft Articles recognize international disaster law as an autonomous branch of international law whose principal aim is: "*to facilitate the adequate and effective response to disasters, and reduction of the risk of disasters, so as to meet the essential needs of the persons concerned, with full respect for their rights*" (Draft Article 2). DRR falls in the scope of the Draft Articles, and it is the subject of Draft Article 9 (Reduction of the risk of disasters): In its broad scope, the duty to reduce the risk of disasters is drawn from principles emanating from IHRL, IDL, DRR, and Climate Change instruments. Its content is shaped by the due diligence approach typical of International Environmental Law, leaving States a margin of discretion on the measures to take, providing that they adopt a certain conduct (Zorzi, 2018). With this progressive Draft Article, the ILC endorses the recognition of the essential role of DRR by the international community, as enshrined in the SFDRR 2015–2030, with its strong call for "*accountability for disaster risk creation … at all levels*" (United Nations, 2015–2030).

The ILC Draft Articles acknowledge the importance of human rights in disaster settings: the commentary on draft article 9 (Disaster Risk Reduction) states that "*protection entails a positive obligation on States to take the necessary and appropriate measures to prevent harm from impending disasters*" as confirmed by international tribunal jurisprudence affirming the duty to take preventive measures (ILC, 2016).

The ILC stresses for the reduction of risk caused by a hazard as distinguished from the prevention and the management of disasters. The ILC Draft Articles reaffirm the fundamental principles of State sovereignty and nonintervention while stating the existence of a primary duty of the State to establish a normative and administrative framework on DRR that follows a due diligence approach in identifying, mitigating, and accounting for the negative impacts caused by human activities (Sossai, 2018b). Draft Article 5 reaffirms the general rights-based nature of the Draft Articles as "*persons affected by disasters are entitled to the respect for and protection of their human rights in accordance with international law*"; however, the rest of the Draft Articles are more duty-oriented, focusing on the rights and obligations of the State vis-à-vis other States, rather than those of the States toward individuals (Hesselman, 2018). The Special Rapporteur himself recognized the presence in the Draft Articles of a tension between the protection of the rights of disaster-affected persons and the principles of territorial sovereignty and noninterference in internal affairs of the affected States. Some authors (McDermott, 2018) claim the ILC has been cautious about a full embracement of a human rights-based approach to the protection of persons in the event of disasters, probably anticipating the reactions of UN Members States, who have a general preference for soft low outcomes as they infringe less on their sovereignty. Consideration of the Draft Articles by the General Assembly, originally scheduled for September 2020, has been deferred to the 78th session of the Assembly in 2023.

Today, the "Draft Articles on the protection of persons in the event of disasters" held a nonbinding legal status; nevertheless, they have already allowed for a better understanding of international legal obligations in the context of disasters, and promoted the development of a more coherent body of IDL, by overcoming that sectoral approach that has traditionally characterized this branch of law (Cubie, 2017). Moreover, as it has happened for the ILC's Draft Articles on State Sovereignty, which were cited by courts and tribunals prior to their formal conclusion, the Draft Articles on the protection of persons in the event of disasters could be used in a similar way. As a matter of fact, because of their strong persuasive character, other than addressing the fragmented nature of IDL and encouraging its progressive development and codification (Connolly et al., 2016), the Draft Articles on the protection of persons in the event of disasters could significantly shape the planning and implementation of national Disaster Management policies to ensure an enhanced level of human rights protection. The ILC Draft Articles could also play a role in the monitoring of human rights by UN Treaty Bodies.

Despite having a strong human rights grounding, as recalled, the SFDRR does not pose any binding obligations upon States. Soft law tools present problems in terms of accountability and implementation, even though the SFDRR provides a set of specific indicators to facilitate the States' monitoring activity. The SFDRR is strictly interrelated with the 2030 Agenda for Sustainable Development that has Goals with targets related to DRR, and the SFDRR can contribute to the realization of all the 17 goals and has explicit references to human rights, enshrined in its ultimate aim of "leaving no one behind." Conversely, rights enshrined in human rights covenants and in the CRPD are particularly relevant to better understand the 2030 Agenda and to practically implement the SDGs. In particular, the CRPD principles are favorable to the realization of the whole Agenda.

The Role of UN Treaty Bodies UN Treaty Bodies, in charge of the monitoring of Human Rights covenants, can play an important role in supporting the implementation of the 2030 Agenda. In fact, UNTBs and the 2030 Agenda mutually interact in at least two ways. First, by gathering a significant amount of information related to the realization of a specific provision through their reporting procedure, UNTBs become a source of data to monitor the implementation of related SDGs, for example, by requesting data on the employment of persons with disability in the open-labor market in a specific sector (OHCHR, 2016). Second, UNTBs also facilitate the assessment of the "leaving no one behind" principle, focusing the attention on the most marginalized individuals and groups, and driving States' attention to the existence of multiple drivers of inequality and on the social construction of vulnerability. In this sense, UNTBs further strengthen the negative correlation between inequality and development effort, other than just recognizing it as a human rights violation. Henceforth, UNTBs go beyond the mere assessment of the situation of those at risk to be left behind as they actually identify implementation gaps, areas of main concerns, as well as risks and challenges, and suggest the next steps to adopt in their regard. As a matter of fact, UNTBs Committees usually recommend the adoption, the amendment, or the revision of laws and policies that protect individuals against any form of discrimination, including the provision of effective remedies. For example, the CRPD Committee in its Concluding Observations often recommends the inclusion in law of the denial of reasonable accommodation as a form of discrimination, in particular in the field of education and employment (see CRPD Concluding Observations on the Former Yugoslav Republic of Macedonia, 2018). Again, according to UNTBs, the collection of disaggregated data is extremely important for effective disaster prevention and preparedness in order to formulate more tailored and context-specific policies and programs (see CRC Concluding Observations on Saint Vincent and the Grenadines, 2017).

CRPD Article 11 is the only binding provision in IHRL citing "natural disasters" as a situation in which a State Party must ensure the protection of persons with disabilities, which offers huge potential in fostering the implementation of soft law instruments, as it calls for a human rights-based approach to humanitarian assistance (OHCHR, 2015). The CRPD Committee has already developed a consistent practice explicating the measures to take in order to ensure the protection of persons in humanitarian emergencies, including the following: the meaningful participation and consultation of persons with disabilities through their representative organizations; and ensuring that all strategies are inclusive and accessible and in line with the SFDRR by, for instance, optimizing the use of mass media, by providing the necessary assistive devices and by adequately training emergency relief personnel on an age and disability approach. States actions are required by the CRPD in all phases of Disaster Management, from DRR, prevention, and preparedness to rehabilitation and reconstruction, as well as rebuilding processes. The Committee has also stressed the importance of mainstreaming disability in resettlement and refugee policies, and of prioritizing the safety of women and children with disabilities. The Committee has often, though generally, recalled the SFDRR with regard to the adoption of compliant legislation, while it has extensively cited the 2030 Agenda in a very detailed manner. In this way, the Committee has eased States' work in keeping track of their progresses in the implementation of both the Convention and the 2030 Agenda. The CRPD Committee should adopt the same approach when citing the SFDRR so that States could harmonize their efforts, by implementing tailored strategies in line with the two frameworks and the Convention. Moreover, such an approach would also be helpful for all the other stakeholders involved in the monitoring process, such as civil society organizations and national human rights institutions, compensating the lack of expertise on technical topics. Moreover, the CRPD Committee should consider citing the work of the ILC with regard to the protection of persons in the event of disasters in its upcoming General Comment on Article 11, as well as the Sendai Framework and the SDGs, because even in their current nonbinding status, they constitute a strong advocacy tool and an authoritative interpretation to strengthen the interpretation on DRR- and CCA-related provisions.

Conclusion

Although UNTBs outputs are not legally binding, their potential in contributing to the monitoring of the implementation of DRR soft law instruments is not only limited to Concluding Observations and General Comments. Other than the state-reporting procedure, the consideration of individual communication, and its follow-up procedures, contributes to shaping the expectations on what is considered of an appropriate behavior from States, in strengthening human rights standards, and in identifying human rights claims vis-à-vis stakeholders. Most importantly, they reinforce the international obligation to apply a human rights-based approach to DRR and CCA measures and provide specific indications on how to practically implement that approach. Therefore, TBs strengthen the connection between DRR-related objectives of the various international agendas and compensate the current lack of a binding treaty regulating the protection of persons in the event of disasters by also reinforcing the synergetic implementation and monitoring of relevant soft law tools, namely, the SFDRR and the SDGs.

In particular, the case of the CRPD was raised as a demonstration that the mainstreaming of human rights standards can contribute to make the management of disasters more efficient and effective: In fact, through its principles and formulation, the CRPD provide a guidance to formulate and implement inclusive and human rights-based CCA/DRR measures.

There is a full convergence between the main principles of the CRPD and those at the basis of an effective people-centered approach to DRR and CCA. Moreover, CRPD's specific elements lead to effective and people-centered DRR: First, the vulnerability paradigm and the robust nondiscrimination framework enhance legal protection, which is extended to all individuals discriminated on the basis of disability. The CRPD's accessibility perspective entails the concepts of "transformative equality" (obligation to provide accessibility, universal design, awareness-raising, and reasonable accommodation) and of "inclusive equality" (redistributive, combating stigma, participative and inclusive, and accommodating) as tools to redress systemic discrimination, achieve positive social change, and empower individuals with disabilities. Embracing all these elements in disaster scenario means that States must ensure the respect of the principle of nondiscrimination in all emergency programs and actions, by duly recognizing the disproportionate vulnerability of persons with disabilities in evacuation scenarios, by providing accessible information and ensuring that humanitarian aid relief is distributed in an accessible, nondiscriminatory way.

Second, the CRPD stand-alone provision on international cooperation (article 32) implicitly underpins inclusive and accessible development to persons with disabilities as a means for the realization of all their rights enshrined in the Covenant, to be achieved through a twin track approach. In combination with Article 11, Article 32 makes the human rights-based approach to development and humanitarian aid a binding obligation under international law, together with the mainstreaming of disability policies and the importance of equal participation.

Finally, the CRPD, with its provision on active and informed participation and meaningful consultation of every individual in decision-making, creates an environment conducive to "good governance," which is part and parcel of achieving effective DRR and CCA.

Thus, the CRPD and its perspective on disability show a still untapped potential in contributing to the evolution of DRR and CCA measures toward being more human rights based and people-centered, enhancing their effectiveness, as well as in sustaining the development of an organic and coherent legal binding framework to protect persons in the event of disasters.

Disability Activism and Advocacy

Disability Activism and Advocacy: Introduction

75

Victor S. Pineda and Serida L. Catalano

Contents

Abstract

The second decade of the twenty-first century has witnessed a multitude of significant changes that have engendered systemic shifts, civic disruptions, and humanitarian crises, which have proven to be especially harmful to those who are most at risk of exclusion, in both the global North and South. In this context, disability activism and advocacy assume a pivotal role in reshaping and restructuring societies, and redefining our conceptualization of emancipatory politics, equity, rights, space, and democracy. Indeed, disability justice activists have been and continue to be instrumental in advancing innovative visions, tactics, strategies, and transformational outreach to dismantle institutional, physical, and attitudinal barriers to inclusion.

This introduction provides a comprehensive framework to understand the foundational role of disability justice advocacy and activism and the inescapable challenges that disability activists must confront to promote inclusion for all and contribute to building more resilient, sustainable, and just societies.

Introduction

The second decade of the new millennium has seen a flood of technological, political, socioeconomic, and cultural transformations. These changes are led in part by systemic shifts, which have caused a surge of instability, civic disruptions, austerity, lockdowns, pandemic outbreaks, protracted conflicts, and humanitarian emergencies. The rights of those at the margins of society are particularly at risk, both in the global North and South, and it is imperative to understand what tools and strategies are available to ensure that all transformations which are required to build a more resilient and sustainable future are also inclusive for all.

Over 15% of the world's population has a form of impairment (WHO, 2011) and with a progressively aging world population and the emergence of non-communicable diseases in low- and middle-income countries; the number of persons with disabilities is predicted to further increase. While disability activism is often incorrectly viewed as only about disability "rights" with limited political impact, in fact, disabled people, disability activism, and advocacy hold a crucial role in transforming both culturally and structurally our societies, by bringing about strong repercussions in our conceptualization of emancipatory politics, rights, space, and democracy itself.

In this section, we aim to emphasize the foundational role of disability justice activists and how activism across the world brings together tactics, strategies, and their transformational outreach. The conceptualization of activism is ultimately connected with that of the border (Brambilla, 2012, Lafanzani, 2012), in that any struggles highlight a separation between insiders, that is right-holders and, outsiders, not holders in the juridical sense of the term. In particular, as Nyers (2008) points out, activism is a vocalizing act of citizenship and is one of the activities that advocacy uses to reach targeted stakeholders. Disability advocacy is defined as any action that speaks in favor of, recommends, argues for, demands, supports, defends, or pleads for or on behalf of social and spatial justice for persons with disabilities. It promotes equality, social justice, social inclusion, and human rights for persons with any type of impairment and aims to eliminate social, physical, and institutional barriers. Disability advocacy recognizes that allies matter, but also contends that self-advocacy – whereby people with first-hand lived experience of disability, perhaps with encouragement and/or support, speak out and act on their own behalf – is critical to bring about change. Disability advocacy also contends that disability is not simply a medical condition or an illness but a social construction and has largely focused on repairing the toxic social isolation, discrimination, neglect, and abuse created by systemic ableism, thus succeeding in rewriting the way in which individuals with disabilities can define – and be defined by – society.

An ableist framework inherently links a "normal" set of human functionings with standards tied to a "normal body." As Rodas (2009, 837) argues, "[w]hen people speak of the social construction of disability, they refer to the view that disability is a social invention, a category determined not by the physical body but by external factors." Such external factors include social, physical, and/or institutional barriers that limit the freedoms of persons with disabilities to participate on an equal basis with others. According to this view, “while people with disabilities may be characterized by some form of physical impairment – blindness, deafness, or paraplegia – the physical condition of the body is secondary to the way that body is defined socially” (Rodas, 2009, 238). From this perspective, disability is “a product of the interaction between the individual and the environment” (Hahn, 1985).

Thus, disability originates from a society whose design or attitudes discriminate against impairment, not simply from the physical composition of the body and/or cognitive structure of the brain. So far, an inclusive space is a place where everyone, regardless of their economic means, gender, ethnicity, disability, age, or religion, is enabled and empowered to fully participate in the social, economic, cultural, and political opportunities that cities have to offer. Inclusive environments consider people’s diversity and break down unnecessary barriers and exclusions in a manner that benefits all. In the urban environment, realizing the politics of difference means building spaces that do not create barriers or prevent participation, and rather promote and defend the access of all groups. It follows that when disability advocates talk about disability as a social construction, it becomes a social and spatial reality that cannot solely be tended to by medical professionals. It must rather be addressed by planners, policymakers, and designers who understand the nuances and diversity of the human condition. Disability advocacy thus brings into focus the enabling and disabling roles of environmental design and raises the possibility of constructing more flexible, sustainable, and just cities.

At the core of disability advocacy lies, the belief that participation is the primary tool for unlocking new capabilities in individuals and in groups, and allows otherwise marginalized individuals to address their respective deprivations by influencing the processes of public decision-making. As the chapter of Maria Soledad Cisternan will show, the negotiation process of the UN Convention on the Rights of Persons with Disabilities (CRPD), as well as its outcomes, have been crucial in asserting the meaningful and effective participation of persons with disabilities as is witnessed by the motto “Nothing about us without us.” The CRPD was the result of a concerted effort of disability advocates whereby people with disabilities affirmed the need to be consulted in all matters affecting their lives, rather than being subjected to decisions made on their behalf.

The participatory processes of persons with disabilities, through organizations of persons with disabilities and their partners, in the negotiation and drafting of the CRPD strongly influenced the outcomes of the Convention and its relevance for persons with disabilities, becoming a striking example of the principle of participation. Indeed, the CRPD enshrines the obligation of States parties to closely consult and actively involve persons with disabilities (art. 4 (3)) and the participation of persons with disabilities in the monitoring process (art. 33 (3)) as part of a wider concept of participation in public life. In addition, through the CRPD, people with disabilities and their representative organizations also generated a consistent paradigm shift from the medical/charity model of disability to the social/human rights model of disability.

The medical model (or biomedical model) considers disability as a problem of the individual that is directly caused by a disease, an injury, or other health conditions, and requires medical care in the form of treatment and rehabilitation (Mitra, 2018). The medical model attributes the problem to the individual, who has a condition that is unwanted and that places him or her in the "sick" role with the aim to "cure" or "treat" (Mitra, 2006). Such a model is based on "divergence from a capacity of conducting current activities considered as a norm" and thus views disability as an inherently limiting characteristic of the individual (Trani et al., 2011).

The CRPD conceptualizes disability through the social/human-rights model, which defines disability as the result of the interaction between people living with impairments and an environment filled with physical, attitudinal, communication, and social barriers. The Convention, therefore, implies that the environment must change to enable people living with impairments to participate in society on an equal basis with others. Unlike the charity or medical model – in which people with disabilities are "objects" of charity, medical treatment, and social protection – the social/human rights model views people with disabilities as "subjects" with rights, who are capable of claiming those rights, able to make decisions for their own lives based on their free and informed consent and be active members of society. According to Nagata (2008), who has been actively involved in the CRPD and in promoting disability-inclusive development throughout her 24-year career with the United Nations, a rights model of disability should integrate three key perspectives and create a space to operationalize local solutions. Her model recognizes:

1. The mutual and dynamic interaction between a disabled individual and their social environments (e.g., social barriers, attitudes, and accessibility).
2. The diversity existing among different types and categories of disabled persons and the difference in their needs and priorities.
3. The relevance of the human-rights-based approach to individual disability experiences in diverse local cultures and customs.

What is innovative about the human rights model is the central role that social barriers and attitudes play, as well as the cultural context of diverse individual disability experiences. In fact, the conceptualization of disability under the lens of the social/human rights model and the principle of participation enshrined in the CRPD are the result of a long battle of disability activists, of which the negotiation and drafting of the Convention is the culmination. As it is sketched out in our chapter in this section, disability advocates in the US shaped new policies, programs, and initiatives framed on a social model of disability to undo generations of harm perpetrated by urban planners who conceptualized disability as a medical abnormality, or social blight. The Independent Living Movement that began across several cities in the 1970s presented, for the first time, a socially and spatially just perspective of disability. This socio-spatial model was seen most clearly in the social justice campaigns of advocates living in Berkeley and featured in the Oscar-nominated feature documentary film *Crip Camp*. From Berkeley to Washington D.C., advocates fought to define and assert the right to the city for, by, and with disabled people. For example, in April of 1977, a historic battle took place in San Francisco where advocates, organized alongside a range of other advocacy groups, staged a critical confrontation for social and spatial justice, with a fundamental right to be considered whole and equal members of the societies within which they lived. Some of the practical tenets brought up by disability-inclusive planning are already embodied in key laws protecting the rights of persons with disabilities. Key federal legislation such as the Architectural Barriers Act of 1968, the Rehabilitation Act of 1973, and the Americans with Disabilities Act of 1990 set into motion mandates, standards, and guidelines aimed at advancing employment and the public participation of persons with disabilities by incrementally removing physical barriers from the built environment. New standards in construction, transportation, and design were enforceable by-laws. Disability advocacy literally changed the face of the nation. By identifying and mandating compliance with anti-discrimination law in education, employment, architecture, and transportation, these laws began to empower advocates in San Francisco, Chicago, Los Angeles, Houston, and Eugene, Oregon, to create pockets of radical inclusion that not only benefited disabled people but also older persons, families with children, and individuals who have temporary or situational impairments.

This section is the result of the critical and ground-breaking work of scholars across the world who are advancing our understanding of advocacy and activism work by disability rights leaders in both the Global North and South. We are seeing the enormous successes resulting from the work of disabled activists and their allies, and as our conception of disability has changed considerably, we no longer have to rely on outdated models to understand the meaning and experience of disability. This work has resulted in enormous gains for people with disabilities around the world, but as the number of people with disabilities is expected to increase, it is critical that today's activists have the knowledge and resources to learn from each other in the ongoing fight for access and inclusion.

A thorough review of scholarship on disability advocacy and activism is more important now than ever. This section sheds light on some key aspects of advocacy and activism that illuminate dimensions that are particularly relevant for the second decade of the twenty-first century, such as the institutional (policies, laws, and social reforms), immediate challenges (e.g., humanitarian crises), and inescapable ones (e.g., aging population), as well as technological innovation.

The authors of these chapters understand the critical role environmental design, social acceptance, and government policy have in creating just, sustainable, and inclusive cities for all. It is our hope that this section furthers the ongoing collaborative work of disability activists around the world, providing just one outlet for us to learn from each other. Complex systemic factors are usually baked into institutions that perpetuate exclusion and marginalization through a range of domains ranging from parent's rights, to technology, to urban planning. Institutional failures too often and for too long have completely disregarded the fundamental rights and dignities of disabled people. For this reason, any approach designed to address these issues must be multidimensional and cross-sectional.

Each chapter will highlight some or all of the five pillars for evaluation and assessment of inclusive urban development as simplified by the DisCo Urban Policy Framework (Pineda, 2020):

- Legislative measures: what do local, national, and international laws stipulate with regard to regulating and mandating disability rights and justice?
- Leadership: what has the highest political authority or executive in this domain said publicly on the topic? Is this a political priority? If so, is there adequate budgetary support?
- Institutional Capacity: do key institutions have the necessary administrative and coordinating capabilities to manage and lead transformation across siloes?
- Participation of the targeted group: what mechanisms and norms exist to ensure substantial, authentic, and representative engagement by diverse Stakeholders and other social groups?
- Attitudes toward the targeted group: What are the attitudes of the general community toward persons with disabilities in a specific domain or policy area?

The chapter from Ikponwosa Ero et al. explores the attitudinal barriers faced by people with albinism in Tanzania and the work of a group of mothers and women with albinism to combat these challenges. Though albinism is a relatively rare condition, rates of disability are higher in Tanzania than elsewhere, and those with albinism in Tanzania face significant discrimination in all areas of daily life. The authors demonstrate the significant human rights work of these mothers, drawing from their ethnographic research in the region. The mothers in the study described how they fought for their children to receive education and healthcare, and recounted their children's experiences of bullying, discrimination, and violence. This chapter illuminates how groups, such as the one created by mothers of children with albinism, can be a key site of human rights activism and asserts that States should see these groups as partners and collaborate with them as such.

The chapter from Pineda et al. shows how people with disabilities have long been locked out of the urban environment due to the practices of architects and planners with the result that solutions to address inaccessibility and exclusion have been lacking. Therefore, the chapter explores the intersection of disability advocacy and urban planning, highlighting how disability advocacy efforts have historically focused on undoing the harms of the planning profession and responding to the consequences of social and economic exclusion. These efforts, including the protests for Section 504 and the 1990 Capitol Crawl in support of the Americans with Disabilities Movement, demonstrate the keys ways the Disability Rights Movement has fought to upend centuries of discrimination and exclusion caused by architects, urban planners, and others by also bringing about a new focus in human-centered design and inclusive development.

This chapter from Holness, W. illuminates the context of parent-led activism in South Africa, by highlighting the barriers preventing children with disabilities from accessing education and healthcare, and the work and methods of their parents in agitating for change. While parents are often critical advocates for their children with disabilities and may play a key role in ensuring their children have access to services and education, this chapter also contends that parental activism is rooted in paternalistic beliefs and the medical approach to disability. Moreover, parental advocacy efforts are dependent on the resources available to the family, as advocacy work requires significant time and the capacity to navigate bureaucratic systems. Many of the challenges faced by both children with disabilities and their parents arise from systemic failures, including the widespread exclusion of children with disabilities from schools in South Africa.

The contribution from Maria Soledad Cisternas sheds light on the genesis and implications of the principle "nothing about us without us," which has been a defining slogan of the Disability Rights Movement, asserting that all decisions relating to a disability must be made in consultation with people with disabilities. This chapter illustrates how the principle shaped the development of the United Nations Convention on the Rights of Persons with Disabilities (UN CRPD), signaling a critical change in the perception of people with disabilities. The author contends that every aspect of the Convention was guided by this principle and illuminates the key ways in which the inclusion of people with disabilities shaped the text.

The chapter from Willis explores the important link between disability advocacy and activism in humanitarian action and its crucial role in impacting the policies, practices, and recommendations set out by international treaties, federal and local legislation, policies, and practices. In particular, central to this movement is a focus on rights, equity, and inclusion, particularly when concerning persons with disabilities and older persons, as well as refugee and displaced populations, who are at an increased risk of experiencing further harm and marginalization as a result of multilayered barriers and compounded (but often inadvertent) discriminatory and exclusionary emergency response mechanisms, human rights and protection systems, and humanitarian action.

The chapter from Mailloux and Ludke focuses on the often unexplored link between disability activism and innovation, which has been made even more relevant by the repercussions of the Covid-19 pandemic and the consequent need to adjust to digital-first communications and hybrid models at work. This contribution aims to compile a wider range of examples of inventions and technologies made possible by the disability community, highlight diverse perspectives from the disability community, and draw recommendations from expert practitioners on the "how" of benefiting from disability-led innovation.

Finally, the chapter from Nzo et al. highlights the crucial aspects and consequences of the aging population worldwide, especially considering the inevitable link between aging and disability. A crucial problem for older people is the risk of institutionalization. This is despite the fact that the literature indicates the reduced costs of living in communities compared to institutions, coupled with evidence showing that older persons and persons with disabilities prefer to stay in their homes and communities. This chapter explores the critical thinking around an institutionalized and independent living arrangement that can enhance sustainability and resilience in community living arrangements and provides the reader with a comprehensive understanding of how movements led by persons with disabilities bring social innovation to activism and advocacy for sustainable and resilient community living arrangements for an aging population.

The authors contributing to this section all understand the critical role environmental design, social acceptance, and government policy have in creating just, sustainable, and inclusive cities for all. It is our hope that this section furthers the ongoing collaborative work of disability activists around the world, providing just one outlet for us to learn from each other.

Contents

Abstract

Human rights activism is often undertaken by human rights defenders (OHCHR [Office of the United Nations High Commissioner for Human Rights], *Who is a defender*. https://www.ohchr.org/en/issues/srhrdefenders/pages/defender.aspx, 2020). The most obvious human rights defenders are those working in organizations dedicated to human rights. It is neither the role nor institution that

determines if one is a human rights activist or defender but rather the "human rights character of the work undertaken" (OHCHR, *Who is a defender*. https://www.ohchr.org/en/issues/srhrdefenders/pages/defender.aspx, 2020, para. 18). The activism carried out by the network of women impacted by albinism in Tanzania, consisting of women with albinism and mothers of children with albinism – the latter being the primary subject of this chapter – bears the hallmark of human rights. The Mamas' Groups, as they are commonly known, work and live in rural conditions with many of them being illiterate. The mothers, as the data will demonstrate, have undertaken human rights work in the advancement of both their rights and those of their children.

Keywords

Albinism · Human rights · Women human rights defenders · Mothers · Parent-led advocacy · Tanzania · Children with albinism · Mamas' Groups

Introduction

In this chapter, we present an analysis of the activism of the mothers of children with albinism, a relatively rare and little-understood disability, through the conceptualization of their rights. We draw on a study on mothering, albinism, and human rights underway in Tanzania (Social Sciences and Humanities Research Council Canada #435-2019-1120), and the work of the United Nations (UN) Independent Expert on the enjoyment of human rights by persons with albinism with the mandate to conduct official country visits, and survey persons with albinism and their representative organizations. We provide insights into the stigma and attitudinal barriers which impact the enjoyment of various human rights and the role of mothers of children with albinism as defenders and implementers of those rights.

Background

Albinism

Albinism is a relatively rare, noncontagious, genetically inherited group of conditions resulting in little to no pigmentation in the skin, hair, and eyes (Kromberg & Manga, 2018; Kromberg et al., 2020). The condition affects people worldwide regardless of ethnicity or gender. While several types exist, oculocutaneous albinism type 2 is the most visible and the most prevalent in sub-Saharan Africa (Kromberg et al., 2012). The health implications of albinism center on vulnerability to skin cancer which kills a significant number in developing countries where access to healthcare is precarious. Albinism often leads to vision impairment that requires assistive devices. Tanzania has a relatively high prevalence of albinism with a 2012 census citing 1 in 2,673 (the United Republic of Tanzania, 2014, 2016). This is likely an underestimation because of challenges to data gathering in rural areas and fear of self-reporting related to Tanzania's history of violent attacks against persons with albinism (de Groot et al., 2019; Lund & Roberts, 2018). Persons with albinism in Tanzania face stigma and discrimination in nearly all aspects of life (e.g., education, employment, healthcare, and marriage). They also face ritual attacks motivated by erroneous but widespread beliefs that the body parts of persons with albinism can be efficacious in bringing good luck or wealth. This has resulted in multiple cases of grave desecrations, trafficking, ritual rape, and other forms of harmful practices (UNGA [United Nations General Assembly], 2017a; Under the Same Sun, 2020). Women and children bear the burden of human rights violations arising from albinism (Reimer-Kirkham et al., 2020; UNGA [United Nations General Assembly], 2020).

Parents' Advocacy and Albinism

Parents of children with disabilities in developing countries, rural areas in particular, face multiple challenges, specifically in the area of socioeconomic rights. These rights encompass access to an adequate standard of living in order to attain an appropriate standard of health. (Carey et al., 2020; Tigere & Makhubele, 2019). In parts of Africa, parents of children with disabilities also face stigma and accusations of witchcraft and wrongdoing on the basis of the disability of their child (Reimer-Kirkham et al., 2020; Tigere & Makhubele, 2019).

Increasing evidence shows that early intervention and parent training programs, to support children with disabilities, improves parent's self-efficacy. Healthcare workers are then able to implement such training and improve parenting self-efficacy (Hohlfeld et al., 2018). A scoping review (Hohlfeld et al., 2018) found that such intervention in the case of children with neurodevelopmental disabilities had "numerous psychosocial benefits for parents, including an increase in parental empowerment, a decrease in parental stress and the improvement of parental self-efficacy" (p. 1).

Mothers of children with disabilities develop a unique skill amassed from navigating the barriers to social inclusion on behalf of their children (Carey et al., 2020; Runswick-Cole & Ryan, 2019). Their potential activism as ongoing and coordinated efforts – not merely temporary or individual – remains undervalued by society (Ryan & Runswick-Cole, 2008). A study by Lynch et al. (2014) on albinism in Malawi identified mothers of children with albinism as potential advocates to mitigate the effects of isolation that often flows from bearing and rearing children with albinism. Although the role of activist-mother could be dismissed as a by-product of a maternal instinct, this view does not factor the discrimination both "directly and by proxy" faced by mothers of children with disabilities (Ryan & Runswick-Cole, 2008, p. 202). The combined effect of discrimination based on gender and discrimination against persons with albinism, a little-understood disability, multiplies the barriers for women with albinism and for mothers of children with albinism (Ero, 2017; Reimer-Kirkham et al., 2020). The experience of such women and children must also be understood within the patriarchal norms that suppress many women in Tanzania (Imafidon, 2018; Nyangweso, & Olupona, 2020; Reimer-Kirkham et al., 2020).

Locating the Activism of Mothers Impacted by Albinism within an International Human Rights Framework

Human rights are entitlements inherent to each human being (UNGA, 1948). Corresponding to these rights are duties to promote, protect, and fulfil human rights, and the state is the primary duty-bearer in this regard (OHCHR, 1998; ACHPR [African Commission on Human and People's Rights], 1981). At the core of human rights, whether at the national or international level, is human development including the morals and ethics that facilitate that pursuit (Rukooko, 2002; Stanford Encyclopedia of Philosophy, 2019). These morals and ethics are undergirded by principles of justice and fairness often embedded in human cultural practices (Rukooko, 2002). It is for this reason that without the use of technical terms in human rights, human beings are able to articulate what may be described as human rights violations.

In international human rights law, on which this chapter bases its human rights discourse, and where, in the last decade, a significant increase in attention to the rights of persons with albinism in Africa is noted (UNGA, 1948; Reimer-Kirkham et al., 2019; UNGA, 2019), persons with albinism hold the same fundamental rights as any other individual or group. These include the rights to life, security of person, equality, and nondiscrimination irrespective of, inter alia, impairment and gender, the right to the highest attainable standard of health, and an adequate standard of living. There are also international conventions for specific groups such as the UN Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) and the UN Convention on the Rights of Persons with Disabilities (CRPD) with counterpart African Protocols (Maputo and Disability Protocols, respectively). Persons with albinism are a constituency of persons with disabilities, and as reports from the Independent Expert indicate, access to the CRPD protection framework is often granted to them on the basis of their visual impairment alone (UNGA, 2019). However, persons with albinism also face discrimination stemming from their unusual appearance, in particular their skin color (Mswela, 2018; Phatoli et al., 2015; UNGA, 2017b). This suggests that persons with albinism encounter multiple and intersecting discrimination. Multiple discrimination is a situation where a person can experience discrimination on two or more grounds, in the sense that discrimination is compounded or aggravated. Intersecting discrimination refers to a situation where several grounds for discrimination operate and interact with one another at the same time in such a way that they are inseparable (UNGA, 2017b).

The harmful practices faced by persons with albinism are defined as "persistent practices and forms of behaviour that are grounded in discrimination on the basis of, among other things, sex, gender and age, in addition to multiple and/or intersecting forms of discrimination that often involve violence and cause physical and/or psychological harm or suffering" (CEDAW & CRC [United Nations Convention on the Rights of the Child], 2014, p. 524). According to the CEDAW Committee, "the practice of prescribing sex with girls or women with albinism as a cure for HIV, ritual killings and attacks on persons with albinism, including women and girls, the use of their body parts for purposes of witchcraft, and the stigma and social exclusion suffered by mothers of children with albinism" constitute harmful practices (UNGA, 2017b, p.8).

The African Charter on Human and Peoples' Rights establishes a general obligation that state parties should put in place "special measures of protection" (ACHPR, 1981, p. 6) for persons with disabilities in articles 18(2) and 18(4). The African Disability Protocol reaffirms many of the core provisions of the CRPD (Appiagyei-Atua, 2017). In addition, the protocol explicitly recognizes persons with albinism as persons falling under the scope of the protocol. It also has an expanded section on harmful practices which is among the key aspects distinguishing it from the CRPD. The CRPD and the protocol stipulate support for persons with disabilities, and their family members, as a cross-cutting principle directly linked to the realization of their rights and the general obligation of the state to carry out specific measures (UNGA, 2016).

Human Rights Defenders

Article 1 of the Declaration on the Right and Responsibility of Individuals, Groups and Organs of Society to Promote and Protect Universally Recognized Human Rights and Fundamental Freedoms (also known as the "Declaration on Human Rights Defenders") states that "everyone has the right, individually and in association with others, to promote and to strive for the protection and realization of human rights and fundamental freedoms at the national and international levels" (OHCHR, 1998, para. 9). However, doing so in non-orthodox ways, for instance, through narratives, storytelling, and support groups, means that these groups using non-orthodox approaches are not often recognized, supported, and protected as human rights defenders (Child Rights Connect, 2020).

According to the Office of the High Commissioner for Human Rights (OHCHR) (2020), human rights defenders are best identified by the work they do and the contexts in which they work. They often serve particular groups, such as women or children, and participate in activities that may not overtly be labeled as human rights, but which, in reality, contribute to the realization of international human rights standards (ACHPR, 2015; Rukooko, 2002). The three minimum standards of a human rights defender include (i) the advancement of human rights; (ii) the acceptance of the universality of human rights, meaning, they shall not promote human rights in a way that contradicts human rights or promote human rights in a discriminatory manner; and (iii) they ought to use peaceful means for attaining their goals (OHCHR, 2020). These three elements are found in the activism of the mothers who are the subject of this case study and who often take on the role of defending and realizing the human rights of their children with albinism.

Extending the Disabilities Discourse: Lessons from Fieldwork

In the remainder of the chapter, we extend existing disabilities and human rights discourse by drawing on lessons from Tanzanian fieldwork that illuminate how parents (mothers in this case; pseudonyms applied) become human rights activists to protect and realize the human rights of their children with albinism.

Describing the Study

In the context of a critical ethnographic study exploring the resilience of mothers impacted by albinism, at the intersection of gender and religion, we recruited participants through convenience and purposeful sampling by collaborating with a local nongovernmental organization (NGO) and other local and international key stakeholders from both urban and rural experiences in Tanzania. During two field visits, ethnographic data collection consisted of sharing circles (akin to focus groups), conducting in-depth semi-structured interviews and participant observation. Sixty-two participants were recruited: 26 mothers impacted by albinism and 36 key stakeholders (see Table 1). We conducted fieldwork with three Mamas' Groups (one urban, two rural) comprised of women impacted by albinism, whether as persons with albinism or as mothers of children with albinism.

Qualitative methods of data analysis facilitated by NVivo™ led to a final coherent analytic narrative (for detailed description of study methodology, see Reimer-Kirkham et al. (2020) and project blog at http://www.motheringandalbinism.com). Research ethics clearance was granted from the university in Canada, Tanzania's National Institute of Medical Research (NIMR), and the Tanzania Commission for Science and Technology (COSTECH).

Firsthand Accounts of Human Rights Violations and the Activism of Mothers of Children with Albinism

Based on information gathered in 2014 and 2019, the core human rights issues faced by women and children impacted by albinism globally are characterized by the following elements: blame and abandonment after having a child with albinism; increasing poverty; health risk for women and children with albinism; sexual violence for women with albinism; heightened vulnerability to attacks; impunity in context of access to justice; reprisals; and displacement (UNGA, 2020). The current study confirms the relevance of these elements and reveals some nuances, such as a general deprioritization of those elements that are related to attacks. The study highlights elements facilitative of social inclusion, particularly attitudinal change and socioeconomic rights. Importantly, it shows that mothers engage in human rights activism even when the technical language of human rights is not explicitly stated. The Mamas' Groups allow a consolidation of experiences – whether urban/rural and despite economic and educational differences – from which patterns of human rights violations are traced below.

Table 1 Demographic data

Mothers (N = 26)	
Mothers of children with albinism	9

[a] While no participants identified ATR as prime religion, there was evidence of how ATR overlaps with mainstream religion in participant interviews and observation

Poverty and the Intervention of Mamas' Groups

A lack of access to resources influences the day-to-day lives of the mothers. Many are already living in deprivation when they give birth to a child with albinism, in turn, resulting in an extreme form of subsistence if abandoned. They refer to poverty as a barrier to independence, dignity, and the ability to access education for themselves and their children. After describing two instances of attempted kidnapping of their daughter, Amana explained their situation:

> If we have food for the day, fine. If we don't, fine, but the way we are in this dead end [situation] where...I can't even manage to look for a job that is a working job because I have to somehow be there for the child [for her safety]... We struggle a day at a time.

In the context of poverty and scarcity, Mamas' Groups are a place of generating income through various activities, such as the production of high-quality crafts that are sold at markets frequented by international tourists. Additionally, they engage in a micro-savings and micro-loan system accessible only to members of the group. These activities fulfill, in part, the socioeconomic rights of mothers of children with albinism who have been abandoned by their partner. As expressed by one mother, Margreth: "So now at least if you have. . .a job. . .which you earn an income you will help your kids rather than depending on the husband." Other women with albinism in the group voiced the same sentiment, adding that the group gave them purpose:

> [I am] so grateful because of the support and the encouragement I get from this group...every time I come. . . I get encouraged and more hopeful that I have a means to somehow meet the needs of my children and raise them better. (Sharing Circle Participant)

Russom remarked:

> ...the soap making...gets some money that helps me get my daughter going for the next day, and also income we get from this group somehow pushes it. Of course it's not enough... everybody [in my family] is still getting a share from this little income that I have.

Even with the support of Mamas' Groups and the subsequent economic advantage, Russom noted that there is still room for progress, stating that despite "economic empowerment. . .the support is still not sufficient because we still have routine needs." Russom's insight describes the various social determinants of health impacting her and her family along with the other mothers. These illustrate areas where government policy and action must meet the efforts of individuals, groups such as these Mamas' Groups, and the work of NGOs/civil society organizations (CSOs).

Mothers also recounted multiple ways in which they advocate for access to education and health services. They tend to be the ones taking initiative to ensure the child has access to healthcare such as dermatologists or vision specialists. Amani explained, "I was the one. . .to advocate for schooling, glasses. . .I was dealing with my children all alone and following up on everything."

Where the child is enrolled in school, mothers indicate their concern for reasonable accommodation. The teacher may be unaware of the child's vision impairment or may be unwilling or unable to make accommodations. Mothers also spoke about bullying from other children which interferes with the child's learning. Amana reflected on her daughters' experience in school: "So the [other] kids really stigmatize her. Sometimes she'll come home with no glasses, no shoes." Zainabu, a mother and NGO staff with albinism, described how a mother's advocacy and persistence can be the difference between a discouraged child abandoning school and an empowered child continuing their education:

> Our mom struggled to get us education. I remember other kids were like 'Oh, what kind are you?' They're just touching you. 'Oh, it's just like us, ya.' And when you are a kid you don't know anything. 'Oh, what is this, that is happening to me?' Then sometimes I tell my mom that I don't want to go to school... But our mom was very strong and encouraging...'No, you have to go to school.'

This experience is in contrast to a number of the mothers whose children with albinism have been sponsored by NGOs to attend boarding schools, where both their educational and health needs are met (e.g., sunscreen, mobile skin and vision assessments). Yet, even then, mothers described having to ration a bottle of sunscreen provided by an NGO (where only sponsored children are eligible for the free access to sunscreen):

> One of my children is sponsored...but the other two kids with albinism are not...I will maybe wait until [my sponsored daughter] gets two bottles of sunscreen. Then I will take one and share it with the kids [who are not sponsored]... This is an important issue for us [where] we have more than one kid with albinism and only one is being sponsored and the rest are not sponsored. (Imara)

The Mamas' Groups, along with NGO/CSO support, are avenues to a basic level of human rights attainment.

The Social Support of Mamas' Groups to Counter Attitudinal Barriers

More than an income-generating group, the productivity of the mothers diminishes the deep and multilayered attitudinal barriers faced by mothers of children with albinism. One common barrier centers on myths and name-calling. These often begin from the birth of the child with albinism. A nurse with albinism observed: "You know we have this myth and when you have a child with albinism there are so many myths; many, I mean they can tell [you] anything." Attitudes toward albinism were functionalist at their base, tying the dignity and acceptability of a person with albinism to what they can do and, in the absence of proof to the contrary, considers the person with albinism as inept and incapable of working. As Zahara explained, "So you see your dignity is shattered.... People will kind of dismiss you, 'after all she's nothing, she's just a woman with albinism with nothing to offer." Other attitudes revolve around questions of the womanhood of the woman with albinism especially around her ability to conceive and to be economically self-sufficient. Johari explained that "when you get pregnant having albinism, everyone could feel pity for you, everyone could say that 'who did this to her' as if you have no rights to have that pregnancy."

The mothers who do not have albinism face discrimination on the basis of the albinism of their child. Oyana referred to the frequent name-calling of *zeru zeru* (often translated as ghost "ghost" in Swahili):

> [The] other challenge is from the community. Most of the conversations and disagreements with people always go back to, 'Oh, you're like a *zeru zeru* because you have a child [that is] *zeru zeru.* You're treated like you're not a human being.

Atiena, an NGO staff member, further confirmed how having a child with albinism irreparably taints how the mother is often rejected by her spouse and the community at large:

> They're single mothers. And the rejection and the discrimination does not end with just one child. Even if they have other children without albinism the stigma is still there because they have a baby or a child with albinism in that family.

Several interviewees observed that public name-calling was decreasing compared to the time of their upbringing ten or more years ago. Oftentimes, this decline was attributed to public education – either at the individual or community levels by groups, such as NGOs/CSOs, and through the work of Mamas' Groups.

Mothers expressed knowledge of how to change negative stereotypes and attitudes from society toward their child with albinism. One of the means is through parental acceptance and love of the child:

> If parents, both father and mother, accept the child and treat and love them, the community loves them too. But if you show discrimination to your child then the community is learning from you and they discriminate more. (Penda)

At the societal level, social inclusion efforts done early are key, as Zahara explained:

> So you see when you raise a child in an environment that is not friendly to the society, they grow in that isolation. Then it is very hard for them to mingle with the community. So it has to start, the integration [in society] as early as you can.

The result is that the mothers have been equipped to raise awareness about albinism in their community. Imara noted that this action has reduced the teasing and name-calling in her community, such that her children with albinism are respected more than before. Even though several other Mamas' Group participants shared this sentiment of a decrease in name-calling, some pointed out the limits of their efforts because they, as one explained, "cannot perceive what someone is thinking in his or her own mind about [my] children."

The productivity of the mothers through their income-generating activities is also a concrete response to attitudinal barriers, based on functionalism and their ability to contribute to society. As explained by Russom:

> The society could not understand if [we], women with albinism can do anything. They did not believe that we can work or have a business. But from our [Mamas'] groups it seems that people will learn we can work, and can do a lot together with other people. So that's one of the things that society could learn.

Another added:

> The things we've been doing as a group has also earned us respect out there in the society because this group is a classic example that if you empower women, we are capable. And the things we make here are made by both persons with albinism and mamas who have children with albinism and make a very good indication [to society] that, 'yes they have albinism but, they are making fabulous stuff.' (Sharing Circle Participant)

The income-generating activity thus becomes an awareness-raising in itself which is a counter-narrative to existing misbeliefs and negative attitudes toward albinism. This indirect awareness-raising complements traditional modes of [direct] public education which can inadvertently create an us-versus-them framework, especially when the awareness-raising is done by persons impacted by albinism.

Mamas' Groups as Source of Support Against Gender-Based Violence

The abandonment of children with albinism by their mothers was frequently reported. One interviewee, a Catholic Priest in Dar es Salaam, explained:

> Because men, even having had a Christian marriage or civil marriage or even traditional marriage, where they [get] an albino in the family sometimes the men run away. Leaves the mother alone with the child or children depending who is the first to be delivered. The general impression from the people around to have an albino in the family is not a blessing.

Gender-based violence included attitudes toward marriage that do not culturally approve options for women who wish to leave their marriage. Imara explained that upon the birth of her second child with albinism:

> My husband beat me, saying 'You've not stopped cheating with that albino man up to now.' For me, I knew from deep within that this was my child, his child, I did not know what to do. I contemplated wanting to move out but where would I move out to? There's nobody else who's going to marry a woman with two kids, three kids and two who have albinism. So, I decided to stay for the sake of my children... [I am] single handedly raising my kids. So it's like I am married and not married at the same time.

In the face of gender-based violations from their spouses and the community, the Mamas' Group offers a psychosocial solution. The group is a place of safety where a mother can share her experiences and receive emotional support. As Atiena (NGO staff) reflected, "For those women who have been rejected already, they need to understand that they are not alone." The chairperson of the Mwanza region Mamas' Group, Russom, herself a mother of a daughter with albinism, further detailed the impact of these groups and their broader potential:

> [This] kind of group is a very big help and also it can function to other people and those outside. [If] we could gather other mamas to learn the things that we are doing, because it seems like when they are alone, not in a group, they feel like 'I have a big problem and I can't handle it by myself.' But when you come together, we get to know that we can manage things, that we can do things.

The group offers a critical mass which is important for the condition of albinism that is relatively uncommon. Safiyah explained that “It’s not like the previous [years]. You find yourself just one in your village. But now we can meet even five [with albinism] in the public transport.” The mothers drawing on their experience recognize that visibility can shift community attitudes.

The Mamas’ Group also provides informal and long-term counseling on how to deal with domestic and social challenges. Here, mothers have access to other mothers who have survived their current struggles and have as evidence, their thriving children with albinism. Having learned of the value and dignity of their child with albinism, mothers enter into conjugal relationships from a place of power, often on the condition of acceptance of their child with albinism by the potential spouse or partner. Mothers are also willing to walk away from such relationships, even when it is an opportunity to increase their income.

Mamas’ Group as Protection from Attacks and Harmful Practice

Even though Tanzania has witnessed a decline in reported attacks in the last 4 years, mothers indicated that they still lived with deep-seated fear of attack (UNGA, 2017c). The fear stemmed from both the lack of control of perpetrators and the ability of myths about albinism to morph. Rehema described the attack on her young son while she was not home. A man dressed as a woman wearing a *hijab* entered her home and cut off one of her son’s fingers and attempted to kidnap him. A neighbor recognized the child and was immediately suspicious of the person carrying him. Noticing the child’s bloodied hand and obvious distress, the neighbor whistled for help, and it was the community that prevented the rest of the violent crime. This violence was facilitated by the child’s own father and uncle who, per Rehema, had told her husband, to either leave or recognize:

> the money you have in your own house...why do you sleep hungry and work so hard when you have all the money in the world that you need in your house? If you take that one...and if you just cut a finger, you will be very rich.

Fear of attack in this context has concrete impact on the socioeconomic activities of the mothers. Amana and Imara both identified this as one of their biggest challenges as mothers of children with albinism. Both described occasions of attempted kidnapping that affirmed their fears for the safety and security of their children. Amana explained how she struggles to go to work because her daughter survived an attempted kidnapping as a young child and again recently while she was walking to school. As a result, Amana accompanies her daughter to school, waiting nearby until school is over and then walking her daughter home. For Imara, the perpetrator was a man lurking around her neighborhood looking for her home. Because of her own advocacy within her community, it was the neighbors who recognized the suspicious activity and called for help. Following a series of events that eventually brought the police to her home, Imara stated:

> So this forced me to stay home, I can’t go to work, just watch over my kids. That scared me. I stopped them from going to school. Because I couldn’t ensure their safety.

The Mamas' Groups further empowered mothers to take on the role of protectors of their child(ren), a role normally assumed by the father in a patriarchal society such as Tanzania. Hamida, a social worker, described the following example:

> Two weeks ago another mom called me to share 'there's a number that is calling and saying they are NGO-1 and they were checking on...the child.' The mom asked me, 'do you know that number? I asked NGO-1 if they knew [the number] and they started tracing. Meanwhile, I called the street leaders and told them to be on the lookout just in case someone has bad intentions. In a span of 10 minutes we knew the number was for NGO-2. The child had been seen at a vision clinic and they were inviting her for a follow up [visit]. [In any case], I told the mother, 'continue being vigilant. Take the child as we have confirmed it's a genuine [appointment].'

In Hamida's example, we see the ongoing vigilance and extra precaution warranted by mothers. The Mamas' Groups examined and validated danger that mothers perceived. However, the mothers also reported that physical attacks had generally reduced in recent years, attributed to increased awareness about albinism. NGO respondents, on the contrary, made more frequent references to attacks and physical aggression against persons with albinism. They also raised other examples of harmful practices that are less likely to be reported such as the expulsion of a mother with albinism by her community for being a "curse" or a father cutting, forcibly or without consent, the hair of their child or partner with albinism and selling it. Overall, mothers tended to focus less on thwarting an imminent threat of attack on themselves or on their children but on the removal of barriers to the enjoyment of those rights that facilitate social inclusion.

The Activism of Mamas as Implementers of Human Rights Recommendations

As mentioned earlier, the ultimate responsibility for the promotion, protection, and fulfilment of human rights belongs to the state. In reality, the state is often hindered in its duties by limited resources. Accordingly, the principle of progressive realization or minimum core obligations permits a gradual realization of rights, particularly those grouped as socioeconomic rights including the rights to health, education, and an adequate standard of living (ACHPR, n.d.; OHCHR, 2008).

In the case of women impacted by albinism, having faced years without concrete or sustained intervention from the state, the mothers appear to have taken on this role. They have, through the building of a movement of women impacted by albinism at the community level, "provided a solution to the questions that they were asking themselves" (Joyce). The Mamas' Groups became a collective source of human rights intervention as well as a consolidation of, and complement to, their individual interventions, both in the advancement of human rights for themselves and ultimately for their children. The mothers' interventions are congruent with recommendations made to their government by the UN and the African Union (AU) mechanisms, indicating that the Mamas' Groups are more than a mere social support group.

The Government of Tanzania has been urged via numerous general recommendations from the AU and the UN to incorporate albinism into public health initiatives such as maternal and family support, cancer prevention, and genetic counseling (African Committee of Experts on the Rights and Welfare of the Child, 2016; UNGA, 2013, 2017d). In addition, governments ought to provide access to income-generating activities, as well as access to education including all necessary accommodation and devices. Also, they have been urged to raise awareness on albinism among health professionals and to ensure nondiscrimination on the basis of disability and color. They also ought to provide women impacted by albinism with remedial support when violation ensued including rehabilitation services, in the form of medical, psychological, and socioeconomic support in regaining their livelihood.

In 2016, the Committee on the Elimination of Discrimination Against Women made direct recommendations to the government of Tanzania as follows:

> The Committee urges the State party to reinforce its measures to protect women and girls with albinism from all forms of violence and address the discrimination, stigmatization and social exclusion faced by them. In particular, it calls upon the State party to effectively investigate, prosecute and punish those responsible for such crimes, expand its awareness-raising efforts to combat superstitious beliefs that are detrimental to the well-being of women and girls with albinism and ensure that those women and girls have access, without discrimination or fear, to education, employment, health care and other basic services (CEDAW, 2016, p. 14).

With regard to women in general who are subjects of harmful practices and other gendered forms of discrimination, the CEDAW urged Tanzania:

> To expeditiously adopt, in line with article 5 (b) of the Convention, a comprehensive strategy to eliminate discriminatory stereotypes relating to the roles and responsibilities of women and men in society and in the family, as well as harmful practices that discriminate against women, and create an enabling and supportive environment for women to exercise their human rights. The strategy should include comprehensive education and awareness-raising programmes targeting women and men at all levels of society, with a particular focus on traditional leaders. The State party should also monitor and regularly assess the impact of its measures (CEDAW, 2016, pp. 5–6).

The Regional Action Plan (RAP), 2017–2021, on albinism in Africa includes a measure to promote programs targeting women impacted by albinism (Action on Albinism, 2017). Further, the RAP includes measures encapsulating various recommendations from human rights mechanisms at the UN and AU including awareness-raising, both generally and targeted to health professionals, measures to end harmful practice such as legislation, access to education, and reasonable accommodation (the RAP's online platform is http://www.actiononalbinism.org). According to the RAP platform, Tanzania has met the target on women impacted by albinism including through the Mamas' Group. This is the only indicator on which Tanzania has hit the maximum of 100 percent based on the metric used on the RAP platform. Based on the available data from the Mamas' Groups and reports on the RAP platform, there are sufficient indicators that the activism of Mamas' Groups – and not active government measures – has delivered this target (Action on Albinism, 2017).

Discussion

The activities of Mamas' Groups both implicitly and explicitly show a powerful understanding of their human rights and how these have been violated and the corresponding and effective interventions that are needed, acceptable, and sustainable in their context. The latter two factors in particular are elements that may not be entirely considered when NGOs or governments carry out similar activities. While the government is the ultimate duty bearer in removing barriers to the enjoyment of human rights of women impacted by albinism, the best interest of the child, the absence of immediate and concrete intervention from government, and the capacity of the Mamas' Group to resolve a significant portion of their immediate barriers to human rights ought to be considered in terms of advocacy strategies in the implementation of human rights.

This study supported what was previously reported that the intensity of human rights violations based on albinism is gendered. These violations are disproportionately borne by the mothers of children with albinism and women with albinism. In the context of conjugal relationships, the vulnerability to gender-based violence and abandonment appears to be more severe in women with albinism than mothers of children with albinism because in the latter, the reason for stigma, namely, albinism, pre-dates the marriage or relationship. Negative stereotypes that drive attitudinal barriers in response to albinism tend to be driven by functionalist presumptions whereby albinism and mothers of children with albinism are viewed as a null unit of production in the community. There is a need to include in awareness-raising against attitudinal barriers answers to the particular questions relevant to the community. Awareness-raising on science alone, which is often popular, is unlikely sufficient given the multiplicity of influences in the life of the average modern Tanzanian.

Socioeconomic productivity was the core of empowerment for women impacted by albinism. It is an appropriate response to several human rights issues including attitudinal barriers and an adequate standard of living. It provides a limited respite from abject poverty triggered by various forms of gender-based violence such as abandonment and violence from partners and other family and community members. It was socioeconomic activity that distinguished this group of Mamas from a mere support group. Yet, even the support afforded to the mothers by this group such as a conceptualization of their experiences, a critical mass, counseling, information about albinism including on health and education, as well as protection measures are conditions facilitative of the enjoyment of their human rights and ultimately actualize several recommendations made by human rights bodies to Tanzania.

While the sample in this study is relatively small, it ought to be considered in relation to the relatively small size of persons with albinism who make up less than

1% of persons with disabilities in Tanzania and other neighboring countries. Therefore, the impact of the sample or the Mamas' Group as a whole should not be underestimated. It is also important to note that the Mamas' Group had a head start with support from international actors. However, this alone does not account for the success of the mothers as evidenced from their own responses and advocacy roles.

Mamas' Groups with socioeconomic activities at their core could be replicated to other countries across the Africa region. The relevant targets in the RAP indicate that several contextual similarities exist on this issue which will facilitate transfer to other locations. For example, Mamas' Groups may be considered for replication in Malawi with its similar history of violence against persons with albinism, a significant number of which were perpetrated by parents and other family members of children with albinism (Parliament of Malawi, 2019).

Conclusion

Mamas' Groups illustrate that parent support groups of children with disabilities, in this case albinism, can be a locus, not merely of support to their children but of human rights activism. Based on the evidence, the mothers have met the three minimum standards of human rights defenders. They have (i) pursued the advancement of rights by conceptualizing human rights violations through a consolidation of experiences, (ii) accepted and promoted the universality of relevant human rights by identifying what ought to have been done, irrespective of their gender, or the disability of their children; and (iii) promoted the enjoyment of human rights for themselves and for their children through the peaceful means of socioeconomic projects that facilitate the removal of barriers to the enjoyment of human rights for themselves and for their children (OHCHR, 2020).

NGOs working in human rights and albinism, in particular, should ensure that they frequently check in with community groups such as Mamas' Groups to mutually assess approaches, priorities, and human rights advocacy strategies. States should actively seek out and support groups of parents of children with disabilities such as Mamas' Groups as important partners in their primary duty to ensure the promotion, protection, and realization of human rights of persons impacted by disability.

Acknowledgments We are indebted to the mothers and stakeholders who participated in the study *Mothering, albinism, and human rights in Africa: Mapping patterns of resilience at the juncture of gender, colourism, and religio*n (Funding: Social Sciences and Humanities Research Council Canada #435-2019-1120; Principal Applicant: Sheryl Reimer-Kirkham). Thank you to the NGOs who have supported this project (Under the Same Sun, Standing Voice) and contributed in countless ways (such as providing for the logistics of transportation and interpreters, facilitating REB clearance, recruitment, data collection, and knowledge translation). We are grateful for expert cultural liaison Jane Waithera. With acknowledgment of the project team: Sheryl Reimer-Kirkham, Barbara Astle, Ikponwosa Ero, Lori Beaman, Bonny Ibhawoh, Elvis Imafidon, Jennifer Kromberg, Berthasia Ladislaus, Nomasonto Mazibuko, Innocentia Mgijima-Konopi, Kristi Panchuk, Perpetua Senkoro, Sonya Sharma, Wisdom Tettey, and Boateng Wiafi. Thank you to Ester Rwela for assisting with research ethics clearance and other logistics in Tanzania.

Building Cities for All: Amplifying Advocacy, Access, and Equity in the Urban Century

77

Contents

Abstract

Urban planners in the late nineteenth and early twentieth centuries viewed disability as a deficit to cure or a blight to erase. As a result, the built environment in the twenty-first century excludes, marginalizes, and invalidates the lived experience and basic dignities of 550 million people with disabilities that live in cities or urban settlements.

This chapter centers its analysis on the too often overlooked linkage between urban planning misplaced notions of space, justice, and sociality and their repercussions in the genesis and evolving experience of disability advocacy. The latter, in turn, by responding to and resisting these notions, eventually transformed and reshaped them. After a brief overview of the early urban planners' conceptualization of space and sociality, the chapter displays historical examples from the late nineteenth and early twentieth centuries, thus illuminating the often neglected experiences of disability advocacy in urban policy, planning, and design. In doing so, the authors try to show how early advocates set into motion practices to remedy past failures of urban planning which altered the

Introduction

Dominant architectural and planning practices neglected or purposefully ignored the lived experiences of persons with disabilities. Planners over the years responded in various ways to disability: as a public health issue (Molina, 2006), a public threat (Schweik, 2010), an individual tragedy, a biological deformity (Bond, 1947), social depravity (Longmore, 1985), a moral deficiency, or an ethical duty to solve (Fishman, 1982). Planners have both ameliorated and aggravated the atrocious abuses faced by disabled people (Longmore & Umansky, 2001; Imrie, 1996), and although this history is discussed in disability studies, practitioners and planners have largely failed to notice the centrality of disability advocacy in the urban realm.

To be sure, with few exceptions of scholar-advocates (Dear & Wolch, 1987; Imrie, 1996; Gleeson, 1997, 2001), planning literature does little to explain the ways that the urban experience of disability is situated within the legal, social, spatial, medical, and ultimately urban transformations that influenced the history of planning. Urban planning is in short supply of disability advocacy and as a result has historically failed to see disability as anything other than a medical impairment. As such, the planning profession has to a great part failed to consider social and environmental solutions to address the experiences of people with disabilities. From this perspective, the understudied history of disability advocacy in American cities provides a critical lens from which to understand the development of political efforts seeking to reimagine the role of the built environment and its potential to enable, rather than disable.

Advocates fought to undo generations of harm perpetrated by urban planners who conceptualized disability as a medical abnormality, or social blight.

From Berkeley to Washington, D.C., advocates struggled to define and assert the right to the city for, by, and with disabled people. In April of 1977, a historic battle took place in San Francisco where advocates, organized alongside a range of other advocacy groups, staged a critical confrontation for social and spatial justice, with a fundamental right to be considered whole and equal members of the societies within which they lived.

San Francisco was only one of many battlegrounds on which disability rights advocates claimed and fought for their right to be seen, heard, and considered.

This chapter highlights the underexplored relationships between the practice of urban planning and the advocacy efforts of people with disabilities and their allies.

We contend that disability has historically served as a vehicle for planners to “plan out” functionally impaired and disabled bodies instead of planning them in.[1] Urban planning has long sought to exclude disabled people from the urban environment, marginalizing an enormous subset of the population and largely denying full citizenship to those with disabilities. So far, early urban planning has emerged as the practice of exercising physical and social controls for desired social outcomes. The chapter also discusses how urban planning injustices catalyzed and were transformed by disability advocacy and how the genesis and evolving experience of disability advocacy responded and resisted dominant notions of spatial and social justice eventually reshaping them. By surfacing historical examples from the late nineteenth and early twentieth centuries, early advocates set into motion practices to remedy past failures of urban planning and in doing so altered the social and spatial reality of future generations. So far, by linking multi-generational calls for social and spatial justice, this chapter eventually illuminates the critical yet too often overlooked histories of disability advocacy in urban policy, planning, and design. What emerges is a legacy of resistance that in the late twentieth century fundamentally transformed the social and spatial conceptions of liberty and justice for all.

This matters for discussions on disability advocacy for a few key reasons. First, the history of urban planning is integrally connected to health, disability, and impairment (Longmore, 1985; Longmore & Umansky, 2001). Thus disability advocacy has largely focused on repairing the harms of urban planning. Second, considering disability advocacy as an urban experience illuminates the enabling and disabling role of planning, highlights the socio-spatial dynamics of inclusion/exclusion, and clarifies the motivations of disability advocates to redefine and reclaim public space. Third, the urban experience of disability demonstrates the intersectional nature of the struggle to assert and define access in that the latter is related to not only disability but also race, class, gender, and ethnicity.

The following sections explore the connection between urban planning, disablement, and disability advocacy. The first section of this chapter offers a broad overview of the historical connections between disability and planning by focusing on a few turn-of-the-century planning figures and showing the context within which planners broadly perceived and responded to disability. The second section of this chapter demonstrates how disability advocacy responded to social exclusion and provides case studies of historical and contemporary disability activism to highlight the relationship between urban planning and disability advocacy. Disability advocacy is defined as any action that speaks with or in favor of, recommends, argues for, demands, supports, defends, or even pleads for or on behalf of the social and spatial justice for persons with disabilities. Disability advocacy as a result has, to a degree, succeeded in rewriting the way in which individuals with disabilities can define – and be defined by – society.

---

[1] This work is meant as a preliminary introduction and as such draws from various sources, across various cities, during the formative years of the planning profession in the United States to the present time.

The Medical Model of Urban Planning

During the years 1850–1910, efforts by a handful of urban planning pioneers conceptualized and produced spatial structures of explicit exclusion for large swaths of the population including women, racial minorities, religious groups, immigrants, and the working poor, among others, and last but not least, they too often understudied people with disabilities.[2] Since that time, disability rights and social justice advocates have sought to challenge laws, mandates, plans, covenants, ordinances, and policies that enforce dominant social structures of exclusion and created a built environment that hides people with disabilities and other perceived deviants and/or marginalized identities from public view (Schweik, 2010).

Civic leaders and urban planners during this time viewed disability as a social blight that needed fixing and promoted idealized and romanticized cities: to them, displaying disability in the city signaled not only decay but also social and urban deformity.

Prominent British planner Ebenezer Howard responded to the challenges of urbanization by proposing an environmental determinist cure to the urban ills associated with disability, namely sickness, poverty, and moral depravity. His early and influential work on *Garden Cities* embraced normative ideals of rational order that exiled people with disabilities from urban life. He argued that people with significant impairments would benefit from the virtues that fresh air, sunlight, and open natural settings could offer. In doing so, however, he intended to sequester persons with disabilities away from the non-disabled, creating what Susan Schweik described as “the promise of disability-free boulevards” in urban areas (2009, 146).

Howard’s influential work advanced the notion that the city was no place for persons with impairments and, by doing so, set a trajectory for planners to follow. His Garden City was a radical departure from the status quo in urban planning and was envisioned “to raise the standard of health and comfort of all true workers of whatever grade,” a theme which underpinned the development of a whole range of model towns that sprang up in the nineteenth century. Howard’s 1898 conception of the Garden City involved a particular notion of health and the spatial layout of Howard’s radial city was based on his conception of disability. Howard fundamentally juxtaposed health to disability in his plans and his view of disability as illness, in conjunction with the limited range of planning interventions that were available at the time, relegated disability to the outer margins of urban life.

His plans called for displacing people with disabilities into protected and isolated spaces. In an attempt to provide a place for various marginalized groups, Howard spatialized the zones of care and he took a great effort to define disability categories and territorialize them on his map. As such, Howard’s Garden Cities had specified

---

[2] We understand that there is considerable debate within the disability community on the usage of person-first versus identity-first language to describe the experience and identity of disability. For the purposes of this chapter, we have chosen to alternate between person-first and identity-first language, using both the terms *disabled people* and *people with disabilities* in our writing.

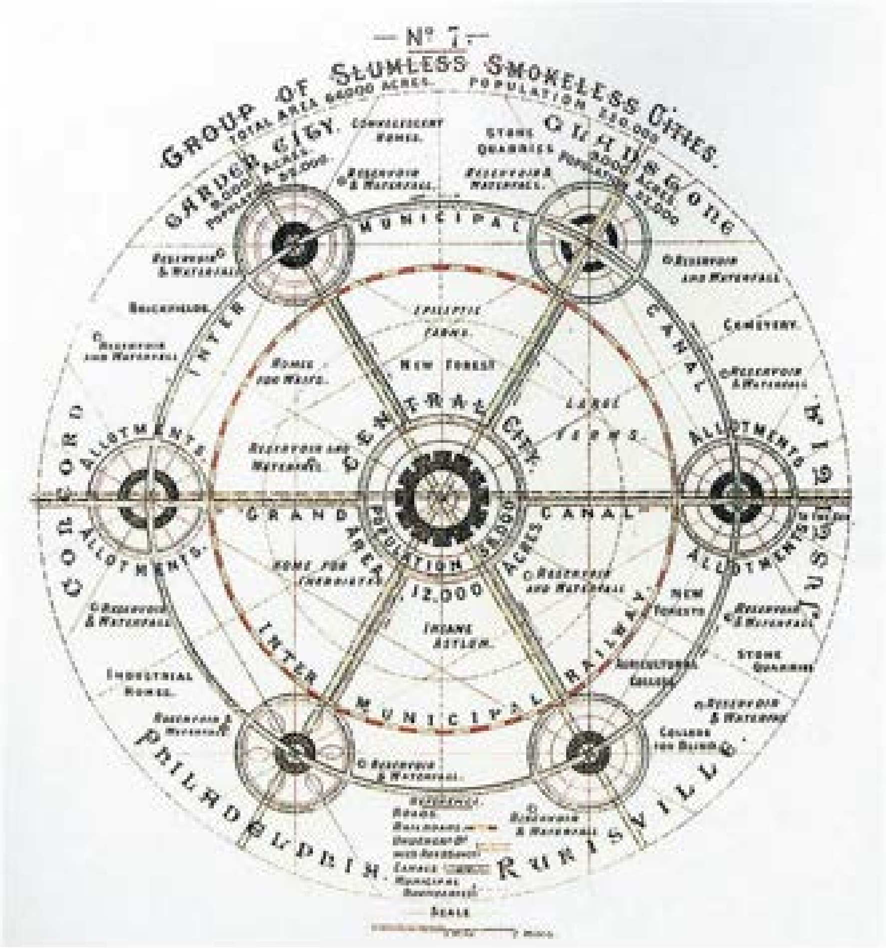

Fig. 1 Howard's Garden City (Howard 1902) planned for disability to exist outside of urban zones

spaces for inebriates, epileptics, lepers, the blind, and the insane (see Fig. 1). By zoning disability, and confining its existence into *spaces of care*, the Garden City rationalized, defined, and controlled the urban experience of disability. Howard thus consciously promoted a notion of spatial segregation of disability which is still dominant a century later in the United States (Wolch et al., 1988; Wolch & Dear, 1993; Dear & Taylor, 1982; Dear & Scott, 1981). Howard notes that "... dotted about the estate are seen various charitable and philanthropic institutions, in an open healthy district... [I]t is but just and right that the more helpless brethren should be able to enjoy the benefits of an experiment which is designed for humanity at large" (Howard 1902, 27). The "more helpless brethren" he was hoping to include in his social experiment embraced those who may not have then identified or been viewed as disabled. However, for all people with disabilities, such "benevolent" schemes are damaging.

Benevolent planning for disabled people (as with all other groups) perpetuates structures of social order and such orders are often reinforced by spatial segregation, institutionalization, and territorialized control. In Howard's seemingly well-intentioned plans, the helpless brethren, of whom persons with disabilities are a part, are pushed farther from sight. The contradictions between planners' intentions and the consequences of their designs are fundamental to the study of urban planning. These contradictions express the inherent tension between planning for and planning with targeted beneficiaries.

After Howard, spatial order and, more specifically, zoning became mainstays of the profession and were used by some planners as a reactive tool to compartmentalize and eliminate marginalized sections of society from parts of the city. To avoid creating a deformed city, planners helped to place human differences out of sight (Schweik 2007). Laws later developed that prohibited those with disabilities and diseases from appearing on public streets because of their displeasing appearance. According to Schweik, these laws reflected how society felt toward marginalized groups and demonstrated society's inability and unwillingness to incorporate human diversity into its perceived image of moral and bodily perfection.

Howard's plans for caring for the disabled in large open estates in part came to fruition in the United States through the architectural and planning efforts of Dr. Thomas Story Kirkbride. Kirkbride was a doctor and an architect who created "The Kirkbride Plan," a nineteenth-century building style that is the direct result of his influential book *On the Construction, Organization and General Arrangements of Hospitals for the Insane*. His book strongly influenced the development of a system of asylums throughout the United States. Kirkbride's plans and architectural designs for the construction, administration, placement, and maintenance of insane asylums did more to zone persons with disabilities out of urban life than any other single effort (Fig. 2) 1848 lithograph of the Kirkbride design of the Trenton Psychiatric Hospital, New Jersey Kirkbride if insane asylums.

Kirkbride Plan buildings were mostly large, imposing, Victorian-era institutions. They were between three and five stories tall, built on large extensively manicured grounds, which often included farmland. According to Yanni (2007, 151),

> A typical Kirkbride Plan building consists of a center section for the hospital administration and a living area for the superintendent and his family. Behind and to either side of the administration section are "wings" that contain patient wards. The patient wards staggered out and back from the administration section. From the air the building would look like a "V" or a "bat wing." Chapels, auditoriums, libraries, and kitchens were often built directly onto the rear of the administration section as this was a convenient, central location for these facilities since the male and female patients resided on opposite sides of the building.

The Kirkbride Plan layout was advantageous compared to previous building styles and was intended to facilitate care through a purposeful spatial distribution. The buildings enabled the arrangement of patients by type and gender, and the noisier and more uncontrollable patients were typically placed in the wards farthest

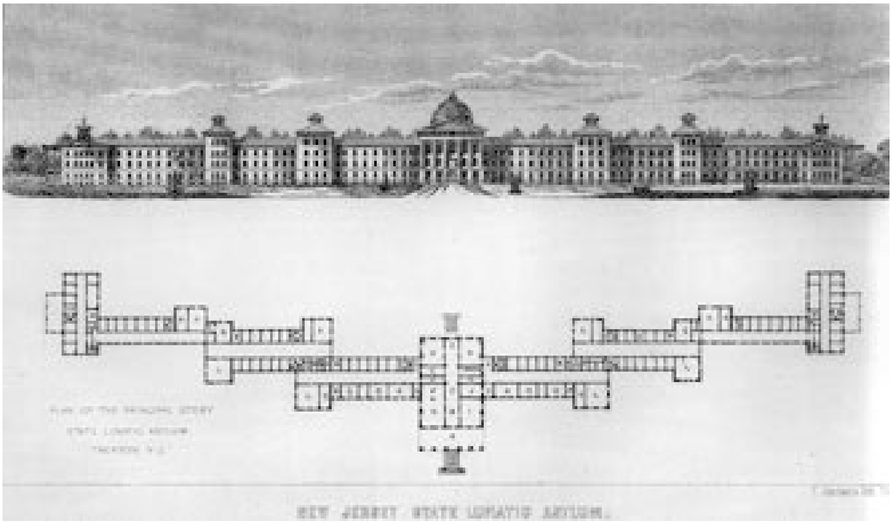

Fig. 2 Kirkbride if insane asylums

from the administration section. The design also allowed for easy expansion of the hospital; additional wards could be built onto the ends of the existing building without disrupting daily life at the hospital. By providing technical solutions to the spatial and functional administration of disability, the Kirkbride asylum was praised by city officials who sought to protect individuals from harm. Under the dominant theories of this time, this necessitated segregation and isolation as many believed that protecting people with disabilities required relocating them from their cities and communities into asylums. Because disability was a constant source of societal anxiety, progressive planners sought to “protect the disabled” by promoting special institutions and policies of institutionalization. These became the principal methods of dealing with disabled people.

Planners supported the institutionalization of persons with disabilities by promoting ordinances that would contribute to cleansing the city of impairments. Asylums for the deaf, dumb, and blind that once operated like local or regional charities were zoned through land grants and organized into federal and state institutions. Institutions received federal and state funds per patient, and thus asylums became a growth industry in the United States from 1850 to 1910. For planners this meant that their technical skills were in demand; put more directly, planners participated in building and zoning the architecture of exclusion. Cleansing the city of people with impairments was seen as a benevolent act that served the greater good *and* a business opportunity.

Immigrants arriving in large numbers also shaped the urban experience of disability. In many accounts, immigrants were seen as an illness or disease that had struck the city (Molina, 2006). According to Molina (2006), immigrants were often targeted as public health risks, a public burden, and dangerous. Immigrants who lived in poverty experienced social and spatial exclusion. Their confinement to a limited supply of affordable housing units promoted crowded conditions and increased the risks of disease transmission. The spatial concentration coupled with language barriers created a phenomenology of disability and social invalidity. Their diminished capacity to exercise individual agency in essence disabled them. Their deficiencies were in part due to the physical squalor and social stigma that limited their societal and functional utility relative to their local American counterparts.

The presence of disability in rapidly urbanizing cities such as New York, Chicago, Philadelphia, and San Francisco needs to be understood from multiple perspectives and with an awareness of the intersectional nature of many experiences. As has been argued, people with disabilities were seen as a burden, or even a threat, but this negative connotation was multiplied for disabled immigrant women, who faced triple discrimination and were vulnerable to exploitation and abuse on the independent facts that they were women, disabled, and immigrants.

Planners prescribed a variety of solutions to alleviate the city's perceived ills and mitigate the threat of contagion brought on by undesirables. Reforms and ordinances were seen as medicine for the disabled city, medicine that targeted the ill, weak, or infirm. Early planners sought to formalize the profession and emphasized the use of rationality and scientific inquiry as a key method for curing social ills. They argued that if science could cure disease, epidemics, and disability, so could urban planners. To them, planners were doctors, capable of healing abandoned, deformed, and unsightly spaces. Early planning studies based on science appeared to have an impact. By the 1860s, quasi-scientific studies commissioned by city managers in - New York, Chicago, and Philadelphia demonstrated the need for radical changes in health and sanitation. A new brand of "urban" science allowed planners to usher in key sewer and sanitary reforms (from 1840 to the 1890s), tenement reforms (1867), and strict immigration laws (1882).

The perceived impact of these laws buoyed the budding profession of city planning and endowed those who practiced it with an increasingly important social role. The laws contributed to controlling the spread of illness, and through sanitary reforms, these legislative efforts curbed the disabling effects of the disease. However, these laws also controlled and contained people, limiting their ability to live amongst and alongside others. In many cases, laws limited and controlled the lives and choices of people with disabilities not because of any real threat to society, but because of the perception of disability. Conceptions of social Darwinism influenced concerns that there existed a strong relationship between physical and mental impairments and crime, unemployment, and other forms of social malaise. Such conceptions led to the view that disability was a threat to the modern urban order. Civic officials in large cities saw disability as incompatible with the physical, social, and institutional order that they were entrusted to ensure.

Notably, not all planners and thinkers held this perspective. Some civic leaders and progressive reformers took proactive steps to plan disability and diversity into the turn of the century American city, rather than planning it out. Mary Kingsbury Simkhovitch, a progressive social reformer and sociologist living in New York City, founded the Greenwich House as a community center supporting women, children, and immigrants, many of whom had disabilities.

She was also active in shaping the profession of planning as it took shape during the turn of the century. Simkhovitch argued that social and physical planning should not be separated from one another and she called for a holistic and more social approach to urban planning (Simkhovitch, 1926). Through her work in almshouses, she came to understand how the social and physical layout of the industrialized city negatively affected women, children, and disabled people. Simkhovitch and her allies worked on housing and city planning in New York City by advocating for more community facilities, services, and networks to help individuals, families, and communities meet their social needs and maximize their potential for neighborhood-scale development (Simkhovitch, 1938). Simkhovitch noted that child labor, infant and maternal mortality, occupational diseases, and industrial accidents are mitigated when physical and social planning occurs in tandem (Simkhovitch, 1917) and she addressed these social issues by providing social services. Simkhovitch proposed three basic tenets for city planning: the provision of social services, community centers to provide such services, and local community involvement (Simkhovitch, 1906). The three tenets she promoted would be heard decades later in New York City in the chants of disability rights protesters who advocated for equitable provision of social services, community centers for empowerment, and measures to increase the participation of people with disabilities in their own communities. For people with disabilities and other marginalized groups, Simkhovitch's ideas ushered in new approaches that brought the targeted beneficiaries to the table.

Disability Rights and Advocacy and the Urban Revolution

The previous sections argue that the planning profession has largely sought to create urban spaces that exclude the needs of individuals living with disabilities, marginalizing an enormous subset of the population and largely denying full citizenship to those with disabilities. Advocacy efforts, to a large degree, have resisted these efforts by establishing and strengthening platform for inclusion and have largely focused on combating exclusionary environments in order to realize the goals of access, equity, and inclusion.

Through a set of interventions, advocates in Berkeley during the 1970s responded to the failure of urban planners to plan for disability and played a significant role in altering the practice of planning to better address the needs of disabled people.

Acknowledging the failures of urban planners to successfully plan *for* those with disabilities, and understanding the role of disability advocacy in addressing these shortcomings, they challenged planners, designers, and city leaders to change course thus bringing about dramatic ramifications for the future of cities.

As a response to the medical model of urban planning, disability advocates in the early 1970s emphasized the enabling and disabling roles of environmental design and raised the possibility of constructing more flexible, sustainable, and just cities. Disability advocates struggled to promote equality, social justice, social inclusion, and human rights for persons with any type of impairment and to eliminate social, physical, and institutional barriers to empower people and unlock their potential. In particular, they fought to show how disability is not simply a medical condition or an illness. As Rodas (2009, 837) argues, "[w]hen people speak of the social construction of disability, they refer to the view that disability is a social invention, a category determined not by the physical body but by external factors." Such external factors include social, physical, and/or institutional barriers that limit the freedoms of persons with disabilities to participate on an equal basis with others. According to this view, "while people with disabilities may be characterized by some form of physical impairment – blindness, deafness, or paraplegia – the physical condition of the body is secondary to the way that body is defined socially" (Rodas, 2009, 238). From this perspective, disability is "a product of the interaction between the individual and the environment" (Hahn, 2003). Thus, disability originates from a society whose design or attitudes discriminate against impairment, not simply from the physical composition of the body and/or cognitive structure of the brain.

When disability advocates talk about disability as a social construction, it becomes a social and spatial reality that cannot solely be tended to by medical professionals. It must rather be addressed by planners, policymakers, and designers who understand the nuances and diversity of the human condition.

The disability rights and independent living movements of the 1970s challenged policymakers, planners, and regular citizens to see disability as a broader social issue (rather than a private, medical one) that was shaped, in large part, due to the work of early urban planners. The movement addressed more than the elimination of physical barriers; it attacked the social and institutional barriers that continuously disable those with impairments. Within a greater social-civil rights agenda, disability activists in the 1970s coordinated social action with research, policy, institutional, and legislative changes to promote, protect, and ensure full and equal participation in the social, cultural, political, and economic aspects of civic life. It gave unprecedented access to the urban environment and dramatically boosted the quality of life of disabled individuals. Many other groups began to receive protections after the passage of the Americans with Disabilities Act: people living with cancer or HIV/AIDS, students with learning disabilities, and workers with invisible disabilities such as chronic pain, arthritis, and myalgic encephalomyelitis, otherwise known as chronic fatigue syndrome, just to name a few. This movement equated physical access to autonomy, mobility to freedom, and thus made the struggle for equal rights an inherently spatial struggle.

Based on planning theories of communal empowerment and organization, there was a strong desire to create a common activist front of the "grassroots disabled" that would eschew the historical divisions between disability groups and the traditional reliance on disability professionals to represent their needs. The remainder of this section provides case studies of disability advocacy in order to illuminate the relationship between urban planning and disability advocacy and further demonstrates how advocacy efforts responded to social and spatial exclusion.

The Disability Rights Movement of the 1970s originated at the University of California, Berkeley, where disabled students who called themselves the Rolling

Quads fought for equal access to education, public space, and independent living. The Rolling Quads aggressively lobbied the city of Berkeley to install curb cuts, going so far as to haul bags of concrete out in the middle of the night to build their own. They eventually shamed the city into creating the first community-wide curb cuts for wheelchair access and fought more broadly for the city to provide tools that would promote independent living and reduce functional barriers to independence. These early activists argued that isolation and segregation due to inaccessibility violated their civil rights and was perpetuated through exclusionary barriers developed by urban planners.

In April of 1977, disability rights advocates launched a series of protests and sit-ins across the country, fighting for regulations to make Section 504[3] of the Rehabilitation Act of 1973 legally enforceable. The most successful of these sit-ins was in San Francisco, where more than 150 disabled individuals and their supporters occupied a federal building for nearly a month, the longest sit-in in American history. Hundreds of their supporters gathered outside throughout the sit-in, and advocacy groups ranging from the Black Panther Party to the United Farm Workers provided material support and bolstered news coverage. These efforts were successful and the regulations were signed, articulating clearly to the American public that the consequences of disability were in fact the result of discriminatory beliefs and inaccessible environments and that the responsibility to repair these harms rests firmly on the shoulders of the government. It is difficult to overstate the significance of this message; the understanding that society is responsible for creating environments that work for everyone rapidly and dramatically changed the face of this country. Well before the passage of the Americans with Disability Act (ADA), Section 504 asserted that any federally funded institution must be accessible to individuals with disabilities, dramatically increasing access and inclusion nationwide.

In 1990, disability activists fighting for the passage of the Americans with Disabilities Act gathered on the National Mall, dropped their mobility aids, and crawled up the steps of the Capitol Building in what was later called the Capitol Crawl. These activists, following a tradition of disability advocacy dating back decades, understood that their disabilities were social and spatial realities, not simply medical impairments, and fought to demonstrate for the country the role of urban design in disabling them. That the Capitol Building, perhaps the most recognizable symbol of democracy in the world, was (and, to a lesser but not insignificant degree, still is) inaccessible illustrated the demands of disability activists for a country that had long ignored the urban experiences of people with disabilities. I. King Jordan, the first Deaf president of Gallaudet University who himself was put into office due

---

[3] Section 504 is a federal law designed to protect the rights of individuals with disabilities in programs and activities that receive Federal financial assistance from the U.S. Department of Education (ED). Section 504 provides: “No otherwise qualified individual with a disability in the United States . . . shall, solely by reason of her or his disability, be excluded from the participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.”

to disability advocacy efforts, argued then, “We’re not asking for any favors … we’re simply asking for the same rights and equality any other American has.”

Gallaudet University, the nation’s only liberal arts college for the Deaf, had for over a century only been run by hearing presidents. In 1988, following the decision of Gallaudet’s Board of Trustees to appoint yet another hearing president, students launched the Deaf President Now movement. These students and their supporters shut down the campus for a week, chaining themselves to the campus gates, holding sit-ins and media interviews, and shifting the public’s attention toward their demands. Eventually, the Board of Trustees relented and installed the first Deaf president of the University, I. King Jordan. The movement created the impetus for political representation and appreciation of Deaf culture in academia and beyond, shaping a larger advocacy climate at Gallaudet that later launched efforts to create a disability-inclusive built environment on campus.

In 2005, students, faculty, and others developed DeafSpace at Gallaudet, an architectural approach designed to center Deaf identity and experience. DeafSpace is both an acknowledgment of the cultural identity that has formed in response to adapting to the hearing world and a template for what the world would look like if Deaf people were never forced to make such adaptations. Its design elements are intended to make visual communication as unencumbered as possible and cover everything from the color of walls to the curvature of classrooms. Hansel Bauman, the campus architect of Gallaudet University who developed DeafSpace with their American Sign Language and Deaf Studies department notes that “DeafSpace architectural patterns are constructed when deaf people modify their environment to fit their linguistic, cognitive, and social sensibilities.” DeafSpace is a critical example of what the world could look like if the experiences of people with disabilities were centered. Notably, nothing about DeafSpace is inaccessible or difficult to navigate for hearing individuals, and moreover, DeafSpace’s emphasis on ramps, curving walls, and wide walkways benefit individuals with mobility disabilities as well. Gallaudet’s advocacy movements created the expectation that the beneficiaries of design and of instruction should also be the ones that shape them. This has repercussions for the greater world, far beyond Gallaudet University and the disability community, and ought to shape how urban planners and civic leaders develop, modify, and maintain the built environment.

The philosophies surrounding independent living, accessibility, and disability inclusion generally echoed the cries of emancipation, autonomy, freedom, and meaningful participation in much the same way as that of African Americans, Latinos, women, and LGBTQ individuals. What is significant is the manner in which this struggle became inherently spatialized connecting to it the imperative of access and the accessibility of space. The movement’s contributions to planning theory come from the manner in which it successfully equated physical access to autonomy and mobility to freedom. A renewed spirit of independence and hope resonated with our nation’s values. The ability of the movement to sustain the fight for over 35 years serves as a testament.

Disability advocacy in the latter part of the twentieth century effectively changed the face of cities, policies, laws, norms, and public spaces in the United States and around the world (Breslin et al., 2002). Some of the practical tenets brought up by disability-inclusive planning are already embodied in key laws protecting the rights of persons with disabilities. Key federal legislation such as the Architectural Barriers Act of 1968, the Rehabilitation Act of 1973, and the Americans with Disabilities Act of 1990 set into motion mandates, standards, and guidelines aimed at advancing employment and the public participation of persons with disabilities by incrementally removing physical barriers from the built environment. New standards in construction, transportation, and design were enforceable by laws. By identifying and mandating compliance with anti-discrimination law in education, employment, architecture, and transportation, these laws further empowered advocates in San Francisco, Chicago, Los Angeles, Houston, and Eugene, Oregon, to create pockets of radical inclusion that benefited not only disabled people but also older persons, families with children, and individuals with temporary or situational impairments.

Conclusion

The disability rights movement confronted and responded to outdated concepts and efforts of urban planners to cure, ignore, or erase the lived experience of disability. Advocacy through historical events described earlier (504 protests, the capital crawl, deaf president movement, and DeafSpace) form part of a larger and longer legacy and failures of urban planning. Ebenezer Howard, Kirkbride, and Mary Simkhovitch were early pioneers in thinking about disability in the built environment and responding to disability and difference in the way we design our cities.

Disability studies theorists have worked to broaden our understanding of disability and show that disability is situated and should be contextualized relative to environmental facilitators and barriers. Consequently, the identification of disability as a socio-spatial relationship sheds light on the socio-political role of planning. This chapter contends that an environmental approach to understanding disability helps us better understand social exclusion and marginalization in American cities.

The first section of this chapter explores how planners used their power to privilege some and marginalize others. Although not often acknowledged in planning history, it is evident that the work of early planners, such as Howard, Kirkbride, and Simkhovitch critically affected the lives of disabled people to a considerable degree. While their ideas of what disability was and how it should be responded to differ, their work influenced the profession in substantial ways. By exploring approaches to disability policy through the twentieth century, we can see the ways in which the dominant ideas of the time shaped the disabled individual’s prospects and outcomes. The dominant paradigms of this era perpetuated oppressive policies and resulted in the development and implementation of expensive plans with sometimes devastating results.

More often than not, urban planners shaped the urban experiences of persons with disabilities by creating spatial barriers, controlling access, territorializing disability, warehousing deformities, depriving agency, and containing deviance. Urban planners, city leaders, and others viewed people with disabilities as having little value in the modernizing state, and as a result, human difference was categorized, sanitized, and constrained. By interrogating the forces that shaped US cities in general, and US urban planning in particular, this chapter explores how our cities continue to disable and disempower their citizens.

The second section of this chapter illustrates how disability advocacy efforts have primarily focused on addressing the failures of urban planners by asserting the right of those with disabilities to access space, participate in city life, and otherwise hold equal citizenship. Though urban planners have largely remained silent about the multitude of quiet indignities and ghastly cruelties within their profession that galvanized the disability rights movement, the consequences of the profession's failures are no less clear.

The relationship between urban planning and disability advocacy elevates the need to document the profession's efforts to control and respond to bio-psycho-social diversity. This section provides case studies which explore this relationship and contends that the disability rights movement and the history of disability advocacy are a direct consequence of exclusionary planning efforts. Moreover, this section contends that the lived experience of disability parallels the common struggle to assert and define access and equity along dimensions of race, class, and gender. Disability has never been a singular or uniformed experience and continues to be highly differentiated by time and place, as well as by race, class, gender, and type of impairment. Specifically, the urban experience of disability illustrates the many ways prejudice is embedded in the physical and social construction of space.

Defining and claiming social and spatial justice continues well into the twenty-first century with vivid images and calls for equity and justice cropping up in cities across the country, persons of color, women, and immigrants alongside disabled people and their allies. There is now a turning point for more inclusive and human-centered approaches to urban planning.

Advocacy as a social practice constructs disability and illustrates the ways that advocacy has helped society evolve.

Parent-Led Activism and Children with Disabilities in South Africa

Contents

Abstract

Parents and caregivers of children with disabilities often act as representatives, mediators, and advocates for their children, partly out of necessity and partly due to the bias of adult-centered agency. This chapter engages with the literature on parent-led activism in South Africa. It also engages with broader activist campaigns which, due to their nature, sometimes subsume the voices of grassroots

actors and the parents who tirelessly advocate for their children. The context of the use of advocacy and activist measures and an overview of the literature on parent and caregiver uptake of these is discussed identifying a critical loss of political voice of persons with disabilities post-democratic attainment as well as the need to build stronger child participation fora. The study finds that while the narrative of the social and human rights model approaches to disability dominates in mission statements and objectives of disabled persons' organizations (DPOs) and nongovernmental organizations, the services offered by some of these organizations have a definite medical slant. A brief synopsis of selected barriers that children with disabilities face, primarily in accessing their socioeconomic rights, including their right to education, health, and freedom from violence, is provided. Litigation brought by parents of children with disabilities is analyzed showing that professionals and organizations acting as curators ad litem and *amicus curia*, respectively, will likely continue to play an enhanced role in South Africa. Where parents and caregivers of children with disabilities are backed up by DPOs with traction in society, they are more likely to be successful in achieving their advocacy goals. Furthermore, the role of law clinics well versed in disability in representing these children, their parents, and DPOs is crucial. Recommendations for future law reform and activism is provided.

Keywords

Parents of children with disabilities · Activism · Litigation · Social justice · Disabled persons organizations

Introduction

Activism is conduct directed at bringing political and/or social change and in the disability context is a quest to secure social justice for persons with disabilities (Barnes & Mercer 2010). Activism by parents of children with disabilities seeks to challenge and dismantle the ableism present in different structures and systems that regulates the lives of their children. Parents and caregivers of children with disabilities often act as representatives, mediators, and advocates for their children, partly out of necessity and partly due to the bias of adult-centered agency (Wickenden & Elphick 2016). Yet, this role, particularly that of mothers, has been undervalued (Ryan & Runswick-Cole 2008). Bobel (2007) argues that the "activist" label is highly idealized requiring impossible standards of persistent and dogged relentlessness. This means that many persons pursing activist goals may not describe themselves as such. An advocacy–activist continuum denotes the move from parental advocacy for their children toward an activist stance. However, categorization of action as either activism or advocacy is problematic as parental interventions are fluid and goal-specific – and require using tools from either or both approaches (Poon-McBrayer & McBrayer 2014; Crow & Merchant 2019). Parental activism can be individual, collective, and may be informal or organized.

Many nongovernmental organizations (NGOs) in South Africa and disabled persons organizations (DPOs) find their origin in parental advocacy for their children with disabilities – such as the Disabled Children's Action Group (DICAG). A number of umbrella NGOs exist in South Africa, stratified along the lines of different disability identity groups (e.g., Autism SA, Blind SA, DeafSA, Down Syndrome SA, and Epilepsy SA). These NGOs sometimes have regional or local DPO members. Grassroots or local NGOs or DPOs, on the other hand, have members who include parents of children with disabilities. A key number of recent campaigns for realizing specific rights for persons with disabilities is a result of strategic advocacy and lobbying and litigation led by the umbrella NGOs that brief law clinics. Indeed, since the advent of democracy a small upsurge in Equality and High Court litigation dealing with the rights of persons with disabilities has occurred. It has focused on diverse issues such as scholar transport, wrongful life suits, reasonable accommodation in schools, sign language in schools, and compulsory incarceration of children "unfit" to stand trial.

This chapter engages with some of the limited literature on parent-led activism in South Africa. It also engages with broader activist campaigns which, due to their nature, sometimes subsume the voices of grassroots actors and the parents who tirelessly advocate for their children. However, it can also promote the voices of persons with disabilities, including children with disabilities, from the margins to forums such as domestic courts and treaty monitoring bodies (TMBs). The policy and legislative landscape, despite the lack of comprehensive disability-specific legislation, is relatively progressive. However, the flagship policy, the Department of Social Development's White Paper on the Rights of Persons with Disabilities (WPRPD) (2016), is not explicitly financed and mainstreaming disability across all sectors has faltered (Black & De Matos-Ala 2016). The efficacy of parental activism therefore can be undermined by inaccessible bureaucratic systems. However, it shows promise in many aspects for including children with disabilities and promoting their participation in life.

The context of the use of advocacy and activist measures and an overview of the literature on parent and caregiver uptake of these is discussed first. Then follows a brief synopsis of selected barriers that children with disabilities face, primarily in accessing their socioeconomic rights, including their right to education, health, and freedom from violence. Third, barriers to the daily activism of parents and carers in relation to children's schooling and access to services, including during the COVID-19 era, are outlined. Fourth, the role of parents and caregivers as protectors and advocates of their children's rights in relation to family responsibility for autistic children in the workplace and associational stigma experienced by mothers of children with albinism is identified. The potential role of anti-vax parents and caregivers as violators of their children's rights is identified as well as the ethical conundrum posed by wrongful life suits. Fifth, a brief reflective discussion on the literature follows considering parents and caregivers' role in partnership with DPOs and in litigation on behalf of their children, as well as the role of national human rights institutions in supporting children with disabilities. Finally, recommendations for future activism are provided.

Advocacy and Activism by Parents and Caregivers

This section first identifies the historical place of parental activism in South Africa. Second, the tools for activism such as lobbying for law reform, advocacy, and litigation are identified, as is the role of parents and caregivers in activism on behalf of their children. Third, the preference for child participation is discussed, and finally, the limited literature on parent-led activism in South Africa is analyzed.

Parent-Led Advocacy and Its Historical Roots in South Africa

Howell et al. (2006) documented the history of the disability rights movement in South Africa. This account, the authors concede, is limited due to the small number of participants interviewed and its emphasis on the origins of the formation of Disabled Persons South Africa (DPSA) – an umbrella organization that included membership from diverse disability groups. Their account includes a focus on the actions of adults with disabilities, as it reflects on how the international movement galvanized local movement toward organizing *by* persons with disabilities as opposed to organizing *for* them. Such paternalistic representation of persons with disabilities characterized NGOs prior to the 1980s. Mention is made of the self-help groups started by legendary activist Friday Mavuso in Soweto. Importantly, the formation and activities of DICAG are also discussed. The account reflects on how DICAG lobbied for the inclusion of children with disabilities on the agenda of the nascent democratic state, with notable successes such as the Disability Rights Charter. Post-1994, the organization promoted the disability mainstreaming agenda in policy reform.

According to Howell et al., DICAG provided a platform for parents to support each other, particularly as their shared experience of poverty and isolation in caring for children with disabilities came to the fore. More recently, DICAG has lobbied government for law reform in key areas such as education, health, and social development (DICAG 2008, 2016). Philpott and Muthukrishna (2019) identify that DICAG is embarking on a reflective strategic planning journey. However, documents indicating its future direction are not publicly available.

There are few organized parent advocacy groups in South Africa and most have been subsumed by larger NGOs and DPOs. For example, Autism SA was founded by parents and professionals aimed at lobbying and networking in 1989, while Down Syndrome SA was founded by parent advocates in 1986. Today, Autism SA has affiliate members (schools and NGOs focusing on autism), but not parent members. The nascent disability movement's roots can be traced in the literature on the history of the movement – including its successes in securing victories such as the inclusion of disability as a protected ground in the equality clause of the Constitution (Rowland 2004). Black and De Matos-Ala (2016) criticized the loss of critical voice and capacity when disability activists were subsumed into government, and also the more recent fragmentation of the disability sector. A focused narrative of the periods after the newly democratic state and negotiations by persons with disabilities and

DPOs for recognition in the new state machinery – aside from some reflections by Black and De Matos-Ala (2016) – is absent.

The Context of and Tools for Activism

Advocacy for the rights of children with disabilities often starts in the home and community. Stereotypes about the causes of disability and communities' perceptions about prognosis and ability to participate in community life can isolate and stifle the development and growth of children with disabilities in urban and rural areas. Traditional communities in rural areas face many challenges such as higher rates of poverty and incidence of gender-based violence (Cheteni et al. 2019). Children with disabilities in rural areas are doubly disadvantaged given the lack of access to resources. Community workers such as community health workers, child and youth care workers, and community disability workers are allies for families with children with disabilities and help in advocating for children's access to services, and for acceptance and inclusion in communities (Mahlangu et al. 2019; Lorenzo et al. 2012).

A move away from the central role that parents, especially mothers, play in advocating for their children, toward using a disability commons approach, has been called for in Britain. This is partly due to the perceived failures of mother-led activism (Runswick-Cole & Ryan 2019). Parental activism in relation to children with disabilities is fraught with contradictions. These contradictions emanate from the paternalism and medical approach that originally characterized parents' efforts to advocate for their children, and also from the move toward the social and human rights model approach to disability espoused by persons with disabilities from the 1980s onwards and which promotes self-representation (Carey et al. 2019). The possible disconnect between the goals of parents and disability activists should be acknowledged (Carey et al. 2021). This is particularly in South Africa where the charity/welfare or biomedical approaches still dominate the approaches to disability in many communities and state and private institutions (Howell, et al. 2006; Retief & Letšosa 2018; Mkabile & Swartz 2020a). This must also be seen in the context of a number of factors such as the burdens and challenges encountered by parents and caregivers, and coping strategies and support needs when caring for a child with a disability (Reddy et al. 2019; Tigere & Makhubele 2019; van der Mark et al. 2019; Maddocks et al. 2020; Sadiki & Kibirige 2020; Davids et al. 2021), and also the systemic barriers faced by children with disabilities generally and those with particular disabilities such as autism (Reddy et al. 2019). Accordingly, the role of the family in dismantling ableist stereotypes in communities cannot be denied (McConkey et al. 2016). However, the danger of children being neglected or abused by their parents or family members (Watermeyer and Mall 2016; Mdikana et al. 2018) weighs against the lack of safeguards where parents are their sole agents.

Parental abandonment, economic migration, the HIV/AIDS, and COVID-19 pandemics mean that in South Africa many children are cared for by relatives and non-relatives, and not their biological parents. This is particularly as they are more likely to be orphaned than their non-disabled peers (DSD, DWCPD & UNICEF, 2012). The triage protocol bias in favor of non-disabled persons during COVID-19 can have direct consequences where children or adults with disabilities do not receive adequate care, and indirectly when parents or caregivers die (McKinney et al. 2020). Accordingly, due to the structure of South African families and child care, it is necessary to consider parent and caregiver-led advocacy for children with disabilities.

Parents and caregivers' ability to advocate on behalf of their children depends largely on access to support and resources and whether their personal needs are met (Wright & Taylor 2014). In resource-poor settings, systemic failures can make their activism efforts appear futile. Poverty intersects with disability to create multiple barriers to accessing resources to secure rights (Hanass-Hancock & McKenzie 2017). Out-of-pocket expenses for persons with disabilities when seeking care and support, and access to services including health care and to enable participation in home and community activities, include high transport costs (Hanass-Hancock et al. 2017). Sousa (2016) argues that the cost of parental advocacy for children with disabilities is not generally measured. This cost refers to opportunity costs caused by efforts to correspond and obtain services for their children, which generally involves navigating intricate and inefficient bureaucratic systems. Not only are income-generating activities affected, but advocacy efforts also consume time that is needed for leisure, rest, and respite.

Parents use different strategies to agitate for change, from lobbying and advocating at an individual level where parents and caregivers advocate for their own children in particular situations usually at micro levels such as in schools and clinics, or at a macro or organizational level in peer support groups, parent groups and as part of NGOs or DPOs to obtain legal-political entitlements or law reform (Fengming 2016). Litigation is also used at times, initiated on behalf of a specific child or children, or more strategically as public interest litigation. In the United Kingdom, the disability movement increasingly uses litigation as a mobilization strategy, partly due to the change in framing of disability from a medical to a social model approach – which facilitated the birth of DPOs as opposed to organizations *for* persons with disabilities (Vanhala 2009). Self-advocacy of persons with disabilities has increased since there has been a move away from advocacy for such persons, toward activism *by* persons with disabilities in South Africa (Watermeyer et al. 2006). Kubicki et al. (2019) compare protest action as an advocacy tool staged on behalf of and brought by persons with disabilities in Poland, but similar scholarly attention has not occurred in democratic South Africa. Protests against the iniquities of apartheid measures undertaken by persons with disabilities is well documented (Rowland 2004). The use of social media to advance activist goals has been studied in relation to social movements (Loudon 2010) but not in relation to its use by parent activists. Increasingly, litigation is also used in South Africa to seek social justice. Meaningful enforcement of judgments obtained and compliance with and implementation of policy and legislative changes in favor of persons (including children) with disabilities remains patchy and inconsistent in South Africa (Boezaart 2012a; McKenzie et al. 2017; Kamga 2016b) and elsewhere (Winter 2003 referring to the USA; Aseka & Kanter 2014, referring to Kenya, for example).

Literature on the enforcement of litigation outcomes tends to focus on the roles of the main actors, usually DPOs or civil society organizations acting on behalf of children with disabilities or their caregivers – instead of the role of the parents in advocating for their children (Ngwena & Pretorius 2012; Du Plessis 2013; Holness, & Rule 2014; Holness 2016b; McKenzie et al. 2017). Others reflect on the responsibilities resting on the state to meet their obligations in respect of children with disabilities, such as protecting their sexual reproductive rights (Boezaart 2012b; Holness 2013) or obtaining perspectives of caregivers and parents on the rights of their children (Erasmus and Dada 2016; Huus et al. 2016) – including their sexuality (Kahonde et al. 2019). Chappell (2016b) noted the lack of political emphasis on the sexuality of adolescents with disabilities in South Africa.

The Child Participation Imperative

South African domestic legislation, in section 10 of the Children's Act 38 of 2005, promotes the participation of children in matters that affect them. This means that their views are to be garnered and considered when possible, considering their age, maturity, and stage of development. Their views are to be elicited, not only from family proceedings and medical decisions (Sloth-Nielsen, 2009). They should also be sought in all matters affecting children. Children and youth with disabilities are rarely included as participants in research about their lives (Walton, 2011; Donohue et al. 2014; Bantjes et al. 2015; Chappell 2016a; Dada et al. 2020). Their agency to self-advocate, however, is more restricted than children without disabilities, particularly where they have "stigmatised" disabilities such as severe intellectual, communication, or behavioral problems (Wickenden & Elphick 2016, p. 169), and where parents often act as their proxies. Child-friendly complaint mechanisms are rare and underutilized (Couzens 2012). For example, the South African Human Rights Commission's (SAHRC) recent child complaint procedures (SAHRC 2017a) are not yet tested. Generous standing provisions in South African law extend the ability to litigate not only to parents and associations acting on behalf of children with disabilities, but also to children (section 38 of the Constitution of the Republic of South Africa, 1996) (Budlender et al. 2014). The Equality Court's free complaint procedures are also underutilized by children or parents of children with disabilities (Holness & Rule 2014).

There are limited examples of attempts by children with disabilities to self-advocate for change – such as the students of Rivoni School for the Visually Impaired who protested against unsafe school facilities in 2019. Unfortunately, this action was not successful, and a national DPO continues to lobby the Department of Basic Education to make special school and hostel facilities safe (Pikoli 2020). Children with albinism participated in the National Conference on Albinism in 2013 and co-signed the Ekurhuleni Declaration on the Rights of Persons with

Albinism. Adults with albinism were more visible in participating in a round table on human rights and albinism which reached consensus on better participation of persons with albinism in future research and advocacy efforts (UN General Assembly 2019). Due to the environmental, physical, and social barriers posed to persons with disabilities seeking to protest a particular disability cause “in person” or physically, online activism can offer an alternative for those otherwise unable to participate (Li et al. 2018), or social media such as Twitter can be used to seek law reform (Auxier et al. 2019). Online activism by persons with disabilities in the Global South and South Africa has not received similar attention in the literature. Access to data pose barriers to using internet-based activism forums in South Africa.

Stereotypes about children’s ability and competence to express themselves and the accommodations that may be required to elicit their views influence the bias in favor of parental decision-making and agency. According to the United Nations’ (UN) Committee on the Rights of the Child, 2018, first prize is the participation of children with disabilities in decision-making – with requisite support where needed. In a training program for children with disabilities and their parents, the need for relevant support for the children to advocate and contribute to policy analysis affecting them was identified (Nomdo et al. 2011). Second prize is effective representation by parents and caregivers. The Committee (2018: para 12(d)) stresses that the role of parents, caregivers, and family members should be rendering support and empowerment to persons with disabilities “to have a voice and take full control of their own lives.” The roles of families and other stakeholders in obtaining the views of children about matters that affect them is crucial and the quality of the relationship with that child enhances obtaining their views (Knight & Oliver 2007). Effective representation by parent and caregivers is therefore a key concern.

Literature on Parent-Led Activism in South Africa

Literature on the positive outcomes of parent and caregiver-led advocacy in South Africa is rare. Scholars have noted the positive impact of caregiver advocacy in a particular locale, for example Orange Farm in Gauteng Province (Elphick et al. 2014; Elphick et al. 2015); and KwaZulu-Natal Province (Rule & Zuma 2011). Elphick et al. (2014) highlight the advocacy efforts and impact of 22 caregivers (mothers and grandmothers) of children with disabilities who are of compulsory school-going age. For example, one caregiver of a boy with hydrocephalus participates in human rights events where she makes public speeches, helps facilitate courses on disability and human rights, and participates in task teams with links to the department’s district office. Her role and other caregivers’ lobbying role in the task team helped with the building of a new school in the area for children with high educational support needs. The caregiver participants narrated challenges faced in accessing education for their children. These ranged from the cost and time involved in obtaining assessments, to the bureaucratic rigors involved in applying to multiple schools, the unsuitability of some schools due to harmful practices and discrimination against their children, and negotiations around high transport costs to schools.

The study identifies that caregivers are engaged in direct agency and also as proxy agents for their children. However, where multiple attempts at gaining ground on an issue failed, some caregivers had to resort to using the assistance of staff and resources from an NGO program that they had attended. Elphick et al. (2015) note:

> Programme staff were viewed as relatively more powerful. Complaints and follow-up referrals made by the NGO were perceived to get “taken seriously” (Caregiver). The Programme staff acted as proxy agents by utilising resources such as telephones, email, networks of professional contacts and transport to undertake activities on behalf of caregivers. These included emailing and calling, drafting letters of referral, taking children with disabilities and caregivers to meetings and assessments, advocating for school placement and arranging for host service providers in Orange Farm to undertake screening and assessment activities.

The study also identifies outcomes from the collective advocacy of the self-help group established by the caregivers. For example, the members participated in marches; launched a disability desk at a local police station; assisted a sexual abuse survivor with attendance at court hearings; contributed to a database of children requiring education in the area; and conducted educational workshops on disability in the community and elsewhere. The study also identifies how the group successfully lobbied for the school referred to earlier through activities such as letter writing to local government councilors, raising the issue in community forums and meetings with the department of education, and drafting written submissions to the mayor of the city and the parliamentary committee responsible for the implementation of the CRPD. Elphick et al. (2015) found that the caregivers relied on their faith, sharing knowledge and the collective agency of their self-help group to advocate for their children. The authors argue that stakeholders should create opportunities for self-help to enable caregiver advocacy as both direct and collective agents, as reliance on advocacy organizations as proxy agents is insufficient and discounts the contribution that caregivers can make to obtaining inclusion for their children.

In an earlier study, Elphick et al. (2014) discuss the barriers faced by children and their caregivers in the same locale. These include the experience of discrimination and attitudinal and environmental barriers. The study articulates that the caregivers’ strategies in dismantling attitudinal barriers, particularly experience of interpersonal (and especially family-based) stigma, were more successful than those used to seek access to essential services for their children. The authors identify that the caregivers incur intolerable personal and financial costs while advocating for their children. They seek recognition of the caregivers’ personal knowledge of the discrimination their children face and their personal investment as advocates for their children. Elphick et al. (2014. p. 251) propose that the caregivers’ agency should be supported through “empowerment programmes that incorporate elements of legal literacy, political participation, effective communication, self-advocacy, the formation of self-help groups and strategic alignment with other advocacy groups.” The authors also recommend the drafting of legislation to provide content to the socio-economic rights of children with disabilities, including provisions that punish non-compliant state officials.

Rule and Zuma (2011) explain the role that human rights forums, which include membership from parents and caregivers of children with disabilities, can play in a rural setting in KwaZulu-Natal Province. Constituted by the Office of the Premier of the province, these forums comprised 20 volunteer members from civil society, including widows and parents and traditional leaders. These forums received training on disability and the UN Convention on the Rights of Persons with Disabilities (CRPD) (United Nations' General Assembly, 2007) from an NGO. Preliminary results show an impact on parental activism in relation to interventions to address the high prevalence of sexual offences against children with disabilities in a particular community, and the vulnerability of girls with intellectual disability to the harmful, distorted cultural practice of *ukuthwala* (abduction and forced marriage) – for example.

Philpott and Muthukrishna (2019) critically analyze the parent–professional relationships in the early childhood education sector. Their study sought the views of parents and of staff members of DICAG. DICAG was established just before democracy was attained and has almost 4000 parent members and local branches in all provinces. Its focus is on advocacy and the monitoring of the implementation of state policy, as well as capacity building and parent empowerment. DICAG's membership of Disabled People International (DPI) and Inclusion International enables a larger footprint. The study considered how "parents of children with disabilities in a rural context experience and navigate partnerships." The authors found that while DICAG speaks to the human rights model and the agency of parents, in practice participants articulated their perceptions that "the agency and rights of parents are often ignored and infringed within partnerships." The authors found that the participants' view of professionals as "experts" and "gatekeepers" to access services and resources the children require was prevalent. As with other studies (Muthukrishna & Ebrahim 2014), the power imbalance between parents and professionals was identified. Philpott and Muthukrishna's study echoes Swartz's (2018) reflective essay on power imbalances in the disability sector – particularly where "experts" are involved such as professionals or researchers. The participants in Philpott and Muthukrishna's study articulate the corporate-managerial style of partnerships between parents and professionals, where service providers, including funders, seek to impose systems and ways of thinking instead of building capacity and learning from parents (or persons with disabilities) about their needs.

The authors' findings highlight the silencing and devaluing of parent voices and identify three key recommendations for dismantling neoliberal and medicalized discourses that view disability as the "problem" of the child and the parent. First, at an "individual level," participants identified a need for parental debriefing and counselling programs to allow safe spaces to support parents emotionally – lest "inappropriate expressions of emotions of grief, stress and anger. . .continue to negatively affect them and their parenting as their children grow older." They also echo other studies' findings that parental access to information to enable informed decision-making on behalf of their children is crucial (Sandy et al. 2013 (South Africa); Odongo 2018 (Kenya); Taderera & Hall 2017 (Namibia)). Second, at the "collective" level, Philpott and Muthukrishna support the collaboration of parents through peer-support groups and joint action. This recommendation underscores the role of so-called parental "self-help" groups. Third, at an "institutional and systemic" level, the authors promote parental representation in forums such as community and disability structures where relevant issues facing their children or constituency can be raised, and to ensure that professionals are held accountable. Ultimately, these structures exist in pockets and as the Orange Farm studies (Elphick et al. 2014, 2015) show, grass-roots activism can bring meaningful social justice change for the children and their parents. The proviso, of course, is that a "rights-based social justice agenda" should undergird the relationships between parents and professionals navigating the space of service provision to children with disabilities (Philpott & Muthukrishna 2019). The "pillar-to-post" experience that participants articulated in the DICAG study is a common refrain of a prevailing symptom of ineffective, incohesive, and fragmented social development services and legal aid provision in South Africa.

Carey et al. (2019) compared the approaches of organizations led by parents to DPOs in the USA. Their findings point to a diversity of approaches, including medicalization with the aim of finding a "cure" followed by some autism organizations, and medicalized support for the social model followed by some organizations for the blind and those with cerebral palsy, for example. In other words, parent-led activism does not fall neatly into the diametrically opposed social and medical approaches. It can include strategies to obtain access to services by using the medical approach in order to break down social barriers, for example.

When looking at the approaches followed by parent-led organizations in South Africa, the narrative of following the social and human rights model approaches to disability dominates in mission statements and objectives of organizations. However, the services offered by some of these organizations have a definite medical slant. For example, the National Council of and for Persons with Disabilities (NCPD), in existence for over 80 years, aims to "advocate and facilitate equitable social and economic inclusion of persons with disabilities in South Africa" in line with an espoused "rights-based approach within the framework of the social and human rights models of disability" (NCPD, 2021). In relation to children with disabilities, the organization aims to lobby government and collaborate with civil society to eliminate "barriers preventing social, educational, recreational and cultural inclusion of children with disabilities." One of its affiliate members, the Association for Persons with Physical Disabilities KwaZulu-Natal (APD-KZN), started in 1967 as "Natal Indian Cripple Care," supports preventing a physical disability (medical) approach in some instances and the social approach in others. For example, it offers assistance to obtain assistive devices, community-based rehabilitation, and assessments of children for placement in special or mainstream schools. It also offers protective workshops for adults with disabilities in nine areas across the province, and yet also claims to offer work placement "in the open labour market." This approach, according to Carey et al. (2019), would fall into the medicalized support for the social model category.

An overview of the contemporary context within which parents and caregivers advocate for their children's access to rights now follows. It highlights some of the pertinent issues facing children with disabilities.

Children with Disabilities Experience Barriers to Full Participation

The sites of struggle and the legal and policy framework within which parental advocacy and activism in South Africa takes place require exposition. Children with disabilities are entitled to a basket of socioeconomic rights, which the state is duty-bound to provide where parents and caregivers are unable to do so (Hansungule & Boezaart 2017). These rights are protected under the Constitution of the Republic of South Africa, 1996, under sections 26 (housing), 27 (health) and enabling legislation such as the Social Assistance Act 13 of 2004, National Health Act 61 of 2003, Mental Health Care Act 17 of 2002, and policies such as the Department of Social Development's WPRPWD and its implementation matrix. Child-specific rights are extended in section 28(1)(c) of the Constitution, which relates to the right to basic nutrition, shelter, basic health care services and social services. Unlike the section 26 and 27 formulations, the children's socioeconomic rights formulation is not subjected to the limitation of available resources and progressive realization internal limitations. Their immediate access to these rights and services in relation thereto are constitutionally guaranteed, particularly for those not in family care (such as those in state or alternative care) (*Centre for Child Law v MEC for Education, Gauteng* 2008).

The right to basic education in section 29(1)(a) is immediately realizable in South Africa (*Governing Body of the Juma Musjid Primary School v Essay NO* (*Centre for Child Law as amici curiae*), 2011; McConnachie & McConnachie 2012) and finds legislative enactment in the National Education Policy Act 27 of 1996 and the South African Schools Act 84 of 1996. The duty to provide reasonable accommodation in schools, including for children with disabilities, is judicially recognized (*MEC for Education: Kwazulu-Natal and Others v Pillay* 2008; *Oortman v St Thomas Aquinas Private School & Bernard Langton* 2010). Furthermore, the paramountcy of the best interests of the child standard and right is protected in section 28(1)(c) of the Constitution (Skelton 2019; Couzens 2019). A new policy document, the National Strategic Framework on Reasonable Accommodation for Persons with Disabilities 2020, developed to provide for reasonable accommodation measures in all sectors, including the education sector, has not yet been implemented as it still requires formal adoption by the National Economic Development and Labour Council (Nedlac), and the social dialogue forum in South Africa, before it is submitted for adoption in parliament. Such a cross-sectoral policy guideline may need legislative backing to police proper implementation and enforcement, particularly as the CRPD explicitly requires reasonable accommodations in all spheres.

The Promotion of Equality and Prohibition of Unfair Discrimination Act 3 of 2000 (the Equality Act) and Children's Act 38 of 2005, as well as the Criminal Law

(Sexual Offences and Related Matters) Amendment Act 32 of 2007 (SORMA), and the Child Justice Act 75 of 2008, all provide some provisions for children's access to justice in civil and criminal courts.

The Equality Courts, established under the Equality Act, have been underutilized by persons with disabilities to bring claims of unfair discrimination on the basis of disability. Two cases brought before the Equality Courts received mixed success. In *Oortman v St Thomas Acquinas Private School* 2010, a mother of a child with physical disabilities and a wheelchair user sought reasonable accommodation and accessible facilities in a private school. These measures were ordered, including disability sensitivity training for the teachers, but no monitoring of the court order has been noted. While mention of the court outcome is evident in the literature (Holness & Rule 2014; Khumalo & Fish Hodgson 2017), the mother and her child's perspective has not been sought after the litigation. In *Haskin v Khan* 2020, the mother of a child with cerebral palsy claimed, successfully, that a shop owner unfairly discriminated against her child when he refused access to him as his "buggy" (adapted wheelchair/perambulator) was banned from being used on his premises. The court order has not been enforced and the mother seeks to take the matter further to ensure compliance.

All the children's rights are enforceable in terms of the state's international and regional law obligations under the Organization of African Unity's (1990) African Charter on the Rights and Welfare of the Child; CRPD (UN General Assembly 2007); and the UN Convention on the Rights of the Child (United Nations' General Assembly 2019; Hansungule & Boezaart 2017). Time will tell how the provisions dealing with children's rights in the African Union's 2018 Protocol to the African Charter, signed by South Africa, but not yet in force, will be interpreted. Three TMBs, the Committee on the Rights of the Child in 2018, the Committee on the Rights of Persons with Disabilities in 2018, and the African Committee of Experts on the Rights and Welfare of the Child in 2019 – have called for state measures to ameliorate these gaps in service provision to children with disabilities in South Africa. However, despite the promise of the legal and policy framework advancing protection and respect for their rights, children with disabilities in South Africa face several barriers to their full participation, including accessing appropriate social, health and educational services (Human Rights Watch 2015; DSD, DWCPD & UNICEF 2012). The South African Law Reform Commission (SALRC) has embarked on a law reform process to domesticate the United Nations' Convention on the Rights of Persons with Disabilities (SALRC 2020). This may result in disability-specific legislation and/or amendments to existing discriminatory laws. In time, the extent of the SALRC's public consultation with children and parents and caregivers of children with disabilities will be revealed.

This next section identifies some selected areas of persistent systemic struggles that children with disabilities and their parents face, and which affect their ability to fully and meaningfully participate in all areas of life. These include challenges to accessing basic education, right to health, heightened risk of gender-based violence and inaccessible policing and justice systems.

The Right to Basic Education

The context of challenges to accessing this right is outlined. The section discusses several key court cases, such as a school admission case for a child with cerebral palsy and the proposed litigation to challenge the state's conduct regarding all out-of-school children with disabilities; a case dealing with access to basic necessities for children residing in an institution and with debilitating conduct disorders; a case about appropriate subsidization of schooling for children with severe and profound intellectual disabilities; a case about the use of sign language as a subject in schools for Deaf children; access to books, including Braille, for children who are blind or have print disabilities; scholar transport litigation; and finally a case dealing with access to personal protective equipment during the COVID-19 pandemic for children in special schools.

Massive Gaps in Educational Provision for Children with Disabilities

Realizing the right to basic education remains elusive for many children with disabilities. Unmonitored waiting lists to secure admission to schools with a high percentage of children being out of school, inadequately trained mainstream and special educators and inaccessible and unaccommodating teaching and learning environments, among others, remain as barriers to the education of children with disabilities – despite civil society advocacy to expose these challenges (The Right to Education of Children with Disabilities Alliance 2017; Section27 2015). This is despite a failed policy framework, the Education White Paper 6: Special Needs Education, 2001, that was aimed at meeting inclusive education targets by 2021 (Human Rights Watch 2018). The revised and Screening, Identification, Assessment and Support (SIAS) policy of 2014 has not yet been funded. The statutory provision for compulsory school-going age for children with disabilities has not been set, whereas the provision for children without disabilities has been in place since 1996 (sections 3(2) and (1) of the South African Schools Act of 1996). Parents who can afford assistive devices or classroom support such as facilitators as reasonable accommodation measures are able to secure places for their children in special schools, whereas children of those who cannot carry this financial burden are excluded from education (Right to Education of Children with Disabilities Alliance 2017). Parents' perspectives on barriers faced in securing inclusive education for their children have been sought (Swart et al. 2008).

TMBs are acutely aware of the education crisis facing children with disabilities in South Africa. The Committee on the Rights of Persons with Disabilities' (2018: para 12(c)) observed that:

> large numbers of children with disabilities, nearly 600,000, who are out of school or studying in specialized schools or classes, in particular children with psychosocial disabilities, and children with disabilities placed in centres for children or less regulated special service centres, all of which are based on long-term institutionalization, [are] often located far from their families and communities, isolated and lacking properly trained staff.

The Committee (2018: para 41(b) and (c)) recommended that the state allocates sufficient financial and human resources to reasonable accommodations of children with disabilities to receive inclusive and quality education in all schools, including in mainstream schools. The Committee pertinently mentioned children with intellectual disabilities, together with autism and Deaf children. The committee also recommended an effective training program for teachers on inclusive education, which should include learning sign language, Braille and Easy Read skills.

Admission to School

Parents seeking assistance to find school placement for their children from the Centre for Child Law have sometimes been successful on a case-by-case basis, yet systemic change is still illusive for most children with disabilities (Maistry 2018). Maistry explains that the nature of children's disabilities, particularly where they have high support needs, are often relied on as an excuse not to provide placement or resources so that these children can remain in school. A court victory was obtained for an 11-year-old child with cerebral palsy after a six-year struggle to admit him to a school (*IOL News* 2018). The Department of Education initially refused to provide him with the staffing needs to assist him at school after the special school he attended indicated it no longer had adequate staff. The court ordered his admission to a boarding school. Subsequently, the Department of Basic Education undertook to provide staff to assist him at school and in the hostel.

The National Council of Disabled Persons (NCDP), a DPO, cites inadequate state funding of educational centers for children with disabilities, including those who are of school-going age (NCPD, 2021). The NCDP, together with a number of other organizations (Autism SA and Down Syndrome SA), sought the assistance of the Centre for Child Law in bringing litigation to challenge the lack of provision of education for children with disabilities, and who remain out of school and on waiting lists (*IOL News* 2019). The COVID-19 pandemic overtook these events, and the matter has not yet been filed in court. This proposed litigation is an example of parent and caregivers forming alliances with DPOs to push for large-scale change in the implementation of the right to inclusive education, as parents of children were requested to provide relevant information on exclusion of their children from schools to the DPOs in preparation for its litigation.

Basic Necessities and Psychosocial Support for Children in Alternative Care

The need for a curator ad litem to be appointed for children with disabilities in litigation has arisen, not only in cases where their parents are not ideal to represent them – for example where they neglected their children – but also because of the expertise that these representatives can bring. For example, in *Centre for Child Law v MEC for Education & Others* (2008) a curator ad litem represented children placed in the alternative care of schools of industry which lacked basic care items such as bedding and psychological and social support services. The Centre for Child Law is a law clinic. The court identified that these schools of industries were subject to a higher duty of care than the children's parents.

Referring to this successful litigation, Boezaart and Skelton (2011) identify that children with debilitating conduct disorders are woefully treated and that curator representation can help force state provision for better models of care for these children. However, the authors also caution that strategic litigation may also be needed in the future to ensure that the needs of these children are met by the various stakeholders.

The challenges faced by children with disabilities who reside in residential institutions, including in communicating their needs, is underexplored (Geiger 2012). Parental and caregiver advocacy and activism on their behalf is also not generally studied.

Reasonable Measures, Including Financial, to Secure the Right to Basic Education

The case *Western Cape Forum for Intellectual Disability v Government of South Africa & Another*, 2011, illustrates the massive gaps in state policy on inclusive education, the lack of political will, and possibly the lack of expertise, to implement supervisory court decisions. The Western Cape Forum for Intellectual Disability (WCFID), an umbrella NGO, represented numerous special education centers, NGOs for the most part, which provide education and rehabilitation services to approximately 1000 children with severe and profound intellectual disabilities. The inadequate subsidizations of these education providers, according to the Department of Basic Education, were excusable because children with severe and profound intellectual disabilities were thought to be unable to benefit from education and were considered “ineducable.” While the state provided funding for and established special schools for children with moderate to mild intellectual disabilities, they did not admit children with severe and profound intellectual disabilities to any special or other state schools. Children unable to access the special care centers run by the NGOs are not educated. Approximately 500 children in the Western Cape Province alone were on the waiting list to be accommodated at special care centers at the time of the litigation. The Department of Health provided small subsidies to the NGOs. Ultimately the financial support offered to them was less than that the state provides for children without severe and profound intellectual disabilities.

The court found that “Inasmuch as the state currently cooperates with and relies on organisations such as the applicant to provide education for [intellectually] disabled children, it must be borne in mind that this does not relieve the state from its constitutional obligation” (para 24). The structural interdict issued by the court contained a declaration of rights violations (access to basic education, protection from neglect or degradation, equality, and human dignity). The court found that both the positive and negative dimensions of the children’s right to equality were infringed, as the state failed to provide these children with a basic education and did not admit them to schools. Furthermore, the court found that

> the children’s rights to dignity have been infringed since they have been marginalised and ignored and in effect stigmatised. The failure to provide the children with education places them at the risk of neglect for it means that they often have to be educated by parents who do

> not have the skills to do so and are already under strain. The inability of the children to develop to their own potential, however limited that may be, is a form of degradation. (para 45)

This finding must also be seen in the light of the state's contention made to the court that the parents would be responsible for teaching any skills to the children, as "no amount of education will be beneficial for them" (para 17). That contention was aptly disposed of by expert testimony and relevant international and comparative law which explicate the need to ensure that all children reach their full potential. The order also included an instruction that the state must take reasonable measures to ensure that all children in the province have "affordable access to a basic education of an adequate quality"; provide "adequate funds to organizations which provide education for severely and profoundly intellectually disabled children in the Western Cape at special care centres" toward "the use of adequate facilities"; and that there are "adequate staff," "appropriate transport," and "proper accreditation, training and remuneration" of staff. The Department had to report back to the court on the measures implemented (para 52).

This case garnered very substantial scholarly attention (Ngwena & Pretorius 2012; Ngwena 2013; Skelton 2013; Murungi 2015; Kruger 2015, Kamga, 2016b; Spangenberg et al. 2016; McKenzie et al. 2017, 2019; Wood et al. 2019). Ngwena and Pretorius (2012) are scathing in their analysis of the state's conduct that led to the widespread state neglect of these children. The state disregarded the White Paper 6 policy which was "manifestly intended to be inclusive," and instead relied on prejudicial tropes about the ineducability of these children, acting "without any moral compunction, [and categorised and drew] a distinction between what is 'normal' and deserving of a claim on state resources from what is 'abnormal' and undeserving" (Ngwena & Pretorius 2012, p. 114).

McKenzie et al. (2017) praise the intervention of WCFID as a community-based organization but warned that implementation of the court order would require continued advocacy and lobbying. Unfortunately, the court order, while progressive and potentially ground-breaking at the time, left it to the discretion of the government stakeholders, particularly the Department of Basic Education, to formulate interventions that meet the standard of "reasonableness" to address the shortcomings in educating these children. As a result, despite continued attempts by the litigants to consult with and lobby the state and advise on good practices for ensuring adequate provision of education-related services such as transport for the children and appropriate funding for infrastructure, staffing, and training – implementation has been slow, incomplete, and in some respects inadequate (WCFID 2019). These centers are still not offered direct funding by the Department of Basic Education. Instead, "transversal outreach teams" have been offered. The therapies proposed to be offered to children by the rehabilitation professionals in these teams have been inconsistent and infrequent. The Departments of Social Development and Health continue to subsidize these centers. This is a fact that the court did not approve of as the main responsibility for education by the state rests on the Department of Basic Education. The danger of unregulated education providers for children with disabilities, and particularly for children with severe and profound intellectual disabilities, remains.

Many of these centers provide so-called "stimulation" for these children, but this amounts to no more than basic caregiving activities and these children are not educated. Parents and caregivers often have no choice but to leave their children in the care of these centers – as there are few to no alternatives. The continued neglect of these children by the state, particularly in relation to accessing basic education, is a gross human rights violation. The voice of the parents and children involved in and affected by the litigation is missing. Wood et al. (2019) comment that the WCFID continues to advocate for proper implementation of the court order. McKenzie et al. (2019, p. 208) identify that the policies that have been developed on inclusive education and specifically the new policy on provision of education to these children do not align the "roles and requirements of educators and educational facilities" "to the needs of these children." Further, that the increased budgetary allocations (both human and infrastructural) remained invested in the segregated education system.

While the WCFID's continued lobbying for social justice for these children is commendable, scholarly attention is needed to measure the impact of the court order and subsequent policy and budget interventions on the affected children and their parents – with an emphasis on their perspectives.

Sign Language Provision in Schools

Language planning policy in relation to sign language was stagnant for many years after the advent of democracy (Reagan 2008). The language and culture rights violations of the Deaf caused by ethnolinguistic separate development during apartheid were perpetuated in democracy (Magongwa 2010). The settlement reached in the *Springate* case brought subsequent reforms in curriculum development of sign language as a subject in special schools (Holness, 2016b). However, the implementation of South African Sign Language (SASL) in schools was substantially delayed. The Deaf matriculant, Kyle Springate, brought the litigation in his own name, represented by the LRC. He was supported by his mother as a co-applicant, and the Deaf Federation of South Africa (DeafSA) an NGO, as well as by a number of schools. Both his and his mother's affidavits set out the challenges that he experienced in securing the offering of sign language as a language subject at his school (a mainstream school). DeafSA, in its papers before court, explicated how it had lobbied and advocated for sign language to be offered in schools for over 12 years.

A compromise was found for Kyle to allow him to matriculate through a court settlement, but the public interest goal of sign language as a subject offering would have to wait. The *Curriculum and Assessment Policy Statement* for South African Sign Language was approved by government gazette in August 2014, in terms of the National Education Policy Act 27 of 1996. A long period of curriculum development ensued, which at the outset only had one Deaf representative on the oversight body. Since 2015, SASL has been offered as a home language subject in special schools, initially for the early grades and by 2018 for matriculants. Non-fluent sign language teachers, however, continue to create barriers to SASL proficiency and the lack of SASL acquisition in the home means that children struggle to learn SASL while also learning other subjects in schools (Ngobeni et al. 2020).

The *Springate* case, which galvanized years of inaction into reality for using SASL, was effectively brought by a mother and her Deaf child. Their voices were articulated in the pleadings before the court. Importantly, they were supported by DeafSA and a number of schools for the Deaf. The litigation was not brought on the usual strategic impact planning basis that underlies some of the education-related cases that expose systemic challenges in South Africa. Nonetheless, its impact has been far-ranging. Yet, implementation of the policy to develop SASL as a language in schools has been fragmented – with a lack of curriculum resources and inadequate training of teachers detracting from the legal and policy victory (DeafSA 2018).

Access to Learning Materials, Including Books

Access to learning materials and infrastructure such as safe buildings is a barrier for children with and without disabilities. Where decades' long lobbying and advocacy fails, litigation is often the only answer. Yet the gains from the litigation are countered by delays and a lack of political will in implementing the court orders. For example, the "mud schools" debacle where there was a lack of infrastructural development of schools despite the first court victory in 2011 (Skelton, 2018) and a more recent one in 2018 which forced the Department of Basic Education to draft compliant regulations on school infrastructure (*Equal Education and Another v Minister of Basic Education* 2018). Another apt example is the Limpopo textbook trilogy of cases, culminating in the *Minister of Basic Education v Basic Education for All* case, where the attorneys for the students and their representatives widely published the judgments obtained in their favor with a view to gathering information from parents and students on the implementation of the order at schools – in other words as a way of monitoring the enforcement (Veriava 2016). The synergy between advocacy and the shrewd choice of litigation techniques used by the law clinic that represented the applicants was vital. In the first case, a law clinic had to act as an applicant due to intimidation suffered by schools that wished to participate in the litigation. The court accepted the standing of a mother of two children from one of the schools affected by the non-delivery of textbooks as a co-applicant due to her "material interest" in the matter (*Section27 and Others v Minister of Education* 2012). By the time the third case arose, a community organization, Basic Education for All and a number of schools took up the cudgels on behalf of affected children in the province (*Minister of Basic Education v Basic Education for All* 2016).

Two cases brought by DPOs for persons with visual or print disabilities should be mentioned. First, following on the partial success of the litigation in the Limpopo textbook case, the South African National Council for the Blind, together with the South African Braille Authority and three schools for students with visual disabilities, sought to have learning materials, primarily textbooks, made available to children in Braille. A settlement agreement was reached with the state after 6 years of engagement and lobbying on the issue (Section27, 2018). Second, a lobbying campaign in favor of passing the Copyright Amendment Act, which would see copyright laws change to allow Braille and extend fair use to teachers and students, was launched by a number of NGOs and DPOs – including BlindSA, ReCreateSA, the South African Disability Alliance, South African Braille Authority, SAGA, Right2Know, A2K, Sadtu, and Section27.

Following the campaign, a court bid was issued recently in the Gauteng High Court contending that a “book famine” for persons with visual impairments is caused by provisions of the current copyright legislation. The contention is that the legislation unconstitutionally prevents persons with visual impairments from accessing books subject to copyright and does not contain exemptions as contemplated by the Marrakesh Treaty to allow such access (*Blind SA v Minister of Trade, Industry and Competition & Others*, 2021). Blind SA, a disabled persons organization, considers these limitations as violations of the rights to equality, dignity, freedom of expression, basic and further education, and the right to participate in the cultural life of choice for persons with visual and print disabilities. Neither the voices of children with visual and print disabilities nor their parents as their representatives are showcased by the campaign or the court case.

With the COVID-19 pandemic illustrating the acute need for cheap and free access to data to enable education to take place remotely where needed, the huge inequalities between those that can afford internet access and those who cannot are likely to become a crucial political tool.

Transport to Schools

Transport provision for school children with disabilities is dismal nation-wide. In 2011, a settlement agreement which was made an order of court was granted in the North West Province. Here parents and caregivers of 36 children sought appropriate scholar transport provision for children residing in a rural area. They were from impoverished households and relied primarily on social grants (*Adam Legoale v MEC for Education, North West* (2011) cited in Skelton 2013). The parents and an NGO, the Centre for Child Law, represented by the LRC, obtained a court order that parents and caregivers were to be provided with a detailed plan of the proposed transport provision.

In a settlement agreement by consent in KwaZulu-Natal Province, the High Court ordered that the provincial department of Education draft and implement a transport policy for children in the province (*Equal Education v MEC for Education* 2017). Section27 represented Siphisila Isizwe, a DPO located in rural Manguzi in Umkhanyakude District. The DPO acted as an *amicus curia* and intervened to highlight the transport needs of children with disabilities. As a result, the court order required a plan for the transport of children with disabilities to be included in the policy. It took 3 years for the policy to be drafted and unfortunately excluded a number of universal design aspects and excluded children with disabilities in mainstream schools (Section27, 2020). This litigation was brought after a three-year campaign by the NGO Equal Education. This resulted in a national transport policy being drafted which delegates transport provision responsibility for children with disabilities to provincial departments. The model of Equal Education, which puts children at the forefront of activism as so-called “equalizers” involved in information sharing, protests, and litigation for its campaigns, should be replicated by DPOs and parents of children with disabilities.

Affect of COVID-19 on Schooling for Children with Disabilities

The return to school for children with disabilities when lockdown restrictions were eased was in a state of uncertainty. A number of NGOs and DPOs lobbied government to ensure that the health and safety measures required for children with disabilities as they returned to schools and hostels and special care centers would be met, as well as the educational and therapeutic needs of those remaining at home – including the provision of assistive devices. These measures included the provision of personal protective equipment (PPE) to children and staff. Due to the delayed responses from the Department of Education, the Centre for Child Law, represented by the Equal Education Law Clinic, brought an urgent application in the Gauteng High Court in July 2020. It challenged the failure to provide the necessary support measures to children with disabilities. A court order by consent was issued, requiring the Department of Education to revise its directions, guidelines, and standard operating procedures – in line with the access to education imperatives (Hasungule 2020; Equal Education 2020).

The school nutrition case, *Equal Education & Others v Minister of Basic Education & Others*, 2021, sought to obtain relief for nine million children whose access to nutrition at schools was affected by school closures at the start of the COVID-19 pandemic and subsequent thereto. The impact of the break in provision of school nutrition to children with disabilities should be studied. Beckmann and Reyneke (2021) suggest better inclusive constructive stakeholder consultation by principals of schools of children with severe and profound intellectual disabilities and parents to better serve the educational needs of these children at a time when government COVID-19 regulations severely constrained their access to education.

Early childhood education and development (ECD) is not guaranteed for children with disabilities in practice, despite the value it brings to inclusion of children, and its mitigating effect when early interventions are provided in the early years (Philpott 2014). The value of ECD for child development was illustrated when centers closed during the COVID-19 lockdown periods in South Africa and elsewhere, with their devastating consequences for family poverty, food insecurity, bereavement, decreased access to health care – including access to vaccinations (Yoshikawa et al. 2020; Abbas et al. 2020).

Disruptions to education for children with disabilities occurred, including in special schools, and it became clear that remote learning for many of these children was undesirable and unfeasible (McKenzie et al. 2020). Higher care needs militate against self-directed learning, especially in the absence of adapted tools such as assistive devices, and with the reality of unaffordable technology and social distancing. Routine disruptions negatively affect the mental health of children with developmental disabilities, including children with autism, and lack of supervision from working parents affects the health and safety of unsupervised children (Patel 2020; Holness & Aziz 2020; Aishworiya & Kang 2020). The mental health of parents of children with disabilities has been exacerbated during the pandemic due to higher stress levels, lack of social support, and higher caregiving burdens (Chen et al. 2020). These families require tailored support measures and assistance on how to better advocate for their children's rights, including in terms of access to education (Ashbury et al. 2020).

The Right to Access Health Care

Access to health care, including habilitation and rehabilitation and the provision of assistive devices to children with disabilities, is inconsistent and patchy (Grut et al. 2012; Saloojee et al. 2006). The legislation in the form of the National Health Act limits free health services to children under the age of 6 years (Buchner-Eveleigh 2016). Cross-sectoral coordination happens in theory, but not practice, including between government and DPOs and NGOs serving the disability community; consequently, disability needs are not prioritized in programs (Philpott 2006).

A study in Orange Farm, Gauteng, found that only 28% of the assistive devices needed by the children were received and that children with physical disabilities were more likely to obtain rehabilitation services than those with intellectual disabilities – at 44% compared to 8%, respectively (Saloojee et al. 2006). Provision of assistive devices depends not only on financial affordability, but also its fit with the child concerned, which may require home and school visits – interventions which rehabilitation professionals rarely implement (van Niekerk et al. 2019). Challenges with inappropriate assessments that determine the eligibility of children with disabilities and chronic illnesses to benefits such as social assistance can compound access to health services (Berry & Smit 2011).

The Esidimeni tragedy focused the world's attention on state negligence and the slow pace of deinstitutionalization that impinge on the rights of persons with psychosocial and intellectual disabilities in South Africa (Makgoba 2017; Moseneke 2018). That case dealt with the neglect and deaths of adults with psychosocial and intellectual disabilities. The SAHRC (2017b), after its investigation into mental health care provision in South Africa which was spurred by the tragedy, notes the lack of access to mental health care for children and adolescents, and specifically refers to a lack of bed capacity in psychiatric institutions where children are housed in adult wards or are placed in juvenile detention centers.

Gcaza and Lorenzo (2008) call for DPOs to support the advocacy and lobbying role of parents and caregivers seeking access to assistive devices and services.

The Right to Social Assistance

The disability grant for adults or the care dependency grant for children often acts as income for extended families (Goldblatt 2009; Wright 2015). As a result, the grants are not fully utilized for the child or adult with the disability. The amount of the grant, however, is also often cited by caregivers as being insufficient to meet the needs of children with complex or high support problems (Pretorius & Steadman 2018).

The launching of litigation in the case of *Hassan v Department of Social Development* (2012), cited in Legal Resources Centre 2012 ensured that regulations were amended to extend the provision of care dependency grants (grants for the care of persons with severe disabilities) to the children of refugees, after litigation was brought by a refugee parent (Legal Resources Centre 2012). The Department agreed to extend this grant to children of refugees. Piecemeal victories have been sought for social assistance for refugees in different categories (e.g., disability grants, social relief of distress grants) from litigation initiated in 2005 (Lawyers for Human Rights 2005). A single mother's activism on behalf of her child brought sweeping social justice change for refugee children.

Similarly, in *Ngalo v South African Social Security Agency* 2013*,* the launching of court proceedings forced the agency responsible for social grants to process an application for a care dependency grant that had been stuck in the system for 2 years. A punitive cost order was granted in favor of the mother of the 11-year-old child with septic arthritis and a hip deformity, despite the case being settled, as the mother "achieved substantial success" especially as the state agency "was moved, upon service of the application papers, to process and approve the grant" (para 28).

The Rights to Freedom from Violence and Access to Justice

The Optimus study (Ward et al. 2018) into the prevalence of sexual offenses against children in South Africa identified that children with disabilities are at a significantly higher risk of sexual abuse. Due to their vulnerability to crime and gender-based violence, children with disabilities interact with the justice system, where they encounter unaccommodating and inaccessible court proceedings (Hesselink-Louw et al. 2003; Dagut & Morgan 2003). Numerous barriers to participation in criminal courts are faced by persons with limited to no functional speech (LNFS), including children. These include perceptions of their (in)ability to testify in court due to their communication impairment (White et al. 2015; White et al. 2018; White et al. 2020). Not only do children and their parents and caregivers lack knowledge of the legal system, but stakeholders such as social workers, the police and magistrates or judges lack knowledge on how to help a person with LNFS during the process (Bornman et al. 2016).

Augmentative and Alternative Communication (AAC) for promoting access to justice for persons with complex communication disabilities, as a measure of accommodation, is used in some courts (Bornman 2017). The impact of the limited accessibility enhancing, procedural and reasonable accommodation measures in the Regulations relating to the Sexual Offences Courts (2020), has not yet been tested. A pilot study by Heath et al. (2018, p. 12) on the uptake of protective measures, such as court preparation in Sexual Offences Courts, highlighted the following distressing anecdotal information:

> People with disabilities: On average prosecutors and Regional Court magistrates estimated that children and adults with disabilities (with an emphasis on adults and children with mental and intellectual disabilities) comprised 10-15% of their cases, with a notable increase in such cases over the last 5 years. While specific statistics on complainants with intellectual disabilities are not available, most of the court actors had not received specific training on consulting with or preparing persons with intellectual disabilities. Senior stakeholders confirmed that many of these cases are not making it to trial and corroborate the statements of some prosecutors that these types of cases get screened carefully and withdrawn early.

Pasha (2012) notes the paucity of studies on sexual offenses perpetrated against adolescents with intellectual disabilities. Meer and Combrinck (2017) highlight families' gatekeeping – stopping particularly women and girls with intellectual disabilities from accessing justice due to fears of the futility of seeking recourse or the loss of income or experiencing stigma. Cape Mental Health et al.'s (2018) shadow report submission to the Committee on the Rights of Persons with Disabilities, identified barriers such as inaccessible police stations, environmentally and attitudinally, and other systemic problems such as a lack of appropriate training for testifying in court. Parents' perspectives in seeking justice – by activist means or others – for their children with disabilities who are victims or witnesses of sexual offenses, are not provided in the literature.

In *De Vos N.O. & Others v Minister of Justice & Constitutional Development & Others* 2015, the Constitutional Court found that it was not constitutionally permissible to constrain the discretion of presiding officers to require automatic detention in prison or psychiatric institutions of adults (and adolescents) with severe intellectual disabilities awaiting trial – where their competence to stand trial was not determined or where they were deemed "unfit" to stand trial. In the case, a young man, who was 14 years old at the time when he allegedly committed the offense, was represented by a curator ad litem. His mother was a co-applicant. Unfortunately, the court was not seized with determining the permissibility of depriving such persons of their legal capacity under the current substituted legal regime. Authors have, however, welcomed the amendment to the legislation that was brought to address the unconstitutional deprivation of their freedom and security of the person and of children's rights, that now provides for a variety of "less restrictive alternatives" to imprisonment (Khan 2017; Pienaar 2018).

The next section articulates the potential for parents to be either protector or violator of their children's rights.

Parents as Protectors, Advocates, and/or Violators

Parents' as activists on behalf of their children rely on their own political agency. In the workplace, for example, where employers do not support the family responsibility of their employees, parents of children with disabilities struggle to maintain work/home balance – particularly where children's specific needs are not accommodated. The example of parents of autistic children is discussed in this regard.

Similarly, the extent of stigma against parents of children with disabilities can also militate against their own actions as agents. Here the example of mothers of children with albinism is discussed. On the other hand, the growth of the "anti-vax" lobby illuminates the potential of parents to be the violators of their children's rights. Ethical conundrums arise in cases such as "wrongful life" suits.

Langan (2011) describes the controversies about causes and cures for autism and parental involvement in either camps, and shows that parental activism can be a powerful tool – for example against the anti-vaccination movement. A study of parental activism in relation to this issue has not been conducted in South Africa. However, a profile of online anti-vaccination lobbying in South Africa found that of the online content reviewed, 66.7% of the content on web pages were related to the thimerosal/mercury/autism and other diseases claim (Burnett, et al. 2015). Farham (2019) questions whether the anti-vaccination movement is rooted in "wilful ignorance or misunderstandings" and credits the retracted Wakefield study for anti-vaccination sentiments by parents of children with autism in the country. Studies on the impact of anti-vax parental activism on the rights of children with disabilities are needed in South Africa, particularly in the COVID-19 era.

Children with autism suffer greatly when their routine, access to therapies, schooling, and lack of respite care for their carers are disrupted. Parental anxiety and coping is severely affected by the isolation and heightened burden of care without access to supportive therapies (Amorim et al. 2020). A DPO in Durban, Action in Autism, noted increased requests for assistance and advice from parents of children with autism during the strict lockdown (level 5) in March 2020. Holness and Aziz (2020) explain how the DPO noted, in particular, parents' complaints that employers lacked an appreciation of their family responsibility at an unprecedented time where children were out of school, isolated, and subject to the care of working (and sometimes single) parents. In two separate instances reported by the authors, the parents' attempts to negotiate with their employers for flexible work arrangements to accommodate their child care responsibilities were initially unsuccessful.

One example cited by Holness and Aziz is that of two autistic brothers, aged 12 and 7 years, who were left in the care of their adult sister with an intellectual disability, while their single mother, a nurse, worked as an essential worker. The older boy had high support needs. The meltdowns that ensued when the boys were inadequately supervised escalated to dangerous behavior where one son climbed to the roof of their building, requiring a rescue from the fire department. Numerous neighbor concerns about the safety of the children were noted. Despite the letter of support from the DPO, the mother's application to her employer for paid leave to allow her to care for her children and grandchild – all with disabilities and requiring high-level support – was denied.

Another complaint emanated from a parent where a nuisance complaint was brought in a sectional title scheme apartment block, against his child, a 19 year old autistic adult. Threats were made to have the young person removed by the SAPS or social welfare due to the noise he made while stimming. The state's regulations banned exercise for a period during the lockdown, with the result that the behavior deteriorated. The DPO's intervention, through correspondence, prevented his arrest. However, the body corporate continues to threaten to have the young man institutionalized. A plea by disabled persons organizations to the President for a relaxation of COVID-19 government exercise restrictions to benefit autistic persons was unsuccessful (Broughton 2020).

These DPO advocacy attempts are still required because of the lack of a precedent in establishing the right to family responsibility of parents of children with disabilities in the workplace. A Labour Court settlement was reached in a case where the mother of a child with autism was unfairly discriminated against when she required reasonable accommodation of her family responsibility (*Hugo v eThekwini Municipality*, Durban High Court, Case Number D18/11 cited in Holness 2016a) after repeated unilateral, unreasonable, and unlawful transfers. In the *Hugo* case, the single mother of a young child with autism sought reasonable accommodation of her family responsibilities in respect of the care of her son through appropriate shift work and being based at a police station close to his school. These adaptations to her work life were needed after she experienced immense challenges with her son's care and behavior as a result of her inconsistent routine and working far from home and school – resulting in multiple changes and transfers at work. The eThekwini Municipality's metropolitan police, her employer, refused to accommodate her. She claimed unfair discrimination on the basis of gender and family responsibility in terms of section 6(1) of the Employment Equity Act 55 of 1998.

A settlement agreement made an order of court after the testimony of the expert witness, a psychologist, was led on the affect of the mother's unsociable working hours on the care of the boy, including leading to self-harming behavior and regressing in terms of developmental milestones. The mother brought the case with the assistance of a law clinic, the Legal Resources Centre (the LRC). Unfortunately, individualistic outcomes, particularly where settlements are reached and precedents are not established as a result, mean that discriminatory conduct of employers needs to be litigated where employees cannot successfully negotiate workplace adjustments to accommodate their family responsibilities (Holness 2016a). The complaints made by parents of children and young adults with autism to Action in Autism regarding care responsibilities of parents of children with autism during the COVID-19 era are an example of this continuing challenge.

Children with albinism are possibly the most marginalized and vulnerable to harm in Sub-Saharan Africa, including South Africa, where they are murdered for muti (witchcraft) (Taylor et al. 2019; Mswela 2017). Mothers with albinism and those whose children have albinism (collectively known as mothers impacted by albinism) face dire consequences of discrimination that include ostracism and potential death (Reimer-Kirkham et al. 2020). Legal approaches to protect persons with albinism have sometimes jarred with the question of identity (Possi & Possi 2017). Nonetheless, a disability approach is useful, as albinism, if construed a disability in the legal sense, can extend protections and accommodations for persons with albinism. The challenge is the continued stigma that mothers and children face – even in schools and health facilities. The Centre for Human Rights of the

University of Pretoria included mothers affected by albinism in a multi-state project to find sustainable solutions for the challenges they face (Centre for Human Rights 2020). The myths facing persons with albinism can be deconstructed to provide culturally neutral explanations (Baker et al. 2010). The effectiveness of activism by mothers of children with albinism for their children needs further study.

The ethical and moral quagmire posed by "wrongful life" suits is not limited to South Africa (Human & Mills 2010). In *H v Fetal Assessment Centre*, 2015, the Constitutional Court provided some guidance to lower courts on what considerations should be taken into account when deciding whether to develop the common law in favor of recognizing these kinds of suits. Historically, South African law has not recognized these suits (Mahery 2016) but has recognized wrongful birth suits (Boezaart 2015). In the *H* case, a claim for damages was sought by the mother on behalf of her six-year-old son due to alleged wrongful and negligent failure of the assessment provider to advise the mother of the risk of her child being born with Down Syndrome. The boy also had other severe health challenges. The High Court refused the matter, citing previous court decisions. It stated that public convictions had not changed in the interim, as instead "public opinion continues to be influenced by the remarkable resilience in overcoming enormous odds displayed by many disabled persons in all walks of life, refuting those who 'treat their lives as inferior to non-existence'" (para 29). The Constitutional Court's decision aimed to remove the emotive elements from the legal debate on recognizing the wrongfulness inherent in these instances and left it to the lower court to decide on the viability of this child's claim (as represented by his mother). This is particularly as the Court posited that a child's claim may in principle exist. Some authors support the bringing of "wrongful suffering" claims such as in the *H* case, in line with the principle of the best interests of the child (Britz & Slabbert 2015; Neethling 2016). This case was brought by a mother in her representative capacity as the parent of the child. Boezaart (2015) posits that the appointment of a curator ad litem for this child may have been apt to represent the child's interests. The notice of motion brought in the Constitutional Court is anonymized to protect the child's identity. However, the entire description of the mother's stance on behalf of her child is redacted from the pleading, making it difficult to unpack her representations on behalf of her child.

Discussion

While the literature on parent-led activism in South Africa is sparse, the richness brought by parents' perspectives of conditions and partnerships that are conducive to successful activism in studies such as Elphick et al. suggests the need for further academic study. While the "burden" of child care is articulated in the literature, parents' activism in obtaining access to services for their children is not generally studied. The use of peer-support groups is a positive, semi-formal method of gaining communal input into areas requiring activism and is well positioned to lobby collectively. However, three studies identified the need for DPOs and NGOs to capacitate and support parents and parent groups in advocating for their children (Philpott 2006; Elphick et al. 2014; Philpott & Muthukrishna 2019). The possibility of amplifying their voices through strategic partnerships with DPOs and NGOs that capacitate and support them without imposing their own objectives should be further studied. Elphick et al. (2014) detailed the traditional tools for activism used by parents and caregivers – advocacy, lobbying, and protesting. Some of the litigation discussed was preceded by these methods, such as the *Springate* and *Western Cape Forum for Intellectual Disabilities* cases. The DPOs/NGOs involved conducted various campaigns to advance their causes prior to and following the litigation. DeafSA continues to lobby for change in sign language provision in schools and the WCFID continues to seek accountability from government in complying with the court order.

The roles of parents and caregivers in utilizing litigation as a strategy differ depending on the forum utilized; the litigation strategy of the legal representatives; and the objectives. For example, the parents' roles in the Equality Court cases were to identify the rights violations their children suffered to the courts, but these cases were not "strategic impact" cases. In other words, the remedies obtained for their individual children did not create a precedent or systemic changes. On the other hand, an Equality Court case brought by an attorney who is a wheelchair user, brought widescale changes to the accessibility of court infrastructure in South Africa (*Muller v Department of Justice & Another* 2003, discussed in Holness & Rule 2014). In other forums, such as the High Court cases, precedents were set in a number of cases, such as the *Centre for Child Law* and *Western Cape Forum for Intellectual Disability*, cases – with varying levels of compliance by the state in implementing the court orders. Immediate compliance in *Centre for Child Law* seems to have been possible because of the nature of the relief sought – for a number of children at one institution. However, the systemic changes required for a group of 1500 children in one province from multiple educational institutions is still problematic. In five cases listed in the table below, law clinics represented the litigants – three of which were the mothers of the children and two were NGOs. Three litigants who were the mothers of the children they represented were legally represented by private law firms, one of which was pro bono. Only in one instance did Legal Aid South Africa, the civil and criminal legal aid provider of the state, represent a child. This representation was by a curator ad litem. Curators ad litem were only appointed in two cases: one for children with behavior conduct disorder and the other for a person with a severe intellectual disability. Four of the cases resulted in settlement agreements (or orders by consent of the parties), and one was withdrawn. DPOs were amici in two cases, while in one a DPO was a co-applicant. Skelton interrogates the role of the amicus curiae in children's litigation, praising their substantial contribution to the jurisprudence (Skelton 2017). There is more scope for DPOs to assist the courts as amici in the future. In three cases with DPO involvement, not as the main litigants, two cases were settled. This means that DPO involvement does not necessarily mean that a court order setting a precedent is likely to result. Only three of the cases listed below are still not satisfactorily resolved. The role of mothers of children with disabilities in litigation on the rights of children with disabilities can therefore not be denied.

There is no ombudsperson for persons with disabilities. The SAHRC as the national human rights institution (NHRI) responsible for the protection of the rights of persons with disabilities in South Africa, intervened (as legal representative) in only one of the cases. It did so after litigation commenced and when a complaint was laid to its offices. There is therefore much scope for dedicated interventions by the SAHRC to help children with disabilities and their parents and caregivers to agitate for change.

Table Reported and unreported cases regarding children with disabilities

Court case	Litigants	NGO or DPO involvement	Legal representation of the applicant(s)	Outcome
Centre for Child Law Psychosocial support in alternative care	Law clinic		Curator ad litem appointed on behalf of the children	Court order: compliance
De Vos NO Automatic detention in prison or hospital	Child represented by curator ad litem.	Down Syndrome South Africa and Cape Mental Health (CMH) (High Court); CMH (Constitutional Court) as amici.	Curator ad litem and mother (second applicant) represented by Legal Aid South Africa	Court order: legislative amendment ensued
Equal Education (2017) Scholar transport	NGO	Siphisila Isizwe as amicus	Law clinic: Equal Education Law Centre	Settled: policy development not satisfactory
H Wrongful life suit	Child and mother of child		Private law firm	Court order: refer back to High Court for decision. Matter not yet resolved
Haskins Access to a private shop	Mother of child		Private law firm: pro bono basis	Court order: still no compliance
Hassan Social grants for refugee children	Mother of child		Law clinic: Legal Resources Centre (LRC)	Withdrawn: regulations passed
Hugo Reasonable accommodation of mother’s family responsibility	Mother of child		Law clinic: LRC	Settled: order implemented

(continued)

Ngalo Care dependency grant processing	Mother of child		Private law firm	Settled: grant application processed
Oortman Reasonable accommodation in a private school	Mother of child		South African Human rRights Commission	Court order: affecting the child concerned. Not strategic
Springate Sign language	Child and mother	DeafSA and special schools as co-applicants	Law clinic: LRC	Partly withdrawn/ settled: long-term objective reached
Western Cape Forum for Intellectual Disability case Education of children with severe and profound intellectual disabilities	NGO		Law clinic: LRC	Court order: declaration; structural interdict Long-term compliance problematic

Conclusion

Parents and carers have to navigate the complex system of legislation and policies and the limited remedies offered in uncoordinated systems and processes. Du Plessis (2013, p. 221) warns against policies that are ostensibly modeled on the promise of the social model of disability, yet “entrenches stereotypes, uncritically endorses the classification of disabled persons’ bodies and measures them against an ‘ideal’, and fails to engage with how policies for inclusion may end up creating new sites for exclusion.” Du Plessis (2013, p. 221) also questions the value of the rights-based models where much depends on whether these rights are

> interpreted to entrench the status quo or as discursive tools with which to fight domination and stake social claims. If the latter, it is not just the courts’ interpretations of their content that are important, but whether they are utilised by affected persons to appeal to political communities to include and value such persons.

On a micro-scale, parents will continue to agitate for their children’s access to services, despite the systemic failures and ableism permeating institutions. A responsive civil service and better coordination between service providers would cut down on opportunity costs, as well as the real costs incurred in seeking recourse for their children. Holding service providers accountable, through utilizing complaint mechanisms where failures occur and seeking strategic outcomes in the public interest, will continue to be necessary. Parents, caregivers, and children should utilize the existing child-friendly complaint mechanisms (such as the SAHRC's mechanism) and the Equality Courts, and test these for their accessibility. Access to information about children's rights is vital for empowering parents and caregivers. Such information should also be provided in accessible formats, such as Easy Read.

Professionals and organizations acting as curators ad litem and *amicus curia*, respectively, will likely continue to play an enhanced role in South African litigation on children's rights. The examples of parental activism and litigation such as the *Springate* case showed that where parents and caregivers of children with disabilities are backed up by DPOs with traction in society, they are more likely to be successful in achieving their advocacy goals. Furthermore, the role of law clinics well versed in disability in representing these children, their parents, and DPOs is crucial.

Perhaps a critique may be brought that the children's and parents' voices were drowned out by the DPOs/NGOs representing their "interests" along disability identity lines. Another construction may be that the DPOs/NGOs amplified the voices of the parents representing the children. The formalized way in which the voices of parents and caregivers were subsumed by the DPOs/NGOs in some cases does not necessarily affect their agency. However, it may overshadow their daily struggles at micro sites of activism where they and their children experience a continued lack of resources and suffer gross inequalities.

Skelton (2017) identified a few instances where children were directly involved in advocacy and litigation. Those did not include children with disabilities. Sloth-Nielsen (2019) argues that the courts recognize children's evolving maturity. However, in some cases an awareness of their autonomy is clear, yet in others a more protectionist stance is evident. What is evident from the litigation discussed in this chapter is that children's voices were only heard in one case (the *Springate* case). The Constitutional Court has called for children's voices to be heard in litigation about them (*MEC for Education: KwaZulu-Natal and Others v Pillay*, 2008) and was critical of only the mother of the child being heard. Obtaining the voices of children with disabilities in the activism for their rights is imperative. This will require dedicated measures to facilitate their full participation, including accessibility and reasonable accommodation requirements – particularly where communication disabilities are concerned.

Reimer-Kirkham et al. (2019) criticize the lack of "endogenous advocates" in albinism scholarship. In the same way, much richness and authenticity can be brought to scholarship on parent-led activism where parents of children with disabilities speak to their experiences. For example, Crow and Merchant's (2019) reflection on not only being parents of children with disabilities but also as being parents with disabilities. Parents and caregivers will likely remain at the forefront of activism until children with disabilities are granted the tools and supportive forums to raise their own voices to help formulate solutions for the barriers they face or are effectively represented by their parents and caregivers.

Lower prioritization of access to the basket of services to which children with disabilities are entitled is likely to be exacerbated after the COVID-19 pandemic, when states struggle to recover from its economic impact on healthcare systems. DPOs are already noting the lower priority that disability services have received in the last year (McKinney et al. 2020). Future research will have to garner empirical data on the impact of COVID-19 measures on children with disabilities in South Africa, similar to data garnered elsewhere in Africa, such as in Uganda (Mbazzi et al. 2021; Latzer et al. 2021). Aishworiya and Kang (2020) identify that the traditional advocacy role of parents is likely to be more challenging during the pandemic. They call for education, health, early intervention, and social services to prioritize children with disabilities, in order to avoid long-term prejudice occasioned from lack of key social, educational, and health interventions during this period. Importantly, the effectiveness of strategies that parents and caregivers rely on to successfully advocate for their children's rights should be studied from a Global South perspective. There needs to be a renewed focus by scholars to source the voices of parents of children with disabilities, in order to understand their role in agitating for change.

There seems to be consensus that accountability for service provision to persons with disabilities, particularly children with disabilities, may come from comprehensive disability-specific legislation. This is because the current fragmented legal and policy formulations make it difficult for parents to navigate the bureaucratic obstacles to obtaining services for their children (Tigere & Makhubele 2019; Kamga 2016a). The SALRC should prioritize a legislative framework for accountability in ensuring the provision of health, social security, education, and other services to children, in its investigation into the domestication of the CRPD in South African law. The continued stigma that parents and their children with disabilities face in communities undermines their efforts to advocate for their children (Mkabile & Swartz 2020b). Stigma-reduction measures should be prioritized, whether in policy or legislation, and should be properly funded to drive the ableism inherent in stereotypical perceptions of disability at a community level, as well as in relevant sectors of society – including public service.

Abstract

This chapter documents the concrete implementation of the principle “Nothing About Us Without Us” through the Disability Rights Movement, especially during the elaboration of the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD). The implementation of this principle by disability rights groups has led to unprecedented changes in social, legal, and political systems, which has brought about a paradigm shift from the medical model of disability to the social and human rights models. Years later, the principle was even reflected in the Sustainable Development Goals of the 2030 Agenda. The chapter also shows that there is still progress to be made with regard to how

Introduction: “Nothing About Us Without Us” in the Elaboration of the United Nations Conventions on the Rights of Persons with Disabilities, CRPD

In 1983, the United Nations proclaimed the Decade for Disabled Persons culminating in the approval of the Standard Rules for Equal Opportunities for Persons with Disabilities, a Resolution approved by the United Nations General Assembly.[1] In this document, we begin to see how some elements of the social model of disability are adopted by the Resolution, and the ways in which the text recognizes the decisive role persons with disabilities and their representative organizations should play in the planning and execution of all measures that affect their civil, political, economic, social, and cultural rights.

During the 2001 World Conference against Racism, Racial Discrimination, Xenophobia, and Related Forms of Intolerance in Durban, South Africa, the delegation of Mexico proposed the development of a comprehensive International Convention for the promotion and protection of the rights of persons with disabilities, which was materialized in Resolution 56/168 that formed the Ad hoc Committee of the United Nations for this work. The proposal was advanced by Gilberto Rincón Gallardo, President of the National Council to Prevent Discrimination (CONAPRED). Gilberto was not only representing his government as an official but as a person with disability himself.

The sessions of the Committee began in 2002, and persons with psychosocial and intellectual disabilities, their representative organizations, and experts with disabilities from various delegations had a strong presence from the start. They provided a significant contribution in the preparation of the text of the Treaty on Human Rights, directly and intensively advocating with the official delegations of the United Nations member states to commit to the different issues of “disability.” The negotiations comprised eight sessions, ending in 2006, and throughout these sessions, the principle of “Nothing About Us Without Us” guided the work. Indeed, all those involved in the process understood the importance of persons with psychosocial and intellectual disabilities participating in the convention, demonstrating how the principle was operationalized in the UN setting.

[1] Normas Uniformes para la Igualdad de Oportunidades de las Personas con Discapacidad. Resolución 48/96, del 20 de diciembre de 1993.

The Convention conceptualizes disability through the social/human rights model, which defines disability as the result of the interaction between persons living with impairments and an environment filled with physical, attitudinal, communication, and social barriers. The Convention therefore implies that the environment must change to enable persons living with impairments to participate in society on an equal basis with others. Unlike the charity or medical model – in which persons with disabilities are "objects" of charity, medical treatment, and social protection – the social/human rights model views persons with disabilities as "subjects" with rights, who are capable of claiming those rights, able to make decisions for their own lives based on their free and informed consent and be active members of society.

The Treaty establishes three substantive pillars, developed as a result of the participation of persons with disabilities who embraced the principle "Nothing About Us Without Us."

The first pillar, accessibility, is a legal term that had not been specified or developed in other human rights treaties. The CRPD refers to accessibility from the preamble[2] and in the general principles.[3] Specifically, the CRPD prescribes that the States Parties adopt pertinent measures to ensure access for persons with disabilities, on equal terms with others, to the physical environment, transportation, information and services, communications, including information and communication technologies and systems, and other services and facilities open to the public or for public use, both in urban and rural areas, so that persons with disabilities can live independently and participate fully in all aspects of life.[4]

The Convention has considered this legal innovation so relevant that it defined universal design, on which accessibility should be based, as "the design of products, environments, programs and services that can be used by all persons, to the greatest extent possible, without the need for adaptation or specialized design." Of note, however, universal design does not exclude technical aids for particular groups of persons with disabilities, when needed.[5] Organizations of persons with physical disabilities and sensory disabilities made a strong impact on bringing about this legal innovation. Furthermore, the Convention emphasized the importance of providing information and communications in accessible formats and also the use of sign language for Deaf persons.[6] These norms require not only the recognition of accessibility in the internal legislation of countries but also the development of plans for the allocation of a specific budget for this purpose.

---

[2] CDPD, Preámbulo, letra v): Reconociendo la importancia de la accesibilidad al entorno físico, social, económico y cultural, a la salud y la educación ya la información y las comunicaciones, para que las personas con discapacidad puedan gozar plenamente de todos los derechos humanos y las libertades fundamentales.

[3] Ibid, art. 3, letra f).

[4] CDPD, op. cit. art 9.

[5] Ibid, op.cit. Art 2.

[6] Ibid, op. cit. Art.21.

The second pillar focuses on respect for inherent dignity and individual autonomy, including the freedom to make one's own decisions, which first appears in the preamble[7] and as the first general principle of the Convention.[8] This pillar is the heart of the treaty and operationalizes the principles of respect and autonomy through the definition of "legal capacity." It prescribes that "States Parties shall recognize that persons with disabilities have legal capacity on an equal basis with others in all aspects of life" and that they shall adopt the pertinent measures to provide access to persons with disabilities to the support that they may need in order to exercise their legal capacity, with adequate and effective safeguards to prevent abuses in accordance with international human rights law. This norm changes the traditional approach of the civil codes of the nineteenth century based on the supposed "protection" of persons with disabilities towards the vision of a rights holder that exercises their autonomy and decisional freedom.

In other words, this precept requires the legal and philosophical reinterpretation of the pro-personae principle, forcing awareness and impacting areas of law such as civil law, criminal law, and procedural law, among others. In cases when the legal capacity of a person is not respected, especially in safeguarding their physical or mental integrity, such as involuntary sterilization, invasive, or irreversible surgeries without free and informed consent, or forced hospitalizations, those can now be classified as "torture and other cruel, inhuman or degrading treatment or punishment."

We are in the presence of a transcendental achievement with the rise of organizations of persons with psychosocial and disabilities, as well as organizations of Deaf persons and deafblind persons whose populations have been affected by disability labels and the appointment of guardians. In a metaphorical sense, the Convention's adoption of the "Nothing About Us Without Us" principle marks the abolition of another form of slavery, opening the door for many persons with disabilities to have their own voice and the full exercise of their legal capacity.

The third pillar is the right to live independently and to be included in the community, which appears in the preamble[9] and in the general principles of the

---

[7] Ibid, op. cit. Preámbulo, letras m): Reconociendo el valor de las contribuciones que realizan y pueden realizar las personas con discapacidad al bienestar general ya la diversidad de sus comunidades, y que la promoción del pleno goce de los derechos humanos y las libertades fundamentales por las personas con discapacidad y de su plena participación tendrán como resultado un mayor sentido de pertenencia de estas personas y avances significativos en el desarrollo económico, social y humano de la sociedad y en la erradicación de la pobreza; y letra n): Reconociendo la importancia que para las personas con discapacidad reviste su autonomía e independencia individual, incluida la libertad de tomar sus propias decisiones.

[8] Ibid, op. cit. Art. 3, letra a).

[9] Ibid. Op. cit. Letra m): Reconociendo el valor de las contribuciones que realizan y pueden realizar las personas con discapacidad al bienestar general ya la diversidad de sus comunidades, y que la promoción del pleno goce de los derechos humanos y las libertades fundamentales por las personas con discapacidad y de su plena participación tendrán como resultado un mayor sentido de pertenencia de estas personas y avances significativos en el desarrollo económico, social y humano de la sociedad y en la erradicación de la pobreza.

Convention, in terms of "... the independence of persons"[10] and their social inclusion. This pillar asserts that persons with disabilities should have the opportunity to choose their place of residence and where and with whom to live, on an equal basis with others, and not be forced to live according to a specific way of life. The Convention proposed that in order to ensure persons with disabilities are able to fully exercise their rights; the systems of institutionalization must be eradicated. Moreover, the Convention asserts that persons with disabilities should have access to a variety of home care, residential, and other community support services for the general population, avoiding their isolation or separation from it.

This is an immense achievement, spearheaded by organizations of persons with psychosocial disabilities and intellectual disabilities, who powerfully and effectively asserted "Nothing About Us Without Us."

The Committee also relied on the principle of "Nothing About Us Without Us" when it developed accountability measures. The Committee established that civil society, and in particular persons with disabilities and the organizations that represent them, must be integrated and fully participate at all levels of the Convention's implementation process.[11] When establishing the international monitoring mechanism through a Committee, various eligibility criteria are indicated for its members, such as a balanced gender representation and the participation of experts with disabilities.[12]

Sustainable Development

The Millennium Development Goals (year 2000) did not include persons with psychosocial and intellectual disabilities in their goals and indicators. "Nothing About Us Without Us" was the guiding principle persons with disabilities advocated for during the development of the 2030 Agenda and its Sustainable Development Goals.

While the Millennium Development Goals (year 2000) did not include persons with psychosocial and intellectual disabilities in their goals and indicators, activists determined to change this for the 2030 Agenda adopted the guiding principle of "Nothing About Us Without Us" during the development of the 2030 Agenda and Sustainable Development Goals.

At the High Level Meeting on Disability and Development (HLMDD, 2013), the Official Declaration of the United Nations Committee on the Rights of Persons with Disabilities emphasized the human rights approach and the importance of equality

---

[10] Ibid, op.cit. art. 3, letra a).

[11] Ibid, op.cit. art. 33, N° 3.

[12] Ibid, op. cit, art. 34, N° 4.

and non-discrimination for persons with disabilities, guaranteeing their right to inclusive, accessible, and sustainable development.

As a result of the intense work, the 2030 Agenda and its Sustainable Development Goals expressly mention persons with disabilities: SDG No. 4 Guarantee an inclusive quality education and lifelong learning; SDG No. 8 Promote economic growth, employment, and decent work; SDG No. 10 Reduce inequality within and between countries; SDG No. 11 Make cities and human settlements inclusive, safe, resilient, and sustainable; and SDG No. 17 Strengthen the means of implementation and revitalize the global partnership for sustainable development.

At the 8th Conference of States Parties to the CRPD / UN-NY: "Incorporation of the rights of persons with disabilities in the post-2015 development agenda," the Committee underlined the relevance of the Development Goals with indicators that directly consider persons with disabilities, in the five aforementioned Goals, while also highlighting the adoption of specific indicators on disability in two more Goals – End poverty in all its forms everywhere and promote peaceful and inclusive societies, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels – which did not expressly mention persons with psychosocial and intellectual disabilities.

Sustainable Development goals and indicators that expressly mention persons with disabilities are notable achievements for the movement of persons with disabilities at a global level and of the systematic work carried out by the United Nations Committee on the Rights of Persons with Disabilities.

Another achievement was the visibility of the disability issue in the High Political Level Forum (HLPF, 2018), where the opening message pointed out that a challenge for Sustainable Development is the reorientation of substantive approaches towards marginalized sectors of the population. It was proposed that sustainable development should consider universal accessibility. It was also underlined that multidimensional poverty is aggravated when there are groups of persons who cannot express their will, see their legal capacity restricted, or are denied the right to vote. This is a situation that affects millions of persons worldwide, including especially persons with psychosocial and intellectual disabilities.

The HLPF 2020s decision to set universal accessibility as a condition for the sustainable development of millions shows that disability has been mainstreamed within the United Nations. The Human Rights Council decided to incorporate a Special Rapporteur on the Rights of Persons with Disabilities in its body of Rapporteurs, held from 2014 to 2020 by a woman with a disability (Catalina Devandas Aguilar, 2014–2020). For his part, the Secretary General of the United Nations decided to appoint a Special Envoy on Disability and Accessibility in 2013, being succeeded by a woman as Special Envoy in 2017, in both cases, persons with disabilities (Lenín Voltaire Moreno Garcés, 2013).

The Secretary General even established a Unit on Disability in which a specialist with disabilities participates, in accordance with the policy of the United Nations Strategy for the Inclusion of Disabilities (UNDIS, 2019), which considers both the labor inclusion of persons with disabilities at the United Nations and universal accessibility.

United Nations Committee on the Rights of Persons with Disabilities

The first election of experts for the human rights treaty occurred in 2008 and adopted the eligibility criteria recommended in the Convention, prioritizing the presence of experts with disabilities. Indeed, 83% of the international experts elected by the States Parties (10/12) had disabilities.

The inclusion of expert candidates with disabilities reaffirmed the provisions of the Convention, particularly with regard to internal monitoring mechanisms which require the participation of persons with disabilities. Once again, "Nothing About Us Without Us" had concrete visibility, which has been maintained to date. In the recent election of the Committee (year 2020), 77% of the experts elected by the Committee (14/18) were persons with disabilities.

Efforts to ensure adequate representation of marginalized groups also resulted in significant gender diversity. In the first election, five female experts were elected, equivalent to 41% of the total Committee. In 2010, female participation consisted of seven experts, equivalent to 38% of the total number of members. In the last election (2020), the Committee was made up of 11 experts (61% of the total) (Table 1).

Since its installation, the Committee emphasized the participation of persons with psychosocial and intellectual disabilities and their representative organizations in different phases of the monitoring process through its Rules of Procedure, Guidelines for Reporting, and Working Methods. In the Rules of Procedure, regarding the admissibility criteria of an individual or collective communication in accordance with the Optional Protocol to the Convention, it is worth highlighting the rule that states "To decide whether a communication is admissible, the Committee will apply the established criteria in Article 12 of the Convention to recognize the legal capacity of the author or victim before the Committee, regardless of whether or not the State party against whom the communication is directed." Undoubtedly, this regulation is a strong expression of "Nothing About Us Without Us" consigned by the monitoring mechanism.

The Committee was in charge of preparing guidelines for the participation of organizations of persons with disabilities and civil society organizations in the

Table 1 Elections every 2 years to integrate the CRPD Committee

reporting processes by the States, thereby reiterating the importance of the participation of those directly involved.

The impact of "Nothing About Us Without Us" also led to the beginning of mainstreaming the issue in other Committees, for example, in the Committee on the Rights of the Child. It has similarly led to the mainstreaming of experts with disabilities in other Committees, such as in the Committee for the Elimination of Discrimination against Women CEDAW, with the election of an expert with disabilities in the year 2018, for example.

Undoubtedly, civil society organizations of persons with disabilities at a global level, both individually and grouped together in the International Disabilities Alliance (IDA), have demonstrated the principle of "Nothing About Us Without Us," both in the United Nations and internationally. These organizations include the African Disability Forum, Arab Organization of Persons with Disabilities; ASEAN Disability Forum; Down Syndrome International; European Disability Forum; Inclusion International; International Federation of Hard of Hearing Persons; International Federation for Spina Bifida and Hydrocephalus; Pacific Disability Forum; RIADIS World Blind Union; World Federation of the Deaf; World Federation of Deafblind; and World Network of Users and Survivors of Psychiatry.

Other Readings of "Nothing About Us Without Us"

"Nothing About Us Without Us" imagines persons with psychosocial and intellectual disabilities participating in different aspects of society including the design, preparation, implementation, and monitoring of public policies and legislation.

The genesis of the slogan was and has been to highlight the irreplaceable role of persons with disabilities, which is in line with the Convention. In other words, no one could claim the "representation" of persons with disabilities.

However, there are two aspects that we must take into account:

Regarding the expression "we," the relatives of persons with disabilities also want to be incorporated so that their opinions and contributions are considered, as a complement to the actions of persons with disabilities.

A second aspect refers to the fact that persons with disabilities should not only participate in matters related to disability but also in any other matter in the community.

Persons with psychosocial and intellectual disabilities are crossing the social fabric, without distinction and, therefore, as inhabitants of a territory and as citizens regardless of their age or condition, they have the right to broad political and public participation. This has led to the reformulation of the expression: "everything with persons with disabilities."

"Nothing About Us Without Us": Psychosocial and Intellectual Disability

Persons with psychosocial disabilities experienced the historical reality of devastation as a result of the treatment of their condition. Understanding the person as an ineffable and ungraspable being, they have been objectified and trapped in diagnoses that were only treated through institutionalization and/or exclusion from community life, based on the belief of their dangerousness and the need to control their behavior. The disability/illness formula found them subject to public policies that built asylum models in the countries, an example of this is the construction of the panopticon as a paradigm of care, as established through the disciplinary control of the body, constituting a "state of exception."

The state of exception is the device that must, ultimately, articulate and keep together the two aspects of the legal-political machine, instituting a threshold of undecidability between anomie and nomos, between life and law, between auctoritas and potestas. This is founded on the essential fiction by which anomie – in the form of the auctoritas, the living law or the force-of-law – is still in relation to the legal order and the power to suspend the norm is prey.

Systems become entrenched when international law is ignored while internal mechanisms seek to produce a permanent state of exclusion, which nevertheless pretends to be applying the law.

The harmony and interdependence of the rights that the CRPD brings in exercise and accessibility will settle the systems that still remain without recognizing the active citizenship of persons with psychosocial disabilities.

Human Rights and the Path to the CRPD

From 1960 onwards, Human Rights are raised as a rule of proportionality, as a right, as an action, as a principle, as a value, and as an exception. The impact that recognized rights produce establishes an epistemological change where concepts are de-centered and established in a continuous movement, through intersubjective dialogue, "Democratic plurality is the recognition of diversity and difference; above all, to the pragmatic use that citizens make of social discourses when they want to be part of the democratic dialogue." It is the thesis that Habermas maintains, when he considers that communicative pragmatics is the reference to which political practice must be associated if it is to delve into the symbolic components and the representations made by citizens of the State and its institutional organization systems. Democracy should be communication without exclusion; it is the political program that will allow each citizen to direct their actions in correspondence with a social participation where agreement and consensus allow them to recognize the interests and common goods that should guide society. It is in the field of intersubjectivity that the recognition of the other makes justice, equity, and human solidarity possible.

Equality in the CRPD is proclaimed as a fundamental condition; while "The rights of freedom behave equally with the principle of equal treatment. Regarding the rights of freedom, the principle that all men are equal serves. In Locke's state of nature, which has been the great inspiration for the declarations of human rights, men are all equal, where by 'equality' it is understood that they are equal in the enjoyment of freedom, in the sense that no individual can have more freedom than another."

The Convention views access to information as a key condition of achieving equality, as this access grants persons the ability to communicate, to make decisions, and to otherwise exercise their civil rights through the elimination of the barrier between individuals with and without disabilities. In the Convention on the Rights of Persons with Disabilities (arts. 14, 22 et seq) the right to equality is viewed as a principle, as a value, and as an action.

Reference is usually made to the dignity of persons with psychosocial and intellectual disabilities, without taking into account that recognition of the dignity of persons implies that they move in the three spheres of dignity, this is the recognition of their ability to reason, to choose, and communicate. These features are gradual, relative and abstract, and imply leaving behind the valuation of the human being because of its usefulness, in the sense that Bobbio assigns it when he points out "Less socially useful less valuation as a human being." This concept implies the operability that Article 12 of the Convention on the Rights of Persons with Disabilities brings, entitled "equal recognition as a person before the law." The harmonization of Article 12 with the capacity to act entails the recognition that persons with psychosocial and intellectual disabilities are on the same footing as others; being able to make their decisions with the support that is required for them demonstrates the concept of dignity that we have referred to.

In short, being on the same footing is to be able to have life goals, to have the means to carry out those goals, and to not to be discriminated against on the basis of disability. Persons with psychosocial and intellectual disabilities may require a diversity of supports that in each case, as in the life of any person, are linked to their history and narrative, loneliness, absences, powerlessness, and success. The social construction of disability demonstrates the relationship between the environment and the person. The lack of understanding, failures in communication, and the continued othering of persons with intellectual and psychosocial disabilities are barriers to the full community inclusion of persons with disabilities. However, the global movement is seeking to influence the organization and empowerment of the rights of persons with psychosocial and intellectual disabilities. Without centering these groups and valuing their preferences above other factors, an effective inclusion model cannot be argued.

The current status of accessibility and public policy in most countries continues to stand as a major barrier to Article Eight of the Convention, equal recognition as a person before the law.

Participation: Nothing About Us Without Us

In this sense, one of the main tensions to overcome is linked to the defense of sectoral interests and the continued development of policies without the inclusion of persons with psychosocial and intellectual disabilities or disability organizations.

La Observación General N° 7 (2018), sobre la participación de las personas con discapacidad, incluidos los niños y las niñas con discapacidad, a través de las organizaciones que las representan, en la aplicación y el seguimiento de la Convención, elaborada por el Comité sobre los Derechos de las Personas con Discapacidad de Naciones Unidas, ha señalado que "El derecho a participar es un derecho civil y político y una obligación de cumplimiento inmediato, sin sujeción a ninguna forma de restricción presupuestaria, aplicable a los procesos de adopción de decisiones, implementación y seguimiento, en relación con la Convención" (párr. 28).

Al mismo tiempo, el Comité afirma que "La 'participación plena y efectiva' (art. 3 c)) en la sociedad se refiere a la colaboración con todas las personas, incluidas las personas con discapacidad, a fin de que sientan que pertenecen a la sociedad y forman parte de ella" (párr. 27), reconociendo que "La participación plena y efectiva debería entenderse como un proceso y no como un acontecimiento puntual aislado " (párr. 28). En consecuencia, "Todas las personas con discapacidad, sin exclusión alguna en razón del tipo de deficiencia que presenten, como las personas con discapacidad psicosocial o intelectual, pueden participar eficaz y plenamente, sin discriminación y en igualdad de condiciones con las demás" (párr.16).

The Convention on the Rights of Persons with Disabilities also emphasizes the importance of participation in its articles on enforcement and monitoring mechanisms (arts. 4, 33, 34, and 35) and on international cooperation (art. 32). Faced with all recognized rights, it is the State, in its role as guarantor, who must promote accessibility and participation in the enjoyment of Rights through government management.

The States must generate comprehensive policies to favor the full participation of persons with psychosocial and intellectual disabilities. The constitutive elements of these policies characterized under an ethical floor of Human Rights must inevitably involve citizen participation, *not* induced by the State. Train the different sectors in the transversality of the CRPD. Ensure adequate dissemination of information for the full exercise of citizen rights. The slogan "Nothing About Us Without Us" is an operational legal mandate and that is why we affirm that the participation of the direct protagonists is the fundamental tool in the consolidation of more respectful and inclusive policies, and thus, in their effective compliance.

Equal participation and full inclusion is the principle that runs through the Convention as it is the foundation, mandate, and interpretative criterion of its legal norms (Article 3); the inescapable scope of its expression is found in the concept that persons with disabilities have the right to exercise their freedom, decision-making and, therefore, legal capacity.

Reflecting on this, Sessarego has analyzed the relationship between capacity and freedom, saying that: "Just as there is only one freedom, there is also only one capacity. What happens is that both freedom and capacity are presented to us in two instances or moments. The first is subjective. As for freedom, this moment represents the power of the person to decide for himself. This decision, in which freedom consists, occurs in the field of pure subjectivity, so it is not externalized. As regards capacity, the subjective moment is that of the pure aptitude that every human being has, as such, to enjoy all the rights inherent in his nature as a human being. All men are equally free and all also have the same capacity for enjoyment. This capacity, which is a mere potentiality, belongs to the intimate world of the person. An ontologically free being possesses, naturally, the aptitude to carry out all the necessary acts to fulfill his life project. The human being has the innate aptitude or capacity to decide between an infinite range of existential possibilities. Freedom and the capacity for enjoyment are indissoluble, inseparable elements." The discussion takes place in the restriction of capacity in the face of decision-making, and this is when the Convention on the Rights of Persons with Disabilities has responded to the concept of legal capacity within the social model of disability that has been visualized in Article 12, when it recognizes the right to exercise legal capacity on an equal footing with others in relation to persons with disabilities.

> The gateway to the legal discourse is the recognition of the capacity, In effect, in order to be the holder of rights and obligations it is necessary to have recognized legal capacity. This is generally held, due to the fact of being a person, although at this point there is usually a difference between legal capacity and capacity to act. The former, as I have just pointed out, is linked to being considered as a person; the second, on the contrary, implies possessing a series of traits, among which the capacity to carry out free and responsible conscious acts stands out. These references that determine what is understood by capacity in the ethical and legal fields are a consequence of the very idea of Human Dignity, as it has been constructed from its origin (in modernity) to the present day and that is presented as an argument justification of the rights.

The dynamics of their life plans is the achievement of a dignified human life where the person feels that they are part of the social nucleus through an active life of their own, with an enabling environment for human diversity.

In relation to the exercise of political rights – also called participation rights – these are recognized for persons with disabilities in the Convention (Article 29) and include persons with psychosocial and intellectual disabilities, with the right to choose and be elected. For its part, the operational aspect of recognition of political rights is found in the human rights contained in the Covenant on Civil and Political Rights in Article 25, where the right of everyone to participate in the management of affairs is established and recognized. This includes the right to vote and hold elected positions, as well as the right to have access to public service under conditions of equality and non-discrimination, in the conduct of public affairs, through civil society organizations, in political parties or constituting or from the organizations of persons with disabilities that represent them at the local, regional, national, and international levels. The right to vote as an act of active citizenship is found in the American Convention on Human Rights (Article 23), social interaction guaranteed by the state through reasonable accommodation and support. This becomes clear when persons have the opportunity to get out of the legal foundation of interdiction and community accessibility in all areas is granted through possible channels for the realization of life. On the other hand, it also establishes the right to participate fully and effectively. In this sense, the obligation for the States is to promote participation, through positive action measures. Article 4, paragraph 3, of the Convention on the general obligations of States, highlights the duty of public authorities to closely consult and actively collaborate with persons with disabilities and the organizations that represent them in preparing of the legislation and policies and in any situation that concerns them – That is, it represents the operation of the slogan *Nothing About Us Without Us*.

Deinstitutionalization

As a result of the aforementioned, the paradigm of substitution accompanied the medical/legal criterion of psychosocial and intellectual disability with institutionalization; even today, there is a model that resists transformation, arguing the benefits of specialized hospitals or institutionalization homes for mental health reasons. Institutionalization appropriates lives and slowly convinces persons subjected to the asymmetry of power existing in the system that the only reality is the one that surrounds them.

So the first possible action in the face of institutionalization is accompaniment, the promotion of skills, the recognition of a complex but non-discriminatory outside, the right to life, just as persons are, that is, respect for their integrity. For this accessibility, there is support among peers, making human rights in small gestures that make life. Listen, communicate, and give support for the organization of persons with psychosocial and intellectual disabilities. Persons have the memory of a unique authority, and their participation depends on the nourishment of their active citizenship. Perhaps the first gesture of deinstitutionalization is the power to choose, stand up to the imposed decisions and be part of the proposals.

For that, they need to have the same life experiences that other persons want. A structural barrier to the inclusion and participation of persons with psychosocial and intellectual disabilities is discrimination which continues to block access to equal conditions in community facilities and services.

Respect for their own leadership, through the exclusive knowledge of their experiences; in this lies, the centrality of the person specifying a difference as a variable of real equality. Public Policies that have an inter-sectoral vision of the State to create a mode of inclusion in residences with the support that persons require. That they have a budget and financing for independent living devices.

Support systems for when the person expresses this way through their preferences, this implies that there is no confusion regarding the choice of them or the content that makes them up. It is vital that we generate support systems with values according to the needs of the person. To provide the support, as well as to determine the type of support that the person would accept or would find useful, an interactive process should always be used. Creative and accessible communication should be fostered, as well as reasonable adjustments/modifications to the usual modes of interaction, in order to establish a good supportive relationship and function adequately within it. Ideally, supportive relationships should be ongoing and "the persons" establish such relationships early, for a future when they may need them. However, support can also be used in the case of operations or specific legal acts, so that persons with disabilities can use the services of doctors, lawyers, notaries, banks, etc., ordinarily when they choose to be self-reliant or not enter into an ongoing supportive relationship. This support, in ordinary contexts, in which persons with disabilities interact with other persons on an equal footing, can be seen as comparable to the required conditions of accessibility in communication and reasonable accommodations.

Reasonable adjustments that imply reconversion of a previous protectionist system and asylum by independent living devices with self-management, co-managed and accessibility to credit on the same foot as other persons. Reasonable adjustments in everything that disrupts the enjoyment of the rights recognized in the CRPD, an example of this is the access to sexual and reproductive rights.

In the same way, it is necessary to establish reasonable adjustments for accessing employment, where the ownership of a pension right does not undermine the fullness of labor law. We could point out that the line is regarding deinstitutionalization, establishing the game to the interdependence of Employment rights • Independent life. • Community inclusion. • Health.

Civil dialogue stands as an effective tool and is valued by the authorities, in the same way that universities and extension programs have activities supporting the participation of persons with disabilities in models of deinstitutionalization and independent living.

Independent Life

Persons with psychosocial and intellectual disabilities require that independent living be promoted in the space where the person with psychosocial and intellectual disabilities has their center of life. The change and the setting are to deepen the conception of the Independent Living model as a concept dynamic, and that is used to indicate that persons with psychosocial and intellectual disabilities have control over their lives, accessibility to opportunities on the same footing of equality, to face their decisions, and to exercise responsibilities, assuming the right to take risks. The participation of young persons with psychosocial and intellectual disabilities in an independent housing project is vital for their subjectivity in a discourse of equal opportunities.

Family members of persons with disabilities require accompaniment to promote the independent life of persons with disabilities.

Article 19 of the CRPD establishes: “The States Parties to this Convention recognize the right, on equal terms, of all persons with disabilities to live in the community, with options equal to those of others, and shall adopt effective and pertinent measures to facilitate the full enjoyment of this right by persons with disabilities and their full inclusion and participation in the community, ensuring in particular that:

a) Persons with disabilities have the opportunity to choose their place of residence and where and with whom to live, on an equal basis with others, and are not forced to live according to a specific way of life;
b) Persons with disabilities have access to a variety of home, residential and other community support services, including personal assistance that is necessary to facilitate their existence and inclusion in the community and to avoid their isolation or separation from it;

c) Community facilities and services for the general population are available, under equal conditions, to persons with disabilities and take their needs into account."

Article 19 considers the right to autonomous life and access to services for its realization. In the case of persons with disabilities, the particular situation of exclusion, abandonment and discrimination requires that the term "facilitate" referred to in article 19 be translated into "ensure and promote."

Importantly, the Convention establishes that assistance and support services must be provided within the community.

In general, support is needed to move through life and for persons with psychosocial and intellectual disabilities, the most frequent forms of assistance and support are:

Support among peers, organize and be a protagonist in the construction of an independent living program.

– Community support and independent living: help with personal care, support for the performance of some formal acts. Procedures, etc., according to each person.

Residential support: individual housing, self-managed, or co-managed coexistence housing with a community center. According to the preference and autonomy of the person.

– Support for education or employment.
– Communication support.
– Community access: community benefits, peer support, or organizations of persons with psychosocial disabilities.
– Information and advisory services: professional help, guidance service, and decision-making support.

The person is central: the needs, desires, and aspirations of the persons are the priority of the services. Community-based services allow the person to achieve their goals and are flexible over time according to the individual's needs.

Support is for the person and their environment: it implies that extra help is offered to the person, their family, and their friends to help them live and be part of the community, increasing their resources.

Disability as a social construct: disability is understood through the social model of disability as an experience mediated by social structures and processes.

Comprehensive support: they provide any help necessary to overcome the obstacles that disable you and enable you to have a good quality of life.

The strategies vary according to the greater development of the countries, since in those with structural poverty, the deinstitutionalization processes and, therefore, the programs from the public policies for independent living are often very weak.

In this last element, the provision of services through NGOs that have advantages, specialization, and response capacity is strongly emerging in several countries.

The family cannot always be an assistant or support. Assistance through family members can affect the autonomy and mobility of support due to involvement and the family relationship itself. For this reason, it is necessary for persons with psychosocial and intellectual disabilities to have support independent from their families, when necessary.

It is for this reason that the State must ensure financing and accessibility to the sectors that enable independent living, housing, accompaniment, assistance, employment, health, recreation, culture, sports, etc. The role of the States appears as a guarantor of access to independent life. In other words, the pending issues not yet achieved for the effective inclusion of persons with psychosocial and intellectual disabilities are the current challenge. In view of this reality, the activism of the protagonists in their visibility and unavoidable presence are the axes that are narrowing the existing gaps. This is what gives strength and meaning to the expression “Nothing About Us Without Us.”

Conclusions

The Convention, by defining the universal accessibility model as the real possibility that persons with disabilities can interact with their environment and access goods and services without adaptations or specialized design, produced not only an epistemological change but also change in the most intimate of the structures of the world order of distributions.

The slogan “Nothing about Us without Us” has impacted the organizational structures of the States and the reformulation of the Law, emphasizing legal capacity. There is no full right without the exercise and enjoyment of the recognized right.

Respect for inherent dignity, and individual autonomy, including the freedom to make one’s own decisions, which appears from the preamble and as the first general principle of the Convention; for this reason, Article 12 appears clearly when it headlines: “Equal recognition as person before the law.” Legal capacity imposes decision-making and is the gateway to make irreconcilable any way or means of non-recognition of the person in their actions and preferences.

We can conclude that it is the right to live independently and to be included in the community, to have the opportunity to choose where and with whom to live, on equal terms with others, and not be forced to live according to anyone else’s decisions.

Sustainable Development goals and indicators that expressly mention persons with disabilities are notable achievements of the movement of persons with disabilities at a global level and of the systematic work carried out by the United Nations Committee on the Rights of Persons with Disabilities, supported by the CDPD.

Persons with disabilities are crossing the social fabric, without distinction, and therefore, as inhabitants of a territory and as citizens, regardless of their age or condition, they have the right to broad political and public participation. This has led to the reformulation of the expression: “everything with persons with disabilities.”

It is a result of these conclusions that persons with disabilities should be able to count on a life project with the means to carry out the same project and not be discriminated against on the basis of disability.

Communication about this model should be provided to societies that have been captive under the substitution model so that they can also responsibly promote or enable deinstitutionalization for persons with psychosocial and intellectual disabilities who still continue under systems of asylum and hospital-centric treatment.

The construction of a diverse, complex, decentered, and dynamic world is where the effective participation of persons with disabilities finds its seat through the dynamics of their life plans, speaking on their own behalf in relation to life plans.

In relation to the exercise of political rights, it includes persons with psychosocial and intellectual disabilities, with the right to choose and be elected; it is not only an act of active citizenship but is also a foundation for the development of the legal personality of persons with disability.

Public Policies present an intersectionality of concrete guarantees that make the social dimension of the conquest of rights, establishing the necessary support for their realization.

Deinstitutionalization represents the loss of control of lives and the responsibility for generating active means of social presence in terms of equality among persons without establishing ranges of difference due to disability.

Finally, we can conclude that it is the model of independent living.

It translates into access to Housing, accompaniment, assistance, employment, health, recreation, culture, sports, etc. The role of the States appears as a guarantor of accessibility to independent life.

Legal capacity, the right to rights, full participation, and independent living supported by public policy and citizens organization of persons with disabilities demonstrate the meaning of "Nothing About Us Without Us."

"The interhuman also resides in the recourse of some to the aid of others, before the brilliant otherness of others is trivialized or minimized in a simple exchange of good manners established as" interpersonal "commerce within the customs . . ."

Advocacy in Inclusive Humanitarian Action

80

Sandra Willis and Helen Verdeli

Contents

Abstract

Disability Advocacy and Activism in humanitarian action is both a voice and a mechanism steering disability-informed and disability-mainstreamed development agendas, legislative and regulatory processes, tools, and innovations to consider political, economic, social, and cultural processes that can propagate equitable, inclusionary, and spatially efficient forms of normativity that *leave no one behind*. The Disability Advocacy and Activism movement leverages from, and partners with, individual actors and the groups they represent, multilateral agencies, governments, and civil society, among other key stakeholders and actors, in progressing the policies, practices, and recommendations set out by international treaties and federal and local legislation, policies, and practices. The ultimate aim is to ensure the Triple Nexus or the Humanitarian–Development–Peace (HDP) Nexus (International Organization for Migration (IOM),

Operationalizing the Humanitarian–Development–Peace Nexus: Lessons Learned from Colombia, Mali, Nigeria, Somalia and Turkey. (2019). https://publications.iom.int/fr/system/files/pdf/operationalizing_hdpn.pdf) is disability-inclusive and actioned in a way that is proportionately universal, resourcing and delivering of universal services at a scale and intensity proportionate to the degree of need. Proportionate universalism recognizes that universal responses are needed to trigger social and environmental investment and legislative and behavioral changes to reduce the impact of present and future shocks and increase society's resilience, highlighting the needs of those who are perpetually marginalized. Central to this movement is a focus on rights, equity, and inclusion, particularly when concerning persons with disabilities and older persons, as well as, displaced populations include refugees. The latter group is at an increased risk of experiencing further harm and marginalization as a result of multilayered barriers and compounded (often inadvertent) discriminatory and exclusionary emergency response mechanisms, human rights and protection systems, and humanitarian action.

The Challenge

Migration is a megatrend that is reshaping the global landscape with an estimated 1 billion migrants, or one in every seven people globally (World Government Summit Future State 2030, 2016). Migration and forced displacement are focal issues for human rights and the Triple HDP (Humanitarian–Development–Peace) Nexus, influencing both local and global discourse among advocates, policymakers, and practitioners (Nguya & Siddiqui, 2020). As governments and policymakers scramble to understand how these mass movements affect societies and economies, the needs of persons with disabilities and older persons remain largely excluded from strategic and systematic considerations. Few would argue that the need for disability rights advocacy and activism remains imperative since disability and aging are major contributors to the vulnerability of persons in humanitarian settings.

The Context

Recent large-scale humanitarian crises, whether they unfold rapidly (such as the pandemic or the Ukrainian war) or slowly (a number of impacts of climate crisis), have been developing into complex emergencies that have the ability to shut down nations, overwhelm healthcare systems, and catalyze a global economic and social crises. They require unparalleled urgent and coordinated global response that directs political will, commits adequate resourcing, and adopts uncompromising duty-of-care to curtail or prevent unprecedented human suffering and financial ruin. They leave impoverished and marginalized populations particularly vulnerable to shocks, causing disproportionate suffering.

In emergency and humanitarian settings with people fleeing insecurity and violence, the forced displacement of persons with disabilities and older persons often leads to great distress and exclusion, with some being left behind or not surviving the displacement journey. Those who reach humanitarian assistance may risk not being identified in the registration process and consequently face further exclusion due to physical, environmental, and institutional barriers to accessing both essential and specialized services and human rights protection (UNHCR, 2011). This chapter sets out how disability advocates and activists set the agenda to highlight such vulnerabilities and set forth specific actions that governments and other humanitarian actors can take to minimize these risks and vulnerabilities.

Persons with Disabilities in Humanitarian Contexts

Persons with disabilities are estimated to represent 15% of the world's population (World Health Organization and the World Bank, World Report on Disability, 2011). In humanitarian contexts, they form a much higher percentage. At higher risk of living in poverty globally, an estimated 9.3 million persons with disabilities are forcibly displaced as the result of persecution, conflict, violence, and human rights violations in addition to climate-induced migration[1]. Persons with disabilities are known as those who are consistently "left behind," being one of the most marginalized populations in conflict, disaster, and even peacetime settings (United Nations General Assembly, 2016).

> Persons with disabilities "include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others."
>
> Convention on the Rights of Persons with Disabilities and its Optional Protocol (CRPD, 2006).

From conflict to natural disasters, humanitarian aid is essential in tackling some of the world's most devastating crises. However, not all people have equal access. Persons with disabilities have the same rights and basic needs as others in situations of crisis and/or forced displacement. However, they often face a multitude of barriers to accessing humanitarian assistance, education, livelihoods, health care, protection, and legal rights. In addition, multiple and intersecting forms of discrimination further exacerbate the situation of persons with disabilities, contributing to the violation of

their human rights. Persons with disabilities and older persons are among the vulnerable and exposed to multiple, compounding, and intersecting forms of discrimination, exploitation, violence, and sexual and gender-based violence, while at the same time they may be excluded from support and services compared to persons without disabilities (Inter-Agency Standing Committee (IASC), 2019, Women's Refugee Commission, 2014).

When analyzing the risks and barriers to including persons with disabilities in humanitarian contexts and action, barriers lead to exclusion, which persons with disabilities face at a higher level than the rest of the crisis-affected population (DG ECHO, 2019). Through the systematic identification and removal of institutionalized, environmental, and attitudinal barriers as well as the use of enablers such as promoting accessibility and universal design standards to shelter/camps, food distribution points, or acquisition of assistive devices, rehabilitation, and psychosocial support, persons with disabilities will be less at risk and improve their resilience.

The Multiplier Effect (United Nations Office on Drugs and Crime, 2016)

Displaced women with disabilities face TRIPLE discrimination – as women, refugees/displaced persons, and persons with disabilities. Displaced women with disabilities can suffer three times over from the stigma, threats, and barriers, experiencing discrimination based on their migrant/displaced status AND their gender and disability. This can include discrimination, exclusion, and mistreatment in accessing essential services, seeking shelter and housing, and accessing education and health services. In humanitarian contexts, displaced women and girls are also more likely to face health problems – both in transit and at their destinations. They continue to face barriers to health care services, sexual and reproductive health services and family planning, rehabilitation services, medication, and access to assistive devices, which are extremely limited, reducing mobility and thus increasing dependency and vulnerability. The lack of these services is considered one of the leading causes of death, illness, and disability among displaced women, especially those of childbearing age. All displaced people are vulnerable to abuse and exploitation, but displaced women and girls, especially those with disabilities, are particularly at risk. It is estimated that women and girls account for 71% of all human trafficking victims. Lack of accessible shelter, overcrowding in camps, and lack of access to basic services and communications increase the risk of gender-based violence, including sexual violence and child marriage. Moreover, when abuses occur, many displaced women with disabilities lack accessible resources, support systems, and knowledge to seek help.

Beek et al., 2017

United Nations Office on Drugs and Crime (UNODC) (2016).

Despite increasing recognition of and commitment to disability inclusion in humanitarian contexts, reliable data on disability among displaced populations is relatively scarce. A seminal study conducted by Handicap International, now Humanity & Inclusion (HI), (Humanity & Inclusion, Disability in Humanitarian Context, 2015) was based on extensive consultation with 484 persons with disabilities, 118 Disabled People's Organisations (DPOs), and 167 humanitarian actors from Latins America, and the Caribbean, Africa, Asia, and Europe. The research showed that persons with disabilities are strongly impacted when a crisis occurs, with up to three-quarters of people with disabilities affected by a humanitarian crisis reporting that they did not have adequate access to basic assistance such as water, shelter, food, or health care services. Half of the respondents reported not having access to specific care such as rehabilitation and assistive devices. Over half (54%) of the respondents with disabilities stated that they have experienced a direct physical impact, sometimes causing new impairments, while 27% report being psychologically, physically, or sexually abused. Increased psychological stress and disorientation are other effects of the crisis for 38% of the respondents with disabilities. It was also estimated that humanitarian crises currently impact approximately 20 million persons with disabilities, and numbers related to budget allocation also indicate a lack of resourcing, with a meager 1% of aid work budgets estimated to go toward supporting persons with disabilities. This is somewhat verified with nearly all aid workers saying persons with disabilities do not have their needs met in crisis and humanitarian situations.

Older Persons in Humanitarian Crises

Available data, although limited, clearly show that older people are disproportionately represented in disaster-related morbidity and mortality. When emergencies strike, whether due to conflicts or natural disasters and where people are forcibly displaced, older men and women are some of the most vulnerable and neglected. They are at the highest risk for fatalities as they face barriers, threats, and risks in meeting their needs due to their age. Such barriers are similar to those faced by persons with disabilities. Unfortunately, the current reality is that similar to the plight of persons with disabilities, older persons are increasingly inadequately addressed in emergencies and humanitarian crises, as highlighted in the 2016 World Humanitarian Summit stating that there was a need to "correct the neglect of older people (HelpAge International, 2016)." Humanitarian action rarely identifies or addresses the immediate needs of older persons, who remain one of the most vulnerable and neglected groups in crises. Even in cases where the response does identify the needs of older persons, often the resources allocated to addressing those needs are inadequate. This was recently evidenced by both the COVID-19 global pandemic and the Ukraine conflict.

Advocacy for the inclusion of persons with disabilities and older persons needs to reach all actors involved in humanitarian response to catalyze immediate changes that include, but are not limited to, the identification and documentation of short and intermediate needs, securing funding, ensuring accessible and equitable humanitarian response, and establishing coordination mechanisms with outcomes-based interventions that are monitored and evaluated for access and inclusion.

Mental Health Conditions and Psychosocial Disabilities in Humanitarian Contexts

Evidence suggests that displaced populations are at an increased risk of experiencing mental health conditions and psychosocial disabilities. Emergency settings requiring humanitarian action, such as armed conflicts and natural disasters, cause significant psychological distress, such as feelings of anxiety and sadness, hopelessness, difficulty sleeping, fatigue, irritability, anger, and more (WHO, 2022). The burden of mental health conditions and more severe, prolonged psychosocial disabilities among conflict-affected and displaced populations is extremely high, as measured by WHO's review of 129 studies in 39 countries. The study reported that among people who have experienced war or another conflict in the previous 10 years, one in five people (22%) will have depression, anxiety, posttraumatic stress disorder (PTSD), bipolar disorder, or schizophrenia (WHO, 2019). The prevalence of mental disorders such as depression and anxiety is expected to more than double among displaced populations in a humanitarian context. According to WHO's recent review, the estimated prevalence of mental health conditions and psychosocial disabilities among conflict-affected populations at any specific point in time (point prevalence) is 13% for mild forms of depression, anxiety, and posttraumatic stress disorder, and 4% for moderate forms of these disorders. The estimated point prevalence for severe mental health conditions and psychosocial disabilities (i.e., schizophrenia, bipolar disorder, severe depression, severe anxiety, and severe posttraumatic stress disorder) is 5%.

In humanitarian settings, depression and anxiety are higher among women and increase with age, placing older persons at high risk. Women, children, and adolescents are at an elevated risk of common mental health disorders, such as depression, anxiety, and posttraumatic stress disorder (PTSD). Recent estimates place the age-standardized prevalence of mental disorders among displaced populations at 10.8% for depression, 15.3% for PTSD, and 21.7% for anxiety (Scherer et al., 2020). Similar figures are seen among young refugees and people (under 18 years) displaced to European countries, with prevalence figures for depression estimated between 10.3% and 32.8%, PTSD from 19% to 52.7%, and anxiety from 8.7% to 31.6% (Kien et al., 2019). These figures are considerably higher than WHO estimates of common mental disorders among the general global population, at 4.4% for depression and 3.6% for anxiety disorders (including PTSD) (Charlson, 2019), conceivably due to the exposure of various stress factors which affect their mental health and well-being.

People with severe mental disorders can be especially vulnerable during and after emergencies and humanitarian settings as they need access to basic needs and clinical care. A review by Charlson (2019) of the health information system from 90 refugee camps across 15 low- and middle-income countries found that 41% of health care visits for mental, neurological, and substance use disorders were for epilepsy/seizures, 23% for psychotic disorders, and 13% for moderate and severe forms of depression, anxiety, or posttraumatic stress disorder. Based on a systematic review and meta-analysis findings, the researchers estimated that approximately one in five people in post-conflict settings has depression, anxiety disorder, posttraumatic stress disorder, bipolar disorder, or schizophrenia, with an estimated prevalence of 22.1% (95% UI: Unit Interval 18.8–25.7) at any point in time in the conflict-affected populations assessed. The estimates showed a higher prevalence of severe mental disorders (about 5.1% point prevalence in the current estimate compared with 3–4% 12-month prevalence in previous estimates) and a higher prevalence of mild to moderate mental disorders (approximately 17% point prevalence in the revised estimates). The estimated YLDs (Years Lost to Disability) per 1000 people for depression and posttraumatic stress disorder were more than five times higher than the existing global mean burden of disease. Children exposed to conflict also face severe emotional stress resulting in lifelong mental health and psychosocial issues (UNICEF, 2020). Children with mental conditions suffer stigma and discrimination and may be excluded from their communities or exposed to further violence. Mental health and psychosocial support (MHPSS) Is essential for improving children's and adolescents' mental health and well-being in humanitarian emergencies.

One of the priorities is to protect and improve people's mental health and psychosocial well-being, focusing on those who are particularly vulnerable, such as those with pre-existing mental health conditions, older persons and persons with disabilities. However, a significant gap has been the absence of a multi-sectoral, interagency framework that enables effective coordination and identifies beneficial practices (Inter-Agency Standing Committee (IASC), 2007). Achieving this priority required coordinated advocacy leading to action among all government and non-government humanitarian actors. This gap was addressed was addressed in the IN Inter-Agency Standing Committee (IASC) Guidelines on Mental Health and Psychosocial Support in Emergency Settings (Convention on the Rights of Persons with Disabilities (2006)).

Advocating for Change: Global Advocacy and Normative Frameworks

International treaties, laws, instruments, and policy frameworks emphasize the relevance of international law in humanitarian crises (IASC, IASC Policy on Protection in Humanitarian Action, 2016). In particular, the International Humanitarian Law (IHL), International Human Rights Law (IHRL), and International Refugee Law, all these bodies of law provide a legal framework that grounds humanitarian action in internationally agreed principles and standards that affirm the rights of all individuals affected by crises, including persons with disabilities. For instance, the IHL provides general protection to all "without adverse distinction" or discrimination, permitting humanitarian actors to prioritize persons with disabilities. Humanitarian aid must make sure, for example, that shelter, food, water, health care, rehabilitation, and protection measures are accessible to persons with disabilities. Both IHL and IHRL affirm the obligations to protect and ensure the safety of persons with disabilities, keeping in mind that they are at risk of being left behind as they may require adapted evacuation. In addition to the above, specific provisions for persons with disabilities that advocate their inclusion in response to movements of refugees and migrants are noted in both the Global Compact on Refugees (UNHCR, Global Compact on Refugees, 2018) and the Global Compact for Safe, Orderly and Regular Migration (IOM UN Migration, 2018).

International normative frameworks have made concerted and decisive measures to address the rights and needs of persons with disabilities in development. Only recently, however, some consideration has been given to persons with disabilities and older persons in humanitarian crises, including those with refugee status. The Convention on the Rights of Persons with Disabilities (CRPD, 2006) is a treaty binding on states to ratify and affirm that states parties must protect and promote the rights of persons with disabilities in their laws, policies, and practices and must also comply with the treaty's standards when they engage in international cooperation. Broader structural issues needed to support persons with disabilities in humanitarian crises are identified by the CRPD. They include the (a) provision of education for children with disabilities; (b) access to appropriate health care; (c) access to shelter, food, and sanitation; and (d) safety from the risk of harm, including exploitation and physical or sexual violence. However, it is known that emergency settings and forced migration increase the likelihood of exclusion from the barriers that prohibit full access to safe evacuations and humanitarian aid and protection, all of which lead to an elevated risk of exploitation and violence, with women and children being most at risk for trafficking, abuse, emotional violence, and sexualized violence.

Provisions are also set out in Article 11 of the Convention on the Rights of Persons with Disabilities (CRPD) (Convention on the Rights of Persons with Disabilities, 2006) and the Optional Protocol (Convention on the Rights of Persons with Disabilities and Optional Protocol, 2007). Article 11 of the CRPD indicates that "*States Parties shall take, in accordance with their obligations under international law, including international humanitarian law and international human rights law, all necessary measures to ensure the protection and safety of persons with disabilities in situations of risk, including situations of armed conflict, humanitarian emergencies and the occurrence of natural disasters.*" The Article requires state parties explicitly to take all necessary measures to protect and reduce risks for persons with disabilities in situations of risk, including armed conflicts, humanitarian emergencies, and natural hazards.

The 2030 Agenda also stresses that all states need to respect, protect, and promote human rights for all, including persons with disabilities. The Sustainable Goals (SDGs) (UN Department of Economic and Social Affairs, 2018) global framework includes a global commitment "to leave no one behind," as outlined in Goal 96, promoting the inclusion of persons with disabilities in humanitarian action. The Sustainable Goals (SDGs) (UN Department of Economic and Social Affairs, 2018) global framework includes a global commitment "to leave no one behind," promoting the inclusion of persons with disabilities in humanitarian action with Goal 9 calling on societies to build sound infrastructures, particularly in areas affected by disasters. The Sendai Framework for Disaster Risk Reduction 2015–2030 (The Sendai Framework for Disaster Risk Reduction 2015 – 2030, 2015) guiding principles include accessibility, the application of universal design standards, and the participation of persons with disabilities to lead publicly and promote universally accessible response, recovery, rehabilitation, and reconstruction approaches. The framework notes the importance of strengthening disaster-resilient public and private investments, mainly through "building better from the start to withstand hazards through proper design and construction, including the use of the principles of universal design." It promotes an "all of society" approach that includes persons with disabilities, aiming to reduce disaster risks and loss of lives and assets.

The World Humanitarian Summit prioritized and offered "hope for an often-forgotten population: the millions of people with disabilities affected by humanitarian crises (Humanity and Inclusion, 2016)." It afforded a platform to focus representatives of NGOs, states, and funding bodies on the needs of this population, which is made acutely vulnerable during natural disasters and conflicts, and promoted the signing of a new Charter on Inclusion of Persons with Disabilities in Humanitarian Action (Humanitarian Disability Charter (2017)), reaffirming their commitment to upholding the rights and meeting the needs of people with disabilities during an emergency. Signatories promise that their future humanitarian actions will be inclusive of people with disabilities, based on five principles (Humanity and Inclusion, 2016):

1. Non-discrimination and recognition of the diversity of people with disabilities
2. Involvement of people with disabilities in developing humanitarian programs
3. Ensuring services and humanitarian assistance are equally available for and accessible to all people with disabilities
4. Implementation of inclusive global policies
5. Cooperation and coordination among humanitarian actors to improve the inclusion of people with disabilities

Following the Summit in 2018, the UN Inter-Agency Standing Committee (IASC) Task Team on Inclusion of Persons with Disabilities in Humanitarian Action began developing the AISC developed guidelines (Inter-Agency Standing Committee (IASC), 2019) to promote the inclusion and full and effective participation of persons with disabilities in humanitarian action. The guidelines specify the deliberate action in all phases of the humanitarian program cycle to ensure the systematic inclusion of persons with disabilities by national, regional, and international humanitarian actors who are involved in policymaking, coordination, programming, and funding, together with the participation of Organizations of Persons with Disabilities (OPDs). The IASC guidelines assist humanitarian actors and affected communities to coordinate, plan, implement, monitor, and evaluate essential actions that foster the full and effective participation and inclusion of persons with disabilities across all phases of humanitarian action.

Advocating for Change: Strategies to Promote Access and Inclusion

Advocating for the needs of the most vulnerable and marginalized, including persons with disabilities and older persons, has to be strategic and comprehensive across the humanitarian spectrum. Therefore, the legal and policy frameworks, the Charter, and guidelines all converge to ensure that relevant stakeholders (1) align with the International Human Rights and International Humanitarian Laws, the Convention on the Rights of Persons with Disabilities (CRPD), the 2030 Agenda (SDGs), and the Sendai Framework for Disaster Risk Reduction and (2) adopt all necessary measures outlined in the IASC guidelines, among others, to ensure the full inclusion, reducing risk, improving resilience, and increasing protection of persons with disabilities and older persons in situations of risk, including the adoption and implementation of inclusive and accessible policies and programs and promotion of the full and meaningful participation and inclusion of persons with disabilities and older persons in the development of and decision-making processes relating to such actions, across all aspects of the Analytical Model for Vulnerability Analysis (Department of International Development (DIFID), 2019). In line with this Model, advocates need to continually pose the following question:

> What obligations do local and state governments have to respect the rights of all persons, including persons with disabilities and older persons, to protect those rights against barriers and abuses, and to fulfill the rights necessary for them to enjoy a life of dignity and security in humanitarian contexts?

Advocates also need to frame the work from the perspective of the HDP Nexus by holding and promoting the position that protecting these rights is not only a legal obligation but also a matter of extreme public interest and intrinsically linked to human development, social cohesion, inclusion, and peacebuilding.

1. Advocate with governments to remove discriminatory laws and ensure their legal frameworks are non-discriminatory and in line with the provisions of the CRPD:
   – Ensure that migration laws and practices uphold the rights of persons with disabilities and older persons by removing existing laws, regulations, customs, and practices that are deemed discriminatory.
   – The CRPD underlines a requirement for equality and non-discrimination of persons with disabilities and older persons. This outlines a need to offset the impact of impairment, including in the emergency and humanitarian contexts. Accessible information, sign language interpreters, the provision of aids (such

    as wheelchairs and hearing aids), and level access camp settings are clear examples of fundamental adjustments.
  - The disability must not be a reason for denying an immigration application or residency as per Article 18 of the CRPD.
2. Advocate for increased awareness, capacity, and guidance:
   - For many humanitarian actors, a lack of understanding of persons with disabilities and older people's needs or knowledge of addressing the barriers they face is a significant challenge. HelpAge International has developed minimum standards (HelpAge, 2012), technical guidelines, and training material and an Age and Disability Capacity Programme (ADCAP (HelpAge, 2013)) to increase individual and organizational capacity to provide age and disability-inclusive humanitarian response.
   - Promote a coordinated response that, at the global and country levels, UN agencies and national governments are responsible for coordinating humanitarian responses to address the needs of persons with disabilities and older persons. Partnerships are critical, including specialist disability agencies such as Humanity & Inclusion (HI) and the Christian Blind Mission (CBM), members of the Red Cross Movement, including the International Federation of Red Cross and Red Crescent Societies (IFRC) and the International Committee of the Red Cross (ICRC), and mainstream NGOs such as Islamic Relief Concern World Wide and Christian Aid, among others.
3. Advocate for inclusive data collection and research:
   - Persons with disabilities and older persons within populations of the displaced, migrants, and refugees in emergency and humanitarian contexts need to be continually highlighted and represented by reliable and robust data to generate a greater understanding of the elevated risk posed by emergencies and to develop strategies to mitigate such risks.
   - Intersectionality: There is a need for robust and reliable data about the numbers and profile of persons with disabilities – including mental health disorders – women, youth, children, and older persons – in emergency and humanitarian contexts globally. Accurate, reliable data are needed during assessments to respond to their needs. However, there is a critical lack of data regarding the numbers and their characteristics and demographics, the barriers they face, and specific needs regarding age, gender, impairment, location, or living situation. After all, an estimated ten million people are disabled within displaced populations, with around two million experiencing significant difficulties in functioning (Migration Data Portal, 2022).
   - There is a lack of consistency in terminology and methodologies for data collection, cultural differences in definitions and concepts of disability, and lack of training or disability awareness among data collection staff which affect the availability and accuracy of data.
   - Persons with intellectual disabilities and mental illness may have difficulties preparing for interviews and collecting the necessary information. In addition, refugees with hearing or physical impairments may need particular assistance to communicate or overcome barriers.

4. Advocate for a twin-track approach to ensure access to funded mainstream and specialized services:
   - Barriers impede accessibility in physical, transport, and communication infrastructure to facilities and services, including schools, health clinics, latrines, water points, bathing facilities, and food distribution points. Difficulties with physical access and the poor design of buildings, including shelters, affect all aspects of daily life and increase the isolation of persons with disabilities and older persons.
   - Ensure that persons/women with disabilities enjoy equal access to health, education, and social protection policies, including protection strategies for women with disabilities.
   - Specific inclusive services are essential to ensure accessible communication services, assistive devices, mobility aids, and carer support where required.
   - In addition to lack of physical access, mainstream services often either are inappropriate or do not cater for the specific needs of persons with disabilities and older persons. In addition, a lack of specialized evacuation procedures, health care that includes orthotics, hearing devices, pain management and psychiatric medication, psychosocial support, and counseling services is of particular concern.
   - Governments and other stakeholders need to tackle the challenge that displaced and refugee populations face to access health care to improve health conditions.
   - Uphold women with disabilities' right to access sexual and reproductive health care and prenatal care, including deploying mobile health clinics (United Nations Population Fund (UNFPA), 2018) to displacement camps and refugee communities.
   - To identify the protection and assistance needs, relevant partners should ensure a swift and systematic identification and registration of persons with disabilities and older persons, particularly those who cannot communicate their own needs. It is also encouraged to include persons with disabilities and older persons in relevant policies and programs in an accessible way.
   - Funding and donor policy: HelpAge International analyzed over 16,000 humanitarian projects between 2010 and 2014 and found that less than 1% (154) had any activity explicitly targeting older people.[13] To address these gaps, advocates need to work with major humanitarian donors in developing mechanisms for assessing proposals that will ensure persons with disabilities and older people's needs are not left behind.

Conclusion

Persons with disabilities and older persons represent a largely invisible group of individuals who are forced to endure emergencies and humanitarian crises, often being trapped and unable to evacuate or being displaced and leaving their homes and homelands in strongly disadvantaged conditions. Apart from the challenge of surviving the journey, persons with disabilities and older persons encounter several barriers. For example, they may face a lack of accessibility to assistance and protection risks, lack of access to medical care, and insufficient access to assistive technology which could make communication and mobility easier. In addition, persons with disabilities and older persons face an even higher risk of being discriminated against or excluded from receiving appropriate support.

Of the more than 100 million people displaced worldwide, women, children, and youth with disabilities and older persons are often excluded from vital services, including those that address gender-based violence, programs for adolescents and youth, and education on sexual and reproductive health care. There is a dire need to advocate for their inclusion across all pertinent programs and services, including equal access to health, education, and social protection policies, including protection strategies for women with disabilities. Also, strengthening the leadership of organizations of persons with disabilities in humanitarian and development action is imperative to address the needs while improving accountability.

Advocacy for the advancement of international normative frameworks, such as the CRPD, the International Humanitarian Law, the Charter on the Inclusion of Persons with Disabilities in Humanitarian Action, and the Sendai Framework for Disaster Risk Reduction ensures provisions concerning situations of risk and humanitarian emergencies. Combined, they all ensure that, with the involvement of persons with disabilities and older persons in decision making and monitoring and their inclusion in the disaster management policies and monitoring process, persons with disabilities and older persons will be supported, protected, and served on an equal basis with others.

Despite the scale and protracted crises and the scarcity of sustainable resources to fund ongoing humanitarian responses, more must be done to promote the inclusion of people with disabilities within existing emergency and humanitarian aid efforts. Creating an inclusive environment for refugees and displaced persons with disabilities and older persons in humanitarian settings is indeed challenging but undoubtedly imperative. Only from a platform of collective advocacy and coordinated action can we ensure that no one is truly left behind.

Case Study

The International Disability Alliance (IDA) – Global Leaders in Inclusive Humanitarian Action

The **International Disability Alliance** (IDA) is an Alliance of 14 global and regional organizations of persons with disabilities (OPDs), representing over 1100 OPDs from across 182 countries, representing an estimated one billion persons with disabilities worldwide. With member organizations around the world, IDA represents the estimated one billion people worldwide living with disabilities. IDA's core mandate is to both advocate for the rights, and promote the inclusion of, persons with disabilities at the United Nations and support organizations of persons with disabilities to advocate for change locally, nationally, and internationally. With its unique composition, including the foremost international disability rights organizations, IDA is considered by the United Nations System as the most authoritative representation of persons with disabilities on a global level. In the past few years, IDA is increasingly becoming more recognized as the key global interlocutor representing persons with disabilities with the United Nations (UN) system, key donor agencies, and beyond.

IDA promotes its effective implementation of the CRPD through coordinated action by representative organizations of persons with disabilities (OPDs) to ensure compliance of the CRPD at national, regional, and international levels. It works with allies and partners to build the capacity of persons with disabilities and their organizations around the world to advocate for collective rights and to take part in the design and implementation of the policies and practices needed for their realization. The 2030 Agenda and its Sustainable Development Goals are integral to IDA's work to promote sustainable development that is inclusive of persons with disabilities.

IDA's commitment and global leadership in Inclusive Humanitarian Action and Disaster Risk Reduction is unparalleled. The global advocacy platform, led by IDA, calls for inclusive humanitarian action and disaster risk reduction that require the full inclusion and meaningful participation of persons with disabilities and their representative organizations in needs assessments, design, implementation, coordination, monitoring, and evaluation of humanitarian and disaster preparedness and response programs and policies is crucial. IDA is reshaping humanitarian aid and emergency response via the following coordinated interventions:

- Coordinating all actors to promote the **UN Convention and Political Commitments**, thereby ensuring the rights and needs of persons with disabilities in situations of risk and humanitarian emergencies via the UN Convention on the Rights of Persons with Disabilities, the 2030 Agenda for Sustainable Development, the Sendai Framework for Disaster Risk Reduction, the IASC Guidelines on Inclusion of Persons with Disabilities in Humanitarian Action, and the Charter on Inclusion of Persons with Disabilities in Humanitarian Action.
- Co-chairing the development of the **IASC Guidelines on Inclusion of Persons with Disabilities in Humanitarian Action**. The Inter-Agency Standing Committee (IASC) is the UN mechanism responsible for coordinating humanitarian assistance across the UN system, together with mainstream humanitarian actors. In 2016, the IASC established the IASC Task Team on Inclusion of Persons with Disabilities in Humanitarian Action ("Task Team") for a time-bound period (2017–2019) to develop IASC Guidelines on Inclusion of Persons with Disabilities in Humanitarian Action. The Guidelines are designed to assist humanitarian actors, governments, and affected communities to coordinate, plan, implement, monitor, and evaluate essential actions that foster the effectiveness and efficiency of humanitarian action. In 2016, the Task Team was established with a tri-partite co-chairing arrangement comprising the International Disability Alliance (representing DPOs), UNICEF (representing UN agencies), and Humanity & Inclusion (representing humanitarian stakeholders). This co-chairing arrangement

is unique within the IASC structure and reflects the Task Team's commitment to CRPD Article 4.3 and the principle of "Nothing about us, without us." The IASC Task Team is an open coordination mechanism with more than 90 stakeholders across DPOs, mainstream NGOs, UN agencies, and governments.

- Leading **Disability-Inclusive Disaster Risk Reduction**: The sixth session of the Global Platform for Disaster Risk Reduction (GP2019) took place in Geneva, in May 2019. Established as a biennial multi-stakeholder forum by the UN General Assembly, the Global Platform is a critical component of the monitoring and implementation process of the Sendai Framework for Disaster Risk Reduction (2015–2030). The aim of the Global Platform is to review progress, share knowledge, and discuss the latest developments and trends in reducing disaster risk. The outcomes of the Global Platform inform the deliberations of the High-Level Political Forum on Sustainable Development and the UN 2019 Climate Summit from a disaster risk reduction perspective. The Stakeholder Group of Persons with Disabilities: Thematic Group on Disaster Risk Reduction actively engaged in advance of and during the GP2019, with the aim to bring a strong message that disaster risk reduction must be inclusive of persons with disabilities. IDA was represented in the Global Platform by a delegation comprising the following regions.
- Agenda setting in **Disability-Inclusive Climate Action**

To date, the rights of persons with disabilities have received limited attention in the context of the UN Framework Convention on Climate Change (UNFCCC). In the Cancun Agreements, adopted at COP16 in 2010, parties identified persons with disabilities as one of the segments of the population whose human rights are acutely affected by the impacts of climate change (decision 1/CP.16). In the Paris Agreement, the parties further acknowledged that they should, "when taking action to address climate change, respect, promote and consider their respective obligations on human rights," including those owed to persons with disabilities (Preamble). In a number of decisions and reports, UNFCCC bodies have also affirmed the importance of taking into account the needs of persons with disabilities and ensuring their engagement in relation to capacity building, education, awareness, adaptation, and action for climate empowerment. In these provisions, decisions, and reports, persons with disabilities are included alongside other vulnerable groups and are not given special consideration. Moreover, persons with disabilities have not been the focus of specific initiatives to respect and fulfill their rights, such as those that have been created for other groups (e.g., the Indigenous Peoples Platform or the Gender Action Plan). IDA is working tirelessly in enhancing inclusion and participation of persons with disabilities and their representative organizations in climate change mitigation and adaptation as a key priority. In collaboration with members and partners, IDA is pursuing the below activities in Disability-Inclusive Climate Action:

1. Meaningful integration of persons with disabilities in climate-related education, training, public awareness, public participation, and international cooperation in the context of the review of the Doha work program and Action for Climate Empowerment (decision to be adopted at UNFCCC COP-26 in Glasgow).

2. Integration of disability rights language, where appropriate throughout decisions adopted by the UNFCCC COP.
3. Creation of a constituency for persons with disabilities under the UNFCCC. Adoption of a series of decisions by the UNFCCC COP on disability-inclusive climate action, which would include the following:
   (a) Measures to enhance the participation of persons with disabilities in UNFCCC negotiations and in bodies established under the UNFCCC;
   (b) A mandate for the UNFCCC Secretariat to produce a series of technical reports, organize a series of workshops, provide capacity-building to UNFCCC bodies, secretariat staff, parties, and
   (c) observers, and facilitate coordination with other UN agencies, international organizations, state parties, and NGOs to identify, promote, and implement disability-inclusive climate policies and programs.
   (d) Measures for state parties and other actors to fully and effectively integrate disability rights in climate policies and programs at the national, regional, and international levels.
4. The Secretariat of the Global Action on Disability (GLAD) Network presents "an action call and guide to promoting disability-inclusive climate change." The preamble to the 2015 Paris Agreement includes persons with disabilities as one of the populations most acutely affected by climate change. However, subsequent provisions omit disability inclusion as an essential principle in action against climate change. Persons with disabilities remain largely excluded from decision-making processes and plans to address and prevent climate change and the responses to climate-related disasters and emergencies at sub-national, national, regional, and international levels. To address this, the Secretariat of the GLAD Network, in close consultation with and guidance by the GLAD Network's working group on disability-inclusive climate action, presented an issues paper on "Promoting Disability-Inclusive Climate Change Action."
5. On April 29, 2021, the International Disability Alliance, the European Disability Forum, the Pacific Disability Forum, Stakeholders Group of Persons with Disabilities for Sustainable Development, United Nations High Commissioner for Refugees, and International Displacement Monitoring Centre co-hosted an event in the framework of the Humanitarian Networks and Partnerships Week (HNPW) 2021 to discuss the relationship between disability and climate change. As the first one in the history of HNPW, the event focused on the urgent need to build bridges between disability rights, environmental, and climate justice movements to ensure that no one is left behind in the context of unpredictable weather patterns (i.e., drought, hurricanes, and storms). This statement was issued by the International Disability Alliance (IDA) and the International Disability and Development Consortium (IDDC) as COP26 – the United Nations Climate Change Conference. IDA and IDDC are calling on all member states and other actors attending COP26 to ensure that the rights of persons with disabilities are protected, respected, and fulfilled in design, implementation, and monitoring of environmental degradation, and climate adaptation and climate mitigation pledges and policies. Immediate measures must be taken to ensure removing environmental, attitudinal, communication, and institutional barriers hindering

the participation of persons with disabilities in climate action negotiations, processes, and events. IDA's advocacy continues to COP28 with the clear statement that without meaningful inclusion and participation of persons with disabilities and their representative organizations, climate action is missing 15% of our planet's population who have the right, responsibility, and capacity to be part of the solution to this global crisis.

- **Persons with Disabilities in Armed Conflict**

IDA hosted the launch of the UN Special Rapporteur thematic report on disability and armed conflict for the civil society and OPDs in 2019. The International Disability Alliance initiated a joint submission to the Office of the United Nations High Commissioner for Human Rights (OHCHR) on the occasion of the 20th anniversary of Security Council Resolution 1325. Jointly prepared by Humanity & Inclusion, Human Rights Watch, International Disability Alliance, Women Enabled International, and the Women's Refugee Commission, this submission will help promote an intersectional approach to the UN Human Rights Council's forthcoming discussions on the 20th anniversary of a ground-breaking Security Council resolution, focusing on the role of women in ensuring peace and security.

- **Refugees and Internally Displaced Persons with Disabilities**

In 2020, the International Disability Alliance and the United Nations Refugee Agency (UNHCR) signed a Memorandum of Understanding (MoU) to facilitate and frame their collaboration. Building on the unique status of UNHCR as the main coordinator of global refugee response, and IDA as the unique representation of persons with disabilities and their organizations, the MOU initiated a key collaboration toward enhancing equal protection, inclusion, and participation of forcibly displaced and stateless persons with disabilities. According to this MOU, UNHCR and IDA commit to joining efforts and exchanging expertise to actively promote the rights of persons of concern with disabilities and affected communities through a partnership to strengthen the capacity and cooperation between organizations of persons with disabilities and UNHCR HQ, bureaus, and country offices. The expected outcome of this collaboration will be enhanced visibility and respect for the rights of persons of concern with disabilities across the capacity-building, coordination, advocacy, human rights monitoring, and strategic efforts undertaken by both parties.

Abstract

Disability as a driver of innovation is an underexplored topic. However, it is taking on increased relevance following the COVID-19 pandemic and as we continue to adjust to digital-first communications and hybrid models at work. Several outstanding disability activists and entrepreneurs have written or spoken about disability as a driver of innovation recently, including Haben Girma, Eddie Ndopu, and Diego Mariscal. That said, the need is great for more learning on this critical topic. This chapter aims to compile a wider range of examples of inventions and technologies made possible by the disability community, highlight diverse perspectives from the disability community, and draw recommendations from expert practitioners on the "how" of benefiting from disability-led innovation. Further, this chapter seeks to place disability as a driver of innovation as a trend in the global economy and the future of work. In addition to a literature review and case studies, this chapter includes primary research from either interviews or a survey.

Introduction

Persons with disabilities (PWD) have a rich and impressive history of imagining, producing, and bringing to market impactful innovations that meet a human need while solving a problem. The constraints we face every day are both an incentive and a forcing mechanism to think outside the box and find workable solutions. As Haben Girma – a human rights lawyer committed to advancing justice – wrote, "Disability creates a constraint, and embracing constraints spurs inventive solutions. Our history has numerous examples of people with disabilities leading advances in science, technology and other fields."[1]

There is no lack of case studies to demonstrate how many innovations and inventions we experience every day were created by or for the disability community, even if ableism prevents history books and general entrepreneurial lore from sharing these stories through the lens of disability. Examples of such inventions and innovations include the following: the typewriter, cruise control in vehicles, the phonograph, the ever-popular text function, voice to text options, touch features on your phone, the electric toothbrush, and the Internet. All were designed by people with a disability as part of designing themselves into a built environment, technology revolution, and mainstream culture that did not center their needs. Each product found its way to mainstream acceptance, enjoyed widespread commercial success, and fostered a positive change in how we live our lives. Yet, for most, the origin that these innovations stem from the disability community is lost on history.

---

[1] Girma, Haben, "Break down disability barriers to spur growth and innovation," *Financial Times*, September 13, 2017.

Elon Musk, an entrepreneur with Autism Spectrum Disorder, said it best, "When something is important enough, you do it even if the odds are not in your favor." That quote defines the reality of innovators, creative thinkers, and entrepreneurs. Any person who dreams of turning an idea into a reality faces countless challenges – precious little support and encouragement, scant funding, and skeptical buyers – to name a few. This experience is further amplified for the disability community.

Now Is the Moment in History to Transform Workplace Inclusion to Truly Harness the Ingenuity of the Wider Workforce

Because of the COVID-19 pandemic, the nature of work and the idea of "the office" have fundamentally – and forever – shifted. Accommodations that the disability community has championed for decades, such as more flexible working models (working remote to an office, work part time or hours outside of the standard "9–5," and reduced stigma to take time off), are more commonplace for most industries and sectors that are not facility-dependent. The impacts of that change go far beyond a transition to more virtual and hybrid work models. Technology is more deeply embedded into our careers, and centering family care, self-care, and mental health are more commonplace. In addition, we are witnessing the "Great Resignation" in the U.S. In November 2021, a record 4.53 million Americans quit their jobs[2] in pursuit of more money, less stressful roles, or more favorable and flexible working conditions. Many considered the benefits of entrepreneurship for the first time – including many in the PWD population. In fact, as Tom Butcher, Senior Advisor to the Zero Project and Director of ESG at VanEck, a global asset management firm, noted, "Whilst people with disabilities most usually haven't had the opportunity to resign to find better opportunities, because of the 'Great Resignation', that is now a possibility."[3]

Taken together, these developments are creating a moment in time uniquely suited to widespread innovation at all levels of society – from large research institutes to entrepreneurs working in their basements or garages to people who do not have a prior identity with entrepreneurship, and now have greater access to spaces and networks because of COVID-19. Specifically, this moment in time is well suited for PWD, especially those who have been excluded from the workforce in traditional models of full-time, onsite roles. PWD who were only able to work part-time pre-COVID can now work full time because they do not have to exert energy in arranging transportation, do not have to take as much time off for appointments, and can still participate in work even when they are not well enough to go out. The nature of employment has evolved to a place where it plays to the strengths of PWD, adept in working remotely,

---

[2] https://www.weforum.org/agenda/2022/01/the-great-resignation-in-numbers-record/

[3] Interview with Tom Butcher, Senior Advisor to the Zero Project and Director of ESG, VanEck, March 25, 2022.

staying socially connected when unable to meet in person, maximizing what can be done with limited resources, general resilience to push through in tough situations, and a willingness to be adaptable in the face of change and uncertainty.[4]

There is an urgency to unlock the best that innovation represents, so it becomes a path to upward social and career mobility for PWD, whether part of a larger organization or as an entrepreneur. As many reading this book know all too well, barriers to meaningful advancement experienced by the disability community are pervasive and immense, and even more so when viewed through intersectional lenses such as gender, sexual expression and identity, and race. We often are consigned to entry-level positions, passed over for promotion, not rewarded with equal pay for equal work, treated more as a compliance requirement than a valuable contributor to the organization, and have limited access to vital services such as health care, skills training, the Internet, and affordable transportation. And, for the 12.6% of the disability community unemployed, and those experiencing the highest unemployment rates in 7 years,[5] employment is luxury for many in the disability community. These realities are in conflict.

The onus is, and should be, on organizations to galvanize the innovative potential of PWD. This onus extends beyond just organizations themselves, but also Venture Capital (VC) firms and investor relations bodies like Nasdaq that influence standards of diversity, such as board diversity. With “The Future of Work” now “the way we work” for many companies and roles in the knowledge economy, we are well poised to permanently transform the concepts of employment and value creation within the disability community. More broadly, if we are to solve the existential threats to our well-being that we face today – climate change, resource scarcity, and outdated and wasteful means of production, to name a few – we must embrace the innovative potential and intersectional identities of every one of us.

The coming pages provide an actionable roadmap with case studies and recommendations to more fully utilize the innovative potential for persons with disabilities, specifically geared toward benefiting from the perspectives of existing employees in larger organizations and taking steps to become a more disability-inclusive work culture generally. The roadmap applies across all sectors of the economy and organizations of all kinds – corporations, research institutes, venture capital funds, and small business incubators, to name a few.

This chapter covers the following topics:

1. The connection between disability and innovation. We will explore the physical, intellectual, and emotional traits that allow people with disabilities to be at the forefront of innovation. By better understanding how people innovate, we can more effectively develop and use their talents.

---

[4] “How a post COVID-19 workplace can embrace accessibility – for everyone,” guardianlife.com, 2020.

[5] US Bureau of Labor Statistics (BLS).

2. The current state of innovation in the disability community. What are the opportunities and challenges facing the disability community that are either advancing or hindering its potential to innovate?
3. Case studies. Using case studies of innovations brought to market, we will identify best practices of individuals and organizations able to foster innovation.
4. Actionable recommendations. Building on insights from previous topics of this chapter, desktop research, and input from expert practitioners interviewed for this chapter, we will develop a series of actionable recommendations that are widely applicable across organizations of all kinds.

Literature Review

In reviewing the spectrum of research conducted at the intersection of disability inclusion, innovation, and value creation, we identified four themes around which much of the scholarship has coalesced. For sake of clarity, we use the term "scholarship" very broadly – ranging from published books to peer-reviewed journals to research conducted by public sector entities (such as the United Nations or World Bank) to consultancies to focused pieces of content of less than 1000 words written for publication in news outlets. We believe each form of research is important in advancing greater appreciation of the subject, and thus every effort was made to take a comprehensive approach to our literature review.

Our goal is not to conduct an exhaustive review of published work. Rather, we provide sources for interested scholars and practitioners to learn more, highlight opportunities for future research, and demonstrate where this chapter adds to the existing body of research.

Theme #1: The Business Case

There is a limited amount of published research demonstrating a connection between disability inclusion, innovation, and business value. Starting with its pioneering 2018 study, "Getting to Equal: The Disability Inclusion Advantage,"[6] and continuing with its 2020 study, "Getting to Equal 2020: Disability Inclusion,"[7] Accenture has provided a wealth of data and insights that make the connection between disability inclusion and value creation. Accenture's work also provides case studies of work being done in organizations to foster inclusiveness and innovation while also sharing concrete recommendations for organizations to follow.

Return on Disability, a Toronto-based insights and design firm, produces extensive research exploring the economic potential of disability and the integration of disability into business as a value added to shareholders.[8]

---

[6] Accenture, "Getting to Equal: The Disability Inclusion Advantage," 2018.

[7] Henneborn, Laurie, and Jerdee, Chad, "Getting to Equal 2020: Disability Inclusion," Accenture, 2020.

[8] For more information on Return on Disability, visit www.rod-group.com

The World Bank has done impressive work in exploring disability inclusion on a global scale, particularly in the areas of development, poverty eradication, and the connection between education and innovation. It has created a frequently updated page on its website dedicated to disability inclusion issues.[9]

Theme #2: The Market Opportunity

From 2020, no organization has conducted as much research as the Valuable 500 to demonstrate the market opportunities for companies that foster innovation through achieving competitive, integrated employment for persons with disabilities. The Valuable 500 has partnered with organizations such as Accenture, EY, Tortoise, Mintel, and the World Economic Forum to conduct a variety of research papers on the market opportunity for disability inclusion and barriers holding companies back from being fully inclusive and better engaging the disability community.[10]

Global Disability Innovation Hub, a UK-based research and practice center with a mission of "driving disability innovation for a fairer world," has a dedicated section of its website where it shares wealth of research, conference papers, and publications from workshops on topics related to disability and innovation.[11]

Theme #3: Product-Specific Innovation

Thanks to the efforts of thought leaders and active publishers such as Haben Girma and Jonathan Kaufman,[12] journalists such as Shira Ovide,[13] and executives like KR Liu and Eve Andersson at Google and Jennie Lay-Flurrie at Microsoft, there is no shortage of published content showcasing how innovation is creating products that are "just as usable by people with disabilities as they are by the general public."[14]

In their recently published book, *Disability Interactions: Creating Inclusive Innovations*, Catherine Holloway and Giulia Barbareschi of University College of London take on an important topic. They explore how the growing understanding of how people with disabilities interact with technology (known as Disability Interactions, or DIX) is helping foster greater innovation by persons with disabilities and

[12] Kaufman writes a regular column for *Forbes* entitled "Mindset Matters" that is an excellent resource for learning more about technology, innovation, and making workplaces accessible for persons with disabilities to best utilize their talents.

[13] Ovide writes the "On Tech" newsletter for *The New York Times*.

[14] Brownlee, John, "How Designing For Disabled People Is Giving Google An Edge," *Fast Company*, May 23, 2016.

allowing society to "tackle complex issues where disability problems are part of a system that does not have a simple solution."[15]

Theme #4: How-to Guides and Playbooks

Just as there is a wealth of examples of disability-driven innovation, there also are many publications, "how-to guides," and "playbooks" that offer recommendations and steps organizations can take to foster disability-driven innovation and maximize its outputs. Many of the experts and organizations previously cited in this section are actively engaged in developing such materials. Examples include "Six ways to advance disability inclusion in your organization" by Karyn Twaronite of EY. Understood.org and Chronically Capable also offer how-to guides.

Areas for Additional Scholarship

Our landscape assessment of current research and content identified three areas of need for additional scholarship:

1. The Connection Between Disability Inclusion, Innovation, and Company Performance: While Accenture and Return on Disability have produced excellent research, more is needed to prove the business case of disability inclusion. This is not research for the sake of creating more research. Rather, "it is about trust and generating trust," observed Abraham McAllister, an advisor and investment manager. "While one great study goes a long way, humans are averaging machines. Something as complex as disability inclusion needs a lot of validation across many scenarios."[16]
2. Disability Representation and Organization Performance: Sophia Akrum, a freelance journalist, recently wrote an article entitled, "Why a dearth of data is blocking disabled access to the boardroom."[17] Its premise is the lack of self-identification by CEOs and c-suite executives on disability status not only limits upward mobility by persons with disabilities in the private sector but also makes it hard to assess the impact disability inclusion has on organization performance and its ability to innovate. Similarly, The Harkin Institute for Public Policy & Citizen Engagement has found there is little data on disability status of boards of

---

[15] Holloway, Catherine and Barbareschi, and Giulia, *Disability Interactions: Cleating Inclusive Innovations*, Morgan and Claypool, 2022, X.

[16] Interview with Abraham McAllister, Managing Director, Index Plus, October 1, 2020, and excerpted from Ludke, Robert, "Solving 'Then What?': Empowering Investors to Achieve Competitive, Integrated Employment for Persons with Disabilities," The Harkin Institute for Public Policy & Citizen Engagement, December 2020.

[17] Akram, Sophie, "Why a dearth of data is blocking disabled access to the boardroom," *Raconteur*, January 31, 2022.

directors in publicly traded companies. C-suite leaders and boards of directors often play an essential role in setting long-term priorities such as capital investments in research and development initiatives and ensuring an organization is innovating for tomorrow rather than reacting to today.

3. The Future of Work and Innovation in the Disability Community: As noted prior, we are experiencing unprecedented demand for the skills and talents of PWD to be exactly what organizations need to be innovative. Jonathan Kaufman wrote in one of his *Forbes* columns, “It’s time for companies to realize that the disability experience by definition is innovation personified. Organizations have to think more broadly of what their current needs are and do a serious audit of the potential dividends that the disability experience can offer for future success.”[18] Failure to ensure that all relevant considerations of persons with disabilities are at the forefront of that “re-thinking” will result in a massive, missed opportunity whose consequences will impact all of society for generations to come.

Our Contribution to This Topic

The purpose of this chapter is to draw a connection between the traits that foster the innovative potential of persons with disabilities, how the workplace can adapt to best utilize those traits, and how that results in better organizational performance. Based on the insights from bringing together those concepts, we will provide recommendations on best practices to be implemented by organizations that prioritize innovation.

Forging the Connection Between Disability and Innovation

The data supporting the size of the disability community, purchasing parity of the disability community, and market size for PWD is staggering. The COVID-19 pandemic and long COVID have only increased these numbers and market opportunity.

Let us start with the basics: What do we mean when we use the term disability? This chapter considers PWD to include neurodiversity, chronic illness, mental illness, learning disability, and physical and mobility-related disability. While estimates vary depending upon the definition of disability used, it ranges from 15 to 25%.[19] CDC states that six of ten adults in the U.S. have a chronic disease and four of ten have two or more.[20] Conservatively, an estimated 1 billion people are PWD globally. In 2018, the purchasing power of working-age adults with disabilities was

---

[18] Kaufman, Jonathan, “Mindset Matters: The Future of Work, Disability, And Imagining What’s Next,” *Forbes*, December 3, 2020.

[19] WHO, CDC.

[20] https://www.cdc.gov/chronicdisease/about/index.htm

approximately $490 billion, with $21 billion in discretionary income.[21] Another estimate suggests the PWD population at 1.85 billion, an emerging market larger than China. If one considers the friends and family of the disability community, you add another 3.3 billion potential consumers with a personal connection to disability. Combined, the disability market controls over $13 trillion in disposable income.[22] Disability is the majority minority diversity identity globally, and the only one that cuts across all others (age, gender expression, race, ethnicity, and religion). These numbers are rising, attributed to longer life expectancy due to advancements in technology, biotech, and healthcare, disability acquired from the natural aging process, pandemic stress, long COVID (which is now protected under the Americans with Disabilities Act (ADA), and an increase in chronic diseases like heart disease in low- and middle-income countries. The disability community is the only minority group that anyone can join at any time.[23]

Because disability also represents a dynamic culture and community, simplified definitions can be deceptive. The universal symbol of disability is a wheelchair user. The reality is that 96% of severe disability is invisible, including traumatic stress disorder (PTSD), traumatic brain injury, diabetes, cancer, lupus, Crohn's disease, and fibromyalgia.[24] It also negates that disability can be temporary, permanent, or acquired. For example, in the U.S., childbirth is considered temporary, or short-term disability. And 25%, or one in four people in their 20s in the U.S., will become disabled before reaching retirement age.[25] Racial and ethnic minorities in the U.S. are 1.5–2x more likely to have most major chronic diseases,[26] and estimates show that nearly four of ten Americans identify with a race or ethnic group other than white, and suggest that the 2010–2020 decade will be the first in the nation's history in which the white population declined in numbers.[27]

In addition to a rise in chronic health conditions, an aging population globally also contributes to a rise in PWD. And baby boomers control a lot of wealth.

Born between 1946 and 1964, the baby boomer generation in 2022 ranges between 58 and 76 years old and makes up a substantial portion of the world's population, especially in developed nations. Boomers represent 21.19% of the U.S. population, representing 52% of aggregate spending – making it the wealthiest generation in history.[28] The COVID-19 pandemic has only driven these numbers

higher. For example, long COVID, or experiencing one or more lingering symptoms, like chest pain, fatigue, or brain fog, 6 months after catching the coronavirus, is experienced by up to 60% of people with confirmed cases.[29]

With the caveat that we do not discount the loss of life globally or the continued discrimination the disability community faces in COVID protocols, elements of pandemic have been a positive test case for the economy more fluidly adjusting to the functional demands of disability markets – and the realization that these adjustments benefit a larger market than PWD alone. Examples include retailers instituting special hours for PWD and seniors before regular shopping hours and technology companies like Zoom, the video conferencing platform ubiquitous with communicating during COVID, adding features like closed captioning and live transcription.

This pandemic-forced experiment in better serving customers has been so successful that many innovation-driven companies are now remote-first versus "hybrid" or "flex" (LinkedIn, Cisco, Alphabet (Google), and PwC).[30] Accommodations that PWD have championed for decades became actualized due to pandemic by embedding accessibility into all business operations, not just technology or physical spaces.

We have established a growing disability community exacerbated by COVID. What do these trends look like in the workforce? Before COVID, an estimated 30% employees were PWD, 62% were invisible, and only 3.2% disclosed[31] (vs. 76% employment participation for those without disabilities.)[32] We support that disability discrimination is a major barrier to PWD more fully participating in the global economy. And, while substantial barriers to employment exist for PWD, and we believe that we can activate the innovative potential of the 30% of employed PWD with greater ease and momentum than we can remove the stigma that prevents PWD from entering the workforce. The opportunity here is enormous to shepherd in a paradigm shift; disabled talent is already in the workforce, to an extent. Statistically, PWD are not disclosing, which suggests active concealment of disabilities and not harnessing this lived experience to influence product and service design – skill sets and experiences critical to unlocking the growing disability market. How can we better harness the innovation potential of disabled talent already employed?

The next segment explores in greater depth the life cycle connection between having PWD to drive outstanding products and services to attract new PWD talent. In short, we surmise that disabled talent designs better products, offers outstanding service to customers and to the organizations they are employed at, and serves as role models to attract more PWD to continue to harness the ingenuity of disabled talent. As disability design advocate Liz Jackson coined, "we are the original life hackers."[33] For many, innovation is a luxury of time. For PWD, innovation is a matter of necessity and survival. Imagine the influx of new ideas at a company where

---

[33] https://www.nytimes.com/2018/05/30/opinion/disability-design-lifehacks.html

30% of its workforce rechanneled the ingenuity of masking disability and instead applied these traits of creativity, resourcefulness, and resilience to the job itself.

The good news is that, while rare, there are concrete examples of PWD at organizations championing disability inclusion and disability culture in the name of innovation in direct ways. As Microsoft's Chief Accessibility Officer, Jennie Lay-Flurrie says, "I don't want to hear 'special abilities' or 'diverse abilities' or 'different abilities,' it's disability. We are proud of our identity. People with disabilities come to that once they see that they're going to be supported and their disability is not going to be seen as [a negative] — it's going to be seen as a strength that it is and, for me, the expertise that it is."[34] This sentiment does not live in isolation – 75% of disabled employees have an idea that can drive value for their companies.[35]

We will continuously revisit the concept of traits and how specific traits enable people with disabilities to be at the forefront of innovation. By better understanding how people innovate, and where they innovate, we can more effectively connect outstanding talent with market opportunities, attract more PWD, and break the cycle of stigma needed to serve the growing disability consumer base.

Current State of Innovation in the Disability Community

The prevalence of disability, as well as the cultural and environmental factors that impact PWD, looks different globally. Multinational companies have the greatest opportunity for impact because of their global talent networks, incentives to compete for top talent, resourcing, and ability to influence a business culture within and between cultures and economies defied by specific geographic borders.

Challenges: Stigmas, Metrics, and Structures

Around the world, PWD experience a near-universal cultural stigma. Historically, this stigma has presented as eugenics, institutionalization, involuntary sterilization, immigration restrictions, and other direct attacks on the lives of disabled people.[36] This stigma is by far an experience of the past. During COVID in the U.S., we have experienced polices approving or establishing "crisis standards of care" denying treatment to people with disabilities or chronic illnesses specifically because they are disabled or relaxing precautions like mask wearing early in response to business demands and political pressure versus scientific evidence, creating overlapping risks for those at higher risk.[37]

---

[34] https://www.geekwire.com/2021/microsofts-accessibility-chief-benefits-closing-disability-divide/

[35] https://www.talentinnovation.org/_private/assets/DisabilitiesInclusion_KeyFindings-CTI.pdf

[36] https://daily.jstor.org/the-rise-of-disability-stigma/

[37] https://www.forbes.com/sites/andrewpulrang/2022/01/31/6-ways-responses-to-covid-19-have-been-ableist-and-why-it-matters/?sh=162e25946129

In short, PWD are undervalued in nearly all cultures around the world and this discrimination exists intersectionally with many other forms of oppression such as sexism, ageism, and racism. It should be of no surprise that for the minority of PWD who are employed, there is little incentive to disclose for fear of discrimination or retaliation.

Without voluntary disability disclosures, we do not have the benefit of metrics to connect disability and disability-driven innovation as a material contributor to the profitability of a company. Corporate perceptions of disability do not translate easily into shareholder value that can be measured in a traditional manner: revenue and cost,[38] and only a small handful of large, well-resourced, multinational tech companies like Google, Apple, and Amazon are acting in material ways to center the opportunities that PWD represent.

Disability-related metrics that are more frequently tracked than innovation, growth, and product sales are connected to compliance, which is logical given that diversity, equity, and inclusion (DEI) work in the modern corporation was born from compliance considerations. In the U.S., workplace diversity training first emerged in the mid-1960s following the introduction of equal employment laws and affirmative action. These new laws prompted companies to stand up for diversity "training programs" to support PWD adjust to working in office settings not designed structurally or culturally for PWD. Not surprisingly, since the DNA of corporate DEI metrics and structured for disability inclusion was not rooted in growth and innovation, we have floundered historically to achieve a paradigm shift from compliance to strategy and innovation. DEI is not structured into business in a way to fully realize the innovative potential of PWD.

Simply put: The incentives for disability inclusion at work are not aligned with innovation. In most countries around the world that have specific quotas and protections for PWD, they are implemented as a hiring quota for compliance purposes and not as a strategy for innovation and growth. The inefficiencies of this design live all over the modern corporation as well, such as DEI reporting in through human resources and not customer- and product-focused roles.

The challenges facing PWD are massive. And, we believe that the opportunities at this moment in time might actually stand up to systemic ableism for the first time in history.

Opportunities

The disability justice movement and disability community are larger, more global, and intersectional than it has ever been before. This is likely because of COVID-19, newly disabled PWD seeking community with long COVID, pandemic forcing people to find community virtually versus in person, and greater event accessibility with a pause on live programming around the globe. It is not a coincidence that TikTok and ClubHouse downloads and use rose dramatically during COVID

---

[38] Return on Disability, pg 26.

(though Clubhouse downloads and valuation have not kept up). TikTok experienced a significant increase in popularity during the COVID-19 outbreak in the U.S. with a growth of 180% among 15–25-year-old users.[39] Vital technology platforms have united the disability community across time zones and continents and technology to positively reinforcing the "life hacking" movement and innovative mindset that many PWD typically reserve for home versus office expression. And, these virtual networks of the disability community are channeling their collective voices to spread advocacy further into public consciousness and corporate policy. For example, in the summer of 2021, two wheelchair users, Bri Scalesse and Gabrielle deFiebre, were flying within the U.S. When they arrived at their destination, they discovered that Scalesse's wheelchair was damaged beyond use. When the airline staff were asked about the damage, the customer service they received was abysmal.

Scalesse, a TikTock influencer, filmed the entire event and posted it – where it went viral. It was picked up by major outlets, and investigations were launched into how many mobility devices were damaged daily by U.S. airlines.[40]

It should come as no surprise that PWD, our "extreme users," experience high levels of product dissatisfaction, and therefore, a need to innovate,[41] even if they do not think of themselves as being innovators. Simply put, PWD innovate; they simply do it for personal use versus professional gain since 1) it is a matter of necessity and survival and 2) the incentive does not exist to integrate innovation methodology at work. Getting back to traits, if innovation is born from the need to solve a problem outside the norm and PWD do things in ways that average consumers tend not to think about, we can easily extend an assumption that many PWD are natural innovators, "extreme users" of technology and infrastructure, and resourceful to explore many problem-solving pathways. From the moment disabled people wake up, they have to figure out how to get dressed, how to drive, how to communicate, and how to live in a world that is not build to fit their needs. The mindset of disabled people is innately collaborative and communicative, oriented toward problem solving, good at working with limited resources, and used to overcoming daily challenges.[42]

By broadening the talent pool, organizations can "future proof" themselves while focusing on long-term value creation. "If investors want to get a good rate of return, they are going to invest in companies that are looking forward," said Sasha DeMarino, Client Engagement Director at Turnberry Solutions, a global IT and professional services consulting firm. "They want to find the companies that will never have a resource shortage. The smart companies are the ones that opened up that umbrella and found more people to bring in who can sustain the company for a long time."[43]

[43] Interview with Sasha DeMarino, Turnberry Solutions, March 16, 2022.

Organizational DEI is getting a makeover. In the past 2 years, the rise of disability community and connection in a virtual social landscape coincided with a surge in antiracism protests in response to race-related violence against black and Asian American Pacific Islander (AAPI) people, most notably the murder of George Floyd. On May 25, 2020, Floyd, a 46-year-old black man, was murdered in the U.S. city of Minneapolis by a 44-year-old white police officer. In the one year following his murder, America's 50 biggest public companies and their foundations collectively committed at least $49.5 billion to address racial inequality.[44] While there is great critique about if this promised money was ever invested, and invested meaningfully, there is undoubtedly more workplace dialogue around issues of mental health and trauma at work, as well as a surge in DEI-related roles. Despite COVID-19's effects on the U.S. economy, the number of DEI-related job postings increased by 123% between May and September of 2020.[45] The combination of better resourcing for DEI generally and pressure on workplaces to support difficult conversations about justice, pandemic, mental health at work, and trauma have opened the door for DEI programs to be more human versus compliance centric.

The COVID-19 epidemic has compounded this "DEI makeover," accelerating prior investments in digital accessibility, or "ally work." Accessibility jobs, ranging from "head of accessibility" to "accessibility analyst," are increasing at a rapid pace. The number of job listings with "accessibility" in the title grew 78% in 2021. Such listings had risen 38% in the year between August 2019 and July 2020 compared with the previous year.[46] Digital accessibility has largely been a compliance-driven phenomenon from Web Content Accessibility Guidelines (WCAG) and enforced in the U.S. by the ADA. In a world where COVID-19 forced many out of the office overnight, digital accessibility became a need for all – not just those who identified prior with disability. Relatively simple office equipment like second monitors and headphones were shipped prolifically, to make basic tasks more perceivable, understandable, and perceivable (WCAG principles). This should come as no surprise: 5.9% of Americans experience deafness or serious difficulty hearing, and 4.6% experience blindness or serious difficulty seeing.[47] More specifically, approximately 12 million people 40 years and over in the U.S. have vision impairment, including 1 million who are blind, 3 million who have vision impairment after correction, and 8 million who have vision impairment due to uncorrected refractive error.[48] These issues are most likely present during key years of employment. Expanding accessibility work from legal mandates on website to design to the lived experience of more user-friendly interactions with laptops and monitors has helped pave the way for

more disability-related conversations in some workplaces. And for good reason, a study conducted by Accenture, the American Association of People with Disabilities, and Disability:IN found that organizations prioritizing accessibility had 28% higher revenue, and people with disabilities represent the third-largest market segment in the U.S.[49]

The formula of a growing disability community that is better connected through technology and has more opportunities to thrive in the workplace working from home, colliding with increased organizational resourcing for DEI, makes this moment an important juncture for organizations. The future of work is now.

Case Studies

As shared in the introduction, there is no lack of case studies to support the connection between disability and invention and innovation: the typewriter, cruise control in vehicles, the phonograph, the ever-popular text function or touch features on your phone, the electric toothbrush, and the Internet. To that list of case studies, we can add more than a few more including Siri,[50] computing transistors,[51] and audiobooks.[52]

While not universal, there are several themes that tie together many of these case studies:

- The original inventor was working to solve a need personal to them and not part of large, well-funded organizations (even if technology eventually acquired).
- The evolution and wider application of the invention/innovation was not originally perceived of by the inventor themself.
- When we think about the mainstream success of these products, there is no widespread appreciation of the innovations/inventions that credit the disability community.

There are also case studies to support the innovation "misses" of disabled talent being removed from innovation practice; this is what Liz Jackson would refer to a "disability dongle," an elegant and well-intended, but ultimately useless solution to a problem people with disabilities never knew they had. It signals the larger problem of perceiving the disability community as recipients versus active participants in a design process.[53] An example? A stair-climbing wheelchair, which has intention to

[53] https://www.cbc.ca/radio/spark/disabled-people-want-disability-design-not-disability-dongles-1.5353131

do good, but in reality, is a terrifying concept for many and less preferred to direct access, like ramps and elevators. The sign language glove is another infamous example, which claimed to translate sign language in real time to text or speech as the wearer gestures. For people in the deaf community, and linguists, the sign-language glove is rooted in the preoccupations of the hearing world, not the needs of deaf signers.[54]

The data largely supports these trends and observations: PWD are actively involved in product development, and their solutions have a positive impact on their lives. Solutions also provide value for nondisabled persons, suggesting a connection between disability and innovation.[55] One explanation for this trend is the idea of PWD being "extreme users,"[56] not considered part of the core customer or user base initially. Then again, does not most great innovation happen at the fringes? Otherwise, it would be repetitive of existing solutions and not actual innovation.

Case studies confirm the contradiction that we have laid out prior:

1. PWD are likely not tapping into their disability "expertise" at work.
2. PWD innovating at home for their own use are disconnected from resources to test, scale, and commercialize.

And, those businesses that do include disability perspectives as part of the design process are more likely to consider functionality and consider physical features versus the broader experiences of disability, like mental illness and neurodiversity.[57] For most workplaces supporting disability inclusion at work through the lens of compliance, the benefits of innovation are not being realized. Disproportionately disability-driven innovation is not commercialized, and where it is groups with greater social mobility (men, those already in business) are more likely to be credited. Unfortunately, women and the disability community are less likely to be credited – the origin story of OXO Products, now Helen of Troy, tell this story well. Founder and designer Betsey Farber, if mentioned as all, is remembered as "the wife with arthritis" and not an entrepreneur in her own right.

There are frustrations, and there are also positive trends solving for the contradiction laid out above. The secret to closing the circle? Recruit PWD to lead and participate in roles throughout the product and customer organizations, leverage community and successful role models to attract disabled talent, and leverage disability-driven innovation for profit and widespread appeal. While it is a tall order, strong examples exist of organizations centering disability as a growth opportunity versus compliance mandate: Google, Microsoft, PepsiCo, Disney, TD

Bank, and Shopify, to name a few in the U.S. and Canada. There are also great role models. For example, Daniel Hajas, Innovation Manager at Global Disability Innovation Hub, got his start in innovation "solving his own problem." As a blind person, one of his earliest works was an electronic refreshable tactile graphics display (a Braille-like display for graphics and diagrams). His work to access information in physics class led to a student-led startup. Today he leverages research into disability innovation.[58]

Recommendations

Overall, we support the need and opportunity for repeatable process and scale to hire people with disabilities because it creates value for recruiting, hiring, and engaging PWD.[59] And, beyond hiring, we argue that earning the trust and truly benefiting from the skills and perspectives of PWD extends into the entire employee life cycle. A positive cycle looks like:

> Disabled talent integrated into all areas of business, design innovative products/services, market includes disability community, more happy customers, company growth, role models attract more disabled talent.

Where organizations break in will depend on their size, business model, industry, attitudes of leadership, resourcing, and cultural, structural, policy, and behavioral readiness.

Let us be clear: While there are increasingly roadmaps to follow if you are a multinational like Microsoft, this positive cycling is far less obvious to achieve as an entrepreneur or small to midsize company. One component is critical – this work lives with organizations, not with PWD. It is an organization's responsibility to create cultures of belonging and meaningful career pathways for all employees, independent of gender, race, gender expression and identity, disability, age, etc. Wherever your organization is on your journey, there are always incremental ways to drive workplace inclusion and benefit from a culture of innovation.

Build Organizations Centering Belonging

Transformational DEI work lives in culture, structure, and policy. No amount of unconscious bias training or compliance-driven hiring quotas can compare to building equity into business processes. Inclusion for the disability community, and all employees, lives in the way people treat each other, the written cultural values and

[59] ROD.

policy protections, and the structure of an organization, which includes everything from compensation philosophy to promotion transparency to where in an organization culture or diversity work lives.

1. Begin with integrating disability into definitions of diversity at your workplace, and acknowledging that disability is the majority minority globally – and the only one that encompasses all other diversity identities. Race- and gender-related definitions, protections, and programming are not enough to truly benefit from a diverse talent base.
2. Move DEI from under Human Resources or People Operations to a core business function like Product, Strategy, Commercial, or Office of the CEO. For the majority of organizations supporting DEI work, the budget and head-count exists under the Chief Human Resource Officer or General Counsel. While legal teams should own mandated compliance, value for DEI work by employees and talent prospects are highest when driven by customer need. For example, as of April 2022, at Tile, the VP of Software Engineering heads up DEI. At Clover Health, it lives in the Office of the President under the Chief of Staff. At Sarepta Therapeutics, DEI reports to the CFO within the Corporate Affairs team.
3. Make diversity, equity, and inclusion a performance metric: In 2019, tech company Atlassian redesigned its performance review process to no longer reward “smart jerks” with promotion[60] by making team-building one-third of performance reviews. This was an intentional decision to center equity and inclusion. Several other companies connect corporate goals and manager bonuses to creating cultures of belonging. In 2021, Apple, McDonald’s, and Chipotle Mexican Grill made bonuses partially contingent on measurable progress on gender and racial equity. Alphabet’s Google took a step in that direction, indicating it will include such metrics in executive performance reviews. Microsoft, Intel, and utility FirstEnergy have been doing so even longer.[61]
4. Continue to prioritize flexibility and a remote, distributed workforce for nonfacility-dependent roles. In March 2022, the competing leadership priorities to woo people back to the office versus declaring that no one needs to remote to an office ever again began to play out across the economy. What we do know is that elements of pandemic were advantageous to PWD who did not need to rely on transport to access the workplace and had many more opportunities for access events due to the digital environment. We believe that businesses of all sizes and sectors that continue to prioritize flexibility will have the upper hand in attracting dabbled talent and benefited from disability-driven innovation.
5. Invest in Diversity, Equity, and Inclusion work: While there has been a surge in new DEI hires in the U.S., as well as a trend for Chief Diversity Officers to report

---

[60] https://www.atlassian.com/blog/hr-teams/our-performance-reviews-framework

directly to the CEO, the reality is that existing DEI roles have been underfunded, and underappreciated for a long time. Only 34% DEI professionals hold a senior-most role, and only 28% are fully dedicated to DEI work, indicating a lack of resources and commitment from the top to allow for full-time focus.[62]

Integrating Disability Inclusion into VC Funding and Board Diversity

Larger organizations and corporate entities have a large role to play. But we cannot consider building inclusive organizations and potential for innovation without looking at data for startups. The pandemic disrupted the economic status quo in many unexpected ways over the past 2 years, a top benefit being the explosion of new business applications that began taking shape in the summer of 2020. Nearly 5.4 million applications were filed to form new businesses in 2021 in the U.S. — the most of any year on record, based on the latest data from Census Bureau's Business Formation Statistics.[63] As Tamara Giltshoff says, it should not just be corporates driving innovation. For disability-driven innovation, we need more accelerators and university-based technology hubs, and networks of incubators and accelerators.[64] The funding requirements of VCs have long driven early inclusion at startups.

Create a Culture to Seize the Market Opportunity of Disability-Led Innovation

As previously covered in this chapter, there is a massive market opportunity for mass consumption of products innovated with disability considerations at their core. Companies that are able to bring together people with a variety of lived experiences – disabled and nondisabled alike – are able to innovate at a scope and scale far beyond that of organizations with a homogenous culture. As Caroline Casey, the Founder and CEO of the Valuable 500, remarked, "I'm 50 years old. If I was to innovate about something with a bunch of Irish white women, we would only have one point of view. But I'm not sure how we can problem-solve with such a narrow perspective. It doesn't matter how great talent is. Without different experiences challenging what we believe I am pretty sure that we would create something that only serves 50 year old Irish women. What's the value of that?"[65]

Earn Disabled Talent: Flip the Narrative

Corporate DEI work was born out of a reaction to regulations around affirmative action hiring. Hiring quotas for any diversity identity can be high risk for both the employee and the employer – it is the leaky bucket analogy. It does not matter how many disabled employees we hire to fill a quota; if they arrive, they are not welcomed or given opportunities to thrive, and they leave feeling harmed and losing trust. This is at the detriment to both employees and employers.

1. Disability is a not a bad word. For many, it is a proud culture, community, and identity. Say the word out loud 10, 50, and 100 times until it becomes natural to say.
2. Shift from hiring quotas to structure and building an organization for equity where all employees can thrive. If businesses understand value creation from a product and services standpoint, we need to shift to disabled talent as value creation, not compliance. Recruit disabled talent to every level and function of an organization, not a specific program which can create an "and vs. them" experience as an employee. Customer and product roles can especially benefit from disabled talent for innovation and reaching wider markets.
3. Make accommodations routine and promote access to accommodations: "what do you need to thrive?" is a much inviting experience than not asking the question, or centering the experience around a legal process. Did you know that for the majority of workplace accommodations, 56% are free to execute? The remaining accommodations typically cost USD 500 or less and are products easy to order from an office supply store, like noise canceling headphones or a standup desk.[66] In many countries outside the U.S., "productivity enhancers" is a more common term for accommodations. Prior to platforms like Disclo, there has not been a standardized way to disclose and ask for accommodations at work. There is clearly a need for disruption in this arena when 24,000, 36%, of EEOC lawsuits were disability-related in 2020 and the median cost to defend against disability discrimination lawsuits USD 200,000 K.[67]
4. Champion disabled leaders and employees, across the spectrum of mental illness, neurodiversity, or physical or mobility differences. Role models matter. If you are a disabled leader in your workplace, consider being more public with your relationship to disability. Support the formation of disability-focused employee resource groups, affinity groups, or business resource groups.
5. Mandate inclusive language in job descriptions: This can include everything from gender neutral pronouns, including pay ranges, not requiring advanced degrees or certificate programs (or offering to fund these opportunities as part of the role), and considering the prolific use of ablest language. For example, job descriptions that require that a person be able to lift a certain amount or weight or must have access to their own vehicle can directly discriminate against disabled talent, especially in roles where these requirements are not critical to performance in the role.

---

[66] https://askjan.org/topics/costs.cfm?csSearch=2546498_1

[67] https://www.eeoc.gov/newsroom/eeoc-releases-fiscal-year-2020-enforcement-and-litigation-data

Conclusion

"People who live with disabilities bring incredible ideas and creative solutions to the workplace, and I want them at my table." – Wendy Myers Cambor, Managing Director of Human Resources, Accenture (Coqual).

We could not agree more. It truly feels like this juncture in time is momentous for disability inclusion at work. The events of the past 2–3 years, most notably the COVID-19 pandemic, surges of civilian and corporate activism for racial justice, and explosions of new virtual networks, mean that we are witnessing colossal change all which support greater disability-driven innovation. While all of these experiences exist in the ecosystem of ableist corporate culture and wider world, we have made major strides in the last 2–3 years to more fully benefit from the innovation-driven traits that PWD are accustomed to employ in their daily lives, even if not at work.

Most notably, making work-from-home routine has forged greater disability inclusion; many organizations are building resource for their DEI programming and moving toward disability-focused programming through conversations about mental health at work or workplace-based experiences with trauma. Startups are emerging as consulting or staffing organizations centering the culture, perspectives, and talent of the disability community (notably Diversability and the Diversability Leadership Collective, The Valuable 500, C-Talent, Chronically Capable and Disclo, 2gether-International, and Disability:IN. In Canada, Access-can and the Rick Hansen Foundation are also champions for change.)

These gains are because universal forces like politics and pandemic have shifted workplaces by force, not because of any major shift in the quality or availability of disabled talent. Adaptation, resilience, resourcefulness, time management, risk management, creativity, and empathy and compassion have always been traits that PWD embody.

The more workplaces continue to earn disabled talent, the more likely they are to benefit from disability-driven innovation, resulting in higher revenues, profit margins, retention rates, and employee productivity.[68]

The choice for us is clear. Invest in disability-inclusive workplaces to benefit from disability-driven innovation.

Contents

Abstract

The book chapter purports to provide insights, research gaps, and lessons using a narrative literature review approach. The discussion was centered on unveiling aging (aging with disability and disability with aging included) advocacy and activism for living arrangement-instutionalized, while taking inspiration from disability movement that is led by disabled people that adopted independent living as an example of community living. The discourse discovered that advo-

cacy on aging began in the 1970s, while oriented toward feminism; however, the twenty-first century fosters social innovation as well as learning from independent living, thereby making the chapter to foster the idea of giving options for the aging population to choose preference on living arrangements that enhance freedom and dignity as essential human rights.

Keywords

Ageing and disability · Independent living · Sustainable and resilient community living · Empowerment · Sustainable socioeconomic participation and development · Advocacy and activism

Introduction

The purpose of this chapter is inspired by approaches from the activism and advocacy of disabled people to inform aging activism and advocacy for effective use of existing data to strengthen evidence-based policy and program development. The chapter provides the reader with a comprehensive background to understanding current knowledge while highlighting the significance of new dimensions that emerge from insights, gaps, and lessons for community living as informed by advocacy and activism in developing and developed countries. The chapter purports to be a literature review that establishes value, perspectives, and scientific documentation of narrative (activities), both historical and those mushrooming as progressive and contemporary-innovative activism and advocacy geared toward community living of (i) aging with disability, (ii) disability with aging, and (iii) aging while learning from independent living principles applied by disabled people. It is further inspired by a growing call from scholars to ensure that the requirements of this ever-increasing population segment are not ignored by promoting traditional solutions and historical assumptions while extracting value from the population group. Further inspiration of this chapter draws from the heart of the 2030 agenda for sustainable development and its pledge to leave no one behind, paying particular attention to the most vulnerable groups, thereby bringing attention to the need for an intersectional approach based on multiple individuals and environmental characteristics that can hinder effective participation of the aging society such as an older person who has an impairment further facing disablism, added to existing ageism already confronted by.

As background and rationale, literature shows the developed countries' family size as shrinking while exponentially increasing the aging population (Veress & Bagirova, 2018). The United Nations Department of Economic and Social Affairs (UNDESA) report (2017) shows that, globally, the number of persons aged above 80 years is projected to increase more than threefold between 2017 and 2050, resulting from a decline in fertility, improvement in survival, and medical excellence throughout the world. However, the effects of the COVID-19 pandemic brought a need to reconsider responses to aging through advocacy and activism in societies in the global village.

As illustrated in Table 1. While developed countries reveal an inevitable increase in the share of the aging demographics, African countries range from 53 to 75 years (Statistica, 2021).

Table 1 presents the average estimated life expectancy without considering COVID- 19–induced death rate. Taylor and Smith (2017) had an increased concern about the sustainability of the welfare system and the supply of labor. On the one hand, labor unions and governments in developed countries have implemented reforms to encourage people to retire later and employers to hire older workers (Taylor & Smith, 2017). On the other hand, advocacy organizations have enthusiastically promoted the working-longer agenda (Taylor & Smith, 2017). Amid calls to work longer, the availability and quality of paid employees and how those not employed would build and maintain a sense of identity are critical issues that have received little consideration in policy and advocacy on aging and living arrangement. Just as highlighted in Table 1, Australian Treasury's 2015 Intergenerational Report projects substantial change in the composition of its population by 2054–2055; a more considerable proportion of the people will be aged 65 and over, with the number in this age group more than doubling. Labor force participation among people aged over 15 is projected to decline.

The aspects mentioned above affect living arrangements, thereby positioning the chapter to contribute insights toward bringing interventions from an advocacy perspective, as there is a need for careful consideration when responding to the needs of the elderly while taking advantage of their unrealized and overshadowed value to societies (Sorensen & Black, 2001). This chapter focuses on advocacy and activism of disability and aging population groups toward sustainable and resilient community living of the aging population (including aging with disability and disability with aging). The said population groups experience similar challenges in institutionalized Living, requiring similar solutions (Altpeter et al., 2014). On the one hand, Pogach (2019) believes there is a need to give the aging population opportunities to choose between institutionalized and independent living arrangements inspired by the development of the present chapter. On the other hand, consider the global trends that reveal an inevitable increase in movements led by disabled people. At the same time, it has become evident that aging also causes an increase in the number of persons with disabilities, as many would acquire some form of impairment (Robertson, 1999, cited

Table 1 Old age by gender and life expectancy projections

Gender	Developed countries –average life expectancy		Developing countries – average life expectancy	
Male	91.5 years (present)	95.1 years (post-2030)	63 years (present)	76 years (post-2030)
Female	93.6 years (present)	96.6 years (post-2030)	66 years (present)	78 years (post-2030)
Other	–	–	–	–

Source: a compilation from various documents in Sorensen & Black, 2001), thereby raising the alarm to economists concerned with life cycle patterns, production, and consumption; in a welfare state older people do not produce as much as they consume and exert more pressure on the fiscus (Holstein, 2013; Takao, 2009), thus exacerbating the need for sustainable solutions. An explanation of the fundamental definition in this context as follows:

Disability is defined from a social model perspective as a social situation that perpetuates social oppression imposed on people with impairments due to environmental barriers that exclude them from participating in society. Such is entirely distinguished from their impairment (Kazou, 2017). World Health organization's International Classification of Functioning (WHO-ICF) interprets disability as a multidimensional and interactive experience from difficulties in functioning, and arising out of the complex interaction between health conditions, personal factors, and barriers in the physical and social environment (WHO-ICF 2001). Disability comes in because aging people can acquire impairment, while disabled people can grow old. Therefore, based on this social model perspective, this literature will use the terms "persons/people with disabilities" and "disabled people/persons" interchangeably to refer to this population group with functional limitations or impairments which in interaction with environmental barriers hinder their full participation on an equal basis with others (UNCRPD 2006).

Aging is defined as a persistent decline in the age-specific fitness components of an organism due to internal physiological deterioration (Rose et al., 2012). At the same time, ageism is understood as negative and positive stereotypes, prejudices, and discrimination against (or to the advantage of) older adults based on a perception of being senior or elderly (Rose et al., 2012).

Sustainable and resilient community living is, according to Metaxas and Psarropoulou (2021), a combination of words that refers to ensuring dignified living conditions while upholding human rights through creating and maintaining viable options in life. The principle of fairness for present and future generations should be considered in using resources. The chapter presents the methodology, findings, and conclusion as follows.

Methodology

A qualitative research design enabled a narrative literature review strategy to examine the extent of literature. The particular focus was on advocacy and activism and on interconnectedness. The review process considered the chronological and regional scope of the literature from high-ranked academic databases in answering the following questions:

a) What critical thinking around institutionalized and independent living arrangements can enhance sustainability and resilience in community living arrangements?
b) How can movements by persons with disabilities bring social innovation on activism and advocacy for sustainable and resilient community living arrangements for aging with disability and disability with aging population groups?

c) What can be learned from each population group's advocacy to the others for the adoption toward sustainable and resilient community living arrangements while enhancing the socio-economic activeness of the population mentioned above groups?

The researchers conducted a literature search in the following electronic databases: African Journals (Sabinet Online), Emerald Insight Journals, Google Scholar, and Scopus. International, regional, national, and organizational reports, podcasts, publications, campaign materials, social media and websites columns, and personal and unpublished narratives of individuals and organizations concerned (activists and advocates) about aging with disability and disability with aging augmented the scientific documented-scholarly views. Keywords like aging and disability, independent living, institutionalization, sustainable and resilient community living, socio-cultural-economic involvement, and participation were used in the search. A balance of five regional (continental) journals with full text written in English was considered in the present review. A predetermined inclusion of data sources entails (i) published and (ii) unpublished work on activism and advocacy on aging with disability and disability with aging. Exclusion criteria entail activism and advocacy on disabled children, and youth was used in the screening process. The first and second authors independently review each identified data source to determine eligibility and extract study information. The third and fourth authors verified the collected data while refining the chapter to prepare it for publication. Several studies identified, screened, and included or excluded at each stage of study selection shall be established, as shown in Fig. 1. Based on Fig. 1, the researchers retrieved data. They adopted three steps: (a) electronic literature search and screening of research material from the 1970s to 2022, such were augmented with gray literature done using hand searching print, online and social media, and reports of an international organization. (b) Data were extracted and analyzed manually following thematic approach as advised by Miles and Huberman (1994) and in vivo coding (Holton, 2007); based on Saldana (2013), analytical memos were developed, as part of the researchers' reflections concerning the codes, the phenomenon, and their interrelations that distinguished coding from analysis and results. Following Saldana (2013), the memos were based on intuition, reflexivity, and serendipitous occurrences related to disability-skewed independent living. While the coding process and analytical memorizing enable the emergence of patterns in the data, it only enabled and did not determine them as advised by Saldaña (2013). Atlas.ti.8 was used as a computer-aid analytic tool that allowed for immersing data for in-depth analysis and (c) writing the literature review.

Findings

Profiling the Resources Used for the Study

The findings highlight a total of 10,119 academic work, of which 42 met inclusion criteria. Table 2 shows the literature's overview profile on advocacy and activism in developed and developing countries.

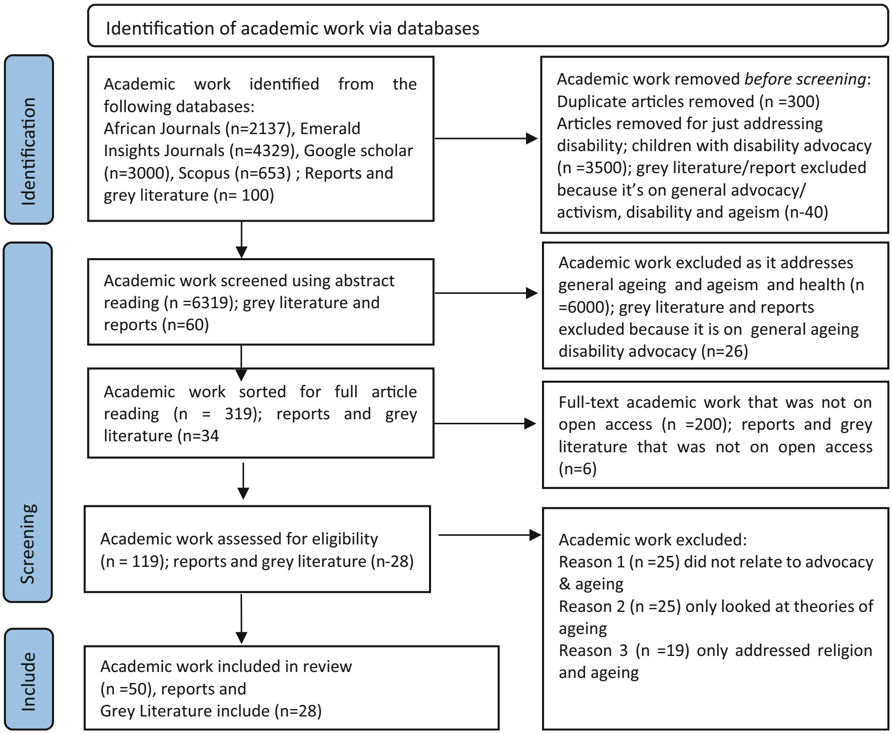

Fig. 1 Data collection and analysis. Source: Adopted in part from Page et al. (2021)

Table 2 shows a dearth of literature on aging advocacy and activism in developing countries, while contrast is observed in developed countries. Literature reflects a difference in demographic composition, social and cultural fabric, economic development, and political systems as determinants in this regard. Despite the differences, there is a shared view on feminism which dominated the rest of advocacy and activism of aging advocacy in all but Japan. The message is skewed on the emancipation of aging women through empowerment and participation in socio-cultural-economic and political spheres. Their voice is equally important as men within the living arrangement.

Literature-Review Discussion

According to Sorensen and Black (2001), advocacy on aging and ageism is dated back to the 1970s as formal, legal, medical-based arguments to probe for changes, where advocacy follows dimensions of (i) self-advocacy, (ii) individual advocacy, (iii) group advocacy, (iv) public interest advocacy provided by paid lawyers, unions, agencies, etc., (v) citizen advocacy by an unpaid citizen, and (vi) systemic advocacy,

Table 2 Overview profiles of results of the review on advocacy and activism on an aging population

Region	Focus areas in the advocacy and activism on aging	Approach used in assessing institutionalized living	Impact/effect and outcome	Lead participants	No. of academic work	No. of gray literature and reports
Developed countries	Japan	Health and social factors	Advocacy for policy reviews; health systems; labor market and employment; involvement, empowerment, and participation in community development	Female aging cohort, lawyers, members of civil society, disabled people led	50	22
	Australia	Health and social factors				
	United Kingdom	Socio-economic factors from a feminist lens				
	Canada	Socio-economic dependence and health factors from a feminist lens				
	United States	Socio-economic independence, dependence, and interdependence using feminist lens				
	Europe					
Developing countries	Still a dearth of literature	Health and social factors	Participation in community	Government and civil society	–	6

which is designed to change the system, or laws, policies, procedures, or practices that cause or perpetuate injustice or inequality.

Rationale of Advocacy and Activism

Advocacy

People are not equal, and others are made more vulnerable, with the perceived and actual risk of abuse, than others (Veress & Bagirova, 2018). One such comes from realizing outcomes of advocacy; for example, in South Africa, social rights movements like the anti-Apartheid movement practiced advocacy on a large scale and lobbied for the change in the structures which deny groups of people certain rights based on race, age, (dis)ability, gender, religion, or sexuality. Freedom emerged from such advocacy (Veress & Bagirova, 2018). On the one hand, international organizations like the United Nations General Assembly recognized contributions made by older members of societies and their value to society by announcing 1999 as the International Year of Older People (Veress & Bagirova, 2018), thereby establishing five critical areas to be incorporated into the United Nations Principles for Older Persons (1991, in Office of Seniors' Interests, 1998), namely (i) independence, (ii) participation, (iii) care, (iv) self-fulfillment, and (v) dignity (Veress & Bagirova, 2018).

Activism

Casey (2014) believes activism is an activity that advocacy uses to reach the targeted stakeholders. People interchangeably use advocacy for activism (Casey & Mehrotra, 2011). The chapter regards other related terms which are sometimes used in association with advocacy like campaigning, engagement, consulting, giving voice, negotiating, policy work, lobbying, social action, organizing, and political action, which are used to describe attempts to directly influence (Casey, 2014; Casey & Mehrotra, 2011). Such has the essence of advocacy in some cases (Casey, 2014). Therefore, the current authors bring a historical overview to contextual understanding as presented next.

Historical Overview of Advocacy and Activism on Aging Population

The historical background of advocacy and activism on aging is traceable to multi-cases that highlighted the need for older adults to participate in politics, especially in the era before and post-World War II (Serrat et al., 2021). Charpentier et al. (2008) examined senior women's involvement experience in Quebec, Canada. Their study shed light on family history and continuity in the involvement trajectory, diversity in terms of group type, involvement practices, and gender differences. Unfortunately, the advocacy for the participation of senior women was worsened by the lack of evidence concerning the experience and meaning of their participation from the perspective of those involved, as disaggregated to gender.

As time progressed, Narushima (2004) and Sawchuk (2009) explored social activism by older Canadian women that implicated later life learning, namely the Raging Grannies in Canada. Despite the heterogeneity among "older women," society tends to pathologize them as a part of the "problem" of aging and languishing welfare societies – that is, stereotyped as passive recipients of welfare and healthcare services in Canada (Narushima, 2004). Elderly women can be part of the "answer" to the challenges faced by societies as they have stock of wisdom from indigenous knowledge on strategies, activities, and the process gained from lived experiences through years at work, traveling, and at home (society) (Sawchuk, 2009). Hence activism on ageism led by females dominated the 1970s and 1980s in developed countries like the United States through the Gray Panthers (Ciafone, 2021). Therefore, it furthered the emancipation and representation of old age in US media as correcting ageism. Ciafone (2021) believes that the senior citizens' movement realized the geographical reach, power, and influence of media and, hence, established their Media Watch Task Force and local committees to monitor media and raise awareness on anti-ageism. They conduct media literacy campaigns and even produce their media content to construct an alternative vision of aging. According to Ciafone (2021), the mid-1980s witnessed a change that was visible even on television as older women appeared as active, successful, sexual beings – like *The Golden Girls* – leading some to ponder whether there was a representational shift on TV, even a "waning devotion to youth." Ciafone (2021) interprets such to have contributed to the positive reframing of old age overturned portrayals of them as sick, poor, and dependent and contributed to emerging discourses of an old age that could be "successful," "active," self-reliant, healthy, and even sexy (ageism).

Based on the social-contemporary trends at community level, ageism can be transformed by establishing the value of choice, dignity, and independence from the senior citizens' perspectives. Developed countries like Canada still have a mandatory retirement system within the advocacy discourse. That policy debate is monopolized by the premise of "older people" as post-productive service recipients (Sorensen & Black, 2001). Hence, opportunities to utilize the skills and strengths of older people have been limited by structural factors (Sorensen & Black, 2001). In short, older people, regardless of gender, are alienated from the mainstream, while the social roles and cultural meaning of "old age" are neglected (Sorensen & Black, 2001).

Rationale for Advocacy and Activism for Aging Population

No agreed age defines aging as a phenomenon with physiological and social dimensions (Wentzell, 2020; Wiggin et al., 2021); however, various sources are consistent that the minimum years to be considered senior is 50 or above (Wentzell, 2020). Growing older is associated with negative images (Serrat et al., 2021; Wentzell, 2020); these are physiological and social, like retirement from the paid workforce, which may influence changes in earning capacity, status, and involvement in the community (Serrat et al., 2021; Wentzell, 2020). Therefore, ageism has had unfavorable consequences for older people in our society (Serrat et al., 2021; Wentzell, 2020; Wiggin et al., 2021). It generated and reinforced denigration of the aging process and has given rise to negative stereotypes and presumptions regarding the competence of older people and their need for protection (Serrat et al., 2021; Wentzell, 2020; Wiggin et al., 2021). Studies have found that ageism has made it more difficult for older people to find employment and remain valued members of the paid workforce (Martin, 2018; Serrat et al., 2021; Wentzell, 2020; Wiggin et al., 2021). However, the common perception that workers over 60 years of age are less competent than younger workers is more a myth than reality (Martin, 2018). The chapter attempts to discuss elements of advocacy and activism on aging in the context of aging with disability and disability with aging.

Aging with Disability and Disability with Aging Advocacy and Activism

Viljanen et al. (2021) brought data used in aging advocacy. Their study established challenges posed to healthcare and elderly services as multimorbidity associated with institutionalization. Viljanen et al. (2021) assessed chronic conditions among home-dwelling older people with and without dementia. Viljanen et al. (2021) found that the mean age of the participants (n = 820) was 74.7 years. During the follow-up, 328 (40%) were institutionalized. Dementia, mood disorders, neurological disorders, and multimorbidity were chronic conditions associated with a higher risk of institutionalization in all the participants (Viljanen et al., 2021). In people without dementia, mood disorders and neurological disorders increase the risk of institutionalization. This, therefore, implies that risk factors should be recognized when providing and targeting care and support for older people still living at home. The above notion perpetuated institutionalized living as a solution that addressed ageism among senior citizens, thereby bringing the need to explore how disabled people have managed to have a balance in institutionalized and community living from an advocacy perspective, as discussed below. Therefore, it is essential to note that in lessons learned from other population groups, these differences must be contextualized in community living solutions to be considered.

Overview of Advocacy and Activism on Disabled People and Community Living

The present authors used academic and gray literature to show evidence that community living has been part of advocacy and activism which led to its implementation, especially in the United States through the independent living concept, targeting community living of disabled people. In general, advocacy and activism are centered on government-public and private sectors and civil society to uphold the fundamental principles of independent living as (i) control, (ii) choice, (iii) freedom, and (iv) dignity (Doncel-García et al., 2022). It has been documented that the early inspiration for the independent living movement (ILM) was drawn from the African American civil rights movement of the 1950s and the 1960s because of the similarities they share in both discrimination and stereotypes in housing, education, transportation, and employment (Hayman, 2019). Although other social movements such as deinstitutionalization based on the principles of normalization developed by Wolf Wolfersberger, led by service providers and parents of people with disabilities, had been in existence, disabled people led the independent living movement themselves (McDonald & Oxford, 1995). Accomplishments of Independent Living include legislation, control, services, and dignity to individuals. Awareness-raising communities have been cited as the most significant independent living movement principles accomplishment.

> The movement's most significant contribution is that it has given disabled persons a voice in their own future and has fostered a new sense of dignity and pride that for too long has been denied them. This will continue to be its most important contribution in the years to come. (DeJong, 1979)

Indeed, almost two decades later, a Canadian study on the impact of independent living centers on individuals and the community confirmed the spread of independent living centers across the country and impact (Hutchison et al., 1997) where on an individual level, the Independent Living Resources provided a feeling of being empowered, thereby increasing competence and confidence (Lord, 1991) and an increase in community participation (Friedman, 1992).

The Convention was adopted by the United Nations General Assembly on December 13, 2006. As of December 2021, it had 163 signatories and 184 parties, 183 states, and the European Union (United Nations Department of Economic and Social Affairs, 2022). One of the articles that these state countries are obligated to be article 19 on living independently and being included in the community with states: "*States Parties to the present Convention recognize the equal right of all persons with disabilities to live in the community, with choices equal to others, and shall take effective and appropriate measures to facilitate full enjoyment by persons with disabilities of this right and their full inclusion and participation in the community, including by ensuring that: disabled people have opportunity to choose their place of residence, where and with whom they live on an equal basis with others, as they are not obliged to live in a particular living arrangement; neither to have access to in-home, nor residential among other community-based support services, like personal assistance needed to support living, inclusion in the community, prevent isolation and segregation; Community services, and facilities for the general population are available on an equal basis for disabled people as responsive to their needs*" (UNDESA, 2022). Since the first reported independent living center (ILC) in Berkley, in the United States, the country saw an increase to over 400 centers nationally. Other countries like Japan reported over 125 centers; Canada, over 25; Australia over 7; Zimbabwe, 1; and South Africa, 3.

Cases of Advocacy and Activism by Disabled Persons on Community Living

Print Media

In the **United States**, according to Ed Roberts, who is widely known as the father of independent living, the University of California at Berkeley hesitated to admit him when he applied, as he had polio. He managed to get the story out using media and was reluctantly admitted in 1962. In 1972, the Berkeley Center for Independent Living (CIL) was started (John, n.d.).

In 1998, a **Japanese** man born without arms and legs authored the book *No One's Perfect*, which became a third best-selling book a year after publishing and has been noted to have contributed to shaping societies' views toward disability, as expressed by over 10,000 letters that he received from society (Los Angeles Times, 1999).

Public Demonstrations and Protests

On April 5, 1977, disabled people in the **United States** held what was called the 504 sit-ins to demand anti-discrimination regulations on the Rehabilitation Act of 1973, they stayed until May 1 after a review and approval of the regulations, paving way for the Americans with Disabilities Act (New York Times, 2020). The San Francisco contingent of over 100 people entered Health Education and Welfare (HEW) offices and stayed for weeks. In 1978, the rehabilitation act was amended to provide consumer-controlled centers for independent living.

In Japan "Kawasaki Bus Toso" in 1977 emerged after members of Aoi Shiba stopped 78 buses in Kawasaki that had refused to transport passengers using wheelchairs. Aoi Shiba members occupied and lay on the ground in front of buses to protest the denial of transportation. Their defiance was symbolic as the issue of accessibility later played a leading role in the disability movements in Japan (Iwakuma 2011).

On June 27, 2017, demonstrations are still viewed as an effective form of activism; Wheelchair Sports Camp MC Kalyn Hefferman and seven members of the disability rights group American Disabled for Attendant Programs Today (ADAPT) began a sit-in at the US senator's office. The group demanded the senator's vote against the healthcare bill that would replace President Obama's Affordable one; the new measure was scheduled to be voted on that week. During the sit-in, the Senate announced the vote be moved to after the 4th of July (Westword: Activism, 2017). On July 26, 2017, the Senate rejected a proposal to repeal significant parts of the Affordable Care Act without providing a replacement (The New York Times, 2017).

Global United Nations (UN) Observances

In 1983, John Evans left Cheshire Home to live in his own home in a community, which marked the start of the independent living movement in the **United Kingdom**. This change was achieved through a group known as "Project 81" because the United Nations designated International Year for Disabled People (Leeds University, 2003), thereby influencing independent living and deinstitutionalization.

Lawsuits

Attorney John Holland had filed a lawsuit in 1977 on behalf of Atlantis Community against Regional Transportation District (RTD), arguing that approximately one-third of the fleet should be fully accessible to people in wheelchairs. The district court later ruled against Atlantis (Atlantis Community, Inc. v Adams, 1978); Atlantis appealed and settled with RTD, where the transportation agency agreed to retrofit all buses with wheelchair lifts (Hearings Before the Committee on the Judiciary United States Senate, 1996). Congress passed the **Americans** with Disabilities Act in 1990.

Support by Other Organizations, Research, and Position Papers

In 2012 **Moldova**'s government had taken historic steps to move disabled people out of institutions through Regulations HG351 aimed at directing financial resources to community-based care (Open Society Foundations, 2012). Disability organizations in 2020 reported a slow level of deinstitutionalization and provision of social support services. Seven organizations documented a position paper called "Deinstitutionalization of Persons with Disabilities in the Republic of Moldova" (Keystone Human Services, 2020), calling for **European Union** (EU) support for deinstitutionalization in the Republic of Moldova. In 1981, disabled individuals from the **United Kingdom** raised funds to travel to the United States and gain a firsthand understanding of establishing an ILC to replicate in the United Kingdom (Independent Living Institute, 2003).

In 2013, **South Africa**, through a Japanese non-government organization, a Japanese development agency, provided technical and financial support for the development of an ILC in South Africa (JICA, 2013). The process involved supporting South African activists to undergo independent living training in Japan and visit an ILC in Japan and engage with pioneers of the movement. Soon after that, an ILC was established in South Africa. In a South African study on economic costs of disability by the Department of Women, Youth and Persons with Disabilities, the leaders of the ILC reported they had succeeded in arranging for financial support from the Department of Social Development to deploy personal assistants (Department of Women Youth and Persons with Disabilities, United Nations Development Agency, 2022).

Online Workshops

In 2021, the **European** Network on Independent Living hosted webinars on deinstitutionalization to reach a wider global audience and create an opportunity for sharing experiences on independent living and learning globally (ENIL, 2021).

Social Media

National **American** ADAPT Twitter feed has 1700+ followers, with a Facebook page having 1600+ friends. When ADAPT protested Medicaid changes in Washington, DC, in early May, it live-tweeted the proceedings, including about 100 disability activists (Haller, 2011). Since 2009, the Disability Rights Education and Defense Fund (DREDF) has had a YouTube channel with 734 subscribers. One of its videos reached 12,000 views, though this was rare. DREDF's activism primarily takes place in the courtroom and through lobbying and public policy development and has embraced social media (Haller, 2011).

Inclusion International on international disability day in 2021 launched a global report on self-advocates experiences, ideas, and expectations on calling for deinstitutionalization; this video had 428 views at the time of writing of this chapter and was tweeted (Inclusion International, 2021).

In short, disabled people's advocacy and activism on community living was skewed toward independent living through (a) deinstitutionalization, (b) accessible transport, (c) change in attitudes and raising awareness of challenges faced by disabled people, (d) medical aid policy amendments, and (e) control over funds allocated – over the years taken shape through print media. However, in many countries, public demonstrations seem to have had more significant documented impacts as they drew media attention and that of society; public demonstrations have also been prevalent in recent years. Although we have seen several types of reforms that have followed these activists, this chapter is not intending to suggest a direct correlation. Recently, social media became a common platform for activism as online workshops broadcasted via online platforms such as YouTube channels, live Facebook, Twitter, and closed sessions via virtual meeting tools have been observed. Nonetheless, current authors have not found literature that shows the impact of social media and online activities on this advocacy and activism.

Community Living Advocacy and Activism Opportunities on Aging Population

According to D'cruz and Banerjee (2020), the COVID-19 pandemic exposed the aging population's institutional living challenges, presenting an opportunity for community living advocacy and activism toward deinstitutionalization of those who wish to live in the community. D'cruz and Banerjee (2020) believe older adults are at disproportionate risk of severe infection and mortality and are vulnerable to loneliness and social exclusion during the pandemic. Age and ageism can act as significant risk factors during the pandemic that increases perceived and actual risk to the physical and psychosocial burden on the elderly (D'cruz & Banerjee, 2020).

Understanding Institutionalized Living's Setbacks

Doncel-García et al. (2022) acknowledge ageism as being studied extensively in community-dwelling older adults but remains poorly understood in institutionalized older adults. Therefore, they have compared the physical, psychological, and social variables associated with self-reported age-based biases in community-dwelling older adults and those living in nursing homes. Doncel-García et al. (2022) found negative stereotypes of aging and different multidimensional variables. The variables differ between institutionalized and non-institutionalized adults and between men and women (Doncel-García et al., 2022). Doncel-García et al. (2022), as a first comparative study, levels of ageism in older people living in two different social environments provide a framework to combat this type of discrimination. Promising strategies include anti-ageism policies and laws, educational interventions, and increased intergenerational contact to inform advocacy and activism on aging.

Rabuffetti et al. (2022) examined the relationship between age-related factors and postural stabilization performance after a transition movement. They established controlled elements in the experiment as (1) assistance in living (independent living for community-dwelling subjects vs. assisted living for institutionalized subjects in nursing homes) and (2) age of institutionalized individuals by comparing groups with different age ranges. Rabuffetti et al. (2022) found that when comparing age-matched subjects from the two groups, the residents in nursing homes were characterized by a worse stabilization performance: (i) stabilization time more than doubled and (ii) instability increased by 39%.

There was no difference between the two age groups of residents in the nursing homes; however, a potential confounding effect has been identified in the unequal mortality rates between the two groups. Nakagawa et al. (2022) believes that in Asia, particularly Japan, where autonomous decision-making is not traditionally well accepted; little is known about individuals' preferences on where and how they can receive care. Hence, older adults were asked about their desired place of care (facility, home, or other) if confined to bed. Nakagawa et al. (2022) found that individuals' "aging in place" (community living) preferences tend to be considered under the long-term care insurance system; hence individuals' priorities should be shared with families and clinicians when deciding the place of care and as such play a role in advocacy and activism on aging. Noguchi et al. (2022) recruited a study cohort of non-institutionalized older adults from the Japan Gerontological Evaluation Study, established in 2013, and institutionalized older adults. Noguchi et al. (2022) assessed three aspects of community-level social capital (civic participation, social cohesion, and reciprocity). Noguchi et al. (2022) found that living in a community with rich civic involvement and participation in social activities is associated with lower frailty onset among older adults and fosters social participation. Such data are crucial in decision-making and approaches to living arrangements for the aging population.

Lessons from Disability Movement on Community Living – The Independent Living Movement (ILM)

The present authors perceive that advocacy and activism on aging can consider lessons from the ILM. The ILM emerged as an element of the broader disability rights movement in the 1980s and ascribed to the precept that people with even the most severe impairments should have the same choices that every citizen has (White et al., 2010). A primary goal is the right to choose to live independently, using paid personal assistance services, while living in a community, instead of being institutionalized. Independent living advocates for removing all barriers – in public attitudes, transportation, and architecture – that interfere with full community living (White et al., 2010). Eventually, it became a widely accepted model for centers for independent living (White et al., 2010). This, therefore, draws back to the causes for such an approach to be developed, because of shared similarities in experiences between aging population and disabled people, and advocacy and activism seek to bring initiating voices for a change.

Scholars believe the independent living concept was captured in Article 19 of the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) because of its position toward enhancing disabled people to live their life "with choices equal to others" (United Nations, 2019). A critical aspect of the ILM philosophy is reframing how we understand disability – from a medical model to a social (or independent living) model (Slasberg & Beresford, 2020). The medical model seeks only to use a medical cure or healing to normalize a person's condition (Slasberg & Beresford, 2020) while ignoring social factors and perceiving disabled people and seniors as lacking and disempowered (DiGennaro Reed et al., 2014). For a long time, the medical model was associated with isolation and segregation through the institutionalization of societal members because of disability and ageism (DiGennaro Reed et al., 2014).

The chapter identified independent living as a noteworthy preliminary point for aging advocacy and activism to learn and contextualize social innovative ways for their living arrangements. Although advocacy and activism on aging and independent living have numerous common areas of interest, the medical versus social model issue has further unified both groups. Both desire access to independence, dignity, and choice – and their collective activism has moved the system forward. Both groups perceive a need to change the primary legislation to make the resources for independent living a legal right for all (Slasberg & Beresford, 2020). But the activism and advocacy to secure the said assertions may face unknown/fear of perceived lack of incentive, motivation, and interest to have computable costs (Slasberg & Beresford, 2020). Perpetuated ignorance among societal members regarding independent living as costing the government and making funding for social care through a budget cease and move to "open cheque" funding produces unfavorable outcomes (Slasberg & Beresford, 2020).

Framing Aging in Advocacy and Activism for Sustainable and Resilient Community Living

Mah et al. (2021) believe older adults want to live at home if possible, even in circumstances that limit their autonomy. The assertion concurs with DiGennaro Reed et al. (2014) that home care services reflect this emergent preference, allowing older adults to "age in place" in familiar settings rather than receiving care for chronic health conditions or aging needs in an institutionalized environment.

Akosile et al. (2021) believe physical activity (PA), fear of falling (FOF), and quality of life (QOL) are fundamental constructs in geriatrics. The interplay among these constructs may vary between community-dwelling and assisted-living older adults (Akosile et al., 2021). However, studies comparing the well-being of community-dwelling older adults with those residing in assisted-living facilities (ALFs) are rare, especially from developing countries. Thus, Akosile et al. (2021) compared PA, FOF, and QOL between assisted-living and community-dwelling older adults and determined the correlations amongst the constructs for each group. Akosile et al. (2021) found that older adults in the ALFs had lower PA and QOL scores with a higher prevalence of FOF than their community-dwelling counterparts. Akosile et al. (2021) suggest that aging in place (community living) ensures better health outcomes than institutionalized aging. Older adults should be encouraged to age in place rather than move into assisted-living facilities (ALFs).

Marengoni et al. (2021) recruited 2571 community-dwelling older adults grouped at baseline according to their underlying multimorbidity patterns. They followed up for six years to test the association between multimorbidity patterns and institutionalization. Marengoni et al. (2021) found that six patterns of multimorbidity were identified. In total, 110 (4.3%) participants were institutionalized during the follow-up (Marengoni et al., 2021). Marengoni et al. (2021) concluded that older persons suffering from specific multimorbidity patterns have a higher risk of institutionalization if they lack formal or informal care. Therefore, interventions to prevent the clustering of diseases could reduce the associated burden on residential long-term care. Formal and informal care provision in community living can effectively reduce the risk of institutionalization. The essence of the above paragraphs provides evidence-based support for aging advocacy and activism to enhance the availability of living arrangement choices and relevant support to their lives.

Conceptualizing a Framework Toward Community Living of the Aging Population Informed by Literature Review

Similarities, Difference, and the Interconnection in Disability and Aging Activism

The authors raised advocacy and activism on aging from different dimensions. However, the discussion established that advocacy and activism on ageism share common ground with a disability based on shared stereotyping, marginalization, alienation, and discrimination, which emerged as less prevalent, according to Gelders (2015), in discussions on disability and ageism. Averill (2012) brought a rural perspective on older adults in the rural southwestern United States and identified themes needing action, including sustained access to prescriptions, transportation solutions for older adults in isolated communities, inadequate access to care, poor infrastructure and coordination of services, scarce assisted-living and in-home care for frail older adults, and barriers related to culture and economics. An interconnection is observed in literature as associated to age, gender, sexuality, rural settings which directly and indirectly align to the state of physical access, legislation, transport, access to services, labor, and stigma (see Fig. 2).

Figure 2 summarizes the literature review outcome by presenting themes that support learning from independent living among disabled people for the same approach that needs to be contextualized for older adults living in communities instead of institutions. Therefore, Fig. 2 is an input to the conceptual framework for the said people preferring to stay in their homes and communities to the institutionalized living arrangement.

Conceptual Framework

The findings upheld the development of a conceptual framework based on similar concerns between disabled people and the aging population that may call for advocacy and activism. In addition, traditional solutions resort to institutionalized living arrangements for both population segments in this regard. The literature examined reflects critical analysis on institutionalized living that informed the researchers to bring independent living as a point to learn in community living advocacy for the aging population. Such can be of value if the existing data are utilized to augment the voice of the affected population groups, however, taking cognizance of interconnection, heterogeneity, and socio-economic inequalities. Figure 3 is a conceptual framework derived from the reflection on literature, showing

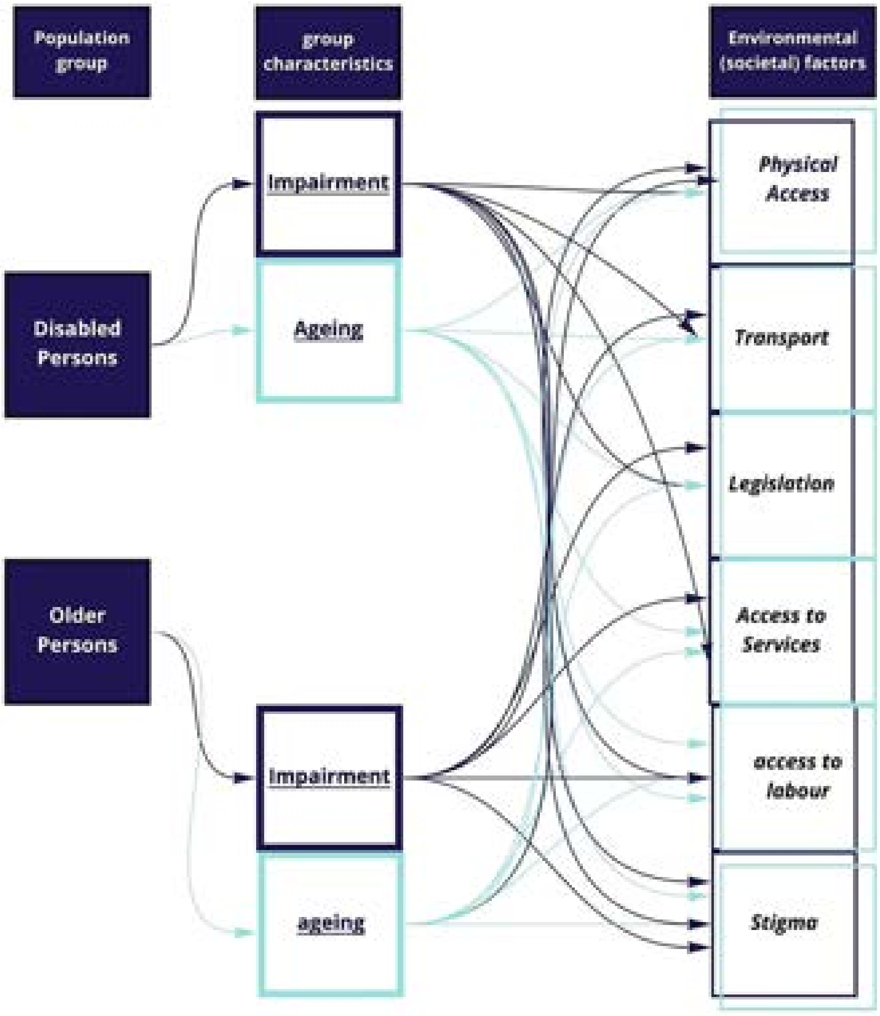

Fig. 2 Disability and aging – the shared similarities and interconnections. Source: Authors' compilation from literature

critical social how interactive factors perpetuating community living arrangement – independent living, impact the following dimensions: (i) individual, (ii) relationships, (iii) community, and (iv) societal levels. When found in institutionalized living, the said elements compromise choices, control, and involvement in decision-making in the said facets. Nonetheless, the review presents advocacy as an enhancer for a similar evolution in the disability movement, to be part of advocacy and activism for aging citizens, as disabled and aging (disability by aging and aging with a disability included) share a societal (socio-economic) negative image,

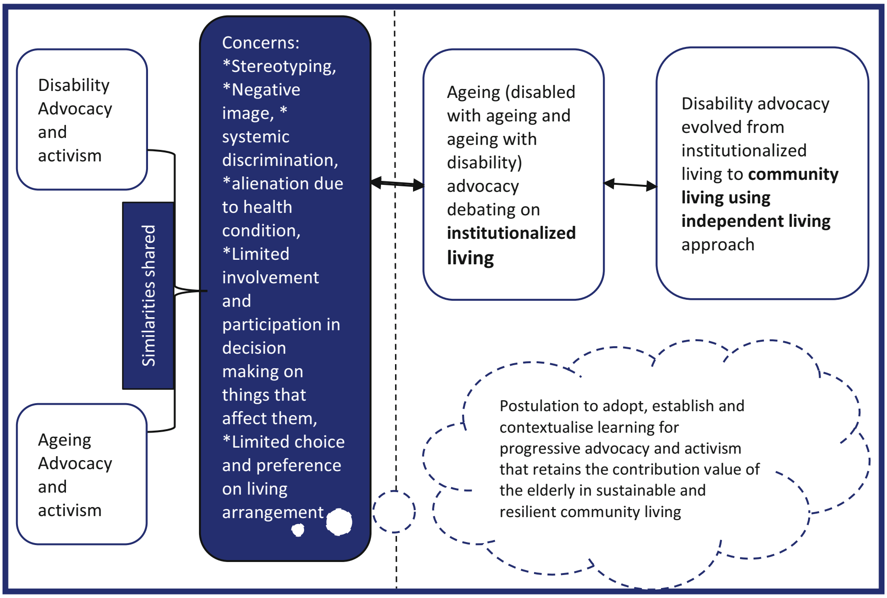

Fig. 3 Conceptual framework toward community living of aging population informed by present literature review. Source: Authors' compilation

stereotyping, and systemic discrimination. Advocacy for independent living regards such people as heterogeneous and hence should have control, choice, decision-making on a preferential living arrangement contextualized to the environment regardless of either growing old or acquiring impairment (see Fig. 3).

Figure 3 presents findings that reflect the need for effort to retain the value of every member of society; however, current solutions contradict this goal. It is clear from findings that costs are reduced with living in communities instead of institutions, coupled with better resilience of health conditions due to improved social interactions. Yet, other countries are undertaking fiscal consolidation reform like their pension systems for cost savings by reducing benefits, while others are in dire need of an increase in the labor force. If advocacy and activism do not use data to inform social action, ignorance and fear of costs on community living will be prevalent.

Conclusion

The chapter presented a consolidation of developed and developing countries' perspectives to enhance and provide the reader with a comprehensive background for understanding current knowledge and highlighting the significance of new research, especially empirical research on addressing interconnecting categories of the aging population beyond impairment characteristics but gender and other factors depending on context. This implies for an aging population to benchmark on independent living movement through, for instance, making plans for physical visits to other centers globally or locally. The chapter encourages the aging population to spearhead activism and advocacy for their voice to be directed to stakeholders like policy-makers while correcting the image stereotyping among other societal members for greater social cohesion in developed and developing countries.

The chapter looked at the *critical thinking around institutionalized and independent living arrangements that can enhance sustainability and resilience in community living arrangements*, where it became clear that ageism, advocacy, and activism on aging share a similar image, stereotyping, marginalization, alienation, and systemic discrimination in line with access and availability of choice and preferences on living arrangements. For freedom of choice, institutionalized living does not have to be eliminated, however solutions towards independence of the aging population should consider their right to choose to participate in the community, and foster innovation due to the value from their experience, wisdom and human capital stock accumulated throughout their life stages. The involvement of senior citizens can enhance a sustainable and resilient community that can exploit the value of aging, which comes with indigenous knowledge systems in addressing life challenges. However, advocacy and activism are vital in changing attitudes (perceptions) and behaviors toward the aging population while considering contextual factors, interconnection, and the choice of the older adult involved.

The aging population's predetermined inclusion and exclusion are influenced by perceived value and perceived costs. However, in addressing issues of sustainability raised by others such as economists, though others have adopted the "working longer agenda," this may not be attained if an enabling environment freely chosen by the aging population is not created. The chapter highlighted challenges posed by environmental barriers that force aging with disability and disability with aging population segments into institutionalized living arrangements. Nonetheless, developed countries have focused on aging and ageism activism and advocacy from the legislative, self, and group to civic dimensions. This contrasts with developing countries, as the two fraternities have different average life expectancy and socioeconomic fabric. In addition, governments are undertaking fiscal consolidation reform like their pension systems for cost savings by reducing benefits, thereby concluding that the aging population prefers to stay in their homes and communities, hence the need for social innovative advocacy and activism, instead of moving to institutions for those who choose to live and participate in the community.

In attempting to address concerns on *how movements led by disabled persons bring social innovation on activism and advocacy for sustainable and resilient community living arrangements for the aging population groups*, the chapter concludes that the disability movement has demonstrated to have a long historical movement aimed at deinstitutionalization and providing choice for living arrangements for disabled people. This group has experience in advocacy and activism geared particularly toward calling for community living, followed by international treaties and legislative reforms, not only on social services and the economic participation of disabled people through employment quota policies and systems and changes in programs and social services. The concept of independent living used by disabled people provides insights for socio-economic innovation in advocacy and activism for the aging population as they share similarities. Such contemporary platforms like social media can be of use to the movements led by aging people while consequently playing a role in shaping advocacy, activism, and implementation of standards set by international organizations.

In addressing *what can be learned from each population group's advocacy to the others for adoption toward sustainable and resilient community living arrangement while enhancing socio-economic activeness of the population mentioned above groups*, in both population groups, it became clear that unless advocacy emerges from the affected parties, decision-makers' ignorance can be perpetuated due to a lack of lived experience-based opinions (voice). Therefore, just as in history, an aging population has demonstrated the capability to advocate for their issues. Hence, the calls for community living should be led by them. Lessons from the disability movement can be considered as the independent living concept is applied in over 500 independent living centers globally. Although there are fewer studies on the impact of independent living centers, those conducted have demonstrated impact on the community and individuals. Guidelines and handbooks on establishing these IL centers already exist in line with the general comments on article 19 on living independently and being included in the community by the Committee on the Rights of Persons with Disabilities in 2017, emphasizing self-representation. However, the existing data are not sufficiently utilized to inform activism and advocacy on aging, causal effects, and impacts of institutionalized living arrangements, and what socio-economic participation could change if community living is enhanced. The chapter was limited because it was developed from desk-top research; hence the authors recommend further empirical research, a longitudinal study that samples developed and developing countries.

Part XIII

Disaster, Conflict, and Environmental Conditions

Disability, Conflict, and Environmental Conditions: Introduction

83

Mary E. Crock and Ron C. McCallum AO

Contents

Abstract

It is now accepted that persons with disabilities suffer disproportionate harms in disaster and displacement contexts, most particularly when persons with disabilities cross international borders in search of protection. Advances in domestic and international laws and policies are changing attitudes and approaches for these people. However, achieving equal treatment and mainstreaming disability-inclusive and rights-based approaches to disaster risk management is a work in progress. The COVID-19 pandemic and ongoing conflicts around the world underscore the importance of the insights provided by the authors in this collection. The shared aim is to lay out a road map to ensuring the full and effective participation of all persons with disabilities in society, acknowledging the intersecting and cross-cutting issues that create barriers in contexts of disaster and displacement.

https://doi.org/10.1007/978-981-19-6056-7_73

Introduction

This handbook was written during a period of generational change and challenge. As concern grew about the increasingly obvious effects of human-induced climate change, the world was gripped by a global pandemic. Deaths from the SARS COVID-19 virus and its variants far outstripped the previous ten-year annual average of fatalities attributable to extreme weather and geophysical disasters.[1] In most countries around the world, persons with disabilities suffered disproportionate harm. At increased risk of (fatal) infection, they were also slow to access vaccinations, and more likely to be denied targeted health care and to be treated badly in hospital systems (Lund et al., 2020; Andrews et al., 2021; Matsui, 2021). Secondary impacts of COVID-19 sounded in disruptions in support services as carers fell ill or because of restrictions introduced to restrict spread of the virus (Human Rights Committee, 2020; Lund & Ayers, 2020; ILO 2022). The pandemic serves as a reminder that the human rights of persons with disabilities remains a work in progress.

As the thematic study undertaken by the Office of the High Commissioner for Human Rights (OHCHR, 2020) found, disasters and humanitarian emergencies magnify risks of morbidity and death for persons with disabilities:

> Sudden-onset natural disasters and slow-onset events can seriously affect the access of persons with disabilities to food and nutrition, safe drinking water and sanitation, health-care services and medicines, education and training, adequate housing and access to decent work. (OHCHR, 2020, 3)

The pandemic had an interesting impact on forced migration. The sudden closure of borders brought to a halt both many forms of irregular migration (Ghezelbash & Tan, 2020; Chetail, 2020) and programs for the organized resettlement of refugees and displaced persons (Caraballo, 2020; Bond et al., 2020; UNHCR, 2021). In some countries, there were reports of refugees becoming so fearful of contracting the virus that they chose return to their war-torn countries over staying in refugee camps (The World.org, 2021). In every instance, the impact of the virus on forced migrants – and most particularly those with disabilities – was devastating (Meer et al., 2021; Owen, 2020). The challenges facing relief organizations such as UNHCR, IOM, and the ICRC were extreme and well documented (Martin & Bergmann, 2021; Truelove et al., 2020; Foster et al., 2021; OHCHR, 2020; Crawley, 2021; Hoofman & Goncalves 2020).

In this section, we explore advances in law, policy, and practice that can or should be assisting persons with disabilities to enjoy rights in emergency and disaster contexts. The situations explored by the authors include some of the most extreme faced by human beings anywhere. At the center of our inquiry is the recognition that while cataclysms kill and maim – creating disabilities – they also impact persons already living with disability. As a number of the contributors point out, the assumption that persons with disabilities are underrepresented in

---

[1] See https://ourworldindata.org/explorers/coronavirus-data-explorer. Compare CRED (2021), p. 1.

displacement contexts is patently false (xrefs) – even as these people continue to be invisible in much of the data collected about populations on the move. (ref) What is more obvious is that displacement can exacerbate vulnerability in persons with disabilities (Crock et al., 2017; Lund et al., 2020). Kälin notes that the 1992 UN Framework Convention on Climate Change (UNFCCC) acknowledged that climate change would increase displacement in three contexts: forced migration, voluntary migration, and planned relocation of at-risk populations.[2] The intervening years have indeed borne out this reality. The section contributors all argue that an inclusive, human rights–based approach should be adopted in both planning for disasters (including disaster risk reduction) and in humanitarian relief operations (including refugee contexts). International law has now developed to the point where core principles should be beyond dispute (Aleinikoff, 2020).

Outline of Part Chapters

The section begins with a chapter by Professor Emeritus Walter Kälin, UN expert advisor on internal displacement, including human movement in response to disaster and climate change. He identifies as starting points for realizing rights in persons with disabilities: nondiscrimination and equality of opportunity, participation and inclusion, accessibility, and reasonable accommodation (of disability) (ref). His chapter is framed around the argument that

> taking the human rights of persons with disabilities seriously contributes significantly to preventing their displacement, addressing their assistance and protection needs during displacement, and finding solutions ending their displacement in ways that address these needs.

Kälin sets the stage for our analysis by identifying key duties in states – to respect, protect, and provide for persons with disabilities – that act as entry points for human rights–based action that can serve to prevent displacement and/or minimize related harms.

A common theme running through the chapters in this section is acknowledgment of the intersectional relationship between disability, poverty (World Bank GFDRR, 2020), and all the multidimensional elements that underlie discrimination and disadvantage in societies around the world. Overlaying this is the huge variation in disabilities, lived experience (capabilities), and needs. Disability expert and legal scholar Janet Lord (▶ Chap. 88, "Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement") notes that the impact of disasters is felt differently by women, children, and older persons with disabilities. Each can face heightened risk (Vidili, 2018). Lord has as her focus Article 11 of the Convention on the Rights of Persons with Disabilities (CRPD). This

---

[2] COP16 (2010), para. 14(f).

revolutionary provision crystalizes and affirms the rights of persons with disability to equal treatment in all situations of emergency or disaster, putting aside older understandings that human rights can be suspended when situations become exquisitely challenging (ref). The first to acknowledge rights in the context of natural disasters.

Lord collects and analyzes the way that states, UN bodies and agencies, as well as NGOs and INGOs have responded to Article 11 in word and deed. She describes a

> complex landscape of disability-inclusive disaster cooperation at the international level (which) includes . . . policy guidance and political signals provided by multilateral organizations; informal cooperation among state and non- state actors across levels and across countries in advancing disability-inclusive disaster action and response.... (A)ll play important roles in bolstering, complementing, and implementing Article 11 of the CPRD.

In the chapter by planning lawyer Matthew Cole, Kälin's overview is given context in a case study that examines how inclusive land use planning can help build resilience in persons with disabilities in disaster situations. Cole uses as his starting point the lived reality of these people, affected as they are by multiple and intersecting structural inequalities. Persons with disabilities are more likely to be poor, lack education, and to live in marginal housing, with inadequate access to health care and emergency accommodation. He argues that "disaster justice" acknowledges both the social dimensions of adverse events and the need to mitigate structural inequities as a means of reducing risk of harm. Taking land use planning as a model, Cole draws out elements of the CRPD that focus on equality of access and the merits of "universal design."

Cole sets out the theoretical underpinnings of "just" disaster risk reduction strategies. He explains that risk planning requires an assessment of four types of assets that affect the impact of adverse events. These are described by the theorists as physical, human social, and environmental. Cole uses these to reflect on ways in which planning laws can and should be framed so as to minimize harm and maximize whole of society resilience.

The four chapters that follow take us into particular disaster contexts. The situation facing persons with disabilities displaced as refugees is addressed by legal academic, Professor Mary Crock, Swiss lawyer and advocate Dr Stephanie Motz, and by academic linguist and lawyer Dr Laura Smith-Khan. Crock opens this discussion with an overview of the particular institutional responses to developments in international disability rights law in UN agencies responsible for migrants and refugees, including UNHCR and IOM. Her chapter also introduces the UN Refugee Convention definition of refugee, noting the way in which understanding of the law has altered in response to the CRPD.

Motz extends this inquiry by examining the extent to which the CRPD has created novel obligations under international law not to return persons with disabilities who face expulsion from a host country. Her chapter analyzes jurisprudence from regional and UN treaty bodies on cases involving *nonrefoulement* claims and persons with disabilities. The work is particularly interesting in its review of

European case law because of the ability in European contexts to use human rights law as “hard” law. She critically analyzes the existing *nonrefoulement* case law in light of the medical and the human rights–based models of disability. The chapter demonstrates the impact that the CRPD is beginning to have on international refugee law, migration law, and general human rights law.

Although mentioned by Crock in her survey chapter, the issue of process in refugee law deserves deeper consideration where the person seeking asylum is living with a disability. Dr Smith-Khan examines those provisions in the CRPD that confer “procedural and communication-related” rights in refugees with disabilities. This author summarizes the guidance policies issued by UNHCR that acknowledge the central importance of designing procedures in a way that allows all refugees to articulate their protection claims. Recent years have brought increased understanding of the ways in which refugee status determination procedures can affect a person’s ability to tell his/her story in a coherent way. Smith-Khan makes the case for inclusive and adaptive procedures through a case study of refugees who are deaf or hard of hearing. This is a form of disability that can be easy to miss in the press of high-volume status determination scenarios. Ever grounded in practice, Smith-Khan concludes with a discussion of strategies that can be adopted to ensure that procedures are inclusive and properly adapted to accommodate different forms of disability.

The section concludes with a piece that takes us back to the sweeping disaster of COVID-19. The case study is situated in Kenya and has as its focus upon the rights of women and girls with disabilities, particularly as these involve sexual and reproductive health. The right to health is regarded as one of the most inviolable of all human rights. Academics and lawyers like Associate Professor Edwin Abuya and Dr Naomi Njuguna note that challenges facing women and girls with disabilities have been greatly exacerbated by the COVID-19 pandemic. In Kenya as in many parts of the world, women and children with disabilities are particularly susceptible to sexual abuse, neglect, and family violence. The authors underscore the injustice and unlawfulness of societal structures, attitudes, and policies that devalue women and girls with disabilities. They argue that equal treatment should extend to all aspects of sexual and reproductive health, including rights to birth control and family planning. Their essay makes interesting observations of how the situation facing women has been affected by both medical systems overwhelmed by COVID-19 patients and by measures introduced to control infections.

Cycles of Disaster

In 2022, the decision by Russia to invade the Ukraine generated new crises that saw very substantial refugee flows into Europe. Research by the contributors to this book – and that of UNHCR, OHCHR, and others – suggest that persons with disabilities are sure to be represented among those displaced by this new violence and armed conflict. This is particularly the case as so many of the fugitives are women and children, – a cohort with recognized vulnerabilities that make them more susceptible to harms that can result in disabilities (World Vision, 2022).

It is clear from the thoughtful chapters in this section that much work is still required to identify persons with disabilities in emergency and in conflict situations. Without appropriate methods of identification, especially of disabilities which are not readily apparent, it is difficult for countries and UN agencies to ensure that reasonable accommodations and assistance are appropriately provided.

It is also clear that there has been insufficient consultation with persons with disabilities and disabled persons organizations concerning risk identification and risk reductions in times of disasters. It is only through dialogue that the human rights and needs of persons with disabilities can be recognized in situations of disasters, national emergencies, and situations of armed conflict. Finally, it is essential to plan responses before the occurrences of disasters which are likely to increase throughout the remainder of this century.

Disaster and Climate Change-Induced Displacement of Persons with Disabilities: A Human Rights Perspective

84

Walter Kälin

Contents

Abstract

Disasters and adverse effects of climate change may significantly exacerbate pre-existing vulnerabilities of persons with disabilities. This is particularly true if such persons are displaced within their country or across borders. The systematic promotion and mainstreaming of disability-inclusive and rights-based approaches to disaster risk management and climate action are crucial to mitigate these challenges. The human rights of persons with disabilities which remain applicable during disasters and the principles of non-discrimination and equality of opportunity, participation and inclusion, accessibility, and reasonable accommodation help in shaping disability-inclusive measures to prevent displacement as well as the provision of protection and assistance during displacement. Finally,

including persons with disabilities in programs and projects on durable solutions and ensuring their participation in decisions aimed at ending their displacement are crucial to avoid replicating and rebuilding barriers and ensuring their full and effective participation in society.

Introduction

Displacement Dynamics

Disasters triggered by flooding, tropical storms, droughts, and heat waves and other weather- and climate-related events or geophysical hazards such as earthquakes, volcano eruptions, or tsunamis have devastating impacts on very large numbers of people. Between 2010 and 2019, an average of 102 such events affected 201.3 million people and caused 61,707 deaths per year.[1] On average, they also trigger 24.5 million new displacements per year.[2] Many displaced persons can return to their homes after a few days or weeks, but others are caught up in protracted displacement. Most of them remain within their own country as internally displaced persons (IDPs). Some, however, are forced to seek refuge abroad.[3] Others may choose to migrate in anticipation of or in the aftermath of a disaster as a way to cope with risks and impacts of sudden- or slow-onset natural hazards and adverse effects of climate change. Finally, authorities or communities may decide to relocate people if actual or anticipated hazards would make it too risky or impossible for them to return to or remain in their homes. In 2010, the States Parties to the 1992 UN Framework Convention on Climate Change (UNFCCC) recognized forced displacement, voluntary migration, and planned relocation as part of the challenge to adapt to climate change.[4]

While it is difficult to predict numbers, it is clear that adverse effects of climate change such as sea level rise or desertification and other environmental degradations will incite or force millions of people to leave their homes in the future: The World Bank estimates that more than 143 million people will move within their countries in Latin America, sub-Saharan Africa, and South Asia by 2050 unless we take robust action to mitigate and adapt to climate change and invest in development aimed at reaching the Sustainable Development Goals.[5]

Displaced Persons with Disabilities: An Invisible Group

Persons with disabilities are numerous[6] among displaced people. However, they remain largely invisible.

While the lack of comprehensive and solid data and knowledge on people displaced in the context of disasters and adverse effects of climate change in general is recognized as a key challenge,[7] the situation is even worse when it comes to displaced persons with disabilities. Global numbers are not available as data disaggregated by disability are scarce.[8] This is at odds with CPRD, Article 31(1), requiring States to generate data needed for policies to respect, protect, and fulfil the human rights of such persons. Even where data exist, they are often problematic. The International Organization for Migration (IOM), for instance, reported in early 2021 that among the 844,642 persons internally displaced in Ethiopia's Somali region due to not only conflict but also drought and flooding or landslides, only 5315 individuals had mental or physical disabilities.[9] While persons with disabilities are estimated to represent around 15 percent of the world population (UNDP 2018: 56), this figure amount to less than 1 percent of this population. When volcanic activities displaced people in Vanuatu in 2017, only 37 persons among a total of 5125 IDPs were identified as persons with disabilities although up to 12 percent of the country's total population are estimated to belong to that category.[10] While higher casualties among those whose disability prevents them to evacuate or flee[11] may contribute to these differences, this factor alone cannot explain these discrepancies. Rather, as the Special Rapporteur on the human rights of internally displaced persons (hereafter: Special Rapporteur) highlighted, the "lack of accessibility, adequate capacity and/or prioritization, stigma and unduly narrow definitions of disability, particularly with regard to psychosocial functioning" are among the factors contributing "to under-identification of internally displaced persons with disabilities."[12]

Displaced persons with disabilities and their rights remain largely invisible in relevant international processes, too. The topic is rarely addressed by States in the context of the Universal Periodic Review.[13] With the exception of the Committee on the Rights of Persons with Disabilities, the same is true for UN treaty bodies. While they often include persons with disabilities when mentioning categories of people with special needs and vulnerabilities such as children or refugees and migrants, specific recommendations such as that of the Committee on Economic, Social and Cultural Rights to the Central African Republic to ensure "that displaced persons

suffering from disability and living in camps are allowed to enjoy adequate protection and humanitarian assistance on equal terms, as well as access to their basic requirements, such as food, water and sanitation, health care and education"[14] remain very rare. Particularly noteworthy is the 2020 thematic report of the Special Rapporteur on the human rights of internally displaced persons, Cecilia Jimenez, on the rights of internally displaced persons with disabilities.[15]

Overview

As these examples indicate, displaced persons with disabilities are not sufficiently seen as individuals with specific needs and interests beyond those shared by other people displaced in disaster and climate change contexts. This chapter argues that taking the human rights of persons with disabilities seriously contributes significantly to preventing their displacement, addressing their assistance and protection needs during displacement, and finding solutions ending their displacement in ways that address these needs. It starts with a description of the role of human rights in disaster situations more generally (section "Human Rights in Disaster Contexts"). This is followed by suggesting a concept of displacement in the context of disasters and adverse effects of climate change which helps to identify entry points for human rights-based action (section "Conceptualizing Displacement in the Context of Disasters and Climate Change"). The chapter then discusses in more detail those human rights which are particularly relevant for preventing displacement, protecting and assisting displaced persons with disabilities, and finding durable solutions for them (section "Protecting Persons with Disabilities Throughout the Displacement Cycle"). The chapter concludes with a call to domestic, regional, and UN human rights mechanisms to play a more active role in safeguarding the human rights of persons with disabilities throughout the displacement cycle.

Human Rights in Disaster Contexts

Relevance

Disasters and adverse effects of climate change affect the human rights of persons with disabilities in many ways.[16] However, it is often assumed that human rights do not play a significant role in such situations because displaced people supposedly face few protection challenges compared to people forced to flee during conflict and who might be attacked, exploited, or otherwise harmed by a party to the conflict or criminal elements even when living in camps or irregular settlements. As a

consequence, humanitarian organizations providing assistance to survivors of a disaster may neglect protection risks. However, the right to protection of life; the rights to access to live-saving food and water, shelter, or medical services; the right to protection from sexual and gender-based violence; guarantees related to the reunification of separated families; rights related to the restitution of lost documentation; or housing, land, and property rights are highly relevant for not only disaster-displaced persons in general[17] but also displaced persons with disabilities.[18] More generally, disasters tend to exacerbate not only vulnerabilities but also pre-existing patterns of discrimination and marginalization. Unlike during armed conflict, protection problems in disaster contexts are, as I have highlighted elsewhere, often "the consequence of neglect, lack of capacity or inappropriate policies that do not take into account the human rights dimension of disasters" rather than the result of deliberate infliction of harm.[19] The Convention on the Rights of Persons with Disabilities (CRPD), Article 11, reflects these realities by obliging States Parties to take, in accordance with their human rights obligations, "all necessary measures to ensure the protection and safety" of persons with disabilities affected, inter alia, by disasters.

Another problematic assumption suggests that human rights play a limited role because they can be suspended during times of emergency. Article 4 of the International Covenant on Civil and Political Rights (ICCPR) and equivalent provisions in regional human rights conventions[20] on derogation permit the suspension of such rights if a "public emergency ... threatens the life of the nation." However, this possibility is of limited practical relevance[21]: Such measures are limited "to the extent strictly required by exigencies of the situation" in terms of duration, location, and the rights whose application is temporarily suspended. Furthermore, certain rights, including the right to protection of life, are non-derogable. While a State might, for instance, be unable to ensure guarantees such as bringing looters promptly before a judge during a disaster as required by ICCPR, Article 9(3), and therefore would be entitled to derogate from them, occasions where relevant rights of disaster-displaced persons with disabilities could be legitimately suspended are difficult to imagine. It is thus no coincidence that States seldom invoke derogation measures in disaster contexts and usually limit them to the freedom of movement, for instance, to keep looters out disaster areas, and the freedom of assembly.[22] While other human rights conventions, including the CRPD, do not contain derogation clauses, States may, in very exceptional and extreme situations, justify temporary disregard of

certain guarantees with reference to necessity as a ground precluding wrongfulness under international law,[23] but such cases hardly occur.

Obligations

A State's triple human right obligation to respect, protect, and fulfil[24] continues to apply in disaster and climate change situations, albeit with some peculiarities. The *duty to respect* may be absolute such as in the case of the prohibition of torture, but many rights can be limited for reasons such as the protection of public order and public health or, in the case of economic, social, and cultural rights,[25] for the promotion of the general welfare in a democratic society. Such reasons often carry great weight in disaster situations and may justify more severe limitations, for example, on the freedom of movement or property rights, than would be permissible at other times. Authorities may also feel compelled to oblige certain people to participate in rescue and recovery operations without pay. Such work does not violate the absolute prohibition of forced labor as, according to ICCPR, Article 8(3)(c), a "service exacted in cases of emergency or calamity threatening the life or well-being of the community" does not amount to such labor.

The *duty to protect* against threats emanating from private actors or natural and human-made hazards[26] is particularly relevant in disaster contexts. According to the European Court of Human Rights, this duty includes, among others, the obligation of competent authorities to adopt laws and implement measures to reduce and mitigate disaster risks; identify and monitor particularly hazardous locations and dangerous situations; inform people living there about possible risks; and ensure their evacuation in case of imminent hazards.[27] The duty to protect persons with disabilities is explicitly enshrined in CRPD, Article 11, with its reference to the obligation "to ensure the protection and safety of persons with disabilities in situations of risks," including disaster situations. Article 16(1) obliges States more generally to "take all appropriate legislative, administrative, social, educational and other measures to protect persons with disabilities. . . from all forms of exploitation, violence and abuse . . .."

The duty to protect is not absolute but exists to the extent that authorities know or should know the threat and possess, to use the words of the European Court of Human Rights, the means which, "judged reasonably," would be suitable "to avoid that risk."[28] The actual level of due diligence required to provide protection depends

[28] European Court of Human Rights (Grand Chamber) (1998), para. 116. See also Inter-American Court of Human Rights, (2012), para. 245.

not only on the specific situation but to some extent also on the right at risk. Thus, unlike in the case of the right to life, the duty to protect the right to property is, according to the Court, less stringent where property is lost not as a result of events occurring under the responsibility of the public authorities but destroyed by a natural hazard.[29] On the other hand, the obligation to protect is particularly strict where the rights of persons with specific vulnerabilities, including persons with disabilities,[30] are at risk.

The *duty to provide* requires States to provide the legal, institutional, and procedural measures and conditions necessary for rights holders to fully realize and enjoy their human rights. In certain situations, the duty also includes the obligation to provide goods such as food and shelter or basic services, including health and education. Thus, according to CRPD, Article 28(1), "States Parties recognize the right of persons with disabilities to an adequate standard of living for themselves and their families, including adequate food, clothing and housing." CRPD, Articles 24 and 25, on the rights to education and to the enjoyment of the highest attainable standard of health obliges them to ensure access to and inclusion of such persons in educational and health services. These rights are particularly relevant for people with disabilities who need humanitarian assistance because they are displaced. However, in such situations, States may lack sufficient resources to provide what is necessary in a disaster situation. Nevertheless, as highlighted by the Committee on Economic, Cultural and Social Rights, every State has the "minimum core obligation to ensure the satisfaction of, at the very least, minimum essential levels" of the rights to food, shelter, health, and education. Thus, a State Party in which, for instance, "a significant number of individuals is deprived of essential foodstuffs, of essential primary health care, of basic housing, or the most basic forms of education is, prima facie, failing to discharge its obligations under the Covenant."[31] If the State does not possess the necessary means and resources to ensure this minimum, its authorities are obliged to call on the international community for support[32] and authorize humanitarian access for UN agencies and international non-governmental organizations ready to help.

In addition to these general duties, States must respect specific principles and rights enshrined in the CRPD when persons with disabilities risk displacement or are already displaced. Besides CRPD, Article 11, which is the topic of another chapter in this book,[33] certain general principles enshrined in CRPD, Article 3, are particularly relevant:

[29] European Court of Human Rights, (2008), paras. 173–4

[30] European Court of Human Rights (2012), paras. 141–150

[31] Committee on Economic, Cultural and Social Rights (1990), para. 10

[32] International Covenant on Economic, Social and Cultural Rights, Article 2(1). Committee on Economic, Cultural and Social Rights (1990), para. 13. See Burson et al. (2018), pp. 402–407.

[33] See ▶ Chap. 88, "Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement."

The principles of *non-discrimination* and *equality of opportunity* enshrined in CRPD, Article 3(b) and (e), and the right to equality and non-discrimination guaranteed in Article 5 are important because multiple and intersectional discrimination is a real risk in displacement situations.[34] Displaced persons might not only be discriminated against on the basis of their disability, intersecting with other relevant grounds such as gender, age, ethnicity, or religion,[35] but also experience adverse distinctions due to the fact that they are displaced – a form of discrimination explicitly prohibited by the Guiding Principles on Internal Displacement.[36] The CRPD not only "seeks to combat direct discrimination by treating persons in a similar situation similarly" which helps "to combat negative stereotyping and prejudices" but, as highlighted by the Committee on the Rights of Persons with Disabilities, promotes substantive equality and thus "seeks to address structural and indirect discrimination," including by addressing power relations.[37] This model of "inclusive equality" recognizes and "reaffirm[s] the social nature of people as members of social groups and the full recognition of humanity through inclusion in society" and "make[s] space for difference as a matter of human dignity."[38] This is particularly important for persons with disabilities as being displaced too often means a life on the margins of society.

The principle of full and effective *participation and inclusion* in society and the equal rights of all persons with disabilities to live in the community with choices equal to others as enshrined in CRPD, Articles 3(c), and the right to participate in the conduct of public affairs guaranteed by Article 29(c) build on this understanding of equality and non-discrimination. It gives persons with disabilities voice and visibility and works against their segregation from other displaced persons and the communities hosting them. As the Special Rapporteur put it, "ensuring participation in all decision-making processes helps overcome protection, accessibility and communication barriers, and reduces discriminatory and exclusion impacts. Participation ensures good governance and social accountability and helps reduce stigma."[39]

The principle of *accessibility* and the rights to access information, education and health services, the labor market, and adequate food, clothing, and housing[40] are essential in all phases of the displacement cycle. Thus, the Committee on the Rights of Persons with Disabilities emphasizes that in situations of disaster, "the emergency services must be accessible to persons with disabilities, or their lives cannot be saved or their well-being protected"; furthermore, "[a]ccessibility must be incorporated as

a priority in post-disaster reconstruction efforts," and "disaster risk reduction must be accessible and disability-inclusive."[41]

Finally, the principle of *reasonable accommodation* calls for modifications and adjustments of measures to prevent displacement, provide assistance and protection during displacement, and achieve durable solutions ending displacement to the extent that they are necessary "to ensure that persons with disabilities" can enjoy their human rights "on an equal basis with others" and do not impose "a disproportionate or undue burden" on the duty bearers (CRPD, Article 2). While, depending on the circumstances, space for accommodations might be limited in the immediate emergency phase of a sudden-onset disaster, adjustments are certainly possible when preventive measures are implemented, displacement becomes protracted, or efforts to find durable solutions are under way.

Conceptualizing Displacement in the Context of Disasters and Climate Change

A deeper understanding of what disasters are and when displacement occurs in such contexts is essential to comprehend how the human rights of persons with disabilities can contribute to preventing their displacement, addressing their protection and assistance needs during displacement, and finding solutions ending their displacement.

The UN defines disasters as situations where the interaction of a hazardous event "with conditions of exposure, vulnerability and capacity" causes losses and negative impacts that lead to a "serious disruption of the functioning of a community or a society."[42] Disasters, thus, are not "natural" but occur when people are exposed to a natural hazard and lack the capacity or are otherwise too vulnerable to cope with its impacts. This definition covers sudden-onset events as well as slow-onset processes such as drought, desertification, or sea level rise, provided they overwhelm the coping capacities of affected societies and communities. It also implies that the prevalent dichotomy of sudden- and slow-onset disasters is problematic. In fact, it is often the interaction between the two that disrupts the functioning of a community or society. Low-lying atoll islands become uninhabitable where sea level rise not only causes coastal erosion but also contributes to stronger and higher storm tides causing the salinization of ground water and previously fertile soil.[43] Biological hazards triggering epidemics and pandemics such as COVID-19 can, as explicitly recognized by the Sendai Framework for Disaster Risk Reduction (hereafter Sendai Framework),[44] also trigger disasters when societies are unable to manage the medical as well as the social and economic impacts of pathogens.

---

[41] Committee on the Rights of Persons with Disabilities (2014), para. 36

[42] UNDRR, Definitions

[43] International Law Association (2016), p. 21

[44] Sendai Framework (2015), para. 15

Building on the UN's notion of disaster, the Nansen Initiative Protection Agenda, the outcome of a state-led process of consultations endorsed in 2015 by 109 States, understands disaster displacement as "situations where people are forced to leave their homes or places of habitual residence as a result of a disaster or in order to avoid the impact of an immediate and foreseeable natural hazard" and highlights that "[s]uch displacement results from the fact that affected persons are (i) exposed to (ii) a natural hazard in a situation where (iii) they are too vulnerable and lack the resilience to withstand the impacts of that hazard."[45]

The element of vulnerability highlights the multi-causality of displacement. People exposed to hazards and environmental degradation may lack resilience for a multitude of socioeconomic and political reasons, including poverty, social and economic marginalization, poor urban planning, expansion of settlements into risk-prone areas, population growth, weak governance regarding disaster risk reduction and management, and violence or armed conflict. As compared to the impacts of the natural hazard itself, these human factors contribute as much as, and sometimes even more, to whether affected people will be able to stay or forced to move. An illustrative example is the case of the Somali pastoralists displaced internally as well as to neighboring countries in 2011/2012 when drought-induced food insecurity turned into famine due to human factors such as weak clan protection, the lack of food assistance reaching them, and the ongoing armed conflict.[46]

Understanding disaster- and climate change-related displacement as a consequence of the interaction of hazards with exposure and vulnerability offers the advantage of providing three entry points for action addressing displacement risks. First, hazards linked to climate change can be mitigated by reducing the emission of greenhouse gases and enhancing sinks and reservoirs for them, in particular forests, in accordance with the goal of the 2015 Paris Agreement to keep global warming well below 2 °C above pre-industrial levels.[47] Second, reducing vulnerability and strengthening resilience through measures related to disaster risk reduction and climate change adaptation, and more generally development in line with the Sustainable Development Goals,[48] can significantly help people to stay. Finally, exposure to hazards can be reduced by helping people to move out of harm's way before disasters strike with measures such as anticipatory evacuation, planned relocation, and provision of pathways for safe, orderly, and regular migration.[49] However, as such measures will often not be sufficient to prevent displacement, protecting and assisting persons displaced within their country or across borders and helping them finding durable solutions ending their displacement remain highly relevant in most disaster contexts.

Protecting Persons with Disabilities Throughout the Displacement Cycle

Helping Persons with Disabilities to Stay

Efforts aimed at preventing displacement have clear human rights implications. In the Budayeva case, the European Court of Human Rights found a violation of the right to life when people were killed during a particularly strong mudslide because authorities had, among others, failed to repair a mud retention dam and collector protecting the town of Tyrnauz from such seasonal hazards.[50] According to the Court, competent authorities have a positive obligation to implement disaster risk reduction measures in hazardous areas where residents are exposed to potentially mortal risks.[51] More generally, the Sendai Framework calls on States to develop national and local disaster risk reduction strategies and to substantially increase their number by 2020.[52] Integrating displacement risks in such strategies by identifying high-risk areas and their populations, including groups likely to face higher levels of risks such as poor people living in informal settlements, and developing targeted programs to build their resilience[53] are important measures that help people stay in case of a disaster. The Sendai Framework highlights the importance of "comprehensive public and community consultations" during the development of such strategies.[54] However, according to a UN survey conducted in 2013, persons with disabilities are rarely included in such consultations and unable to participate in community-based disaster management and risk reduction processes.[55] Without participation and inclusion[56] as required by CRPD, Articles 3(c) and 29(b), relevant barriers and specific accommodations needed to overcome them may not be identified and thus remain unaddressed. The Committee on the Rights of Persons with Disabilities has repeatedly called on States to adopt and enact disability-inclusive disaster risk reduction strategies[57] and criticized the "lack of policies regarding consultation of organizations of persons with disabilities in planning, implementing, monitoring, and evaluating disaster risk reduction strategies."[58]

Similar considerations apply to efforts to adapt to climate change,[59] including the development of national and local climate change adaptation plans under the

UNFCCC. In 2018, the Conference of Parties supported a recommendation to "integrate climate change related human mobility challenges and opportunities into national planning processes"[60] and encouraged States Parties "to apply a participatory approach to adaptation planning and implementation" by seeking "stakeholder input, including from persons with disabilities . . .."[61]

Helping Persons with Disabilities to Move out of Harm's Way

Helping people to move out of harm's way before disasters strike is not only an effective way to protect people but may also be required by international human rights law.[62] Such measures include anticipatory evacuation followed by return shortly after the hazard, planned relocation of whole communities, and the facilitation of internal or cross-border migration.

Evacuations,[63] understood as "the rapid movement of persons away from the immediate threat or impact of a disaster to a place of shelter, in order to ensure their security, safety, and well-being,"[64] can be voluntary or, where unavoidable or ordered by authorities, forced. Orders to evacuate may be required by the human rights duty to protect life if despite a life-threatening risk people do not voluntarily evacuate,[65] but such orders must be provided for by law and necessary to protect the life and health of affected persons because less intrusive measures would be insufficient.[66] In both cases, competent authorities have the duty to "provide support to those unable to evacuate themselves."[67] Thus, evacuation plans must, for instance, provide for warning systems designed to reach people with visual and hearing impairments as well as address the timely and safe evacuation of people with limited mobility.[68]

Planned relocation of whole communities, villages, or even towns and cities is a measure of last resort where sea level rise renders coastal areas or low-lying atoll islands uninhabitable. Relocating people may also become unavoidable where, as in the case of landslides or volcano eruptions, areas of return have become permanently uninhabitable or too dangerous for human habitation. Finally, planned relocation is often undertaken as a measure of disaster risk reduction. Most relocations take place within countries. Fiji, for instance, is already undertaking relocations of villages away from eroding coastlines and adopted specific Guidelines on climate

change-related relocation in 2019.[69] A recent desk study identified over 300 cases of disaster- and climate change-related relocations.[70] Planned relocations to other countries are even more challenging. While no contemporary examples exist, they occurred in the past, for instance, during colonial times in the South Pacific,[71] and could become a reality in the future for citizens of low-lying Small Island Developing States (SIDS).

Planned relocations[72] are problematic in human rights terms,[73] particularly where they affect communities with special cultural, religious, or economic attachments to their lands or where the new sites are not suitable and relocated people end up in poverty and marginalization.[74] The International Law Association's Sydney Declaration of Principles on the Protection of Persons Displaced in the Context of Sea Level Rise (hereafter Sydney Declaration) therefore highlights the need for the full, free, and informed consent of affected persons and communities and clarifies that where such consent cannot be obtained, relocation is only permissible "as a measure of last resort to safeguard the lives and safety of those affected," provided it is based on national law and carried out "in accordance with relevant international legal standards." Furthermore, "[p]ersons affected by a planned relocation, including those who receive relocated persons, must be informed, consulted, allowed, and enabled to participate in all relevant decision-making processes."[75] These principles fully apply to persons with disabilities as they must have access to relevant information, be consulted, and allowed to participate as a matter of law (CRPD, Article 3, 21, and 29). Furthermore, and depending on the circumstances, full respect for CRPD, Articles 3(f) and 9, may provide unique opportunities to plan relocation sites in ways that do not replicate physical barriers which existed at the original site and enhance overall accessibility.

Internal or cross-border migration is an important coping mechanism for people who anticipate adverse impacts of climate change and decide to move when they still have some choice when and where to go. The liberty of movement, including the right of persons with disabilities to exercise it "on an equal basis with others" (CRPD, Article 18), is relevant for internal migration. While this provision also entitles them to leave their own country, a concomitant general right to be admitted to another State does not exist. However, as shown below (section "Protecting Displaced Persons with Disabilities"), affected persons may be entitled under bilateral or regional agreement on the free movement of persons. Beyond this, much can be done by States. Important steps recommended by the Sydney Declaration include recognizing "temporary, circular, or permanent migration across borders" as an

important way "to adapt to climate change," reviewing existing laws and agreements and considering "consider[ing] new laws and agreements, to facilitate migration as an adaptation measure."[76] Where this is done, such instruments and laws must cover persons with disabilities in accordance with the principles of inclusion, equality of opportunity, and accessibility (CRPD, Article 3).

Protecting Displaced Persons with Disabilities

Measures to mitigate displacement risks are not always sufficient to avoid displacement. Those who seek refuge *within their own country* become internally displaced persons (IDPs), that is, "persons or groups of persons who have been forced or obliged to flee or to leave their homes or places of habitual residence, in particular as a result of or in order to avoid the effects of [. . .] natural or human-made disasters," provided they "have not crossed an internationally recognized state border."[77] As IDPs, they are entitled to protection and assistance in accordance with the 1998 UN Guiding Principles on Internal Displacement, a soft law instrument based on and reflecting binding international law. Although legally non-binding, they are universally recognized as "important international framework for the protection of internally displaced persons"[78] and have been incorporated in a series of domestic laws and policies.[79] The Guiding Principles mention disability as a prohibited ground for discrimination (Principle 4) and state unequivocally that IDPs "with disabilities shall receive to the fullest extent practicable and with the least possible delay, the medical care and attention they require," as well as "access to psychological and social services" (Principle 19). Overall, they provide detailed guidance for the interpretation and application of CRPD, Article 11, on the obligation of States to take "all necessary measures to ensure the protection and safety of persons with disabilities."[80] This is important as such persons, while in displacement, often face particular barriers in accessing adequate shelter and housing, health, and educational services.[81] The COVID-19 pandemic has triggered additional risks and barriers for such persons living in IDP camps and settlements.[82]

For people *displaced across borders*, the key challenge is admission to the country of refuge and protection from forcible return.[83] Although often called

"climate refugees," they can only be considered refugees in the sense of the 1951 Convention relating to the Status of Refugees in a relatively small number of cases. However, the Convention provides protection if people are fleeing some form of persecution,[84] for instance, if activists are sanctioned for criticizing the authorities for their mismanagement of disaster relief efforts; if they are excluded from humanitarian assistance because they belong to a religious or ethnic minority; or if they are members of communities targeted by armed actors in situations where disasters and armed conflicts interact.[85] In practical terms, however, regional and domestic migration law is often more relevant than refugee law. In Africa, for instance, some sub-regional agreements on the free movement of persons make it possible for victims of drought or flooding to move across borders and find admission and economic opportunities in neighboring countries.[86] A recently adopted Protocol by the Intergovernmental Authority on Development (IGAD) contains a provision explicitly covering persons affected by disasters in the Horn of Africa.[87] In Central and South America, many countries use domestic provisions on humanitarian visa and temporary protection to admit disaster-displaced persons and have started harmonizing their migration laws.[88] At the global level, the 2018 Global Compact on Migration suggests to States to temporarily admit persons displaced by sudden-onset disasters "while adaptation in or return to their country of origin is not possible" and consider permanent relocation and immigration visa in cases where such adaptation or return remains impossible due to permanent effects of slow-onset events such as sea level rise or desertification.[89] The principle of inclusion (CRPD, Article 3) requires that displaced persons with disabilities are not excluded from such possibilities to be admitted to countries of refuge.

The weakness of existing practices and tools is their discretionary nature and the lack of predictability. However, emerging jurisprudence explores the potential of human rights instruments to provide stronger protection.[90] In the case of a citizen of Kiribati who claimed that return to his country of origin would violate his right to life, the UN Human Rights Committee, the expert body monitoring the implementation of ICCPR, decided "that without robust national and international efforts, the effects of climate change in receiving states may expose individuals to a violation of their rights" to life and the prohibition of inhuman treatment and in such cases trigger the non-refoulement obligations of the State deporting an individual to a country

seriously affected by climate change.[91] The European Court of Human Rights recognizes that deporting a vulnerable individual to a country where he or she would be exposed to serious suffering due to a lack of access to humanitarian assistance or medical treatment may amount to inhuman treatment.[92] While these judgements do not deal with disasters, their findings can be made fruitful for such situations, too.

Finding Durable Solutions

Ending displacement is often equated with return of people to their former homes or settlement in a new location. This understanding is too narrow as shattered lives cannot be rebuilt by simply moving to a specific location. In reality, ending displacement requires, inter alia, the reestablishment of physical safety; the restoration of housing; access to services and livelihoods; the restitution of property left behind; as well as the replacement of lost or destroyed personal documentation.[93] This is an often long and complex process which may be even more difficult for persons with disabilities. While, as the Special Rapporteur put it, they have the same rights as everyone "to make an informed and voluntary choice on what durable solution to pursue, they may not have access to information about the options and risks. Their right to participate in the planning and management of durable solutions may also be challenged by barriers to participation . . . Moreover, displaced persons with disabilities often have limited access to the resources they need to reach solutions . . ...."[94]

This highlights the need to systematically include persons with disabilities in programs and projects on durable solutions to avoid replicating and rebuilding barriers.[95] Efforts to achieve durable solutions provide unique opportunities to "build back better" not only in general but also for persons with disabilities, in particular by enhancing their access to an independent life and participation in all aspects of life (CRPD, Articles 9 and 19). Such mainstreaming is rarely done in national strategies on solutions beyond mentioning persons with disabilities as one of the several categories of people with specific needs and vulnerabilities. A noteworthy exception is Sri Lanka's durable solutions strategy which highlights the obligation to pay "specific attention . . . to provide the needed structural modifications, assistive/mobility devices, specialised care and/or training or personnel, and other measures to ensure that persons with disabilities are able to access assistance and fully enjoy their rights."[96]

Conclusion

Persons with disabilities are often particularly affected by disasters and adverse effects of climate change, and such events often exacerbate their pre-existing marginalization and vulnerabilities. They often lack voice, are rarely consulted, and cannot participate in decisions and activities aimed at mitigating displacement risks. During displacement, their "concerns or suggestions. . . appear rarely to reach humanitarian actors and coordination mechanisms or are disregarded"[97] and therefore remain unaddressed. Efforts supporting the displaced to achieve durable solutions may miss the chance to remove barriers and enhance the inclusion of persons with disabilities.

Rather than intentional, such neglect is often a consequence of weak or lacking mandates and responsibilities of authorities and international actors. Systematically promoting and mainstreaming disability-inclusive and rights-based approaches[98] to disaster risk management and climate action would help to remedy this situation. To achieve this, domestic courts and national human rights institutions, including national monitoring mechanisms in accordance with CRPD, Article 33, as well as UN treaty bodies and regional human rights courts and mechanisms will have to play a more active role. After all, human rights demand that persons with disabilities at risk of or being displaced in the context of disasters and adverse effects of climate change are explicitly recognized as rights holders who can and should call and hold duty-bearers to account.

The Flow of a Treaty Practice: Article 11 of the Convention on the Rights of Persons with Disabilities and Disasters

85

Janet E. Lord

Contents

Abstract

This chapter addresses the philosophical and practical implications of the treaty practice generated by Article 11 of the Convention on the Rights of Persons with Disabilities (CRPD) and its creative potential for disability rights protection, specifically in the context of natural disaster. It focuses on the activation of Article 11 of the CRPD through international and domestic legal commitments and institutional reforms and argues that a creative treaty practice is exerting

Introduction

Disaster and Disability: The Context

Poverty disproportionately affects the population of approximately 1 billion persons with disabilities according to the *World Report on Disability* (World Health Organization & World Bank, 2011). Further, the latest data shows that the population of persons with disabilities is expected to double to 2 billion by 2050 (World Health Organization, Sensory Functions, n.d.). Persons with disabilities who live in a disaster-prone environment are more likely than not exposed to an elevated risk of harm for several reasons. First, risk for persons with disabilities is elevated on account of the intersectional relationship between disability and poverty, as the vast majority of persons with disabilities live in poverty (World Bank Group & Global Facility for Disaster Reduction and Recovery, 2020). Second, when disasters occur, persons with disabilities often face severe risks that threatens their immediate and long-term well-being (Office of the High Commissioner for Human Rights, 2015; Office of the High Commissioner for Human Rights, 2020). As noted by the report of the Office of the High Commissioner for Human Rights,

> persons with disabilities are often among those most adversely affected in an emergency, sustaining disproportionately higher rates of morbidity and mortality, and are among those least able to access emergency support. Sudden-onset natural disasters and slow-onset events can seriously affect the access of persons with disabilities to food and nutrition, safe drinking water and sanitation, health-care services and medicines, education and training, adequate housing and access to decent work.

Assessing and responding to risk means also considering intersectionality and the multidimensional discrimination that results from differentiated disability experience and the heterogeneity of disability. Thus, for example, as disasters tend to discriminate along gender and generational lines, women, children with disabilities, and older persons with disabilities may experience heightened risk. This assertion is borne out by research disclosing the disproportionate exposure to risk impacting risk and recovering for women and children during disaster (Vidili, 2018).

The Convention on the Rights of Persons with Disabilities (CRPD) addresses risk to individuals with disabilities in the context of disasters – and other emergencies – and its treaty practice has generated an impressive flow of concepts, commitments, guidance, and action in the domain of disability-inclusive disaster risk reduction and response (Convention on the Rights of Persons with Disabilities, 2006). Responses to the risks posed by disasters to persons with disabilities (and other marginalized groups) are occurring at multiple levels, in multiple forums, and involve a multitude of actors. This complex landscape of disability-inclusive disaster cooperation at the international level includes a wide range of treaty practice. Thus, action taken under the CRPD and other treaty regimes and international bodies, policy guidance and political signals provided by multilateral organizations, and informal cooperation among state and nonstate actors at various levels to advance disability-inclusive disaster action and response should all be considered part of this dynamic treaty practice. Cooperation across the full landscape of human rights treaties, institutions, and actors all play important roles in bolstering, complementing, and implementing Article 11 of the CPRD.

While the foregoing dynamics could perhaps be characterized as yet more evidence of fragmentation of international law, there are other ways to explain such phenomena (Koskenniemi, 2006). This chapter seeks to this chapter to tease out the intersecting flows that exist *across* international law where persons with disabilities are affected. In so doing, international disability rights and disaster law may be characterized as an exemplar of the transversality and coherence of international law. The position taken here is that international disability rights law in disaster as it is emerging functions as a laboratory for the dynamic development of international law more generally.

Part 1 of this chapter introduces the broad context for thinking about disability and introduces the concept of treaty practice used to assess developments in Article 11. Part 2 analyzes the signal contribution of the CRPD to disaster risk reduction and response in human rights law, not only through Article 11 but through a transversal reading of the CRPD in the specific context of disaster risk reduction. Part 3 contextualizes developments arising out of this area of treaty practice with a focus on how both the institutional arrangements of the CRPD have served to elevate Article 11 and disability-inclusive disaster risk reduction. It examines how international cooperation, including the practice of the World Bank, is elevating Article 11 concerns in the design and implementation of disaster risk management projects on the ground. Part 4 considers the implications of the proposal for an international convention on disasters in the light of Article 11 and the chapter concludes by examining the way forward and suggesting additional avenues for a treaty practice advancing disability-inclusive disaster risk management that are not fully realized.

Action, Process, and Flows: Framing a Treaty Practice for Disability-Inclusive Disaster Risk Reduction and Response

A human rights treaty – like any treaty but perhaps particularly so for an international instrument devoted to the protection of human flourishing – ought not to be understood as possessing a fixed, bounded, or closed identity (Wang, 2019). It has no "end" or definitive intention. And yet international lawyers looking at treaties and treaty practice have often struggled to capture the dynamism of treaty practice, too often working within the narrow defensive posture that seeks primarily to prove that a treaty (or other source of international law) is law and less on the complexity of processes by which treaties bring about change.[1] Others have worked more recently to signal the dynamism of treaties, calling attention to how treaties are "living regimes" or "interactional" or "expressive" in how they unfold (Wang, 2019, p. 850). This latter approach begins to capture human rights treaty practice as it unfolds, as it produces flows of concepts, ideas, and rules. These accounts are processual in their focus and thus better positioned to explain and account for the dynamic action that the CRPD, through Article 11 and its intersecting and traversal provisions, has brought about in the area of disability-inclusive disaster risk reduction and response. A further application of this notion is reflected in the work of the French philosopher, Gilles Deleuze, who conceptualizes social and political change in terms of flows; he speaks variously of flows of ideas, from person to person, or organization to organization (Deleuze, 2001). These approaches can help recognize the complexity of treaty practice – well beyond the relations between States inter se – and interrogate the creative, dynamic, and evolutionary flows of practice that result from a conceptualization of treaty practice as encompassing the work a treaty does among a wide range of actors.

The foregoing ideas help work through and make sense of the way a treaty moves ideas, brings about change in law, and impacts legal structures and institutional arrangements (Deleuze & Guttari, 1996; Deleuze, 2001). Under this notion, a treaty is its practice – lawmaking and implementation are no more than the connectivity they bring about – the connections they make, through structures, processes, States, people, and organizations. This is a world of difference, a world that is constantly in motion that cannot be captured through static accounts of treaty ratification, legislative reforms adopted or treaty body pronouncements issued at a particular point in time.

In sum, treaty practice, in its complexity, is best conceptualized as different flows of rights, actors, and institutions forging connections and creating networks in dynamic and sometimes chaotic ways. The flow of human rights treaty ideas seeps out in all directions: It is people, groups, treaties, ideas, principles, processes, institutions, partnerships, letters, lobbying, and other flowing parts. The project here is to apply this concept of treaty practice to the examination of Article 11 of the CRPD and its dynamic unfolding in the context of protection and disaster risk response.

---

[1] The approach, embraced by scholars working to develop a research agenda for International Legal Process, was a response to this tendency and posits a processual account of international public law. See, e.g., O'Connell (1999).

Disaster, Risk, and Article 11

Article 11 and Risk in Protection in Risk Situations

One of the key provisions that sets out to launch a dynamic and flowing treaty practice – one that is to be read and applied transversally across the CPRD text and, more interestingly, across different domains of international law – is Article 11 of the Convention. That provision reads:

> States Parties shall take, in accordance with their obligations under international law, including international humanitarian law and international human rights law, all necessary measures to ensure the protection and safety of persons with disabilities in situations of risk, including situations of armed conflict, humanitarian emergencies and the occurrence of natural disasters (CRPD, 2006).

The text of the CRPD thus recognizes that the rights of persons with disabilities are particularly at risk in situations of emergency – including but not limited to natural disasters. The treaty provides a framework to guide preparedness, response, and recovery efforts in disasters and climate events, as well as conflict situations and other humanitarian emergencies.

The documentation of grossly inadequate attention to the needs of persons with disabilities in disasters led to the adoption of Article 11 during the CRPD negotiations (Office of the High Commissioner on Human Rights, 2015). Its inclusion was by no means assured and indeed the explicit inclusion of disaster risk in Article 11 was a late addition, and not one originally included in initial drafts of the CRPD (Bantekas et al., 2019). The experience of Hurricanes Rita and Katrina, together with the Asian Tsunami, convinced drafters of the need for explicit mention of disaster as a situation of risk for persons with disabilities (Stein & Lord, 2011).

Article 11 adopts a risk reduction approach to protection and it reinforces States' obligations to ensure the protection and safety of persons with disabilities in situations of risk. A transversal reading of the CRPD is anticipated by the terms of Article 11 itself. There, the text acknowledges the protection obligations instantiated in other domains of international law, calling attention in particular to "international humanitarian law and international human rights law" in a non-exhaustive list (CRPD, 2006, art. 11). Brought within the ambit of the CRPD here, then, are those rules of international law that specifically obligate States to accord specific measures of protection to persons with disabilities, for instance, in various provisions of the Geneva Conventions, the Mine Ban, and Cluster Munitions Convention among others (Fourth Geneva Convention, 1949; Convention on the Prohibition of the Use, Stockpiling, Production, and Transfer of Anti-Personnel Mines and on their Destruction, 1999, Art. 6(3); Convention on Cluster Munitions, 2010).

Applying the CRPD Framework to Natural Disaster

Transversality as applied to the CRPD likewise requires reading across the provisions of the CRPD itself, here picking up on the notion that a reading of a human rights treaty is a dynamic and mutually reinforcing exercise. To illustrate, taking Article 3 of the CRPD as an example, its eight general principles help inform the obligation to protect persons with disabilities during situations of risk. Picking up on the general principle in Article 3 of autonomy and independence as well as inclusion means that inclusive approaches to disaster planning must be applied. Conversely, approaches that lead to segregation and separation, as in separate sheltering or evacuation sites for persons with disabilities during a disaster, would not align with the CRPD.

The CRPD Article 4(3), on the participation of persons with disabilities, requires that persons with disabilities benefit from and participate in disaster relief, emergency response, and disaster risk reduction strategies. This means, among other things, ensuring that the voices of persons with disabilities are heard in the overlapping phases of disaster prevention, preparedness, response, and recovery. To assist persons with disabilities through these situations and to ensure their voice is heard, it is critical to have their engagement early and throughout situations of disaster and disaster response as they are a tremendous resource in responding to situations of disaster and play critical roles in informing disaster response interventions that affect them and their communities.

Likewise, amplifying the voice of persons with disabilities means being heard in other CRPD domains, such as adjusting social protection to cushion the impacts of natural disasters (Article 28, Adequate Standard of Living and Social Protection) and on planning for an inclusive labor market and minimizing loss (Article 27, Employment). Article 28 also calls to attention to necessity of ensuring that persons with disabilities have access to food and water, a major problem in the context of emergencies for persons with disabilities and groups at risk. Article 29 (Participation in Political and Public Life) builds on participation and inclusion gives persons with disabilities voice and visibility and serves to undercut the prevailing paradigm of segregation and exclusion, including in disaster contexts.

The CRPD recognizes that situations of risk, including natural disasters, require specific measures that take into account the specific requirements of individuals with disabilities. This is anticipated, for instance, in the concept of reasonable accommodation (Articles 5 & 2) which requires individualized modifications and adjustments – in respect of preventive measures, disaster response including during displacement, and in efforts to develop durable solutions. Reasonable accommodation and other supports measures are applicable, therefore, across the domains of forced migration, mobility, access to basic services like food and water, health, education, and employment opportunities.

While reasonable accommodation addresses specific, individualized measures that an induvial with a disability may require, the CRPD principle of accessibility addresses the collective – and strongly urges anticipatory measures to facilitate access, whether to CRPD rights of access to information, education, and health services, the labor market, and adequate food, clothing, and housing, all of which are essential in relation to disasters and their impacts, to persons with disabilities (Convention on the Rights of Persons with Disabilities, 2006, art. 3(f), 9, 21, 24, 25, 27, and 28). Article 9 (Accessibility) requires States Parties to ensure that people can access, on an equal basis with others, the physical environment, transportation services, information and communications technologies and systems, and all public facilities and services which include emergency services and facilities. Article 9 makes explicit the link to emergency services in specifically mandating measures to make "information, communications and other services, including. . .emergency services accessible." The CRPD Committee has underscored this point emphasizing that in situations of disaster "the emergency services must be accessible to persons with disabilities, or their lives cannot be saved or their well-being protected"; furthermore, "[a]ccessibility must be incorporated as a priority in post-disaster reconstruction efforts," and "disaster risk reduction must be accessible and disability-inclusive" (Committee on the Rights of Persons with Disabilities, 2014, p. 36).

Provisions in the CRPD likewise give recognition to the fact that the adverse impacts of risk situations on individuals with multiple vulnerability factors, including women and girls with disabilities (Articles 6 & 7), necessitate the participation of persons with disabilities in disaster response planning for emergency situations and evacuations, as well as humanitarian emergency response and health care services.

Especially important in addressing the risks that disasters pose to persons with disabilities are those provisions in the CRPD that are designed to dismantle systems of segregation and reflected in Article 3's principles of inclusion, autonomy, and independence. Disaster situations pose a serious problem for the CRPD goal of inclusion. First, persons with disabilities who are in segregated and congregate living arrangements such as nursing homes and orphanages are seriously at risk when disaster strikes absent careful planning for evacuation and other supports. Second, recovery and rebuilding in the wake of a disaster while offering new paths can nonetheless reinforce segregation when noncommunity-based options are rebuilt, renovated, or even built anew. In this respect, disability-inclusive disaster responses must be carried out in line with CRPD principles of inclusion and independence (Article 3) and in relation to Article 19 of the CRPD which obligates States to advance living independently and in the community and to respect the right to persons with disabilities to decide where and with whom they live. The risk is that when disasters strike and donors arrive, there is a serious danger of replicating segregated responses in the aftermath of disaster, if not by publicly funded initiatives, then by privately funded ones that are prevalent in disaster recovery zones.

Finally, in line with Article 31 (Disability Data and Statistics) of the CRPD, an essential aspect of disability-inclusive protection is ensuring the collection of baseline data on barriers and accessibility measures to understand and assess disability inclusion in recovery and reconstruction. Also required are measures to ensure that post-disaster assessments are inclusive of persons with disabilities and their needs. New policies on disability in this context should align with the CRPD's standards on data collection to guide disability-inclusive recovery and reconstruction.

The foregoing suggests a transversal reading of the CRPD to animate full the promise of Article 11 on protecting persons with disabilities throughout the disaster risk management cycle. And, of course, accessible disaster risk management benefits a wide range of groups, whether accessible mass transit enabling evacuation or the creation of accessible early warning systems that warn people in multiple information formats of impending danger. What follows is an analysis of some of the treaty practice emerging from Article 11 as it relates to disability-inclusive disaster risk reduction.

Article 11 Treaty Practice as Flows of Policy Commitments and Operational Guidance

A Dynamic Notion of Article 11 Treaty Practice

Article 11 and the accompanying provisions in the CRPD framework is supporting a diverse treaty practice specifically around the protection of persons with disabilities, broadly defined as “situations of risk” in international policy commitments and frameworks. Notably, while Article 11 addresses situations of risk writ large, it is in the context of disaster risk management that Article 11 implementation is best developed. Treaty practice is less developed in the context of armed conflict or other humanitarian emergencies. Policy commitments regarding disaster planning at the international level have been accompanied by the promulgation of specific guidance and institutional commitments. The discussion below, though not exhaustive, provides an indication of the far-reaching flows of treaty practice centered on Article 11 implementation in the disaster context. It does so by applying the concept of treaty practice attuned to dynamic, flowing, interactional manifestations of change through treaty law processes (Lord et al., 2022).

The 2030 Agenda for Sustainable Development highlights the need to protect and assist persons in vulnerable situations during disasters and persons with disabilities are counted among those who face acute risk during disasters (Sustainable Development Goals, 2015). The cross-cutting nature of disaster risk reduction is mainstreamed in the SDGs, notably in the context of ending poverty through building resilience of people living in poverty and vulnerable situations for climate-related extreme events (SDG 1.5), making human settlements sustainable and inclusive through the protection of people in vulnerable situations from disasters (SDG 11.5), and combating climate change through enhancing capacities for effective climate change–related planning and management with a focus on marginalized communities (SDG 13.b). These elements of the SDGs, together with the overall disability-inclusive nature of the SDGs, including its targets and indicators, make for a disaster-inclusive and disability-inclusive SDG framework. Similarly, the New Urban Agenda (UN, 2016a, b) underscores the importance of resilient urban development that is responsive to the needs of persons with disabilities in infrastructure design and service delivery, with the emphasis on resilience indicative of both disaster and climate adaptation needs.

One of the primary international policy commitments specifically addressing disaster risk is the Sendai Framework for Disaster Risk Reduction 2015–2030 (Sendai Framework). The Sendai Framework, adopted at the Third UN World Conference on Disasters Risk Reduction, is a 15-year international blueprint for saving lives and reducing the economic impact of natural and man-made hazards. A key distinction from prior instruments of its kind is its emphasis on the need for a paradigm shift from managing disasters to managing *risk* and to addressing the underlying causes and drivers of disasters. It adopts a rights-based sustainable agenda and calls for accessibility and the inclusion of persons with disabilities in disaster risk reduction policies, all stages of disaster risk reduction planning, and data disaggregation by disability. It thus reinforces the commitments set out in the CRPD in underscoring the concept that the participation of persons with disabilities is essential in effectively managing disaster risk and designing, as well as resourcing and implementing disability-responsive disaster risk reduction policies, plans, and programs.

Disability-inclusive approaches to disaster response and recovery are reflected in other frameworks wherein disaster is specifically addressed along with other risks. For example, the Commitments to Action made at the World Humanitarian Summit held in Istanbul in 2016 include commitments to meet the needs of persons with disabilities in crisis-response operations and service delivery, to develop partnerships with disability-focused organizations, and to collect disability-disaggregated data (UN, 2016a, b). More than 150 UN Member States and UN agencies, humanitarian organizations, and civil society organizations have endorsed the Charter on Inclusion of Persons with Disabilities in Humanitarian Action.

Even more interesting and to some extent surprising is the increased attention given to disability inclusion in combating climate change within the context of international environmental law practice. The Paris Agreement (2015) of the United Nations Framework Convention on Climate Change acknowledges that States Parties should respect, promote, and consider their respective obligations on human rights, including the rights of persons with disabilities, when taking actions to address climate change (Conference of the Parties, 2015). Specifically, the preamble to the Paris Agreement notes that:

> Parties should, when taking action to address climate change, respect, promote and consider their respective obligations on human rights, the right to health, the rights of indigenous peoples, local communities, migrants, children, persons with disabilities and people in vulnerable situations and the right to development, as well as gender equality, empowerment of women and intergenerational equity (Conference of the Parties, 2015, Preamble).

Disability inclusion in disaster is also increasingly reflected in sector-specific policies and frameworks. Thus, disability-inclusive ideas are beginning to be reflected in the education sector, where disaster risk reduction focuses on school safety. It is recognized that schools – where children spend so much of their time – must be addressed in all disaster risk reduction and consistent with the UNESCO global comprehensive school safety framework (Ronoh et al., 2017). Crucially, the framework anchors key disability-inclusive disaster risk reduction principles.

Disability-Inclusive Disaster Risk Reduction Guidance

Guidance in the area of disaster risk reduction is fast emerging across UN agencies and bears the imprint of CRPD principles and disability-inclusive approaches. Guidance promulgated by actors in disaster response from the donor side (World Bank, UN) and from the implementer side of the equation (NGOs, OPDs) explicitly link core concepts in guidance documents to the CRPD. Several examples serve to demonstrate these connections.

First, among guidance documents are the voluminous guidelines adopted in an multistakeholder process, the Inter-Agency Standing Committee's *Guidelines on the Inclusion of Persons with Disabilities in Humanitarian Action* (IASC, 2019). While applicable beyond disasters, they reflect the starting point for addressing disability inclusion from a humanitarian action perspective. They explicitly embrace the CRPD as the touchstone of the guidance and also connect conceptual approaches to disability reflected in the CRPD to the operations of humanitarian assistance, including risks arising from natural disasters, climate change, and other emergencies. Of note, they adopt a twin-track approach to disability inclusion meaning disability-inclusive approaches are mainstreamed into all interventions and, in addition, targeted interventions are provided where needed. Illustratively, an effective food security intervention would consider how people with disabilities, women, older persons, and other groups can access its services, to ensure they are not further excluded. A targeted intervention may also be appropriate in some contexts, for example, a food security program that focuses on enhancing the resilience of households that include people with disabilities.

The United Nations Office for Disaster Risk Reduction (UNISDR) promulgated the World Health Organizations *Guidance Note on Disability and Emergency Risk Management for Health* in 2013 (World Health Organization, 2013).[2] The Note provides an overview of the impact of emergencies on people with disabilities and then sets out principles that should underpin practical action related to emergencies. Second, it outlines minimum actions required across sectors/clusters and defines specific disability-related actions that can be undertaken by health actors working in different areas of health care provision (e.g., injury prevention and trauma care, mental health and psychosocial support, and child health) to ensure inclusion of disability. This guidance is specifically informed by the principles and concepts set forth in the CRPD.

---

[2] Other disability-inclusive resources include: GFDRR (2020) Disability-Inclusive Disaster Risk Recovery Guidance Note; GFDRR (2018) Five Actions for Disability-Inclusive Disaster Risk Management; GFDRR (2018) Disability Inclusion in Disaster Risk Management: Promising Practices and Opportunities for Enhanced Engagement.

Other guidance adopted includes the *Disability Inclusion Guidelines* published in 2017 by the United Nations Relief and Works Agency for Palestine Refugees in the Near East, UNICEF's series entitled, *Including Children with Disabilities in Humanitarian Action* and the IASC *Guidelines on Mental Health and Psychosocial Support in Emergency Settings* (United Nations Children's Fund, 2018; Inter-Agency Standing Committee Working Group, 2007).

Article 11 and Disability-Inclusive Humanitarian Action and Disaster Risk Reduction

The foregoing evidence shows flows of policy commitments reflecting a dynamic treaty practice inspiring change and movement for which there is a direct connection to Article 11 and its mandate for disaster risk reduction. Attention to the protection of persons with disabilities has also made its way into the policies of some of the largest donor organizations and many of these directly invoke the CRPD and Article 11 as the basis for policy articulation. Thus, one of the ten commitments arising from the first Global Disability Summit (2018) was the commitment regarding universal access features in post-disaster reconstruction (International Disability Summit, 2018).

More difficult, of course, is the assessment of whether and how such policy commitments are actually reflected on the ground, in the operational practice of disability-inclusive disaster risk management. Put another way, to what extent are these commitments reflected across the multitude of actors engaged in the practice of disaster risk management so much of which is not always connected to human rights treaty practices too often measured simplistically as numbers of ratifications or legislative enactments echoing a human rights commitment.

An assessment of World Bank projects funded to assist in the area of disaster risk management (DRM) provides some insights as to where Article 11 is starting to generate movement in disability-inclusive disaster risk reduction and response. In the World Bank's Empowering Elders, Women, and People with Disabilities for Resilience technical assistance program, support was provided to local communities in the Philippines and Nepal to build knowledge and capacity on inclusive preparedness and recovery efforts which include the participation of persons with disabilities (Disaster Risk Management Hub, Tokyo: Knowledge Program, 2016).[3] Co-knowledge production is an essential element of the approach, achieved through knowledge exchange with Japanese experts to replicate the "Ibasho café" approach. Ibasho cafés are run by community elders and offer an enabling space to build the resilience and agency of marginalized groups within the community.

Another World Bank–supported project, the Capacity Building on Social Inclusion (P160328) technical assistance program, works to strengthen the capacity of the Global Facility for Disaster Reduction and Recovery (GFDRR) staff, partners, and

---

[3] World Bank, Empowering Elders, Women, and People with Disabilities for Resilience (P159506).

governments to identify, analyze, and incorporate social inclusion and citizen engagement into DRM projects. One of its first accomplishments report on disability inclusion in DRM capturing promising practices was published (World Bank Group & GFDRR, 2018).

This was followed by a GFDRR effort, in partnership with the Social Sustainability and Inclusion Global Practice, to provide action-oriented directions to government officials and decision-makers responsible for post-disaster recovery and reconstruction. The project resulted in the *Disability-Inclusive Disaster Risk Recovery Guidance Note* (World Bank Group & Global Facility for Disaster Reduction and Recovery, 2020).

While disability inclusion at design stage is the gold standard for disability inclusion in international cooperation programming, it is the reality that programs already underway may require and can often accommodate retrofitting where their design lacks a disability-inclusive framing. The World Bank's Lao PDR Southeast Asia Disaster Risk Management Project (P160930) did not have a disability focus in the parent project but has introduced and applied universal accessibility through additional financing (Southeast Asia Disaster Risk Management Project for Laos, 2017). Other projects have built on gender and social inclusion efforts in the parent project and expanded its scope to disability inclusion at additional financing or restructuring. This work is intended to inspire better policymaking and operational practice in operations to support disability-inclusive disaster risk reduction (World Bank Group and GFDRR, 2018).

United Nations Development Program (UNDP), critiqued for its lack of disability inclusion across its global portfolio, is starting to make some inroads in the disaster risk management space (Independent Evaluation Office, 2016). Following the adoption by the management of the recommendations set out in the Independent Evaluation Office's report on disability inclusion, policy that drives internal organizational policies and expert programming is emerging (UNDP IEO, 2016). For example, through UNDP's Digital Transformation for Resilience project, UNDP has conducted vulnerability mapping and analysis in the Philippines and Sri Lanka, engaging with organizations of persons with disabilities along with other segments of civil society and community members. In Indonesia, UNDP and Indonesia's national disaster management agency are collaborating to make the national digital geospatial platform, InaRISK, accessible for at-risk communities, inclusive of persons with disabilities to facilitate safe evacuation during a disaster (UNDP, 2021).

Some other evidence of traction under international cooperation programming is seen in the collected emerging practices of implementing partners of donor organizations. These too provide some evidence that disability-inclusive disaster risk reduction is taking hold, not only as a matter of domestic and international policy, but in terms of actual work on the ground. More evidence is needed to assess the impact of this work in detail. The OSCE, not particularly noted for its work on disability rights, is beginning to work toward disability inclusion. In 2021, it launched a project to develop online learning modules along its pillars of work. As part of the OSCE pillar on humanitarian action, it included in the online learning modules a module on disability inclusion in humanitarian action. The OSCE has been slow on the uptake of CRPD-inspired action, but the beginnings of work in the space provide some indication of possible reform.

NGOs practices in disaster-affected countries are likewise seeding disability-inclusive approaches in disaster risk contexts. Several are worthy of mention. In Bangladesh, the nongovernmental organization (NGO) CBM, the Center for Disability in Development, and Gana Unnayan Kendra assisted communities in setting up local disaster committees that included persons with disabilities as full members (Disability-Inclusive DRR Network for Asia and Pacific and CBM, n.d.). This led to the development of accessible warning mechanisms, accessible sheltering areas, and disability-inclusive evacuation drills.

In Myanmar, Malteser International conducted participatory hazard vulnerability and capacity assessments that led to the community designing plans that targeted older people, pregnant women, people with disabilities, and children (Marr et al., 2017). The project provided evidence that engagement with the diversity of the community worked to combat stigma, with community members sharing a shift in understanding about disability and thus demonstrating the critical importance of the inclusion, participation, and leadership of people with disabilities for enhancing resilience.

Schools are an important dimension of disaster preparedness work and some examples of school-focused disability-inclusive approaches are beginning to emerge. For example, in a project supported by German international cooperation, the NGO Arbeiter-Samariter-Bund Deutschland trained village-level cadres and organizations of persons with disabilities in Yogyakarta to improve disaster resilience among children with disabilities (World Bank, 2018). The cadres trained 929 out-of-school children with disabilities, 3716 family members, and 3716 neighbors of children with disabilities through safe room settings and drills. The training ensured that children with disabilities who often do not attend school are still able to access emergency preparedness training that is usually given at school.

Beyond these examples, Article 11 is working for change in sector-specific domains where disability inclusion is seriously needed. Thus, for example, the Global Shelter Cluster (GSC) Working Group on Inclusion of Persons with Disabilities, established to support a more systematic approach to disability inclusion in humanitarian shelter across the humanitarian action sector, is working on better disability inclusion in disaster response. To that end, in 2019, the GSC conducted a baseline mapping report, *Disability Inclusion in Shelter and Settlements Programming*, resulting in entry points to better advance inclusive humanitarian shelter, including: (1) ensure that vulnerability assessments identity differentiated needs of women, men, girls, and boys with disabilities; (2) develop more specific guidance and tools inclusive of infrastructure designs; (3) strengthen law and policy frameworks to institutional universal design and accredited training in government regulations; (4) integrate disability questions and engage with OPDs in shelter evaluations; and (5) adapt standardized nonfood item (NFI) catalogues and infrastructure design in partnership with OPDs to ensure context-appropriate options are available (Global Shelter Cluster Working Group, 2019).

Article 11 and Domestic Flows of Treaty Practice

Increased attention is being paid to disability inclusion at the level of domestic law and policy, an area highlighted with some frequency by the CRPD Committee in its reporting process. The CRPD Committee has called attention to the lack of consideration of the protection of persons with disabilities in risk management. The Committee has often underscored, as it did in its reporting on Bolivia, that States Parties should "take measures in the light of the Sendai Framework for Disaster Risk Reduction, for the inclusion of persons with disabilities in strategies for climate change adaptation and disaster risk reduction" (Committee on the Rights of Persons with Disabilities, 2017). Of note, it observed that the country's legal framework for disaster risk management, including Law 602/2014 relative to Risk Management or its Supreme Decree No. 2342/2015, made no reference to risk in relation to persons with disabilities.

Domestic law and policy frameworks are beginning to reflect disability-inclusive disaster, inspired both by the Sendai Framework together with Article 11 of the CRPD. Some examples point to this emerging practice. In New Zealand's report to the CRPD Committee, it reported in detail on implementation of Article 11 including measures taken in instances of risk, disaster, or emergency (New Zealand, 2011). These measures included encouraging civil defense authorities "to assess and mitigate likely impacts on disabled people in their planning and in responding to emergencies." Specific initiatives to advance disability inclusion in civil defense situations included: (a) public information resources on emergency preparedness specifically address the needs of disabled people, including a written guide produced by the Whakatane Disabilities Resource Center Trust and the Bay of Plenty Emergency Management Group; (b) resources for people with hearing impairments, to enhance the availability of civil defense emergency management information, were distributed to all local councils in 2010; and (c) public education resources for people with sight impairments are to be distributed in 2011. New Zealand further reported that, in the 2010 Christchurch earthquakes, persons with disabilities worked in partnership with civil defense to provide updates to deaf community groups, which then used their own information networks to disseminate information and, in some coverage, television updates were made accessible with captioning. Following the February 2011 earthquake, New Zealand sign language interpreters were used at civil defense briefings (New Zealand, 2011).

In Georgia, national disability legislation was adopted as a direct response to the ratification of the CRPD and the country's effort to bring its national framework into alignment with CRPD commitments. The Law on Georgia on the Rights of Persons with Disabilities legislation addresses disability inclusion in emergencies through the designation of its Emergency Management Service as responsible for ensuring that disaster panning is disability inclusive (Georgia, 2019). UNDP is supporting efforts by the Emergency Management Service to implement this component of the national disability legislation in line with Article 11 of the CRPD. The ultimate objective is to ensure that local municipalities develop emergency management plans with a disability perspective and fully engage with Georgian organizations of persons with disabilities across all phases of disaster management.

The foregoing examples suggest movement and change and a treaty practice starting to see some notes of progress. The CRPD Committee has not to date undertaken a comprehensive study of Article 11 in the disaster context. Beyond pointing to the need for States to embrace the Sendai Framework, the CRPD Committee might undertake a more concerted effort to highlight areas for prioritization. Yet the CRPD Committee is heavily reliant on information from civil society organizations and national human rights institutions and without local OPD inputs, the CRPD Committee will be unable to articulate specific opportunities for disability inclusion in this context.

Article 11 and UN Special Procedures

Another domain of action where an Article 11-inspired treaty practice is evident is in the domain of the special procedures of the UN human rights system. Much of the work of the special procedures is devoted to studies submitted to the Human Rights Council and other bodies along with country visits which allow for more detailed examination of state practice in a given domain. Less examined among the special procedures are letters of allegations are transmitted from special procedures including, for example, the UN Special Rapporteur on the rights of persons with disabilities, to States bringing to light evidence of possible treaty violations or areas of concern.

The communications procedure of special procedures can potentially amplify Article 11 in several respects. Here, a communication to the Government of Mozambique might be cited. In a letter from the UN Special Rapporteur on the rights of persons with disabilities dated 19 March 2021, the attention of the government was directed to the CRPD and, specifically, to Article 11 (OHCHR, 2021). In that case, the Special Rapporteur received information regarding allegations of human rights violations and mass displacement in Mozambique in the context of attacks and military operations in Cabo Delgado province and, further, that: “Older persons, especially those with reduced mobility and with disabilities, were reportedly often left behind in the conflict area as their families and community members were not able to carry them to safety. As a result, they remained trapped and have been caught in the fighting between the non-state armed groups and state security forces and their affiliates” (OHCHR, 2021).

Notably for showing how treaty ideas travel across treaties is the additional reference in the letter to other international commitments, including the African Union Convention for the Protection and Assistance of Internally Displaced Persons (Kampala Convention), which provides, among other things, that States are responsible for providing protection and humanitarian assistance to internally displaced persons (African Union, adopted Oct. 23, 2009, entered into force Dec. 6, 2012). It recognizes in Article 9 that protection and assistance should be provided to those with specific support needs, including older persons and persons with disabilities.

The CRPD Committee has similarly weighed in on matters of international concern relating to Article 11 in armed conflict contexts. In the CRPD Committee's communications regarding the Syrian conflict, for example, attention was drawn to the differentiated risk faced by persons with disabilities in the Syrian conflict (OHCHR, 2013). Looking ahead, there is far more scope for the UN Special Rapporteur and the CRPD Committee to give voice to the principles in the CRPD in disaster contexts as national and international actors respond to disasters.

Article 11 Treaty Practice Analysis

The review of the treaty practice generated by Article 11, and specifically its obligation to ensure the protection of persons with disabilities in disaster contexts, is beginning to emerge. It is reflected in both policy and analytical guidance and in international donor programming and national measures of implementation in disaster-affected contexts. Commitments to reach marginalized groups in the aggregate absent-specific attention to the discrete needs of persons with disabilities are increasingly recognized as deficient and unlikely to yield results. What is perhaps most encouraging is that some of these practices are reflected in large-scale, non-disability-specific programming, where such programs advance disability inclusion and include specific actions for disability inclusion as opposed to generalized outreach to "vulnerable groups."

Even where programs are not disability inclusive at the design stage, the retrofitting programming that did not at design stage adequately address the needs of persons with disabilities can be impactful. Here, the example of World Bank projects addressing design shortcomings through additional refinancing or restructuring is relevant (World Bank Group and GFDRR, 2018).

Governance structures must include institutional mechanisms to facilitate the meaningful participation of persons with disabilities in the planning and designing of recovery and reconstruction processes. The identification or designation of an agency with responsibility for coordinating and overseeing disability affairs in recovery and reconstruction is an important option. Georgia promulgated in its national disability legislation responsibility of the Emergency Management Services to give effect to the protection commitment in Article 11 of the CRPD to persons with disabilities in the context of emergencies including disasters, a practice worthy of replication.

Standards for disability inclusion in recovery and reconstruction must not only be established, but effectively communicated and in accessible formats. Accessibility, including universal design standards, must also inform physical and virtual infrastructure (such as online disaster management systems, electronic media, mobile solutions, and disaster broadcasts and communications) used for resilience and disaster management. Disability-inclusive disaster risk management through accessibility standards and universal design approaches in building codes and their implementation when “building back better” after disasters is likewise an important dimension of inclusion.

Commitments to inclusive data must inform national policies and programs and be reflected in operational standards and indicators for the inclusion of persons with disabilities in disaster preparedness, planning, and response, consistent with Article 31 of the CRPD. While disability-inclusive disaster risk reduction projects have included disability-inclusive activities, they may not have explicit indicators to monitor them. Notably, mentioning people with disabilities as potential beneficiaries alone will not facilitate collection of disaggregated beneficiary data. This means developing monitoring frameworks that include both indicators relevant for measuring disability inclusion (e.g., reconstruction of public facilities with resilient standards) and detailed descriptions (e.g., resilient standards including universal accessibility).

Post-disaster reconstruction/recovery projects can aim at both restoring essential services and improving the design standard practices. While reconstruction activities offer immediate opportunities for incorporating universal accessibility, action such as upgrading design guidelines can help introduce and activate principles of universal accessibility in a systematic way. Further, a holistic approach should be adopted that includes a range of elements including providing assistive aids, conducting disability-inclusive search and rescue, building disability-inclusive early warning system, developing disability-inclusive preparedness plans, and proposing a buddy system, among others. Supporting capacity building so that emergency management personnel include needs of persons with disabilities in resilience and disaster management operations might include the provision of technical assistance to ensure reconstruction plans post-disaster are disability inclusive.

Finally, the CRPD contemplates that specific, positive measures are required to advance convention rights. Financial and procurement are clearly elements of such positive measures. Thus, in the context of Article 11, the provision of financial support and related interventions for target households and groups that have limited ability to self-recover, including households with persons with disabilities, is important. This means the setting of standards for disability inclusion in budgeting and procurement quickly as humanitarian disasters prompt financial mechanisms and programming in response to the crisis. Standards of this nature can facilitate disability inclusion transversally, across the recovery and reconstruction process. Including principles of universal design as a condition of financial contributions and assistance by all recovery actors should likewise be an element of such approaches.

In sum, measures to advance Article 11 in the context of disasters should begin with formalized mechanisms for the ongoing participation of persons with disabilities and mainstream disability into disaster risk consultations, which further need assessments, infrastructure development, services, management plans, and policies. Participation in the form of robust consultation should likewise guide governments in their consideration of disaster or humanitarian policies or legislations, or when a community is developing an evacuation plan, an early warning system, or making decisions to combat climate change, it is crucially important to include persons with disabilities.

Toward Disability Inclusion in an International Instrument on Disaster?

While the CRPD has undoubtedly contributed to a surprising flow of treaty practice in relation to Article 11 and the protection of persons with disabilities in disaster contexts, what is less clear is the extent which this protection will be reflected in mainstream instruments of international law that addresses natural disaster. Notably, there is the prospect of a legally binding instrument on the topic of protection in disaster contexts given the work launched in 2008 by the International Law Commission on the topic of the protection of persons in the event of disaster (International Law Commission, 2016). During the ILC's 68th session, a second reading of a full set of 18 draft articles was concluded. In alignment with the mandate of the ILC to undertake studies and make recommendations on the codification and progressive development of international law, (United Nations General Assembly Resolution, 2016; International Law Commission, 2016), the ILC recommended that the General Assembly elaborate a convention on the basis of the draft articles. Notably, while the ILC draft articles reflect a rights-based approach and articulate rights and duties of States in relation to protection, interestingly, they do not enumerate groups at particular risk in the context of disasters. This is all the more surprising, perhaps, given that the current state of international human rights law is quite clear on the necessity of enumerating specific rights in relation to specific groups, lest their invisibility in legal instruments lead to invisibility in operational terms. To that extent, then, the draft articles hardly represent a current statement, much less a step forward in capturing the progressive development of international law. Rather, they reflect a step backward in reaggregating groups most at risk that the law has worked to specify – in human rights law as in international humanitarian law.

Conclusion

Article 11's ultimate purpose is to foster connections transversally – across the CRPD text and beyond – and to engender a treaty practice that activates disability rights into an emerging international disaster law regime as well as into international humanitarian law, refugee and asylum law, and international criminal law. A measure of its effect in so doing is demonstrable by assessing the many inflections it has brought about and the flow of treaty practice it is fostering through Article 11 in the disaster context.

To be sure, the challenge of making resilience and disaster risk reduction operations disability inclusive in alignment with the CRPD and other frameworks, treaties and soft law instruments, is considerable. Yet tracing flows of treaty practice from policies to programming presents a complex picture, one not discernible from a review of treaty ratification numbers or treaty body reporting. It suggests instead a treaty practice that requires reading across the treaty transversely, to explore commitments to stakeholder consultation, nondiscrimination, accessibility, international cooperation, data disaggregation, and the uptake of polices and their implementation on the ground, domestic lawmaking, national disaster planning, and the like. The foregoing account demonstrates the merits of accounting for the change that treaty practice can bring about when approached through a methodology receptive to change, connection, and flows – to speak in terms of a treaty practice conceived more like the Deleuzean notion of flow.

Disability and Disaster Risk Preparedness

Contents

Abstract

The relationship between disaster risk and social vulnerability has been thoroughly researched over the last decade by Verchick, Cutter, Smith, Brown, and others. It is well established that PWDs are at greater risk of harm from disaster events due to reduced levels of resilience concomitant with structural inequality. The following chapter outlines the role of States Parties in determining the resilience of PWDs through a vehicle that is often overlooked – land use regulation. Specifically, the chapter focuses on the way in which land use controls influence the physical, human, environmental, and social "assets" that create resilience and addresses the power of land use planning to enhance resilience and thus mitigate the risk of disaster events.

Building Resilience

Persons with Disabilities (PWDs) are at greater risk of harm from disaster events than the remainder of the population and are up to four times more likely to die in a disaster event than persons without disabilities (Craig et al., 2019, pp. 327–356). This is because the occurrence of a disaster event is dependent upon whether a given community has the resilience to cope with a hazard, and PWDs do not have the same levels of resilience as persons without disabilities due to structural inequalities. PWD's often reside in poorer quality housing due to lower socioeconomic status which increases their exposure to natural hazards such as fire, storms, and floods. They are at greater risk of violence, sexual exploitation, abuse, and discrimination following a hazard event due to inaccessible disaster shelters (Smith et al., 2012) and sociocultural beliefs and practices (Brown et al., 2014). This correlation between social vulnerability and disaster risk has been termed "disaster justice" (Verchick, 2012), and it recognizes that disasters are a social phenomenon (Cutter et al., 2003) and that addressing underlying structural inequalities, such as educational inequality, equal access to healthcare, and racial discrimination go hand in hand with reducing disaster risk. Relevantly, this means that if the structural inequalities that make PWDs vulnerable are mitigated, disaster risk will also be reduced. To this end, both the disability and disaster risk reduction discourse share common ground: the understanding that in order to protect vulnerable groups consideration must be given to the underlying social conditions of people within a society and their relationship with the structures and institutions that govern their agency. To ameliorate vulnerability, those institutions and social structures must confer resilience in both the individual and their community. But how can this be done?

States Parties play a role in determining the resilience of persons with a disability in varying ways: healthcare, education, and welfare among the most obvious. The purpose of this chapter is to explore the role of a less prominent but equally important social institution – land use planning. Specifically, the chapter will address the role of land use planning in controlling the standards to which buildings and structures are constructed, the role of environmental attributes and social capital, and the degree of community participation in the development approval process – all of which play a significant part in influencing levels of resilience to hazards.

Section "Overview of Disaster Risk Reduction and the Inter-relationship with the CRPD" of this chapter provides an overview of disaster risk reduction and the interrelationship with the *Convention on the Rights of Persons with Disabilities* (CRPD). Section "The Role of Vulnerability Theory in Disaster Risk Reduction and Developing Resilience for Persons with Disabilities" explores how to build resilience to disaster risk through the application of vulnerability theory which identifies the types of assets that States should confer to build resilience. Section "Recognizing the Role of Land Use Planning in Enhancing Disaster Resilience for Persons with Disability" considers the way in which land use planning confers those assets with specific reference to building the resilience of PWDs. Final section concludes by suggesting a framework for land use planning that focuses upon building the resilience of PWDs for the purpose of disaster risk reduction.

Overview of Disaster Risk Reduction and the Inter-relationship with the CRPD

Disaster Risk Reduction has its origins in sociology, geography, and international development dating back to Prince (1920), White (1942), and Holling (1973), and has been promoted by the international community through the *World Conference on Disaster Risk Reduction* which first took place in Japan in 1994 (Stough and Kang, 2015), the *United Nations strategy for Disaster Risk Reduction* in 1999, the *Hyogo Framework for Action* 2005–2015, and the *Sendai Framework for Disaster Risk Reduction* 2015–2030. The field has been advanced over the last two decades by the works of Adger (2000), Wisner (1994), Blaikie (1994), Handmer and Dovers (1996), Pelling (2012), and Cutter (1996), among others. The body of research surrounding disaster risk reduction continues to grow as greater emphasis is placed on the correlation between global warming and natural disaster events. It is necessary when considering the topic of Disaster Risk Reduction to start from first principles and consider the distinction between a disaster and a hazard. In its ordinary English interpretation, the word "disaster" means:

> An event, such as a flood, fire, explosion, etc., which devastates a community and is beyond the scope of the community's own resources to manage, requiring assistance on a national scale to restore safe conditions, functioning communications and a continuing livelihood for the people. (Australian Macquarie Dictionary)

The United Nations Office of Disaster Risk Reduction (UNISDR) defines the term as:

> A serious disruption of the functioning of a community or a society involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources.

By distinction, the UNISDR defines the term hazard to mean:

> A dangerous phenomenon, substance, human activity or condition that may cause loss of life, injury or other health impacts, property damage, loss of livelihoods and services, social and economic disruption, or environmental damage.

Key in these definitions are two messages, the first being that the scope of what constitutes a hazard is broad. Hazards present in varying forms that can be divided into two broad categories: "natural hazards" and "technological," or "anthropogenic hazards." Natural hazards refer to naturally occurring phenomena which are caused by slow or rapid onset events and can be further subdivided into the categories of "geophysical hazards" such as volcanic activity and earthquakes; "climatological hazards" such as drought, bushfire, and heatwave; "biological hazards" including plagues and viral pandemics such as Covid-19; and "hydrological hazards" such as floods (Shi, 2019). Technological or anthropogenic hazards on the other hand are those hazards caused by human beings including wars, terrorism, and industrial accidents.

The second message that one can take from the above definitions is that a disaster is not merely the happening of a hazard or accident, but the culmination of the occurrence of that hazard, and the inability of human beings to respond to it. In this way, all disasters are anthropogenic. A bushfire, flood, drought, or hurricane are simply natural phenomena without any subsequent destruction to human life, property, or infrastructure, which is not possible without some element of human failure such as the poor location of settlements, inappropriate height of buildings, or insufficient evacuation routes. Accordingly, when we are talking about "types of disaster" what we actually mean is "types of hazard." When one understands the anthropogenic nature of a disaster event it then becomes possible to start identifying the causal factors of those events and to begin looking for appropriate mechanisms for mitigation. Furthermore, if we accept the premise that there is a direct nexus between human capabilities, that is, the various functionings that a person (and community at large) is able to achieve (Robeyns, 2005) and the magnitude of a disaster event, we can then begin to explore the types of capabilities that need to be enhanced in order to reduce disaster risk.

It is at this juncture – the intersection between human capabilities and causation of disaster events – that there is a clear interrelationship between the disaster risk reduction discourse and the *Convention of the Rights of Persons with Disabilities* (CRPD). A key function of the CRPD is to promote and enhance the capabilities of people with Disabilities. This is evident on examination of Article 9 – "Accessibility" which requires:

> States Parties shall take appropriate measures to ensure to persons with disabilities access, on an equal basis with others, to the physical environment, to transportation, to information and communications, including information and communications technologies and systems, and to other facilities and services open or provided to the public, both in urban and in rural areas. These measures, which shall include the identification and elimination of obstacles and barriers to accessibility, shall apply to, inter alia:
> (a) Buildings, roads, transportation and other indoor and outdoor facilities, including schools, housing, medical facilities and workplaces;
> (b) Information, communications and other services, including electronic services and emergency services.

The Article goes on to require that States Parties, inter alia, take appropriate measures to develop minimum standards and guidelines for the accessibility of facilities and services; to promote appropriate forms of assistance and support to persons with disabilities; and to provide support for access to information, but also that private entities that offer facilities and services take into account all aspects of accessibility for PWDs (CRPD, Article 9). Accordingly, Article 9 "not only imposes widespread positive obligations on States Parties, but it also requires the private sector to take into account accessibility considerations" (Broderick, 2020).

The accessibility norm is enshrined throughout the CRPD. It first appears in the Preamble, then again under the general principles at Article 3, in the general obligations, and also throughout several of the substantive Articles, including in the context of the provision of accessible information (CRPD, Article 21), access to work and employment (CRPD, Article 27), and participation in political and public life (CRPD, Article 29). Accessibility is clearly viewed as a fundamental pillar to ensuring equality for PWDs. Indeed, the United Nations General Assembly has long identified accessibility as a priority in promoting equality of opportunity for persons with disabilities (General Assembly resolution 52/82). As Broderick states (2020, p 399):

> This progressive understanding of equality in the CRPD aligns with the 'social-contextual understanding of disability' that underpins the Convention and its accessibility obligations. This version of the social model views disability as an interaction between persons with impairments and widespread barriers in society (physical barriers, as well as legal and attitudinal barriers, among others). Together with the human rights model of disability that underpins the CRPD, this has resulted in an acknowledgment of the fact that a barrier-free society is essential to ensuring full and effective participation and inclusion of persons with disabilities, something which will require a significant reallocation of resources.

This approach mirrors the socio-environmental lens of the Disaster Risk Reduction discourse, which accounts for the interaction between people and their environment. While accessibility is about building the capability of PWDs so that they have greater autonomy over their environment, so too, disaster risk reduction promotes the building of "resilience" which, put another way, is about enhancing the capabilities of people so that they may be less vulnerable to a hazard when it occurs, therefore reducing the risk of a disaster event. It follows that building the capabilities of people within a community with the intent of ameliorating that community's vulnerability serves the dual purpose of both reducing disability and reducing disaster risk. Recognition of this need to enhance capabilities gives rise to an exploration of the most efficacious approach to do so, which is where an application of vulnerability theory comes to the fore.

The Role of Vulnerability Theory in Disaster Risk Reduction and Developing Resilience for Persons with Disabilities

The UNISDR explains disaster risk using the equation: *risk = hazard x exposure x vulnerability* to explain that disaster risk is "considered as the combination of the severity and frequency of a hazard, the numbers of people and assets exposed to the hazard, and their vulnerability to damage" (Global Assessment Report on Disaster Risk Reduction, 2015). In other words, it is only when a hazard combines with pre-existing human vulnerabilities that disaster events occur. Furthermore, the distinction between a mere hazard and a disaster is dependent upon the ability of a community to withstand the disruption caused by the hazard. Moreover, disasters are not blind to structural inequality; they intensify pre-existing social, economic, and physical vulnerabilities. If one has a solid house that is able to withstand a hazard and is surrounded by adequate and well planned infrastructure, and have the support of a strong social network then they are less vulnerable to the hazard when it occurs, and if the same is true of all of the members of one's community, the hazard is less likely to become a disaster. By corollary, if one is more vulnerable to the hazard because they lack the capability necessary to provide the resilience to withstand it, then the risk of disaster is greater. Moreover, if a disaster ensues it is likely to compound any pre-existing vulnerability leading to increased social inequality because one will not receive the extra assistance needed to recover economically and will subsequently fall into greater dependency.

Accordingly, central to the magnitude of a disaster event is a recognition of the level of vulnerability in a given society. Vulnerability is broadly defined to mean the potential for loss (Cutter, 1996). The most vulnerable are considered those who are the most exposed to loss and who possess a limited capacity to recover from that loss (Bohle et al., 1994). There is a bifurcation in the epistemological approaches taken to the study of vulnerability: it is either analyzed in the context of the loss incurred by the individual (termed individual vulnerability) or the loss incurred by society at large (termed social vulnerability) (Cutter, 1996, p 530). Importantly, vulnerability is to be seen "not as a property of social groups or individuals, but is embedded in complex social relations and processes" (Bankoff et al., 2013) – at its core it is a socio-political concept which is dependent upon the relationship that people have with their environment and the forces and institutions that shape that relationship. Vulnerability Theory posits that the distribution of assets necessary to mitigate and ameliorate the physical fragility universal to the human condition is the proper reference point for legal discourse and substantive equality (Fineman, 2008). The approach has considerable utility for studies on disaster risk reduction because it incorporates a dimension of sociomateriality fundamental to building resilience to natural hazards, which is a core tenant of the disaster risk reduction discourse.

Fineman's "Vulnerability Theory" came to prominence following publication of her article "The Vulnerable Subject: Anchoring Equality in the Human Condition" (Fineman, 2008). The theory posits that vulnerability is to be understood not in the context of specific human characteristics such as sex, age, race, disability, or socioeconomic status, but as concomitant with the fragility of our human embodiment and which results in all persons being constantly and unavoidably susceptible to harmful events beyond our control (Fineman, 2010). These harmful events include disease, injury, and environmental hazards such as bushfires, earthquakes floods, and pandemics (Fineman, 2008).

The antipole of vulnerability, Fineman claims, is not invulnerability, for there can be no such thing (Fineman, 2010), but resilience: not to be understood in the scientific sense of "bouncing back" or "resiling" from adversity in a way that restores the equilibrium, but as possessing the tools necessary to mitigate and ameliorate those aspects of the human condition that makes us susceptible to harm (Fineman, 2010). It is argued that the level of resilience that one attains throughout the stages of their life cycle is relative to their relationship with the various institutions that confer the "assets" necessary to foster that resilience (Fineman, 2010) and inequality and injustice manifests in the unequal distribution of those assets. It follows that the core premise of Vulnerability Theory is that substantive equality is achieved through "equality of resilience" (Mboya, 2018).

This core argument provides the platform to position the State as responsible for the vulnerable subject, to critique its role in the administration of asset conferring institutions, and to demand that it takes a more responsive role in building resilience. In this way, the theory advocates for more equitable institutional responses to socioeconomic problems. Vulnerability Theory challenges the notion of "formal equality" and the predominant liberal legal paradigm in which the legal subject at the core of the juridical order is the autonomous and rational individual. Vulnerability theory challenges this traditional notion to claim that the proper starting point for legal discourse is in fact the "vulnerable subject": the subject embodied in its sociomaterial context, and dependent upon institutions and human relationships (Mboya, 2018). It contends that the "mythos" (Grear, 2014) of the liberal subject exacerbates injustice by masking privilege, failing to acknowledge our dependency on human relationships and social arrangements, and benefiting certain interest groups within society to the detriment of others. The paradigm of the liberal subject gives purchase to the claim that inequalities are justified by reference to individual responsibility and the meritocracy of the free market. Whereas liberal theory fails to recognize that we are all born with differing levels of capacity as a result of varying factors such as our geophysical location on earth, our age and mobility, our sex and socioeconomic status. Vulnerability Theory underscores the embodiment of the individual and the importance of sociomateriality (Fineman and Grear, 2016). Relevantly, the theory recognizes the law as a vehicle by which the State shapes, controls, and reinforces those asset-conferring institutions (Fineman & Grear, 2016). But also the power of the law as an agent to control and mitigate – or exacerbate – our vulnerability.

Fundamental to this claim is an understanding of exactly what assets are necessary to mitigate disaster events and how it is that land use planning confers them. In describing the assets fundamental to building resilience, Fineman draws upon the work of Peadar Kirby (Kirby, 2006) to posit that there are four key asset classes: physical assets, human assets, social assets, and environmental assets (Kirby, 2006). *Physical assets* are "those physical and material goods that we own or command that determine our quality of life and cushion us in the face of disaster events" (Kirby, 2006). In the context of disaster and flood risk reduction, these assets include land, dwellings, and infrastructure such as roads, hospitals, stormwater pipelines and drainage infrastructure, specific flood mitigation infrastructure such as levies and dams, and emergency services.

Human Assets are described as those innate or developed abilities to make the most of a given situation (Kirby, 2006). The concept of human assets draws upon the work of Sen and Nussbaum's Capabilities Approach which focuses upon the "functioning's" of human beings (Nussbaum, 2001). Mobility, health, education, and decision-making, are clear examples of human assets that influence resilience to a hazard. Older and more frail individuals and individuals with physical and mental disabilities have reduced capability to evacuate during a disaster event. Likewise, individuals who are not educated as to the risks associated with hazards are less able to avoid those risks and more susceptible to harm. In addition, people who are unable to speak English cannot read visual flood warning signs or understand verbal communications to evacuate flood prone areas or take advised precautionary measures.

Social Assets are described as those networks of relationships from which we gain support and strength, such as family, friends, cultural groups, and associations (Nussbaum, 2001). The concept of "social vulnerability" in the disaster risk reduction context has been explored in depth by Cutter who emphasizes the importance of "social capital" in building resilience to hazards (Cutter et al., 2003).

The final category is *Environmental Assets*, which are those assets that address issues of the natural and built environment, including bio-diversity, pollution, and natural resources that impact upon individuals and their communities (Kirby, 2006). Environmental assets have particular relevance in the context of disaster risk reduction because of the correlation between the management of natural resources and the occurrence of natural hazards. For example, the preservation of wetlands and the prohibition of development on riparian lands has the potential to reduce the severity of flooding (Lee & Huang, 2018); the transition to clean energy and net zero emissions will reduce the impacts of climate change and sea level rise; and the placement of hazardous development away from populated areas reduces the risk of impact from industrial hazard and pollution. Consider also the intersectionality between physical and environmental assets. The permissibility of development that contributes to the effects of climate change and rising sea levels impacts upon coastal flood risk. In 2019, the New South Wales Land and Environment Court held that a development application for a coal mine was to be refused on the basis of unacceptable scope three (downstream) greenhouse gas emissions, meaning that the project would have unacceptable environmental impacts because the coal that was being mined from the ground in New South Wales would result in unacceptable emissions when it was used for electricity generation in a foreign country. This is an example of the way in which a physical asset – such as a coal mine – has the ability to impact upon environmental assets, and demonstrates the power of land use planning to influence the distribution of environmental assets that have an impact on disaster risk.

The next part in this chapter looks closer at the way in which land use planning can enhance the resilience of PWD's by focusing resources and attention to these four asset classes.

Recognizing the Role of Land Use Planning in Enhancing Disaster Resilience for Persons with Disability

Land use planning shapes the communities in which we live, not just physically by determining the location and built standard of the structures which we occupy, but also environmentally through the preservation of biodiversity and control of environmental impacts, as well as socially through the placement of community services and spaces that create social cohesion. By governing these aspects of our lives, land use planning controls the level of individual and community vulnerability to hazards and in doing so determines the occurrence and magnitude of disaster events.

However, we should not make the assumption that all States have adequate land use planning systems, indeed many developing, and even many developed, States Parties and jurisdictions do not. Consider for example the nation of Nepal which in April 2015 was struck with a magnitude 7.8 earthquake that killed nearly 9000 people and either partly or completely damaged over 900,000 buildings (Pokharel & Goldsworthy, 2017). Research following the earthquake in 2015 found that although an earthquake design code was present in Nepal, it was not mandatory in every part of the country nor was it sufficiently enforced. More than 80% of earthquake risk comes from vulnerable buildings (Guragain et al., 2018) and yet buildings in Nepal were being constructed by individuals based on their own needs and budget without consulting engineers (Guragain et al., 2018). By way of further example, the lack of sufficient land use planning regulation has also been found to contribute to flood risk in Sri Lanka (Dissanayake et al., 2018) and Ghana (Tasantab, 2019), bushfire risk in Australia (Buxton et al., 2011), landslide in Sierra Leone (Guzzetti et al., 1999), and Tsunami in Japan (Nakasu et al., 2018). Accordingly, it is first necessary to acknowledge the need for adequate land use planning, and that its omission can magnify the impacts of disaster events. Secondly, we must ask ourselves what makes a sufficient land use planning system and how can we improve them to build disaster resilience for PWDs and the broader community? It is contended that the answer to that question lies in analyzing the way in which land use planning systems distribute the aforementioned four key assets that build resilience.

Physical Assets

Land use planning plays a role in determining the distribution of physical assets by controlling whether, and the way in which, land is developed and utilized. Land use planning distributes physical assets in two main ways, the first is through *zoning* and the second is by *imposing standards* on development which together determine the positioning of structures relative to hazards, the standard to which those structures must be built and any measures that must be implemented to mitigate any potential hazards, thereby controlling the degree of exposure and the level of vulnerability to a hazard for the user of the development.

The zoning of land involves a process of determining what development is permissible in a given location. For example, a zoning process may determine the location of residential settlements, the location of hospitals and aged care facilities, and the location of emergency services. Residential accommodation and care facilities that accommodate PWDs should not be located in close proximity to hazards such as on flood prone land or bushfire prone land. Equally, emergency services should be located in close proximity to residential settlements that are susceptible to hazards. So too, consideration needs to be given to the zoning of land as open space to create buffers between natural hazards, and evacuation points. Likewise, zoning decisions which sterilize riparian corridors from development help to mitigate flood risk and the amount of infill development permitted on a floodplain has the potential to alter flood levels by displacing water whilst allocating open space for flood storage can mitigate against rising flood levels.

The imposition of standards on development is the second key way in which physical assets are conferred through land use planning. After a zoning process has determined the type of development that is permissible in a given location, land use regulations impose standards on that development to ensure that it is constructed to agreed specifications. The standard to which development is built has particular implications for PWDs. Buildings which incorporate universal design improve the mobility and accessibility of PWDs which in turn affords them greater capability to evacuate and seek shelter from hazards. The standard of infrastructure is also relevant: Roads and bridges need to be adequately built to withstand hazards and facilitate evacuation. Sufficient roads also impact upon evacuation times and the accessibility of emergency services vehicles.

To illustrate the impacts of both zoning and the imposition of standards on development, consider a residential care facility accommodating PWDs located on flood prone land with ground floor living quarters and which is isolated from emergency services. The occupants of that facility are going to be considerably more vulnerable to a flooding hazard than a facility located above the flood level with accessible design features, provisions to shelter in place during a flood event, and which is in close proximity to emergency services (Yeo, 2015). The difference is effective strategic planning which recognizes the need to distribute physical assets (in this case the aged care facility and support services) in a way which minimizes vulnerability to hazards through both consideration of proximity to the hazard and emergency services (through zoning) and the imposition of suitable standards on the development.

Human Assets

Land Use Planning also confers human assets in two key ways. First by ensuring that development is built to a sufficient standard to afford PWDs with autonomy over their mobility during a hazard event. Ensuring that the built environment is equipped with appropriate visual and hearing aids, appropriate alert and alarm systems, inclusive access and egress to buildings, accessibility of shelters and evacuation centers and adequate transportation are all examples of the way in which the built environment can affect the capability of PWDs to respond to a hazard.

The second way that land use planning confers human assets is by controlling the level of self-determination that PWDs have over the decisions made in respect of their environment. Effective land use planning provides for a process of community consultation before development is approved, affording community members with the right to object to development, as well as to advocate for the standards of development. Without the capacity to advocate for or against development, the needs of PWDs can be overlooked. As Young (199o) states:

> decision-making processes in cities and towns can often reproduce and exacerbate inequalities and oppressions. They also produce or reinforce segregations and exclusions within cities and between cities and towns, which contribute to exploitation and marginalisation.

Accordingly, land use planning regimes confer capability upon PWDs by enabling mobility, accessibility, and self-determination through participation in decision-making.

Social Assets

Land use planning plays a significant role in building social capital and fostering inclusivity. Inclusive spaces where community members can gather and socialize and form social networks such as parks and town squares, community halls, function centers, and sporting fields are all public spaces which bring people together and build social capital. It is vital that these spaces also accommodate PWDs so that they are not excluded from this process of social cohesion. As Han et al. have demonstrated, the stronger social capital a community has built up, the fewer lives are lost in times of disaster (Han et al., 2019). When disasters occur, social capital can actually grow and serves as the primary resource for a community to prepare for, respond to, and recover from a disaster event (Han et al., 2019).

Land use planning controls the distribution of social capital in several ways. Firstly, by mandating the design and fragmentation of settlements and the positioning of physical assets such as parks and community facilities. Depending on its effectiveness, land use planning can play a fundamental role in either dislocating or co-locating social networks. It can direct proponents as to which social impacts are relevant for consideration when designing a development. By way of example, in the jurisdiction of New South Wales, a proponent is required to take into consideration comprehensive "Social Impact Assessment Guidelines" when preparing an Environmental Impact Statement (EIS) to accompany a development application for a major project. Those guidelines require a proponent to consider the social impacts of their project upon vulnerable or marginalized people, including PWDs (NSW DPIE, 2021). Those social impacts are categorized to include impacts to way of life: meaning how people get around and interact on a day-to-day basis; community cohesion and people's sense of place; accessibility; culture; health and wellbeing: including mental health; impacts to surroundings and amenity; and livelihood: including the impacts of a project on person's capacity to sustain themselves through employment (NSW DPIE, 2021).

In determining whether to approve development, land use planning regimes can require decision-makers to give consideration to the suitability of a site and the social impacts of the development (*Environmental Planning and Assessment Act 1979*, s 4.15(b) and (c)) and in the absence of sufficient recreational and communal space, a development can be refused. In addition, land use planning regimes in certain jurisdictions may also require a proponent to contribute funds to the creation or upkeep of parks and communal spaces through agreements with government, and the imposition of conditions on the approval of their developments (*Environmental Planning and Assessment Act 1979*, s 7.11). In this way, land use planning regimes are a key lever in distributing the social assets that are necessary to build resilience.

Environmental Assets

The environment has been identified as the primary factor that improves or disadvantages the lives of people with disabilities (Hahn, 1986). Aspects of the natural environment such as geographic location and topography can hinder levels of resilience f0r PWDs. For example, PWDs in rural communities are often isolated from appropriate support services by distance and transport constraints and residential settlements that accommodate PWDs should be located on topography that reduces their exposure to a hazard, such as on a higher ground above flood levels and safe distances from bushfire prone land. Consideration also needs to be given to the positioning of hazardous development relative to communities that accommodate PWDs. One need only take the example of the Vale Brumadhino dam disaster in Brazil in 2019 – in which a mine tailings dam failed killing 270 people in the rural village of Córrego do Feijão located downriver (Rotta et al., 2020) – to appreciate the correlation between natural assets (in that case the river) and their capacity to exacerbate a hazard. Land use planning has a role to play in factoring these aspects of the natural environment into the planning of cities and the approval of developments so that natural assets are used to the advantage of PWDs to ameliorate – and not exacerbate – the risks associated with hazards.

Conclusion

If we accept the premise that disasters are indeed a social phenomenon and that structural inequality and social vulnerability plays a fundamental role in the causation and magnitude of disaster events, it follows that disaster risk reduction must address those underlying pre-existing social inequalities that exacerbate vulnerability. As Fineman claims in her vulnerability theory we as human beings are all vulnerable in some way as a result of our physical embodiment, but “because we are positioned differently within a web of economic and institutional relationships, our vulnerabilities range in magnitude and potential at the individual level” (Fineman, 2008, p.10) and this is particularly true of PWDs. The problem then is those institutional relationships and structural inequalities.

Recognizing the problem for which we are trying to solve, the question is then one of how. How do we build the resilience of PWDs to mitigate their disaster risk? The answer is by looking to those social institutions and vehicles that confer the physical, human, social, and environmental assets that build their resilience. States Parties control many of those social institutions and this provides a platform to position the State as responsible for the vulnerable subject and to demand that it take a more responsive role in building resilience.

This chapter has demonstrated that land use planning is one very powerful vehicle at the disposal of States Parties to confer resilience on PWDs. It controls the positioning and standards of buildings and structures such as roads and bridges that are needed to withstand hazard events and provide adequate shelter. It also controls the degree of mobility and accessibility of PWDs to support services, levels of social capital, and self-determination through participation in decision-making, all of which enhance the capabilities of PWDs and the degree of agency that they have over their environment.

As effective as land use planning can be in building resilience, equally it can exacerbate disaster risk through poor decisions that fail to account for vulnerable people. Unfortunately, poor land use planning decisions that fail to account for PWDs and vulnerable groups are all too common. Too often the vested interests of developers take precedence over the interests of the more marginalized and underprivileged sectors of our society and this plays out in the way our cities and towns are planned and developed, reinforcing disadvantage and structural inequality. As Anguelovski et al. (2016) state:

> land use plans in the name of climate adaptation or resilience can produce maladaptive outcomes for historically marginalized residents through two types of injustices: acts of commission and acts of omission. We find acts of commission when infrastructure investments, land use regulations, or new protected areas disproportionately affect or displace disadvantaged groups. Conversely, acts of omission refer to plans that protect economically valuable areas over low-income or minority neighborhoods, frame adaptation as a private responsibility rather than a public good, or fail to involve affected communities in the process.

There must be a shift in the focus of land use planning systems; they must be viewed through the lens of the vulnerable subject and look past conventional objectives and the power dynamics of vested interest groups that control power, to instead re-position the primary focus on building individual and community resilience to ameliorate vulnerability and reduce disaster risk.

Disability and Refugee Protection

Towards a Formalised Approach

87

Mary E. Crock

Contents

Abstract

Recent years have seen major change in the way vulnerable migrants – including persons with disabilities – have been recognized as subjects of international law deserving of attention and protection in disaster situations. This chapter traces the recent evolution of international law and policy governing the rights of persons with disabilities living as refugees and humanitarian migrants, bereft of state protection. It examines UN and agency-level responses to the UN Convention on the Rights of Persons with Disabilities (CRPD) in the management of persons displaced by human conflict. The COVID-19 pandemic both disrupted asylum law and amplified inequalities and inequity. The chapter explores key elements of the Refugee Convention as it applies to persons with disabilities, using the concept of "reasonable accommodation" enshrined in Art 2 and Art 5(3) of the CRPD adopted as a unifying theme. It examines how obligations to accommodate for disability should alter processes to determine refugee status. The chapter

concludes by discussing durable solutions for refugees with disabilities and international human rights treaty law.

Introduction: Towards Inclusive Protection in Conflict-Induced Displacement

The phenomenon of individuals crossing borders to escape armed conflict and other forms of catastrophic civil unrest has attracted a great deal of attention in international law. In some ways, the Refugee Convention (as amended) represents the strongest of all the human rights treaties: it has certainly become integral to human rights protection (Chetail, 2021). A remarkable feature of the international legal landscape is how little concern was shown for discreetly and uniquely vulnerable groups in displacement, namely women, children, and persons with disabilities. Conflict and disaster obviously cause death and disabilities in such groups.[1] Yet it is only in recent years that the United Nations agencies, including UNHCR, have recognized that particular strategies are required to provide equal protection to different categories of refugees and displaced persons.[2] Prompted by evidence that UNHCR was identifying only very small numbers of refugees as persons with disabilities, research has shown that it is wrong to assume that these people are not able to travel and so are underrepresented in displaced populations.[3] The findings of the WHO (2011) global survey[4] apply absolutely to refugee groups. In fact, a 2014 HelpAge and Handicap International survey found that close to 30% – twice the WHO average – of persons fleeing the conflict in Syria that year were persons with "special needs"/disabilities. This figure jumped to 77% for elderly refugees.[5] As others in this section attest, the invisibility of persons with disability is endemic in all displacement contexts, seemingly whatever the cause of displacement.

This chapter traces the recent evolution of international law and policy governing the rights of persons with disabilities who are living as refugees and humanitarian migrants. "Refugees" in this sense are defined by the Refugee Convention (1954) as persons outside their countries of habitual residence, bereft of state protection. These problems also inhere in humanitarian migrants insofar as repatriation carries a risk of persecution or abuse.[6] The chapter begins in Part 2 by examining UN and agency-level responses to the UN Convention on the Rights of Persons with Disabilities (CRPD) in the management of persons displaced by human conflict. Issues around refugees and

humanitarian migration have attracted unique and specify policy initiatives. As explored throughout this chapter, the COVID-19 pandemic both disrupted asylum law and amplified inequalities and inequity. Part 3 explores key elements of the Refugee Convention as it does and should apply to persons with disabilities. I use as a unifying theme the concept of "reasonable accommodation" enshrined in Art 2 and Art 5(3) of the CRPD. This is complemented by the work of Stephanie Motz in ► Chap. 88, "Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement," who examines the extent to which the CRPD introduces a separate obligation not to return persons with disabilities to a place where they could face persecution or serious human rights abuse. The chapter continues in Part 4 with an examination of how obligations to accommodate for disability should alter processes to determine refugee status. It concludes by discussing durable solutions for refugees with disabilities and international human rights treaty law.

The CRPD and International Protection Initiatives

To set the scene for a detailed discussion of disability and refugee law, this section begins with an overview of how the CRPD changed attitudes, assumptions, and, ultimately, policy settings within key UN agencies. It captures the responses of UNHCR and the International Organization of Migration (IOM) before touching lightly on other international initiatives done following mass migration events in and after 2015. Some of these are the subject of more detailed discussion in Xref.

A pervasive problem for refugees with disabilities seems to have been attitudes that conflate impairments with medical problems (see Arbour, 2006, para 11). UNHCR's, 2004 Resettlement Handbook (UNHCR, 2004, para 4.4.4) stands as an example in point. This document prioritized the evacuation of persons with acute conditions (including disabilities) but directed that refugees with disabilities considered "stable" should not be proposed for resettlement.[7] The revolution wrought by the CRPD is that the Convention rejected categorically the "medical model"[8] by defining disability in Art 1 as an inability to participate in society. Barriers to participation can be caused by long-term physical, mental, intellectual, or sensory impairments, but also by (prejudicial and exclusionary) attitudes – and by a failure to accommodate for impairments. Article 5(3) then requires States parties to make "reasonable accommodations" for persons with disabilities. These are defined in Art 2 as:

---

[7] Paragraph 4.4.4 of the 2004 handbook read:

> Disabled refugees who are well-adjusted to their disability and are functioning at a satisfactory level are generally not to be considered for resettlement. . . . Only when such disabilities are untreatable locally, and when they seriously threaten the person's safety or quality of life, should resettlement be explored.

[8] Shakespeare (2010), 266–73.

> . . . necessary and appropriate modification and adjustments not imposing a disproportionate or undue burden, where needed in a particular case, to ensure to persons with disabilities the enjoyment or exercise on an equal basis with others of all human rights and fundamental freedoms. . .

As Janet Lord explains in ► Chap. 88, "Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement," the second major advance made by the CRPD is the express recognition in Art 11 that the rights of persons with disabilities cannot be suspended in situations of risk, including situations of armed conflict, humanitarian emergencies, and the occurrence of natural disasters.

The Committee overseeing the (CRPD) acknowledged from the outset that the Convention extends beyond citizens, obliging state parties to uphold the rights of refugees and displaced persons (CRPD Committee, 2012, para 16). The Committee includes questions on Article 11 in its review of countries and has frequently offered criticisms of state policies and practice as they affect refugees and migrants with disabilities.[9]

State parties to the Refugee Convention responded to the CRPD with UNHCR Ex Com Conclusion No 110 in 2010. The following year UNHCR issued the "Need to Know Guidance" (UNHCR, 2011b) to encourage field workers to both identify refugees with disabilities and improve targeted assistance (Crock et al., 2017 ch 2, 4). It also revised its Resettlement Handbook to make the document more inclusive (UNHCR, 2011a). Most importantly, after some time spent in research and consultations, UNHCR altered the systems used to register and verify details about persons in its care. This had the effect of bringing its accounting of disabilities among "populations of concern" much closer to WHO estimates (see Crock et al., 2017, Ch 4).

The impact of the CRPD on international and transnational initiatives involving forced migrants is interesting to trace. Suffice to say that the response was not immediate. In 2012, the IOM's *Operational Framework* made no special reference to persons with disabilities (IOM, 2012). The Nansen Initiative on Disaster-Induced Cross-Border Displacement (Nansen Initiative, 2015) made little reference to persons with disabilities in its initial "Protection Agenda." However, 2015 seems to have marked a turning point following the Fukushima disaster in Japan (Xref) and a civil war in Syria generating unprecedented migration flows across Europe. The IOM embraced change as it moved to acquire the status of a UN body (UNGA, 2017, 16–17). Its *Migrants in Countries in Crisis Initiative* (IOM, 2016) called for planning to assist "particularly vulnerable populations" and established guidelines that reference the needs of migrants with physical, visual, or auditory impairments. The subsequent World Humanitarian Summit in Istanbul lead to the creation of the Charter on Inclusion of Persons with Disabilities (2016) which included operational commitments to nondiscrimination and inclusive policy and practice. A parallel summit in North America produced the New York Declaration (2016) for Refugees and Migrants which makes similar calls on States to acknowledge the needs of persons with disabilities in displacement (at [58]).

---

[9] See International Disability Alliance; Crock (2021), Part 4. Xref Lord Ch.

By the time the Global Compacts on Migration and Refugees were concluded in 2018, the rights of refugees and migrants with disabilities were firmly on the mainstream agenda.[10] References to disability in the Global Compacts are echoed in revisions to various standard setting and guidance documents used by the major humanitarian agencies, including UNHCR. These include the 2018 ADCAP (2016) *Minimum Standards for Age and Disability Inclusion in Humanitarian Action*; the UN Inter-Agency Standing Committee (IASC) Guidelines on Inclusion of Persons with Disabilities in Humanitarian Action and Multi-cluster/sector Initial Rapid Needs Assessment tool (IASC, 2015); and the so-called "Grand Bargain" stream convened to improve and integrate needs assessment techniques.[11]

However positive these developments, it is not clear that refugees with disabilities were (or could be) given priority treatment when the COVID-19 pandemic swept the world in 2020–2021. In April 2020, UNHCR estimated that over 71 million refugees, asylum seekers, and internally displaced persons were at particular risk because of their crowded and unsanitary living conditions. Approximately 167 countries had fully or partially closed their borders to contain the virus. Of these, 57 made no exception for asylum seekers and refugees approved for resettlement.[12] While refugees around the world moved to organize,[13] UNHCR issued a special guidance calling on states to consider the rights of vulnerable refugees.[14] The CRPD Committee) (CRPD Joint statement, 2020) and the Committee on Economic, Social and Cultural Rights (CESCR, 2020), and the Human Rights Committee (2020) issued similar exhortations to states to respect the human rights of persons with disabilities within vulnerable populations. As we turn to consider the specific rights of refugees with disabilities, it will be seen that the global pandemic had considerable impact on the realization of those rights.

Rights to Protection: Disability and Refugee Status

UNHCR and other relief agencies can and often do proceed on the assumption that whole populations of displaced persons are "refugees" or "persons of concern" attracting entitlement to relief.[15] This "mandate" approach will not apply where an individual wishes either to avoid expulsion from a country of asylum or to be included in resettlement programs. Here the formal definition of refugee becomes

---

critically important. Article 1A(2) of the Refugee Convention, as amended by the Refugee Protocol (1967), defines a refugee as a person who:

> . . .owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country.

In this short survey piece, it is not possible to explore all elements of this much litigated and scrutinized provision.[16] Rather, key elements of the definition will be examined to articulate the benefits (of being recognized as a refugee) and challenges (in gaining recognition) presented for persons with disabilities in displacement.

Well-Founded Fear

Simply being a person with disabilities displaced internationally by war or disaster does not make a person a refugee at law. The first requirement of Art 1A(2) is that a refugee demonstrate a "well-founded fear" of returning to their country. This phrase underpins an entire industry devoted to examining "country information," described as the objective aspect making a fear "well-founded" (Chan Yee Kin v Minister for Immigration and Ethnic Affairs, 1989; Hathaway and Foster, Ch 2 and 3). However, at least in theory, a claimant must also be able to articulate a subjective state of fear. For persons with psychosocial and severe physical disabilities – as with young children who lack capacity – this can pose a critical barrier to protection. UNHCR, some courts, and many commentators argue that lack of capacity should simply mean a shift of focus from subjective to objective evidence of fear.[17] However, this approach is not universally accepted. As Motz (2015) argues, the "reasonable accommodation" requirement in Art 5(3) of the CRPD should operate to lighten the burden of proof that would otherwise lie with an applicant. Just as baseless fear must be moderated by objective evidence of danger, so too should the "fear-less" applicant have their claims considered in context.[18]

Persecution

Although not defined in the Refugee Convention, persecution is broadly understood in refugee law to comprise three elements: discrimination or targeting; serious harm; and the failure of state protection.[19] Together, these operate to exclude from

consideration individuals who fall victim to natural disasters, random violence, or general civil conflict who cannot show that they risk being singled out for mistreatment – and that they have no state prepared to offer them assistance.[20] Hathaway and Foster (2014, ch 3) offer human rights law as a mechanism to structure the concept of persecutory harm, capturing a hierarchy ranging from physical assaults threatening life and liberty through to acute social and economic privations.

Again, Article 5(3) of the CRPD invite reflection on the possibility that a person with disabilities may experience harm in a unique way. A person's impairment may render them unable or less able to evade persecutory acts. Physical frailty can also mean that a person's experience of harm is disproportionately severe relative to that of an able-bodied victim.[21] It is broadly accepted that disability can both render an individual more susceptible to (regular) abuse and exploitation[22] and attract harms linked directly to the person's impairments. For example, persons with psychosocial disabilities can face state-sanctioned incarceration and cruel and degrading treatment. The central point is that persecution is a question of fact and degree. A person with disabilities may suffer discrimination. They will not be "refugees" unless the discrimination plays out in harms that impede their ability to subsist (to adopt the language of Australia's *Migration Act* (1958), s 5 J(4)). Abusive treatment can amount to persecution if it produces what UNHCR describes as "consequences of a substantially prejudicial nature."[23] For persons with disabilities, a pervasive problem is in showing the point at which policies of general application (including institutionalization) transition from benign responses to lack of resources to actual persecution.

"For Reasons of" and the Five Convention Grounds

If the word "persecution" does not already imply an element of "singling out," the Convention definition also requires claimants to show that their persecution is linked to one of the five Convention grounds. The phrase "for reasons of" has been interpreted by many states to import an element of intention.[24] Again, this can be problematic for persons with disabilities, particularly where harms are caused by omission rather than by positive acts. For example, a failure to make accommodations for disability can be dismissed as a by-product of poverty and limited resources. This is seen in the Australian tribunal decision *0907687* [2010] RRTA 45 which involved a young child with severe disabilities claiming asylum with respect to Jordan, a country best described as overwhelmed by its burden of

refugees. The child was not successful in claiming that he would be persecuted for reasons of his disability.

This issue of intention carries over into consideration of the Convention grounds. Of course, persons with disabilities can fall into any of the five categories. They can be persecuted because of their nationality, race, or ethnicity. They can be targeted because of their religion or because of their political affiliations (actual or perceived). The interesting question is whether they can be characterized as belonging to a "particular social group." Here the jurisprudence is more helpful, with the Canadian case of *Ward* acknowledging the central importance of shared ("innate" and/or "immutable") characteristics that override or complement shared experiences.[25] Hathaway and Foster (2014 at 452) note that state decision makers have accepted that persons with physical, intellectual, and psychosocial impairments can constitute social groups. So too can individuals with particular conditions (such as dwarfism, albinism, autism) and with chronic illnesses. In fact, asylum seekers with obvious disabilities will often have little difficulty in showing that they belong to a cognizable social group. The problems often lie at the point of demonstrating that their treatment amounts to persecution. It is here that evidence of exceptional treatment – discrimination or outright denial of access to scarce resources – becomes critically important. Although again a question of fact, the prevailing jurisprudence shows that a refugee with disabilities will not be required to show that their suffering is at the hands of state actors. It is enough that a state is unable or unwilling to protect the person, even if they face persecution by private individuals.[26]

The Importance of Process: Disability and Refugee Status Determination

Human rights law generally demands that consideration be given to an individual's lived experience and situation. Article 5(3) of the CRPD mandates "reasonable accommodation," described in CRPD General Comment No 6 (at para 26) to include:

> identifying and removing barriers to enjoying human rights; assessing whether accommodation is legally or practically feasible; assessing whether the accommodation is necessary, appropriate, and suitable to achieve the human rights objective.

The objective ("well-founded") element of the Convention definition of refugee should impute an obligation to ensure that asylum seekers with disabilities are given the benefit of the doubt – and process adjustments – in status determination procedures. In practice, this does not always occur. Kagan (2003 at 368) describes the obligation that a refugee make a *credible* claim as "the single biggest hurdle before applicants beginning the refugee status determination process." There is irony in the

---

[25] See, for example, *Tchoukhrova v Gonzales* (2005).

[26] Khawar; Hathaway and Foster (2014), 367.

fact that experiences of persecution can cause physical and psychological disabilities that then impact a person's ability to construct a logical narrative. As Smith Khan explores in ▶ Chap. 88, "Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement," asylum seekers with hearing disabilities will often be left to face critical status determination procedures without adequate assistance. Immediate barriers to communication such as lack of language proficiency may be addressed through the provision of an interpreter. However, this will never be adequate without appreciation of intersecting issues such as a claimant's cognitive functioning, psychological factors, cultural understandings including gender and religion and education.[27]

The nondiscrimination obligation enshrined in Art 5 of the CRPD, together with the good faith requirements of treaty law (Kälin, 2000), should make the identification of and accommodation for disabilities a matter of priority for states in refugee proceedings. Disabilities such as blindness and gross motor impairments are easy to identify. Hearing deficits, psychosocial and cognitive impairments can be less obvious and so less amenable to adjustments.[28] Accommodating disability is not about charity, but legal rights. It is also a matter with serious consequences insofar as failure to understand a claimant's story can lead to rejection of a refugee claim, failure to protect and even to expulsion and *refoulement*.

The United Kingdom stands out as an example of good practice as a state where considerable thought has been given to the strategies needed to cater for individuals with particular disabilities.[29] The UK Benchbook acknowledges that all process should start with the applicant who should be afforded the opportunity to explain the nature of their impairments and to make submissions on the adjustments required for the proper hearing of their claim. Multiple disabilities create cross-cutting challenges. While the ideal is to seek out and identify disabilities at the start of a process, experience shows that claimants can often try hard to hide their impairments because of cultural fears of stigmatization (Crock et al., 2020, ch 3.5). For this reason, decision makers need to be prepared to make adjustments when a disability becomes apparent. Following are examples of adjustments that may be appropriate for asylum seekers with specific impairments.

Blindness and vision impairment obviously affect a person's ability to read and absorb written material which will impact capacity to participate in legal processes. Visual and mobility impairments may also affect a person's ability to physically attend hearings in locations that are not immediately accessible. This is particularly the case if attendance involves use of public transport and where buildings are difficult to navigate by reason of layout, steps, and no access to elevators. Individuals with hearing loss and deafness face particular challenges in understanding and participating in proceedings. The result can be frustration and confusion. The deaf and hard of hearing can find their behavior misinterpreted as rudeness, indifference,

[29] See "Disability Glossary: Impairments and Reasonable Adjustments" in Judicial College, 2018.

or (worse) cognitive deficit. Physical and cognitive impairments, including chronic illness, almost always mean that an individual tires easily, making protracting hearings a challenge. The UK Benchbook recommendations for dealing with each category of impairment frequently include exhortations for short hearing sessions and provision for "time out."

In spite of these examples of good practice, the jurisprudence on legal requirements to make adjustments for asylum seekers with psychosocial disabilities is often disappointing. Unless a person completely lacks capacity to understand the nature and effect of the legal process,[30] many decision makers seem unwilling to accommodate struggling claimants. In the absence of dispositive evidence from medical professionals, Australian Courts have consistently found no legal error in the treatment of asylum seekers with psychosocial impairments either in Australia (*SGLB*) or on Nauru (*ROD122,* 2017 and *TTY167*, 2018). In an unrelated 2021 case, the High Court of Australia overruled a Full Federal Court holding that the Minister for Immigration was legally obliged to consider a noncitizen's capacity to read, understand, and make representations taking into account matters such as literacy, English language ability, mental capacity, and health (*EFX17* [2019] [13], [89] (Greenwood J)). EFX17 was an illiterate refugee from Afghanistan who had a schizophrenic illness arising from his traumatic past and substance abuse (*EFX17* [2019] [6], [109]). The High Court found that the lower Court's approach would "require consideration of the extent of the capacity of a recipient to understand material provided, identification of how limitations could be overcome, and the taking of steps to do so." The High Court found that this would create administrative difficulties in tension with the express terms of the legislation.[31]

COVID-19 and Immigration Detention

As the COVID-19 pandemic spread around the world and lockdowns were implemented, States did not only shut their borders to asylum seekers. For those who had managed to enter countries and to lodge refugee protection claims, lockdowns brought isolation, destitution – and a halt to status determination processing. For refugees with disabilities, the impact was predictably harsh, most particularly for those being held in immigration detention.

Australia's reliance on mandatory detention and its continuing use of offshore processing for asylum seekers arriving by boat without visas makes it an egregious example of bad practice (see generally, Gleeson, 2016). The following summary of the SCIL "COVID-19" submission SCIL (2020) made to the Royal Commission into Violence, Abuse and Neglect and Exploitation of People with Disability (DRC) is

---

[30] See discussion of the principle of "Gillick competence" in *Gillick v West Norfolk and Wisbech* (1986); and McSherry (2012).

[31] EFX17 [2021], [28]. It should be noted that the Court found for the applicant, but on a narrow matter of statutory interpretation.

worth quoting at length. Parenthetically, in preparing this submission, SCIL researchers were unable to find publicly available data on the incidence and nature of disabilities in immigration detention (either in Australia or in the offshore processing centers). They note:

> For immigration detainees with physical disabilities,[32] detention settings have fallen short because of barriers to accessibility and mobility that have resulted in neglect and loss of dignity. The use of elevated, demountable buildings accessible only by stairs in regional processing centres are examples in point.[33] Across Australia, detention sites are characterised by poor ventilation and cramped corridors. Prolonged, indefinite detention continues to cause and/or exacerbate psycho-social disabilities. As of 31 May 2020, the average period of time for people held in detention facilities was 553 days. Self-harm and suicides are ongoing (The Age, 2020).
>
> The stigma of disability has been exploited by a system which has continued to discourage disclosure of disabilities and often directly discriminates against detainees with disabilities. Requests for accommodation of disabilities have been met with lacklustre and unsatisfactory responses. In the result, detainees with disability have been unable to live with dignity, independence and autonomy (in breach of CRPD, Arts 19, 5(4) and 14(2)). An asylum seeker of short stature was deliberately selected for processing in Papua New Guinea where he was not even afforded the dignity of an accessible toilet despite multiple requests (Amnesty International, 2016, 55). There are accounts of persons with neuro-developmental disorders denied access to specialist psychiatric services (*MZYYR*). Children with physical disabilities have fallen by the wayside (Multicultural Disability Advocacy Association of NSW, 2014).

Australia's persistence with immigration detention throughout the pandemic was at odds with the approach taken in Britain (The Guardian, 2020), Canada (where around half of detainees in immigration detention were paroled: Global News, 2020), and Belgium where 300 detainees were released when safe social distancing became impossible (DeMorgen, 2020). The US courts released into the care of family and friends immigration detainees suffering from chronic medical conditions including diabetes, asthma, heart disease, post-traumatic stress disorder, and depression (CBS News, 2020). The rationale for release was well summarized by the US District Court judge Bernal in the *Fraihat* class action (*Fraihat*, 5) (Fraihat v United States Immigration, 2020):

> The risk of infectious disease in prisons and jails are significantly higher than outside for several reasons. First, social distancing to prevent the spread of disease by respiratory droplets is often impossible in congregate settings, due to poor ventilation and inadequate space, and jails and prisons often lack access to personal protective equipment like masks, gowns and eye shields. Second, jails and prisons often lack resources for diagnosing and treating infectious disease. Simple segregation or solitary confinement measures as an outbreak management technique tend to backfire; they result in less medical attention and increased chances of death.

---

[32] See, e.g., cases where the applicant required a wheelchair: *XTZM and Minister for Immigration* (2020); HLQV; 1,709,735 (2018) (Refugee); EWR18 (2018); *Ahmed* (2017); *AUU15* (2017); *Nguyen v Minister* (2017); N98/26275 (2000).

[33] This occurred at several locations. See, SCIL, articles on detention and COVID-19.

> Isolated detainees quickly experience increased psychological distress that manifests in self-harm and suicidality which requires rapid response and intensive care outside the facility. Unless an individual is held in a negative pressure room, his or her respiratory droplets may still flow outwards to the rest of the facility. Third, people held in jails and prisons are more likely than others to have chronic underlying health conditions that make them susceptible to infectious disease. Finally, new information about COVID-19 suggests it may be transmissible through shared bathrooms and cell toilets without lids.

Durable Solutions: Ending Refugee Status

Where a person is recognized as a refugee, UNHCR groups individuals into three broad categories to indicate how a person is to find a new life going forward. Known as "durable solutions," these are: local integration, resettlement in a third country, and repatriation (where conditions change in a home country so as to allow safe return). Refugees with disabilities face challenges in all three of these scenarios.

It is beyond the scope of this chapter to consider issues around the repatriation of refugees with disabilities (and the cessation of refugee status). The subject is broad and has become increasingly important as more host countries have opted to grant refugees temporary status instead of permanent residence allowing pathways to citizenship. Essays by Atak and Crépeau (2021), Zieck (2021), and Long (2021) go some way towards outlining the many issues facing refugees generally. It is safe to assume that the challenges facing refugees with disabilities are magnified by both impairment, resource constraints, and exclusionary attitudes.

In terms of global experience, most refugees will end up in the country where they first seek asylum. The unhappy reality is that countries hosting the largest numbers of refugees are also the poorest in terms of resources. For persons with disabilities in these countries, life can be very difficult. When the privations of displacement as a refugee are added to the mix, the likelihood of positive outcomes diminishes. Although refugees in developing countries are now beginning to organize (Alio et al., 2020), it is fair to say that advocacy for those living with disabilities remains a work in progress. One barrier to progress that the author observed in her research travels has been lack of connections between local disabled peoples' organizations and refugee groups. An example of good practice was in Uganda where deaf community organizations were making an effort to reach out to refugees in the settlements who were deaf and hard of hearing (Crock et al., 2017, Ch 3). Young refugees with disabilities are at particular risk of being denied access to education, a critical development tool and basic human right (Human Rights Watch, 2018). The other challenge for refugees with disabilities is often access to employment opportunities – and to other aspects of participation in society.

Through its country reviews, the CRPD Committee has engaged with the treatment of refugees with disabilities by host countries. Jordan and Uganda stand out as examples in point. Interestingly, both have had nationals serve on the Committee (although not on the specific reviews!). The Committee rightly commended both states for their generosity and positive approach. However, concerns were raised about the failure to include persons with disabilities in disaster planning (Jordan)[34] and in Peace, Recovery and Development Plans (Uganda).[35] Specific questions about refugees with disabilities were also asked in the country review of Turkey[36] and the United Kingdom.[37] Refugees and asylum seekers did not feature in the Committee's initial observations on Australia.[38] Australia's second and third report were considered in September 2019. Criticisms focused particularly on the situation of refugee and asylum seeking children with disabilities detained in Australia and "offshore." The Committee called for release of the children and "the provision of individualized support and recognize the denial of reasonable accommodation as a form of discrimination."[39]

The role of UNHCR in securing the resettlement of refugees in third countries is a small but important part of global attempts to manage mass displacements. As Kneebone and Macklin (2021) document, the number of refugees selected for relocation each year is tiny relative to the scale of the problem. UNHCR responded to the CRPD by both removing the offensive para 4.4.4 from its Handbook,[40] and issuing a new the Resettlement Assessment Tool that takes much less of a "medical" approach to disability.[41] The United States included disability as a "priority one" factor for identifying refugees in situations of heightened need – at least until then President Trump cancelled the refugee intake.[42] As noted earlier, the COVID-19 pandemic brought what programs there were to a grinding halt. With return to a semblance of normality, it seems that refugees with disabilities now have a place in resettlement programs. If the CRPD has achieved anything, it is to cement disability issues as part of mainstream human rights law and international aid and development.

Widening the Scope of Non-refoulement? The CRPD and the Protection of Persons with Disabilities in Displacement

88

Stephanie A. Motz

Contents

Abstract

The international non-refoulement jurisprudence concerning persons with disabilities currently risks falling into the trap of the outdated medical model of disability. Particularly, the European Court of Human Rights and also the UN Human Rights Committee and the Committee on the Rights of Persons with Disabilities display an often-exclusive focus on a person's medical needs. This results in a denial of the human rights-based approach and thus of the promise of the Convention on the Rights of Persons with Disabilities ("CRPD") to one of its most vulnerable constituencies, persons with disabilities facing expulsion proceedings. The author argues that the CRPD Committee may be ready for a new approach to refoulement cases, drawing on existing case law from other specialist UN treaty bodies and applying the human rights-based approach.

Introduction

General Introduction

Persons with disabilities make up between 10 and 30 percent of the population of displaced persons (Crock, 2021, p. 779). As such, they are either internally displaced (▶ Chap. 84, "Disaster and Climate Change-Induced Displacement of Persons with Disabilities: A Human Rights Perspective") or find themselves in a foreign state, in which they may have no right to remain and apply for asylum or become subject to expulsion proceedings. In the context of asylum or expulsion proceedings, the refoulement prohibition as guaranteed in international human rights law is a crucial safeguard in protecting persons with disabilities.

This chapter examines the extent to which the Convention on the Rights of Persons with Disabilities (CRPD) advances obligations concerning the refoulement prohibition for states hosting non-citizens with disabilities who are subject to expulsion proceedings. It explores the recent practice of the CRPD Committee on the refoulement prohibition in cases concerning persons with disabilities and examines the Committee's reliance on principles from international human rights law. In particular, the present chapter analyzes the case law of the European Court of Human Rights (ECtHR) and other UN treaty bodies in the context of refoulement and persons with medical needs, and argues that some of the jurisprudence has not yet effected the necessary shift away from the now generally abandoned medical model to the human rights-based model of disability. It concludes with an analysis of the CRPD's potential with its promise of the human rights approach also for persons with disabilities in expulsion proceedings.

The Refoulement Prohibition in International Human Rights Law

In its broadest sense, the refoulement prohibition protects foreign nationals from being expelled to a country where they face some form of serious harm (Costello & Foster, 2016, p. 284 referring to the "same fundamental core" of all the different refoulement prohibitions). It is enshrined in various international and regional human rights treaties, although its precise scope varies somewhat between the different legal regimes. International extradition treaties and international humanitarian law also contain explicit and implicit refoulement prohibitions (Lauterpacht & Bethlehem, 2003, paras 5–9; Costello & Foster, 2016, p. 283). It has been described as the "cornerstone of the protection of refugees" (Wouters, 2009, pp. 1, 23–24; Kälin et al., 2011, para. 2; Durieux, 2013, p. 248) and provides refugees with the most essential guarantee, the protection from being sent back to a country where they fear persecution (de Weck, 2022, paras 2, 5).

Most notably, Art. 33 of the 1951 Refugee Convention explicitly prohibits the expulsion of refugees to a state where their life or freedom would be threatened. Further express refoulement prohibitions are contained in Art. 3 of the Convention Against Torture (CAT)[1] and Art. 16 of the Convention on Enforced Disappearances (CED).[2] In addition, the refoulement prohibition has been found to flow from the prohibition of torture and other ill-treatment in the International Covenant on Civil and Political Rights (ICCPR),[3] the Convention on the Elimination of Discrimination Against Women (CEDAW),[4] the Convention on the Rights of the Child (CRC),[5] the Convention on the Elimination of Racial Discrimination (CERD),[6] and now also by the Convention on the Rights of Persons with Disabilities (CRPD).[7] Seven of the UN Committees have decided or assessed individual complaints concerning refoulement: the UN Human Rights Committee (HRC),[8] the CAT Committee,[9] the CEDAW Committee,[10] the CRC Committee,[11] the CED Committee,[12] the CERD

---

[1] While the express wording of Art. 3 CAT only prohibits the expulsion to a country where the person would face *torture*, the CAT Committee has clarified in its General Comment No. 2 on the Implementation of Article 2 by States parties, 24 January 2008, CAT/C/GC/2, para. 6, and its General Comment No. 4 (2017) on the implementation of article 3 of the Convention in the context of article 22, 4 September 2018, CAT/C/GC/4, para. 16, that the refoulement prohibition also extends to *cruel, inhuman or degrading treatment or punishment* (CIDTP); the CAT Committee thus found a violation of Art. 16 CAT (prohibition of CIDTP) in the refoulement case of *A.N. v. Switzerland*, comm. no. 742/2016, 3 August 2018, paras. 7.3 and 9.

[2] Art. 16 CED prohibits the expulsion to a country where there are substantial grounds for believing that there is a real risk of enforced disappearance.

[3] It flows from Arts. 6 and 7 ICCPR, see, e.g., HRC, General comment no. 31, The nature of the general legal obligation imposed on States Parties to the Covenant, 26 May 2004, CCPR/C/21/Rev.1/Add.13, para. 12.

[7] See the CRPD Committee's first decision on refoulement in *N.L. v Sweden*, comm. no. 60/2019, 28 August 2020, and the Committee's earlier obiter dicta in *O.O.J. and Ors v. Sweden*, comm. no. 28/2015, 18 August 2017, para. 10.3.

[8] For its first decision see HRC, *Torres v. Finland*, comm. no. 291/1988, 05.04.1990.

[9] See, e.g., above footnote 1.

[10] For the first decision finding a violation of the refoulement prohibition, see CEDAW, *A. v. Denmark,* comm. no. 53/2013, 19 November 2015, and the Committee's early obiter dicta in *M. N.N. v. Denmark*, comm. No. 33/2011, 15 July 2013, paras 8.9–8.10.

[11] For the first decision finding a violation of the refoulement prohibition, see CRC, *I.A.M. (on behalf of K.Y.M.) v Denmark*, comm. no. 3/2016, 25 January 2018.

[12] For the first violation of the refoulement prohibition, see CED, *E.L.A. v. France*, comm. no. 3/2019, 25 September 2020.

Committee,[13] and more recently the CRPD Committee.[14] In addition, the refoulement prohibition is expressly or implicitly contained in regional human rights treaties and for present purposes particularly pertinently in Art. 3 of the European Convention on Human Rights (ECHR).[15]

It was the European Court of Human Rights (ECtHR) in 1989, which decided the first application on non-refoulement under international human rights law. This was the case of *Soering* concerning the famous German fugitive who faced extradition to the United States in order to be tried for the cold-blooded murder, supposedly committed together with his girlfriend, of her parents and who could have faced the inhuman or degrading death row phenomenon there (Soering v United Kingdom, 1989). The Court held, only 5 years after the first express enactment of the refoulement prohibition in Art. 3 CAT, that the refoulement prohibition – prohibiting removal to a state where substantial grounds have been shown that the person would face a real risk of torture or inhuman or degrading treatment – was implicit in the prohibition of torture and inhuman or degrading treatment in Art. 3 ECHR and prevented his removal at that point (Soering v United Kingdom, 1989, para. 91). One year later, the HRC decided its first refoulement case (Torres v Finland, 1990) and another 4 years later, the CAT Committee followed suit (Mutombo v Switzerland, 1994; see further on these developments de Weck, 2016, pp. 3, 40; Schweizerisches Kompetenzzentrum für Menschenrechte (SKMR) & Kälin, 2012, pp. 28–31; Çali et al., 2020, p. 359).

Since then, the UN Committees and the ECtHR are regularly called upon to apply the refoulement prohibition, because they offer a "safety net" – albeit incomplete – to refugees preventing their forcible return to persecution (Lambert, 1999; Durieux, 2013, pp. 249–251; Costello, 2016b, p. 180). The majority of these refoulement cases concern asylum proceedings at the domestic level (Çali et al., 2020, p. 360 considering the decisions of the HRC, CAT, CEDAW, and CRC Committees; for a discussion of the ECtHR's case law, see de Weck, 2016; Costello, 2016a; for a discussion of the CAT, CEDAW, and ECtHR case law, see Motz & de Weck, 2017). The UN Committees effectively fill a void that was left by the first UN treaty concerning international human rights, the 1951 Refugee Convention, for which the drafters at the time did not provide an individual complaints mechanism in contrast to all subsequent UN human rights treaties (Zieck, 2011, pp. 1499, 1508; McAdam, 2011; Chetail, 2021, pp. 212–213; Motz, 2021, pp. 22–25). Today, the ECtHR and the UN Committees play an important role through their individual complaints procedures in shaping the precise contours of the refoulement prohibition in international human rights law (for a discussion of their role in this context, see

Status Quo: The Scope of the Refoulement Prohibition for Persons with Disabilities

In order to examine this more closely, it is necessary to first take a closer look at the ECtHR's jurisprudence in medical cases (section "The ECtHR Non-refoulement Case Law in "Medical Cases"") and the prevalence of the medical approach in its case law (section "The ECtHR's Reliance on the Medical Model in Non-refoulement Cases") before developing a human rights-based approach to refoulement cases of persons with disabilities (section "A New Approach to Non-refoulement of Persons with Disabilities").

The ECtHR Non-refoulement Case Law in "Medical Cases"

The ECtHR is the international forum with the most detailed and long-standing jurisprudence in relation to "medical cases," i.e., cases in which persons suffering from some serious illness or disability have claimed a violation of the refoulement prohibition on account of the lack of medical treatment. Particularly the ECtHR's judgment in *Paposhvili v. Belgium* has greatly influenced the non-refoulement case law of the UN Committees in "medical cases." The Grand Chamber judgment in *Paposhvili* is the product of a line of case law, which will be briefly set out here.

In a string of cases starting with its (in-)famous judgments in *D v. United Kingdom* concerning an applicant with AIDS and *N v. United Kingdom* concerning an applicant with HIV, the ECtHR established a restrictive approach focusing almost entirely on the applicants' need for medical treatment (with a limited consideration of the available social network, though this has not proved decisive in favor of protection in subsequent cases). The Court found a violation of Art. 3 ECHR in the case of *D* because there was no antiretroviral treatment available in St. Kitts and *D* would have faced the "real risk of dying under the most distressing circumstances" and without family support (D. v United Kingdom, 1997, paras 52–54). However, conscious of the financial repercussions of this precedent (N. v. United Kingdom, 2008, para. 44), the Court subsequently backtracked in the case of a Ugandan applicant with HIV in *N* stating that it was only in "very exceptional cases" that the removal of a person with medical needs would entail an Art. 3 ECHR violation (at para. 42). According to the Court, the reason for this was that the harm ensued not from the state or private actors but from a "naturally occurring illness and the lack of sufficient resources to deal with it in the receiving country" (N. v. United Kingdom, 2008, para. 43). The focus in both precedents was on the illness and the availability of medical treatment, with the absence of family members as an additional but not sufficient factor. In neither of these cases did the Court find it apt to consider other aspects, for instance, whether the lack of resource allocation to the treatment of persons with HIV or AIDS in St. Kitts or Uganda had a discriminatory element, specifically targeting this very marginalized group of people (UNAIDS, 2015, 2017).

The same exceptionality threshold has been applied to cases involving mental health issues like schizophrenia, which in the asylum context have all been refused see e.g. (Bensaid v United Kingdom, 2001, paras 16, 37; Tatar v Switzerland, 2015, para. 16). The only exception to the application of the exceptionality threshold is the case of a British national subject to extradition proceedings to the United States on terrorism charges and who had been diagnosed with paranoid schizophrenia. In its first judgment on the matter, the ECtHR found that the extradition of Mr. Aswat to the United States's supermax prison would be in breach of Art. 3 ECHR on account of his mental health, but also stressed that the case was to be distinguished from other expulsion cases (in which the exceptionality threshold applied) as it concerned extradition in a detention setting and the applicant was without family support (Aswat v United Kingdom, 2013, para. 57). However, Mr. Aswat was nonetheless subsequently extradited to the United States on the basis of diplomatic assurances, which the ECtHR approved (Aswat v United Kingdom, 2015, paras 30–31). This was so despite the fact that it was established that the removal of Mr. Aswat from the high-security hospital at which he was detained in the UK to a prison even with considerable mental health facilities would "put the applicant at risk of relapse into an acute psychotic state" (Aswat v United Kingdom, 2013, paras 51, 55; Aswat v United Kingdom, 2015, para. 15). He was subsequently sentenced in the United States to 20 years in prison with specialized psychiatric care, rather than a psychiatric institution as was previously deemed necessary.[16] This case also serves to illustrate the lack of reliability of diplomatic assurances which has been raised particularly in the context of extradition proceedings (de Weck, 2016, pp. 365–366; CAT, 2018, para. 20; Çali et al., 2020, pp. 372–373), but equally pertains in the medical context.

The ECtHR has adapted the refoulement prohibition to new situations, including those involving violations of socioeconomic rights, such as the living conditions of asylum applicants in Greece (M.S.S. v Belgium and Greece, 2011) or the humanitarian conditions in a Somali refugee camp (Sufi and Elmi v United Kingdom, 2011), leading to an interpretation of the refoulement prohibition which addresses present-day challenges of migration law. However, the Court has made it crystal clear that this subsequent case law involving general violations of socioeconomic rights does not apply to removal cases of persons with disabilities. In the case of *S.H.H. v. United Kingdom* concerning an Afghan applicant who had been seriously injured by a rocket launcher in Afghanistan and had had one leg amputated, leaving him in a wheelchair, the Court addressed this question (S.H.H. v United Kingdom, 2013). By four votes to three, it decided that the impossibly high exceptionality threshold from *N. v. United Kingdom* rather than the normal test under *M.S.S.* and *Sufi and Elmi* concerning living conditions applied. As a result of the high threshold, there was no

breach of Art. 3 ECHR in the case of the disabled applicant's removal to Kabul (S.H.H. v United Kingdom, 2013, paras 89–93). The majority of the Court accepted that there was widespread discrimination of persons with disabilities in Afghanistan but held that this did not lead to a different result (at para. 94). The minority of three dissenting judges, however, called for a disability-sensitive interpretation of Art. 3 ECHR (joint dissenting opinion of Judges Ziemele, David Thór Björgvinsson and De Gaetano, para. 4). The division of the Court on these matters persisted over some years, with seven out of eight judges filing concurring opinions on this matter in a case concerning a Cameroonian HIV positive applicant who faced an 98 percent chance of not being able to access antiretroviral treatment upon return and whose application was equally refused (Yoh-Ekale Mwanje v Belgium, 2011).

At the time, it was hoped that the Court would seize the opportunity of the next medical case in order to review its controversial case law and adopt a more disability-sensitive interpretation of Art. 3 ECHR (see also the dissenting opinion of Judge Pinto de Albuquerque in S.J. v Belgium (formerly known as Josef v Belgium*)*, 2014 concerning the strike out of this case of an HIV positive single mother, which would have provided an opportunity for the Court to review its case law in medical cases; on all of this, see also Motz, 2015, pp. 186–192, and Costello, 2016b, pp. 189–191).

However, the Grand Chamber's eventual review of its case law in *Paposhvili v. Belgium* proved underwhelming. The case concerned an applicant who had already died of his illness at the time of the Court's judgment (Paposhvili v. Belgium, 2016, paras 1, 10). In that case, the Grand Chamber held that "other very exceptional circumstances" may also give rise to a breach of Art. 3 ECHR, where "substantial grounds have been shown for believing that he or she, although not at imminent risk of dying, would face a real risk, on account of the absence of appropriate treatment in the receiving country or the lack of access to such treatment, of being exposed to a serious, rapid and irreversible decline in his or her state of health resulting in intense suffering or to a significant reduction in life expectancy" (Paposhvili v. Belgium, 2016, para. 183). While the Court stated that the test was now somewhat relaxed, it remains a high threshold (ECtHR, 2017, pp. 59–60 per Guido Raimondi).

Indeed, it is striking that the only two applications involving removals of persons with disabilities and medical needs, which the Court has granted, concerned one dead person in *Paposhvili* and one on his deathbed in *D v United Kingdom*. Furthermore, the hope that the judgment in *Paposhvili* would actually lower the threshold for medical cases (Çali et al., 2020, p. 382) has since been shattered. In December 2021, the Grand Chamber reached its judgment in *Savran v Denmark*, in which the Court reversed the Chamber finding of a violation of Art. 3 ECHR in the case of the removal of an applicant suffering from schizophrenia to Turkey without assurances for adequate medical treatment. The Court reiterated the relevant principles from *Paposhvili* and made it clear that Art. 3 ECHR is only applicable at all, when a "serious, rapid and irreversible decline" in the applicant's health would ensue in case of removal (Savran v Denmark, 2021, paras 130, 133, 134). On the facts, the Court found that schizophrenia was not a sufficiently serious illness to bring the applicant within the *Paposhvili* threshold of Art. 3 ECHR so that Art. 3 was not applicable at all (Savran v Denmark, 2021, para. 141). This was so despite the fact that in the absence of treatment, the psychotic symptoms would worsen, leading to a significantly higher risk of committing offences against the person and aggressive behavior. In the Court's view, this did not constitute the necessary "intense suffering" required for Art. 3 ECHR to be applicable (Savran v Denmark, 2021, paras 143–144 but see the partly dissenting partly concurring opinion of Judge Serghides on this point at paras 13–15).

The *Paposhvili* judgment has been criticized for failing to follow the ECtHR's own principles concerning refoulement (Bianku, 2021, p. 103). More generally, the Court has been criticized for its unprincipled approach on equality issues in the context of migration cases (Moreno-Lax, 2021, p. 59). Indeed, the Court's reluctance to protect persons with disabilities from expulsion blends in with its slow recognition of disability rights in general (Zimmermann, 2022, p. 183). While the Court sometimes resorts to the concept of vulnerability in order to address such equality issues and this has served applicants with disabilities on rare occasions,[17] the designation of persons with disabilities as vulnerable instead of a contextual, whole-of-person approach, which would allow the identification of circumstances that could render anyone vulnerable, has been criticized (Moreno-Lax, 2021, p. 59; Zimmermann, 2022, p. 322).

Strasbourg's approach to refoulement cases has generally been criticized and the Court has been reminded to focus its mind "first towards 'protection' of an absolute right" in Art. 3 ECHR (Bianku, 2021, p. 103; Dembour, 2021). While it appears that the Court has adopted this restrictive stance out of fear of becoming an asylum court or a "fourth instance" in the midst of a migration crisis in Europe, the hostile political climate would be a time when the Court's role as the guardian of indispensable guarantees is paramount (Çali et al., 2020, pp. 381–382; Bianku, 2021, p. 98; Dembour, 2021).

Critical Appraisal of the ECtHR's Approach based on Disability Rights

The ECtHR case law in the medical cases can be criticized for a further reason, namely the Court's reliance – in all but name – on the medical model of disability. According to the medical model of disability, the focus is on the (mainly medical) consequences of the impairment and their cure or removal with the aim of ridding persons with disabilities of their impairments and approximating them to the non-disabled norm as far as possible (Kanter, 2006, p. 291; Lawson, 2006, p. 572). The Court's case law, since *D v. UK* and up until and including the recent judgment in

Russia,* app nos 31039/11, 48511/11, 76810/12, 14618/13, and 13817/14, 15 March 2016, paras. 86–88, or *Renolde v. France,* app. no. 5608/05, 16 October 2008, para. 84, Nasri v France, app no 19465/92, 13 July 1995.

Savran v. Denmark, focuses exclusively on the seriousness of the medical condition and the availability of medical treatment as threshold questions for Art. 3 ECHR to apply. And while the existence of family members and a social network has also been referenced by the ECtHR as pertinent, it appears from the jurisprudence that this has only ever been used to refuse cases and this on doubtful grounds (Blöndal & Mjöll Arnardóttir, 2018, p. 159). While the Court's litmus test in *N v UK* meant that domestic courts only granted protection to persons who were "close to death" (ECtHR, 2017, p. 60 per Guido Raimondi), the subsequent developments in *Paposhvili* and *Savran* can now hardly be said to lower the bar for protection. In addition, through the ECtHR's express refusal to apply its general case law on socioeconomic rights and living conditions to persons with medical needs (see *S.H.H.* above), the Court relies in all cases concerning persons with disabilities – even those who do not specifically depend on medical treatment as the wheelchair user in *S.H.H.* – on an exclusively medical model. This is no longer in line with international human rights law, as has also been pointed out by various dissenting judges over time.

In particular, this approach to the refoulement of persons with disabilities is incompatible with the CRPD. For the CRPD heralds, a paradigm shifts away from the previously prevalent medical model to the human rights-based approach to disability. The human rights-based model views persons with disabilities as rights holders and members of our society who are more hindered by the "physical and attitudinal barriers societies erect to exclude and stigmatize them" than by their own impairment (Kanter, 2006, p. 291; Lawson, 2006 and see also Art. 1 CRPD). The human rights approach is expressed most clearly in Art. 1 CRPD which emphasizes that a disability consists of the interaction of an impairment with various barriers that hinder the person's full and effective participation in society on an equal basis with others (Kanter, 2006, p. 291) (see ► Chap. 87, "Disability and Refugee Protection"). The CRPD moves international human rights law from a concept of formal equality to a concept of multidimensional equality (Mjöll Arnardóttir, 2009, p. 41). The focus no longer rests merely on the impairment. Instead, the various barriers which society erects and which prevent the person's full and equal participation in society are recognized as a key factor rendering a person disabled. The CRPD's aim is to protect persons with disabilities not as objects of charity or simply as persons in need of medical treatment but as human beings on an equal footing with others and as rights-holders whose dignity must be respected in every way (Flóvenz, 2009, p. 259; MacKay, 2007, p. 328; Mjöll Arnardóttir, 2009, p. 41; Quinn & Degener, 2002). The fact that all Council of Europe Member States have either signed or ratified the CRPD[18] supports the argument that these rights should now be relevant also in expulsion cases under the ECHR (see also Art. 53 ECHR).

An approach to refoulement cases, which adequately reflects the human rights approach to disability would not focus exclusively on the applicant's medical needs.

---

[18] In fact, Lichtenstein is the only Council of Europe member state which has not yet ratified the CRPD.

Rather, it would take a wholistic view of the situation the person would face in the destination state and evaluate the extent to which their human rights would be protected and whether they would face discrimination or human rights violations amounting to serious harm.

The CRPD Committee on Non-Refoulement

The CRPD does not contain any explicit reference to the refoulement prohibition or to refugees with disabilities. However, the CRPD Committee has variously protected the rights of refugees with disabilities, particularly in the context of Art. 11 CRPD on situations of risk (Motz, 2018, pp. 334–336). In this context, the Committee has addressed the need to adapt asylum procedures and reception conditions in a disability-sensitive manner both in its General Comments and in its concluding observations on state reports.[19]

The CRPD Committee has considered the refoulement prohibition under the CRPD in a line of individual communications concerning Sweden. The Committee's first decision in a refoulement case was taken in August 2017 (O.O.J. and Others v. Sweden, 2017). The complaint concerned a Nigerian asylum-seeking family with a child who had been diagnosed with autism and further psychosocial disabilities. The child's impairments had not been considered in the asylum proceedings but in separate migration proceedings, in which the Swedish authorities had refused the family's application. The family applied to the CRPD Committee arguing that the removal of their son to Nigeria would breach Arts. 7, 15(2), 24, 25, 26, and 28 CRPD in addition to a procedural violation of Art. 12 CRPD. In particular, they argued that there were no autism-specific education, health care or habilitation and rehabilitation services, no appropriate and affordable services and support in general for their son's disability needs in Nigeria, and that the whole family would be excluded from Nigerian society because of their son's disability (O.O.J. and Others v. Sweden, 2017, para. 3). While the CRPD Committee declared the case inadmissible, because the family no longer faced expulsion, it nevertheless seized the opportunity to reject Sweden's argument that the CRPD was not applicable to expulsion cases in general. Significantly, the Committee stressed that "the removal by a State party of an individual to a jurisdiction where he or she would risk facing violations of the Convention may, under certain circumstances, engage the responsibility of the removing State under the Convention which has no territorial restriction clause" (O.O.J. and Others v. Sweden, 2017, para. 10.3). The CRPD Committee in *O.O.J.* thus deliberately left open, which CRPD violations would engage the refoulement prohibition and did not limit its *obiter dicta* to particularly serious violations or only

---

[19] CRPD, General Recommendation No. 6 (2018) on equality and nondiscrimination, CRPD/C/GC/6, 26. April 2018, para. 44, and see, e.g., Concluding Observations on Greece, CRPD/C/GRC/CO/1, 29 October 2019, paras 15–16; Concluding Observations on Sudan, CRPD/C/SDN/CO/1, 10 April 2018, para. 21(b); and Concluding Observations on Luxembourg, CRPD/C/LUX/CO/1, 10 October 2017, paras 22–23.

the right to life and the prohibition of torture and cruel, inhuman or degrading treatment in Art. 15 CRPD.

However, after this initial protective stance, the Committee's decisions have become more cautious. Its second decision in a refoulement case concerned an Iraqi asylum seeking woman, who had been diagnosed with depression with psychotic features (N.L. v. Sweden, 2020). In Sweden, she had twice been committed to a psychiatric institution after experiencing hallucinations and suicidal ideation. She had raised her medical issues in migration proceedings after the refusal of her asylum claim. The Swedish authorities had refused her a right of stay, because the medical issues were not serious or life-threatening enough. Before the CRPD Committee, she only raised the right to life and the prohibition of torture or cruel, inhuman or degrading treatment (Arts. 10 and 15 CRPD). Sweden argued that its authorities had conducted a thorough examination of the claims and that there was no reason to conclude that their findings were inadequate.

In *N.L. v. Sweden*, the CRPD Committee confirmed its ruling in *O.O.J.*, but slightly adjusted it by introducing the qualifier that only "serious violations of Convention rights amounting to a real risk of irreparable harm" could, under certain circumstances, prevent the complainant's removal (a language borrowed from the HRC)[20]. It also confirmed its ruling in *O.O.J.* that the refoulement prohibition was not limited to violations of the right to life and of the prohibition of torture Arts. 10 and 15 CRPD (at para. 6.4). It further clarified, relying on the HRC's approach to the refoulement prohibition, that it would give considerable deference to national authority's assessments (at para. 7.3). Further, it referred to the HRC decision in *Abdilafir Abubakar Ali and Mayul Ali Mohamad v. Denmark*, finding that the access to medical care was pertinent to the individualized risk assessment of the personal and foreseeable risk a person would face (Abdilafir Abubakar Ali and Mayul Ali Mohamad v. Denmark, 2016). The CRPD Committee also referred to the CAT decision in *Adam Harun v Switzerland* that due account had to be taken of the complainant's health status under the refoulement prohibition in Art. 3 CAT (Adam Harun v Switzerland, 2018). Finally, the CRPD Committee referenced the ECtHR's judgment in *Paposhvili v. Belgium* in detail (at para. 7.5) (Paposhvili v. Belgium, 2016). It held that it had to determine "whether there are substantial grounds for believing that the author would face a real risk of irreparable harm" if removed to Iraq. Given the undisputed diagnoses of the author, which included the risk of severe or life-threatening complications, the fact that the treatment was described as essential and the risk of relapse to be grave without adequate care, the Committee concluded that the Swedish authorities had violated Art. 15 CRPD by failing to assess whether she would in fact be able to access adequate care in Iraq (N.L. v. Sweden, 2020, para. 7.8). As a result of this finding, the Committee did not find it necessary to consider the right to life under Art. 10 CRPD separately (at para. 7.9).

---

[20] See e.g. HRC, General Comment No. 31, supra footnote 3, para. 12.

A similar ruling followed in September 2021 concerning an Afghan man diagnosed initially with post-traumatic stress disorder with psychotic features and committed once to psychiatric care because of hallucinations and suicidal ideation (Z.H. v. Sweden, 2021). The medical evidence was again raised in migration proceedings, but the Swedish authorities found that some sort of psychiatric treatment would be available in Kabul so that the complainant could be returned there. Subsequently he was diagnosed with paranoid schizophrenia and the Complainant commenced new proceedings, but the Swedish authorities confirmed their earlier ruling that he could be removed to Kabul. The complainant first applied to the ECtHR, but the Court rejected his claim as inadmissible in a single-judge formation, also refusing the application for an interim measure preventing the complainant's removal (at para. 2.6). He then applied to the CRPD Committee invoking breaches of Arts. 10 and 15 CRPD in case of his removal to Afghanistan as well as violations of Arts. 12 and 13 CRPD (the rights to equal recognition before the law and access to justice) because of the Swedish authorities' failure to provide him with adjustments for his mental health needs in the procedure. Once again, the CRPD Committee qualified its ruling in *O.O.J.* limiting it as in *N.L.* to *serious* violations of Convention rights leading to a risk of *irreparable harm*, including but not limited to Arts. 10 and 15 CRPD (at para. 9.4). The complaints concerning Arts. 12 and 13 CRPD were inadmissible for failure of substantiation (at para. 9.5). The Committee made reference to the HRC, CAT, and ECtHR jurisprudence already relied on in *N.L. v. Sweden* and held that the question therefore was whether upon the complainant's removal to Afghanistan, he would face a real risk of irreparable harm under Arts. 10 and 15 CRPD, "such as being exposed to a serious, rapid and irreversible decline in his health resulting in intense suffering or to a significant reduction in life expectancy" (at para. 10.7).

The Committee also reiterated that it was generally for the domestic authorities to evaluate facts and evidence, unless this is found to be "clearly arbitrary" or amounting "to a denial of justice" (at para. 10.8). Nevertheless, the Committee concluded that the complainant had discharged the burden of proving that there were substantial grounds for believing that he would be exposed to a real risk of ill-treatment upon removal to Afghanistan, while the Swedish authorities had failed to dispel the doubts about that risk. The Committee examined the general reports on the situation of health care in Afghanistan and reached the opposite conclusion from the Swedish authorities: the reports revealed "the limited availability of psychiatric care and access to medication" and a lack of trained professionals, infrastructure, and awareness about mental health issues with very limited resources covering a population of more than 30 million people. In contrast to the Swedish authorities, the Committee concluded therefrom that these deficiencies casted serious doubt on the availability of the health care needed by the complainant in order to prevent a violation of Art. 15 CRPD (at para. 10.9). The Committee added that individual assurances would have been "particularly important" given that the complainant had left Afghanistan at the age of 13 years and would face particular challenges in accessing health care (at para. 10.9). Given the accepted diagnosis of PTSD and the apparently undisputed diagnosis of paranoid schizophrenia, the Committee concluded on a finding of a violation of Art. 15 CRPD and did not consider it necessary to consider Art. 10 CRPD separately.

The CRPD Committee has so far decided one further application of an asylum applicant concerning an Afghan Hazara man who was missing three fingers on his right hand (M.Y. v. Sweden, 2021). The combination of this impairment with his ethnicity as a Hazara and the fact that he had been born out of wedlock had led to a life of exploitation and abuse, including rape. However, while confirming its ruling in *N.L. v. Sweden* (at para. 6.4) the Committee held that the complaint was inadmissible, as his claim that he was mistreated on the basis of his disability was vague and unsubstantiated (at paras. 6.5–6.6). While the Committee may have adopted a somewhat restrictive stance on disability as a contributing factor for serious harm, it is difficult based on the facts and the complaint as set out in this decision, to assess whether the link to disability had been sufficiently substantiated.

The development of the CRPD Committee's early case law concerning the refoulement prohibition displays a strong reliance on highly controversial jurisprudence in cases involving medical needs from other international human rights bodies. It is understandable that the Committee would reference refoulement case law concerning persons with disabilities, as there is otherwise a lack of appropriate guidance on such questions in international human rights law. Yet, as will be argued below, the danger of following the preexisting approach to these so-called "medical cases," particularly of the ECtHR and the HRC, is that the CRPD Committee adopts the medical model of disability in refoulement cases, and thereby deprives some of the most vulnerable persons with disabilities – those facing expulsion – of the promise of the CRPD's human rights approach set out above.

A New Approach to Non-refoulement of Persons with Disabilities

Before elaborating in more detail what a human rights approach to non-refoulement of persons with disabilities would require, it is instructive to consult the practice of other specialist UN Committees. For the practice of the UN treaty bodies has been commended as providing a more principled and sound approach to refoulement in such cases (Çali et al., 2021, p. 15).

The Practice of Other UN Committees

Several of the specialist UN Committees have in individual cases demonstrated that they are more qualified to provide a specialized interpretation of the refoulement prohibition in the area of their core competence than the generalist civil and political rights court, the ECtHR. In particular, the CAT and the CRC Committees have been described as vanguard when it comes to refoulement cases (Çali et al., 2020, p. 381).[21] Their decisions serve as good examples as to how UN Committees can act as the guardian of the rights of the particular group of persons or in relation to the particular issue entrusted to them.

For instance, concerning the right to rehabilitation of torture victims, the specialist body for issues surrounding torture, the CAT Committee, has in two decisions set out an entirely different approach from the ECtHR's medical cases. In its decisions in *A.N. v. Switzerland* and *Adam Harun v. Switzerland*, the Committee considered the lawfulness of the removal from Switzerland to Italy of an Eritrean and an Ethiopian torture victim respectively, who both required urgent medical treatment for their rehabilitation from torture (A.N. v. Switzerland, 2018; Adam Harun v Switzerland, 2018). As opposed to the ECtHR, which requires "intense suffering" before its refoulement prohibition even comes into play, the threshold for the applicability of Art. 3 CAT was crossed by virtue of the fact that the complaints concerned torture survivors with rights under CAT. In addition, the Committee did not exclusively focus on the need for medical treatment, but took a more comprehensive view of the right to rehabilitation services and an environment, in which rehabilitation from torture would be possible (Art. 14 CAT). In *A.N.,* the Committee found that the removal of the applicant to Italy without individual assurances that he would have immediate and long-term access to rehabilitation services constituted a violation of the right to rehabilitation of torture survivors in Art. 14 CAT, of the prohibition of cruel, inhuman and degrading treatment in Art. 16 CAT and of the refoulement prohibition in Art. 3 CAT. In *Harun*, the Committee negated the reliability of individual assurances, as the applicant had already once been removed from Norway to Italy and Italy had at that point assured that he would receive access to the desperately needed medical treatment, which transpired to be untrue. This decision serves as a timely reminder of the lack of reliability of such assurances also in the medical context (at paras 2.6, 9.10–9.11). In this case, the Committee found a violation of the refoulement prohibition in Art. 3 CAT in the case of the complainant's removal to Italy because of the lack of access to rehabilitation services, to accommodation, and to the necessary support measures (at paras 9.8, 9.11). These judgments contrast with an earlier ECtHR judgment in the case of a Syrian torture victim also in desperate need of rehabilitation services and medical treatment, also facing removal from Switzerland to Italy, in whose case, the Strasbourg Court applying its exceptionality threshold in medical cases found no breach of Art. 3 ECHR (A.S. v. Switzerland, 2015). At least when torture survivors with mental

---

[21] Other Committees have also proven to be protective of their areas of expertise in refoulement cases, for the CED, see *E.L.A. v. France*, comm. no. 3/2019, 25 September 2020, and even the CEDAW Committee, which has rightly been criticized for its inability to establish "much of a voice on the asylum claims of vulnerable women" (Çali et al., 2020, p. 369; Hodson, 2014, p. 572), has nevertheless demonstrated a more gender-specific interpretation of the refoulement prohibition, e.g., when it comes to private actor persecution, see *A. v. Denmark*, comm. no. XXX; or *R.S.A.A. v. Denmark*, comm. no. XXXX.

health issues resulting from torture are concerned, the CAT therefore appears to offer greater refoulement protection than the ECtHR (Çali et al., 2020, p. 382).

A further example of such a specialist interpretation of the refoulement prohibition can be found in the jurisprudence of the CRC Committee. In addition to the prohibition of torture and cruel, inhuman or degrading treatment, the Committee has extensively relied on the duty to give primary consideration to the best interests of the child pursuant to Art. 3 CRC, finding violations in several expulsion cases so far (A.B. v. Finland, 2021; A.M. (on behalf of M.K.A.H.) v. Switzerland, 2021; I.A.M. (on behalf of K.Y.M.) v. Denmark, 2018; R.H.M. v. Denmark, 2021; V.A. (on behalf of E.A. and U.A.) v. Switzerland, 2020; W.M.C. v. Denmark, 2020). The CRC Committee has also made it clear that the best interests of the child override the general interests in migration control ("Joint General Comment No. 3 (2017) of the Committee on the Protection of the Rights of All Migrant Workers and Members of Their Families and No. 22 (2017) of the Committee on the Rights of the Child on the General Principles Regarding the Human Rights of Children in the Context of International Migration," 2017, para. 33). As a result, the best interests principle has been described as an "autonomous concept that may significantly limit domestic authorities' leeway" (Çali et al., 2020, p. 378).

Concerning refoulement cases of children with medical needs, the CRC Committee has equally refused to follow the ECtHR's restrictive approach in medical cases and has instead held in a case concerning a Sri Lankan family with a baby diagnosed with congenital hypothyroidism that the test was whether medical treatment which is "essential for the life and proper development of the child" is available and accessible in the destination state (D.R. v. Switzerland, 2021, para. 11.6). On the basis that there was extensive published research in Sri Lanka on this disease and that its treatment was "simple, inexpensive and available in the public and private health systems," the Committee found no violation of the refoulement prohibition in this case (at para. 11.6). It is noteworthy, however, that in addition to the invoked Art. 3 CRC, the Committee decided of its own initiative to consider this refoulement case not only under the prohibition of torture or cruel, inhuman or degrading treatment (Art. 37(a) CRC), but also under the right to the maximum extent possible of the survival and development of the child (Art. 6(2) CRC) and the right to the highest attainable standard of health (Art. 24 CRC) (see paras 10.6, 11.6).[22]

The CRC Committee's willingness to provide a wholistic examination in refoulement cases of children can also be gleaned from its recent decision in *A.M. v. Switzerland* concerning the removal of a single mother and her child to Bulgaria. In particular, the Committee took due account of both the mother's mental illness and the fact that the child had suffered trauma as a victim of armed conflict (A.M. (on behalf of M.K.A.H.) v. Switzerland, 2021, para. 10.7–10.8). It considered the destabilizing impact their removal would have on the mother's mental health,

---

[22] See also the recent CRC decision in *K.S. and M.S. v. Switzerland*, comm. no. 74/2019, 10.02.2022, para. 7.6, finding a violation of the right to health in Art. 24 taken with Arts. 3 and 6 CRC.

who, for financial reasons, would not have access to medical treatment in Bulgaria, and the fact that the child had not been able to receive services and treatment necessary for his recovery in the past in Bulgaria. Consequently and because of the dire living conditions and the lack of education for the child, the Committee concluded upon a violation of Arts. 6(2), 22, 27, 28, 37, and 39 CRC in case of their removal (A.M. (on behalf of M.K.A.H.) v. Switzerland, 2021, para. 10.8; see also the grant of an interim measure in the case of an Angolan child with a pervasive developmental disorder who required specialist treatment and education, which would not have been available and accessible in Angola in J.G. v. Switzerland, 2019 struck out of the list after grant of a residence permit).

In a ground-breaking admissibility decision, the CRC Committee further accepted that children could claim victim status for the exacerbation or instigation of a child's illness or disability by different states' failures to mitigate the effects of climate change and actually perpetuating its effects (Sacchi and Ors v. Argentina, Brazil, France, Germany and Turkey, 2021, declaring the applications inadmissible for lack of exhaustion of domestic remedies; see also on the issue of climate change Teitiota v. New Zealand, 2019; discussed in Çali et al., 2020, p. 368).

It is worth mentioning that the HRC, which is not specialized as the other Committees but also a generalist civil and political human rights body, has generally followed the ECtHR's approach to medical cases applying an exceptionality threshold (Çali et al., 2020, p. 382). However, it has granted applications in medical cases more often than its European counterpart (Z. v. Australia, 2014; A.H.G. v. Canada, 2015; Jasin v. Denmark, 2015; R.A.A. and Z.M. v. Denmark, 2016; Abdilafir Abubakar Ali and Mayul Ali Mohamad v. Denmark, 2016; Rezaifar v. Denmark, 2017; Y.A.A. and F.H.M. v. Denmark, 2017). Nevertheless, by applying the exceptionality threshold, the HRC takes a different approach from its more specialized counterparts when it comes to the protection of persons with disabilities or medical needs.

In sum, the specialist UN Committees have demonstrated that they act as guardians of particular groups – for instance, of children or of victims of torture and their rights – and that they can step up to the task or providing adequate protection in the area of their core competence also in the context of the refoulement prohibition.

The Role of the CRPD Committee

The CRPD Committee has started to develop its own practice in relation to the refoulement of persons with disabilities and has in some decisions demonstrated that it is ready to be the guardian of the human rights of persons with disabilities also in expulsion settings. In *O.O.J. v. Sweden*, for instance, the CRPD Committee set out a test which was fully in line with the human rights approach by stating that all CRPD violations could, under certain circumstances, prohibit the removal of a person with disabilities. This general statement is in line with the human rights-based approach to disability, which does not reduce the impact of an impairment to its medical implications, acknowledging instead the various barriers which exist in today's societies for persons with disabilities.

Also noteworthy is the Committee's lack of deference in *Z.H. v. Sweden*, in which it demonstrated that it would provide national authorities with limited leeway for doubtful evidentiary assessments. In this sense, the CRPD Committee is already following in the footsteps of its more experienced counterparts, such as the CRC Committee, which has been commended for not following a doctrine of deference at the moment, possibly because of the "significant deficiencies it finds in the countries it has cases from" (Çali et al., 2020, p. 382). A comparable extent of deficiencies likely pertains in the context of many refoulement cases of persons with disabilities.

However, there are some tendencies in the CRPD Committee's decisions in *N.L. v. Sweden* and *Z.H. v. Sweden*, which may lead the Committee to fall into the trap of the ECtHR's case law on "medical cases," following not only a prohibitively restrictive approach with its "exceptionality threshold" but also a line of case law which is based on the medical model. Instead of continuing to follow the ECtHR's approach in these "medical cases," the CRPD Committee may develop its own approach which is compatible with the general protections of the CRPD, justifying limited deference at present.

First, it is suggested here that the CRPD Committee may draw inspiration from the CRC and CAT Committees concerning complainants with medical needs. For instance, the CRC Committee has set out in *D.R. v. Switzerland* that it will examine whether the medical treatment which is "essential for the life and proper development of the child" is available, thereby rejecting the "intense suffering" and "rapid and irreversible decline in health" tests from *Paposhvili* and *Savran*. Similarly, the CAT Committee considered it pertinent in *A.N.* and *Harun* whether the complainants would have immediate and lasting access to the required medical treatment and would find themselves in living conditions which were conducive to the rehabilitation from torture, thereby taking a more holistic view of the complainants' situation in the destination country.

Secondly, if the human rights approach to disability is to be implemented also for persons with disabilities facing removal, an interpretation of the refoulement prohibition as including various CRPD-rights violations is necessary. The CRPD Committee may go back to its original statement in *O.O.J.* that in fact many violations of CRPD rights may amount to serious harm and therefore act as a bar to removal in expulsion cases. In this regard, the Committee may draw inspiration again from the CRC and CAT Committees, who have already relied on rights other than just the refoulement prohibition (in Art. 3 CAT and Art. 37(a) CRC), such as the right to rehabilitation (in Art. 14 CAT) or appropriate measures to promote physical and psychological recovery and social reintegration (Art. 39 CRC), the right to appropriate protection and humanitarian assistance (Art. 22 CRC), the right to an adequate standard of living (Art. 27 CRC) and to education (Art. 28 CRC), or the right to have the best interests of the child taken into account as a primary consideration, the child's right to survival and development or the highest attainable standard of health (in Arts. 3, 6 and 24 CRC). As the guardian of the human rights of persons with disabilities, the CRPD Committee is tasked with their protection from disability discrimination in expulsion settings. While it is generally accepted in international human rights law that nonnationals can be treated less favorably, a more in-depth scrutiny is required when the differential treatment results in discrimination (Vandenhole, 2014, p. 218). There is also an acute concern about the links between racism and migration (Vandenhole, 2014, p. 218). Given that discriminatory attitudes towards persons with disabilities persist in many countries around the world, a particularly rigorous scrutiny will be required in the context of expulsion cases. Several violations of the CRPD have the potential of seriously affecting a person's life to the extent that it causes them serious harm, such as violations of the right to liberty and security of the person in Art. 14 CRPD which has been described as "one of the most precious rights to which everyone is entitled" (CRPD, 2016, para. 3) and of the corresponding right to live independently and be included in the community in Art. 19 CRPD (CRPD, 2016, para. 9). Equally, violations of the freedom from exploitation, violence, and abuse, and the right to respect for physical and moral integrity and security, e.g., through forced treatment, in Arts. 16 and 17 CRPD as well as in the case of female applicants Art. 6, will regularly amount to serious harm. Children may experience serious harm through the denial of their rights to access to education and child- and disability-specific living conditions in Arts. 24, 28, and 7 CRPD and an adult may face serious harm on account of violations of the rights of access to employment, accessibility, and personal mobility in Arts. 27, 20, and 9 CRPD (see in detail on all of this Motz, 2021, Chap. III). In its examination of communications, the Committee may also find it appropriate to examine additional rights *proprio motu*, as the CRC Committee has for instance done with the rights concerning survival, development and health (under Arts. 6 and 24 CRC, see *D.R. v. Switzerland*, paras 10.6, 11.6).

While there may be an issue of fragmentation if the Committee departs from the ECtHR's approach (Çali et al., 2020, p. 357),[23] other UN Committees have not been stopped by this risk from undertaking a thorough and rights-based assessment in specific refoulement cases.[24] An example of this is the CRC Committee's decision in *D.D. v. Spain* concerning the removal of a minor from the Spanish border in Melilla to neighbouring Morocco (D.D. v. Spain, 2019). The Committee here reached the opposite conclusion from the previous judgment of the ECtHR in *N.D. and N.T. v. Spain*, concerning adults who tried to cross the same border and were sent back, and found violations of Arts. 3 and 37 CRC. The ECtHR decided quite differently, finding the case concerning refoulement under Art. 3 ECHR inadmissible and only communicating the issues relating to the collective expulsion under Art. 4 Protocol 4 to the government, and then finding no violation in relation to that either (see N.D. and N.T. v. Spain, 2020, paras 3–4 on the noncommunication of the

---

[23] Çali et al. (2020), p. 357.

[24] Compare the CRC Committee's ruling in *D.D. v. Spain* with the ECtHR's ruling in ND and NT v Spain a few months prior – the CRC Committee stepped up to its tasked and reached the opposite conclusion from the ECtHR based on the CRC-specific guarantees for children.

refoulement aspect). While the CRC Committee's position on this has been described as vanguard on extraterritoriality by stating that border guards have a duty to protect children at their borders (Çali et al., 2020, pp. 381–382), the ECtHR's assessment has been criticized as "cursory" and the lack of a finding of violation as inconsistent with the Court's own case law (Moreno-Lax, 2021, pp. 50, 52). These potentially conflicting assessments, however, enrich the human rights dialogue which already exists in a "polycentric legal system" such as that of international human rights law (Zimmermann, 2022, p. 439).

It is important that the CRPD Committee, as the specialist body entrusted with disability rights at the UN level, steps up its efforts as the guardian of the human rights of persons with disabilities also for those in need of international protection.

Conclusion

The examination of the existing case law at an international level has demonstrated that the scope of the refoulement prohibition has not been markedly widened by the practice of the CRPD Committee in expulsion cases. On the contrary, the Committee has so far shown some hesitation in applying the full range of disability rights to persons with disabilities who face expulsion. In particular, the CRPD Committee has placed strong reliance on the ECtHR's judgment in *Paposhvili v. Belgium* and therefore on the ECtHR's restrictive stance in so-called "medical cases." It has been argued in this chapter that the ECtHR's approach in these cases, with its almost exclusive focus on the severity of the illness and the availability of the required medical treatment, relies on a medical model of disability. The ECtHR has applied this restrictive approach – which includes a threshold of requiring a case to be "very exceptional" – not only to persons with disabilities, who have acute medical needs, but also to persons with disabilities in general, who may not have particular medical needs as in the case of the Afghan applicant in *S.H.H. v. United Kingdom*. In addition, the recent Grand Chamber judgment in *Savran v. Denmark* has clarified that the Court does not consider the refoulement prohibition in Art. 3 ECHR applicable to persons with disabilities in most circumstances.

The recommendation has therefore been for the CRPD Committee to look to its specialized counterparts of other UN human rights treaties, particularly the CRC and CAT Committee's case law in cases involving medical and rehabilitation needs and develop its own approach to refoulement cases of persons with disabilities. In addition, some aspects of the Committee's decisions so far indicate that the CRPD Committee may be readier than may appear to fully protect persons with disabilities who require international protection. These relate to the limited deference the CRPD Committee accorded to national authorities in *Z.H. v. Sweden* concerning the evidentiary assessment and the different CRPD violations which may bar a person's removal mentioned first and most clearly in *O.O.J. v. Sweden*, but reaffirmed, though in a qualified manner, in subsequent decisions.

Yet, this will not constitute a widening of the scope of the refoulement prohibition. Rather, such an approach will provide for the necessary disability-sensitive interpretation of *non-refoulement* and realize the full impact of the CRPD for persons with disabilities in removal situations, who are among the most marginalized and disenfranchised members of society, and thereby also render the human rights model of disability a reality in the context of refoulement.

Inclusive Processes for Refugees with Disabilities: Improving Communication for Deaf Forced Migrants

89

Laura Smith-Khan

Contents

Abstract

The coming into force of the United Nations (UN) Convention on the Rights of Persons with Disabilities (CRPD) has created an opportunity to evaluate and re-design responses to forced migration, on both domestic and international levels. Indeed, since the creation of the CRPD, international and domestic

organizations have taken a number of steps to make their processes more inclusive. Communication is fundamental to almost every aspect of refugee-related processes, from registration, through status determination, to needs assessments and resettlement evaluations. Ensuring that asylum seekers and refugees, including those who are deaf or hard of hearing, are able to effectively communicate and access information throughout these processes is thus a crucial prerequisite to them being able to enjoy their rights.

The chapter first briefly summarizes the key international legal provisions governing the procedural and communication-related rights of refugees with disabilities and explores recent updates to UN Refugee Agency guidance in this area. It then examines existing scholarship that demonstrates the central importance of effective communication to the crucial refugee status determination (RSD) process. This is followed by an exploration of existing research on disability in forced migration, with particular attention to communication involving refugees who are deaf or hard of hearing. The chapter concludes with a discussion of possible next steps within research and practice best to ensure inclusive and effective communication and thus to promote the enjoyment of procedural rights and access to protection for deaf refugees and asylum seekers.

Keywords

Asylum · Deaf · Hard of hearing · Sign language · Interpreting · Credibility · Communication · Refugee status determination

Introduction

> At the reception center there was another (asylum seeker) who came from the same hometown. . .as me. He got asylum fast! I was surprised and asked and wondered why, he did not lie. . . . we got a negative decision. Allah, we still hope. . . . He is hearing! He can speak. He can speak easily and powerfully. I can't (speak). I am deaf and I have to repeat my signing many times and it is hard. (quoted in Sivunen, 2019, pp. 11–12)

International Human Rights Law requires that all asylum seekers have the opportunity to participate in processes for refugee status determination (RSD) and to access protection on an equal basis with others. In RSD interviews and other hearings and appeal processes, communication is often pivotal. Being able to express oneself, and share one's experiences and fears in a convincing way, is often crucial to gaining protection. While the challenges of communicating across cultural and linguistic diversity have been widely acknowledged, how deaf people fare in these processes is much less documented. The experiences shared by deaf asylum seekers in a recent study in Finland (Sivunen, 2019), including the one cited above, provide rare and valuable insight into the potential inequalities in these all-important processes. However, beyond such exceptional research, much remains to be examined to adequately identify and address issues within these processes.

To elucidate what is currently acknowledged, required, and known regarding the participation of deaf and hard of hearing refugees[1] in decision-making processes, this chapter explores and brings together a combination of three analyses. First, it examines current international laws and standards that apply to RSD processes and other official interactions to better understand how the rules address the rights of deaf refugees. Second, following this, it summarizes transdisciplinary scholarship on communication in RSD processes to clearly set out the main concerns identified in this area. As this examination demonstrates, however, there is very little research specifically incorporating disability and even less particularly focused on the experiences of deaf people in these processes. For this reason, the third part of the analysis examines a broader body of research focused on refugees with disabilities generally, and deaf refugees more specifically, to uncover what *is* known about their experiences communicating in official encounters. The final part of the chapter reflects on these three analyses in combination and discusses the implications and next steps for both policy and practice and for research. It finds that across both these areas, there is still much to be done to ensure that deaf refugees can really enjoy their rights to participate and communicate in migration processes, and thus to access protection, on an equal basis with others.

International Rights and Rules on Communication and Procedural Fairness

International Rights

While the CRPD does not mention refugees and asylum seekers specifically, article 11 creates obligations on states "to ensure the protection and safety of persons with disabilities in situations of risk, including situations of armed conflict, humanitarian emergencies and the occurrence of natural disasters." It is now well established that this provision applies to forced migrants and creates obligations not only for states parties but also for UN bodies, such as the UN High Commissioner for Refugees (UNHCR) (Crock et al., 2013; Crock et al., 2017, Chap. 2; Schulze, 2010) (for an extensive analysis of the relevant international rights framework, see ▶ Chap. 84, "Disaster and Climate Change-Induced Displacement of Persons with Disabilities: A Human Rights Perspective," by Kälin, in this Volume). The existence of the CRPD rights in forced migration is crucial, as the CRPD explicitly addresses a number of

---

[1] Throughout this chapter, I refer to deaf refugees and asylum seekers, and refugees with disabilities or disabled refugees, with an understanding that different individuals identify with different terms and have diverse naming practices. In many contexts, deaf people may identify primarily as being a member of a linguistic and cultural minority group and may or may not identify as being disabled. However, for some, the experience of disability is created or exacerbated through particularly difficult social, political, and legal structures, such as those common in situations of forced displacement. See, e.g., discussion in McAuliff (2021).

rights not contained within the Refugee Convention, yet essential to the enjoyment of the rights contained within the latter.

Underlining the importance of accessible procedures in migration processes is article 18, on the liberty of movement and nationality. This provision requires that individuals "[a]re not deprived, on the basis of disability, of their ability . . . to utilize relevant processes such as immigration proceedings" (art 18(1)(b)). Article 21 reinforces the need to take practical steps to ensure rights to "receive and impart information," requiring States parties to "take all appropriate measures." The provision goes further by listing concrete examples of such measures. These include "Accepting and facilitating the use of sign languages, Braille, augmentative and alternative communication, and all other accessible means, modes and formats of communication of their choice by persons with disabilities in official interactions" (art 21(b)) and "Recognizing and promoting the use of sign languages" (art 21(d)).

Also relevant to accessible RSD processes are the fundamental, overarching CRPD principles such as the article 2 obligation to make reasonable accommodations and the article 9 accessibility obligation, which includes specific requirements to ensure that communications and information are accessible (see, e.g., subsections 2(d), 2(e), and 2(f)). The CRPD also emphasizes the right of disabled people to legal capacity (article 12(2)), requiring that "measures relating to the exercise of legal capacity respect [individuals'] rights, will and preferences" (article 12(4)). It likewise requires ensuring effective access to justice "including through the provision of procedural and age-appropriate accommodations, in order to facilitate their effective role as direct and indirect participants" (13(1)), made possible through the provision of appropriate training for officials working in the justice system (13(2)).

As will become clearer in the below analysis, the article 24 right to education is also of crucial importance. It requires appropriate accommodation and measures to ensure access to education for disabled people on an equal basis with others (art 24(5)), in order "to facilitate their full and equal participation in education and as members of the community" (art 24(3)). Among other things, this explicitly requires "facilitating the learning of sign language and the promotion of the linguistic identity of the deaf community" (art 24(3)(b)).

This combination of provisions makes it clear that deaf refugees and asylum seekers have equal rights to participate in RSD and related decision-making processes on an equal basis with others. Further, and crucially, the CRPD repeatedly stresses throughout these provisions that these rights are unlikely to be realized unless State and non-State actors take multiple specific, concrete steps to ensure deaf people's equal opportunity to participate.

UNHCR Rules and Guidance

Recognition of these participation rights and obligations is reflected on an international level in progressive reforms to UNHCR policy and guidance documents, notably commencing with the introduction of "Need to know guidance: Working with Persons with Disabilities in Forced Displacement" in 2011 (for further exploration of disability-related reforms, see ▶ Chap. 87, “Disability and Refugee Protection,” by Crock in this volume). This guidance includes an instruction to “use appropriate information, dissemination and communication” and lists examples of how this might be achieved (page 13). It further acknowledges that persons with disabilities “have the right. . .to participate in all humanitarian activities, including documentation, registration and legal status” (p. 7). To achieve this, it suggests, inter alia, that staff should “make all reasonable efforts” to ensure access to services, including through the provision of information and communication (p. 8).

The next notable reform addressing inclusive participation came in 2013, with the development of a focused *Resettlement Assessment Tool* (UNHCR, 2013b). Alongside instructions on assessing individuals’ resettlement eligibility, the Tool requires staff to make both information about resettlement and the resettlement interview itself accessible for people with disabilities. For the interview, this means that “All accommodations must be made during the interview to enable refugees with disabilities to participate and ensure that their wishes and needs are considered fully.” It instructs staff to consider individuals’ specific needs when preparing for the interview, and “assess whether specialized interpreters or aids are required,” and also suggests that additional time may need to be allocated (p. 7).

Finally, in 2020, UNHCR updated its *Procedural Standards for RSD (UNHCR, 2020)*. This update removed some problematic language that reflected a medical-model approach to disability, such as references to “suffering” from disability. Significantly, this updated version now includes extensive guidance on the participation of applicants with “mental health concerns or intellectual disabilities” (see section 2.9). This section stresses the need to take all reasonable steps to ensure that applicants with mental health conditions or intellectual disabilities are able to meaningfully participate in the RSD process. It reminds staff of how these conditions may affect recall and the way in which applicants recount events and sets out specific procedural safeguards, accommodation, and support measures. These include, inter alia, identification and protection interventions and provision of “clear, accessible and easy to understand information about the RSD process and procedures, and adequate support to present their refugee status claims” (para 2.9.2(b)). They require that “information [about rights and obligations] must be provided in accessible formats and language” (para 2.9.2(b)) and recommend that all staff involved in RSD procedures involving applicants with mental health conditions or intellectual disabilities should be appropriately trained to do so (para 2.9.2(c)).

Guidance around assessing capacity to participate has been greatly improved from the 2003 standards, commencing with a statement that people should not be excluded just because they have a mental health condition or intellectual disability. Further, staff are instructed that before the interview, specific measures and accommodations should be explored to “maximize effective participation” and “The Applicant’s capacity to understand the RSD process and procedures should inform the way the RSD Interview is conducted, in particular the interviewing techniques and communication methods.” It also suggests that breaks, short interviews, postponing discussion of traumatic events, including a support person, and/or assigning an alternative officer and/or interpreter may assist (para 2.9.2(g)).

However, while such advice could undoubtedly benefit many refugees, there remains little specific discussion of how deaf asylum seekers should be accommodated or, indeed, consideration of vision or speech-related disabilities that may also affect communication or access to information. While there are no mentions of deaf people in the Standards, there are two mentions of people with hearing impairment. One relates to the potential inappropriateness of conducting interviews via telephone or video conference with “Applicants who have specific needs or vulnerabilities, in particular children, persons with hearing or visual impairment or mental health issues. . .” (section 4.3.2) The Standards also suggest that someone “suffering” from a hearing or speech impairment may require a “third party” to attend an interview “in order to facilitate communication” (section 4.3.4). However, there is no specific mention of using sign languages, and 4.3.4 does not explicitly state that such a “third party” could include a sign language interpreter.

Considerations related to recruiting, training, and including appropriate sign language interpreters are not raised. However, there is extensive guidance on the use of interpreters more generally (see section 2.5). This contains important principles for all asylum seekers, including the foundational requirement that “all communications between an Applicant and UNHCR must take place in a language that the Applicant understands and in which he/she is able to communicate clearly” (2.5.1). There are also warnings against using unqualified people or family members as interpreters whenever possible. The Standards advise that decision-makers should be particularly cautious when evaluating credibility in situations where the applicant does not have a UNHCR-employed and qualified interpreter (2.5.3). These cautions are particularly pertinent for forced migrants who may use a particular signed language from their country of origin that is not commonly used in the host country or who use family home sign (for an introduction to and discussion about home sign, also called homesign, and other sign language-related terms, see, e.g., Hou & Kusters, 2019).

Similarly, UNHCR’s Handbook on Procedures and Criteria for Determining Refugee Status (2020) identifies “mentally disturbed persons” as a group that may give “rise to special problems in establishing the facts” (paras 206–212). Children with disabilities are also noted as requiring “whatever mode of communication they need to facilitate expressing their views” (para 71). However, the Handbook does not elaborate regarding procedures to the same extent as the Procedural Standards, and there is no specific mention of considerations for people who are deaf or hard of hearing.

Recent developments in international law emphasize ensuring the equal and fair participation of people with disabilities in decision-making processes that affect them. Reform in UNHCR policy has followed suit, introducing guidance to improve the way UNHCR officials conduct refugee-related procedures and offering influential standards for domestic asylum agencies. In many ways, these guidance texts reflect the issues identified and emphasized in an increasingly large body of scholarship on communication in refugee-related procedures, which the next section explores.

Communication in Refugee-Related Procedures

The central importance of language and communication in refugee-related procedures is well established across a wide range of scholarship. Much of this literature focuses on RSD and more specifically on the interview, hearing, and statement-writing processes associated with producing what is often called the refugee or persecution narrative. As early as Walter Kälin's (1986) foundational article on cross-cultural misunderstandings in asylum hearings, scholars and practitioners have shared an appreciation for the complex yet pivotal nature of communication in these processes.

Yet significant challenges remain to this day. Scholars across multiple disciplines, from law, through psychology, to linguistics, emphasize the difficulties inherent in eliciting and assessing a narrative suitable for the purposes of determining whether an applicant meets the refugee definition set out in article 1A(2) of the 1951 Convention (or a domestic law equivalent). The types and sources of these difficulties are multiple but perhaps unsurprising, given that intercultural communication is a common feature of RSD processes and that they often involve people who have experienced forms of trauma (UNHCR, 2013a, p. 30).

That RSD processes often heavily emphasize assessing applicants' credibility increases the centrality of communication. This is because many of the indicators for deciding whether applicants and/or their narratives are believable rely on particular assumptions about what an honest person's communicative performance should look like. For example, credible narrators are generally expected to recount "logical, linear" stories (McKinnon, 2009, p. 213), and at times there is an overreliance on this expectation, despite guidance warning of the many reasons why consistency may not be possible (see, e.g., UNHCR, 2013a, p. 164). Researchers continue to contest such an overreliance on narrative consistency, pointing to the fact that it is rare for *anyone* to recount stories consistently over time (Cohen, 2001). They also point out that both individual and cultural diversity means that what asylum seekers remember and the way they make sense of their experiences may differ significantly from decision-maker expectations (Evans Cameron, 2008; Jacquemet, 2011).

Cultural differences can also influence whether a decision-maker finds elements of the narrative plausible (Sweeney, 2009). For example, decision-makers may not accept the way a particular applicant assesses risk or responds to a threat. This can stem not from these reported behaviors being untrue, but rather from the gap between a decision-maker's own life experiences and cultural viewpoint and that of an applicant (Dowd et al., 2018; Herlihy et al., 2010). Further, applicants' identities may be viewed in essentialized ways, with stereotypical assumptions about their ethnic, national, religious, or social group influencing decision-maker expectations about how they should think and act (Anker, 1992; Blommaert, 2001; Maryns, 2013; Smith-Khan, 2017a).

The particular language of the RSD interview and/or the language of interpreting are also important considerations that may be overlooked or underacknowledged. For example, research has documented the amplified potential for miscommunication when the applicant and/or the decision-maker is using their non-primary language or when they have a different language dialect, variety, or accent from each other and/or from the interpreter. These factors have led to significant misunderstandings that create apparent narrative inconsistencies which can prove fatal to an applicant's success (Maryns, 2005, 2006).

Interpreting also often plays a central role in RSD interviews, yet the nature of interpreting, and the many potential impacts of having an interpreter participate in these processes, remains underappreciated in many cases. Putting aside cases of dialect difference, poor interpreting, and errors (on these, see discussions in, e.g., Smith-Khan, 2020, 2021b), even the best interpreting entails a range of linguistic choices. It is practically impossible for a particular sentence or even sometimes one word to have only one possible translation. Interpreters also make decisions related to relaying tone and emotion as these also affect the creation of meaning and may be pivotal to the assessment of credibility (Inghilleri, 2003; Tipton, 2008; van der Kleij, 2015).

Moreover, interpreters are people and thus bring to any interaction their own beliefs and personal attributes which inherently influence the way that others perceive and interact with them (Merlini, 2009; Pöllabauer, 2004). Most obviously, this can affect how comfortable asylum seekers feel when sharing intimate or traumatic aspects of their experiences or identity, especially when they stem from being a member of a stigmatized group (see, e.g., Smith-Khan, 2019a, p. 408). Power asymmetries may also mean that asylum seekers become aware of interpreting issues but do not communicate this to the decision-maker in the moment (see example in Smith-Khan, 2017b) or that the interpreter may not feel comfortable interjecting to explain difficulties or complexities in the interpreting process (Cho, 2021a, 2021b).

Other factors may also prevent or delay asylum seekers from disclosing information about themselves or their experiences that may be important for their claim. Delayed or limited disclosure can be related to trauma (Herlihy et al., 2010) or not feeling comfortable sharing personal information with a lawyer, interpreter, and/or decision-maker who they have just met (Kenny & Fiske, 2004; Smith-Khan, 2021b). Applicants may believe that a particular experience is not relevant to their claim or that the decision-maker may not understand it (see, e.g., Bohmer & Shuman, 2007, who discuss a woman escaping female genital mutilation). Yet, delayed disclosure can be harmful to an applicant's credibility, and some jurisdictions specifically block applicants from providing additional details about their experiences or identities after their initial claim is made. For example, in Australia, fast-track review processes for asylum seekers who arrive without a visa rarely allow applicants a fresh hearing (McDonald & O'Sullivan, 2018). Further, decision-makers must draw an unfavorable credibility inference if new information is provided at the review stage without "a reasonable explanation" for why the information was not provided earlier (section 423A of the *Migration Act 1958* (Cth)).

Finally, access to and quality of legal assistance can make a significant impact on the way applicants are able to communicate their claims (Crock et al., 2020). Existing research identifies a number of communication-related roles that migration lawyers play, both directly, by drafting submissions and making oral statements, and indirectly by managing and mediating their clients' and other participants' interactions throughout the procedures (Jacobs & Maryns, 2021; Reynolds, 2020; Smith-Khan, 2020, 2021b). However, these roles have been found to be underacknowledged at both policy and individual case levels, once again leading to applicants being held responsible for factors beyond their individual control (Smith-Khan, 2021a).

This section provides only a brief overview of the myriad ways in which communication, the refugee narrative and assumptions about these, may have an impact on credibility assessment and RSD. What is clear from this substantial, interdisciplinary area of study is that there remain challenges with communication in RSD at two levels. First, the relevant law, policy, or guidelines may not adequately address the complex factors introduced above. Second, even if these documents address these factors, their practical implementation may be lacking or inconsistent. This has the potential to negatively affect RSD at multiple stages. Understandings about communication influence the rules and processes around choosing a language in which to conduct RSD interviews and identifying and booking a suitable interpreter in an appropriate language or dialect. When credibility issues arise due to linguistic reasons, applicants and lawyers who are able to identify and raise these, either during the interview or later in an appeal, will only be successful if decision-makers' beliefs about communication and credibility align with these reasons (Smith-Khan, 2019b, 2022).

It is for this reason that many scholars recommend that RSD processes should emphasize giving applicants the benefit of the doubt and rely much less heavily on scrutinizing credibility (Evans Cameron, 2018; Luker, 2013; Ruppel, 1991; Smith-Khan, 2019b). However, politics that increasingly seek to restrict and reduce numbers of asylum claims mean that many are skeptical about this fundamental shift becoming a reality (see, e.g., discussion in Bohmer & Shuman, 2007, Chap. 4).

Set against the communication complexities evident in this large body of interdisciplinary scholarship is the scarcity of accommodations for, and research about, asylum seekers and refugees who are deaf or hard of hearing.

Research on Deaf Refugees and Communication in Decision-Making

Very little research on communication in RSD or other refugee-related procedures explicitly addresses how people with disabilities fare in these processes. The significant exception is those studies exploring the role of trauma and mental health (e.g., Byrne, 2007; Cohen, 2001; Healicon, 2016; Hunter et al., 2013; Kenny & Fiske, 2004). This may perhaps explain the similar emphasis in the updated UNHCR Procedural Standards, where the most significant changes relate to mental health and intellectual disability. This section summarizes the research that *does* address considerations for people who are deaf and hard of hearing within refugee-related procedural communication.

A number of existing studies have explored the application of the CRPD on how refugee law is interpreted in RSD processes, for example, examining how a well-founded fear can be established, how disabled people can be considered a social group, and how disabled people's experiences may constitute persecution (e.g., Dimopoulos, 2016; Peterson, 2014). Some have also examined the requirements the CRPD creates regarding how RSD procedures are conducted. Those studies that have explored procedural requirements identify and discuss the obligations created by the CRPD (e.g., Camino Morgado, 2019, examining international and domestic law relevant to Peruvian RSD processes; Crock et al., 2013, who examine these obligations more globally).

Rarer are studies that explore the accommodation of disability in RSD procedures empirically. In fact, the literature search undertaken for this chapter identified no studies involving first-hand observations of RSD interviews or hearings that focused on the accommodation of disability generally or deaf participants specifically. Perhaps this should be unsurprising, since such interviews are notoriously difficult for researchers to access, given the sensitivities of this setting (Nikolaidou et al., 2019). However, there is an emerging body of scholarship that explores the experiences of refugees with disabilities in institutional encounters. This includes qualitative research with refugees and asylum seekers, including some focused specifically on deaf people and others interested in disabled people more broadly. Further, other studies focus specifically on the experiences of deaf refugees, but, more broadly, beyond institutional decision-making processes (see McAuliff, 2021, for an excellent literature review). The combination of these bodies of work provides significant preliminary insights into key interrelated considerations and issues for deaf asylum seekers in RSD. These center around access to adequate interpreting, access to language acquisition and training, access to community participation and advocacy, and discrimination and disclosure.

Access to Adequate Interpreting

A key issue identified in existing research is the paucity of appropriate interpreting services for deaf asylum seekers during RSD processes. This includes asylum settings in the global north, where the provision of accredited interpreters is usually the norm. Researchers in both the UK (Roberts & Harris, 2002; Ward et al., 2008) and Finland (Sivunen, 2019) have noted a complete lack of availability of sign language interpreting in RSD and related institutional interactions in asylum seekers' sign languages of origin. Ward, Amas, and Lagnado cite a participant from a disability organization who reported that the Home Office did not provide interpreting or a relay service for deaf people and questioned "how do we know whether deaf people are expressing themselves in their applications and explain why they come to this country?" (Ward et al., 2008, p. 55).

The UK studies both noted that there was even a shortage of interpreters fluent in British Sign Language (BSL). This reflects what the World Federation of the Deaf (WFD) and World Association of Sign Language Interpreters (WASLI) have called a "global problem," noting that "the number of qualified sign language interpreters is very small in most countries" (WFD & WASLI, 2014, p. 1). Discussing deaf migrant children, they (along with other partners) have also noted that while migrants are generally provided with interpreting in a language they understand, deaf migrants are rarely afforded this right (WFD et al., 2016, p. 4).

Even where sign language interpreters are booked for RSD interviews, this can have limited success as the host country's sign languages are often completely unknown to the applicants, who are likely to use very different languages (Sivunen, 2019). In other cases, interpreters qualified in the spoken language(s) of the individual's country of origin are booked for appointments and interviews, with an expectation that asylum seekers know the language and can sufficiently rely on lip reading or literacy in this language as a means of communicating in these high-stakes interactions (Sivunen, 2019). A documented example of the latter is cited in a case study of an Iranian family in Australian immigration detention who were all profoundly deaf and were provided with a Persian spoken language interpreter and expected to lip read in their interviews and without access to their required hearing aids (Australian Human Rights Commission, 2014, p. 68).

At the other end of the spectrum, Olsen's study on interpreting with deaf refugees in Norway exemplifies a more concerted attempt to provide adequate interpreting in government service settings. She describes the complex cooperative processes Norwegian Sign Language (NTS) interpreters report using to overcome the difficulties interpreting for refugees who have limited knowledge of NTS. This requires relay interpreting, involving both a hearing interpreter (to work to and from Norwegian and NTS) and a second deaf interpreter, who is generally more capable of improvised communication with the asylum seeker. In combination, she explains how the two interpreters, along with the official and the refugee, are able to negotiate meaning and understanding. Additionally, the hearing interpreter explains to the official what is happening and sensitizes them regarding the complexity and limitations of the communication process. As she explains, this makes it "possible for the hearing official to grasp the extent of the linguistic obstacles the interpreters and deaf refugees are facing" (Olsen, 2019, p. 21). Such an approach is crucial to avoid holding the applicant responsible for inconsistencies and issues with detail that may emerge as a result of these obstacles.

The provision of appropriate sign language interpreters and/or hiring officials with relevant language skills varies greatly from place to place and organization to organization, with these practices seeming to be more the exception than the rule (Crock et al., 2017). For example, in Jordan, it was found that multiple organizations working with Syrian refugees had lists of sign language interpreters they called on when required, and UNHCR's resettlement office had an employee who knew Jordanian Sign Language, which is mutually comprehensible with its Syrian counterpart (Hendriks, 2008). In contrast, officials at a camp in Turkey explained that they did not have any sign language interpreting services and that they managed this by relying on family members of deaf people to communicate on their behalf as needed (Crock et al., 2015, p. 32).

Access to Language Acquisition and Training

An additional and interrelated challenge for the provision of appropriate interpreting is the barriers to language acquisition and education that deaf asylum seekers (and many other deaf people) face. They may have experienced significant barriers to acquiring a sign language in their life before fleeing their home country, through social isolation and barriers to education. This is an issue that has been identified across a number of studies, focused on refugees from diverse countries of origin. Having limited opportunities to acquire and maintain a national sign language in their home country obviously creates significant difficulties. It also reflects a broader global issue: only a minority of deaf people worldwide have access to education in signed languages and face relatively high rates of limited literacy and lower rates of access to education more broadly (Holmström & Sivunen, 2022).

Participants in various studies described using home sign or gestures to communicate with family members and relying on family to communicate with broader society on their behalf (Roberts & Harris, 2002; Sivunen, 2019; Ward et al., 2008). This leads to practices that contravene international standards, such as relying on spouses or other family members to communicate on behalf of deaf family members or to interpret for them. Such practices often reflect and reinforce gender- or age-based power inequalities, for example, with husbands speaking for wives and parents speaking for (adult) children (Crock et al., 2015; Sivunen, 2019; WFD et al., 2016; Youngs, 2010).

Unfortunately, barriers to language education and language use persist for many after seeking asylum too. Research has found that deaf asylum seekers' experiences during RSD, and when attempting to access government services, can vary greatly depending on their access to training in the sign language of the host country, and their access to other deaf people, with whom they can acquire and improve their sign language skills. Sivunen (2019) found, for example, that while all asylum seekers in Finnish reception centers should not only be able to, but are actually obligated to, attend language classes, no such classes had initially been provided in Finnish Sign Language (FinSL) for her research participants. This meant that deaf asylum seekers were effectively excluded from language training and therefore restricted from access to information and participation in processes and society on an equal basis with other asylum seekers.

In settings where there are a high number of deaf refugees, schools for deaf people or deaf units within mainstream refugee schools have been established, as is the case for refugee children in Dadaab and Kakuma refugee camps in Kenya (Le Maire, 2018b; Youngs, 2010) and deaf Bhutanese refugees of all ages in Nepal (Women's Refugee Commission, 2015). While education in the host country's national sign language may be available for deaf refugee children in many settings, such education is generally much less common for deaf refugee adults (Holmström & Sivunen, 2022).

Conversely, access to language learning in the country of asylum, and social connection with other deaf people, can contribute to much greater participation within RSD processes and beyond and have a concrete impact on RSD outcomes. Sivunen shared reports of asylum seekers who, after having acquired FinSL, were able to look back on their RSD records and identify and correct significant miscommunications and errors that they earlier had simply not known existed. Key to improving access to FinSL language education were asylum seekers' contact with local deaf Finnish volunteers who managed to visit some of the reception centers and proved to be powerful advocates for change (Sivunen, 2019).

Access to Community Participation and Advocacy

Research on refugees with disabilities frequently invokes the often-under-utilized potential for civil society, including disabled people's organizations (DPOs), to support and improve the experiences of refugees and asylum seekers (e.g., Crock et al., 2017; Women's Refugee Commission, 2008, 2015). Sivunen's study found that deaf asylum seekers benefited in multiple ways when local deaf volunteers visited their reception centers. Deaf volunteers acted as language brokers between asylum seekers and reception staff, advocated for a number of changes within the centers, and connected asylum seekers with local deaf clubs. They were important providers of language training (and advocating for making this training available in the first place) and sensitized deaf asylum seekers on their rights in Finland related to using sign language in public and in official interactions, something that had not been the experience of all participants in their home countries. Local DPOs also have the potential to act more formally as key service providers. For example, in the case of Sweden, the Swedish National Association of the Deaf has an agreement with the government to assist in "the management and integration" of deaf migrants (WFD et al., 2016, p. 3). Research in Dadaab camp in Kenya similarly identified the Kenyan National Association of the Deaf as a key player in setting up "deaf units" within the camp (Youngs, 2010). Deaf children in Uganda's south-western refugee settlements were also reported to attend nearby local schools for the deaf, run by Uganda's National Association of the Deaf (Smith-Khan & Crock, 2018).

Lack of access to local disabled people was a common problem identified by my colleagues and I in our research project across six refugee-hosting countries (Crock et al., 2017). We found that while in some locations, disability civil society groups had a strong presence locally, they may have limited contact with or knowledge about the presence of refugees in their country. The most striking example in our study was in Malaysia, where we brought together representatives of various DPOs with representatives of local refugee community groups. DPO participants explained that they simply did not know that there were any refugees living in their country, nor did they know of any conflicts in neighboring countries that would explain their presence. The Burmese ethnic community leaders present were able to sensitize them about their persecution fears and experiences. In the case of Malaysia, we noted that urban refugees were thus often hidden in plain sight, throughout city areas, officially unacknowledged by the government, creating a significant social barrier from the kind of support that local DPOs could offer.

In other places, the (intentional) location of refugee camps and settlements in isolated areas, under strict security where it is difficult to gain permission to enter or exit, can create similar barriers to these types of local supports (see discussion in Mirza, 2014). This can be an ironic outcome in these locations, where an official justification for centralizing refugees in a controlled setting like this is that it is easier to provide a range of services on-site. In practice in our research, we found that this meant that in some locations, camps may have a variety of free medical services, for example, but the geographical and social isolation from local communities can mean that other supports, like those offered by deaf volunteers in Sivunen's study, are completely absent. Sivunen (2019, p. 8) notes the level of isolation and access to community for different individuals varied significantly based on whether they were located in a regional or metropolitan reception center. Similarly, UK policies of dispersal have been identified as barriers to important supports for disabled asylum seekers. For example, Ward et al. (2008, p. 55) noted that the Royal Association for Deaf People provided a range of services for asylum seekers and refugees, including training in BSL and legal advice and advocacy. However, their London location meant that deaf asylum seekers and refugees who were in other locations had more significant geographical/financial difficulties accessing services than their non-deaf counterparts, who were more likely to be able to access local services. Likewise, policies that determine support based on visa status can mean that services available to resettled refugees may not be available for asylum seekers or those on a temporary visa (see, e.g., discussion in Federation of Ethnic Communities' Councils of Australia et al., 2019; Hirsch et al., 2019).

In contrast, where there is greater scope for community building, both between local people and refugees and within refugee groups, studies report more positive outcomes. For example, in Uganda, a number of projects aimed at empowering refugees with disabilities had led to the development of several refugee DPOs within the settlements and within the urban refugee community in the Ugandan capital, Kampala. These groups received support from local organizations, such as the Refugee Law Project (based at Makerere University), which give them opportunities to meet, and access training, and also assist them in domestic RSD processes by providing them with sign language interpreters (Crock et al., 2017). Similarly, cooperation between Jordanian authorities and a local institute for the deaf has led to the provision of education and support for some deaf children in Za'atari camp for Syrian refugees (WFD et al., 2016, p. 3).

In other camp settings, such as camps in Kenya (Le Maire, 2018a, 2018b; Youngs, 2010), deaf refugees of different countries of origin, living together and interacting with each other in daily activities and building a deaf community identity, have created opportunities for the acquisition of multiple sign languages, including those of the host country, the sign languages of refugees from different countries of origin, and the development of camp-specific sign languages. This can mean that individuals are more likely to have access to a sign language that they understand in their interactions with officials.

Disclosure, Identification, and Discrimination

Another key issue identified for refugees who are deaf or hard of hearing when navigating institutional processes relates to the appropriate identification of their disability. This is generally a prerequisite to organizing appropriate accommodations.

It is widely acknowledged that organizations tasked with RSD and providing other assistance to refugees have not always systematically identified disabilities or done so in ways which adequately identified the particular supports or adjustments required to ensure that the organization was meeting their obligations to provide equal access and support (see Smith-Khan et al., 2015, for an extensive discussion on identification).

In some cases, a medical approach to disability may create extra-bureaucratic barriers to identification for deaf people, for example, requiring refugees to acquire hearing test results (at their own expense) to prove that they are deaf or hard of hearing as a prerequisite to this being officially recorded and accommodated (Smith-Khan et al., 2015).

Also significant are the fears and risks around disclosing disability due to the potential for a range of discrimination to occur if their disability is identified. One notable form is policy-based discrimination, when it comes to applying for a visa or accessing resettlement. In her study with deaf migrants in Victoria, Australia, Willoughby noted that some participants did not disclose hearing impairments or deafness due to their fear that it could affect their chances of being selected for resettlement in a third country, like Australia. This fear often continued to have negative impacts post-settlement, as some participants noted that they continued to not disclose and not request supports because they were afraid of potential negative repercussions for their visa (see discussion in Willoughby, 2015). Visa-related fears are not unfounded, given the historical and ongoing discrimination against disabled refugees in international and domestic law and policy in many contexts (Crock et al., 2017; Hirsch et al., 2019; Mirza, 2010; WFD et al., 2016).

Beyond problematic policy, studies have identified other reasons for not disclosing disability (Smith-Khan et al., 2015). Willoughby's study mentioned fears related to social stigma, and similarly, research with Bhutanese refugees with disabilities in Nepal noted a perception that deaf refugees were at higher risk of experiencing sexual violence (Women's Refugee Commission, 2015).

Reluctance to disclose and the broader failure of officials to identify and make suitable accommodations have obvious implications for asylum procedures. Applicants are closely scrutinized on their communication, and in such a situation, miscommunication has the potential to be both substantial and unidentified and therefore harmful for applicant credibility.

Reflecting on RSD, Communication, and Credibility for Deaf Refugees

There has been very little research conducted specifically exploring the experiences of asylum seekers and refugees who are deaf or hard of hearing in RSD and other official decision-making processes. However, some implications emerge from the scholarship, rules, and standards examined above.

One key observation from the large body of literature on language in credibility assessment is that when rule-makers and/or decision-makers underestimate the complexity of communication or have problematic beliefs about how language works, this can cause problems for *all* asylum seekers' participation in RSD processes. Their linguistic needs may be underestimated, and they can be held responsible for misunderstandings that arise not due to their lack of credibility, but rather because of insufficient accommodations within these processes. For example, not having access to adequate legal assistance is a commonly identified problem that can have a serious impact on the development of an asylum seeker's narrative. The research in this section suggests that deaf asylum seekers may be more likely to be expected to communicate in a language or dialect that they do not understand sufficiently and be provided with inadequate sign language or spoken language interpreting. Similarly, the previous section's literature acknowledges the barriers to disclosing sensitive or traumatic information, and once again existing research suggests that such barriers may be exacerbated when disability affects communication, even outside RSD processes (Marshall & Barrett, 2018).

The additional geographical, financial, linguistic, and social barriers identified above suggest that many of the problems and complexities identified in the linguistic research are likely to be even more common and acute in the case of deaf asylum seekers. However, this potential has only just begun to be addressed and explored in policy and practice and in research.

Next Steps

Policy and Practice

The CRPD is a revolutionary document in that its primary function is not to create additional rights, but rather to clearly acknowledge that disabled people, including forced migrants, are rights holders on an equal basis with others. Its emphasis on protecting, promoting, and ensuring these rights is apparent throughout the treaty, especially in the inclusion of many explicit obligations to take concrete measures. It is not enough that disabled people have rights in theory. Making these rights *real* is essential (Bruce, 2015; Schulze, 2010). The rights of disabled asylum seekers and refugees are no exception.

However, this chapter has uncovered ongoing challenges and opportunities on multiple levels. At the level of international standards, there have been significant steps to acknowledge the rights of disabled people in refugee responses, including in official interactions and decision-making. However, this process is ongoing, including when it comes to addressing the practices and accommodations deaf refugees may require to ensure equal participation in procedures. The general procedural standards around communication, language choice, and interpreting undoubtedly apply to *all* asylum seekers and can undoubtedly help ensure the rights of deaf people. However, so far, the CRPD approach of specifying concrete measures to overcome common barriers for disabled people has mainly concentrated on addressing mental illness and intellectual disability. This is an important addition and will hopefully pave the way for adding explicit measures and standards to better ensure the rights of other disabled refugees and asylum seekers, including those who are deaf or hard of hearing.

At the level of practical implementation, emerging research on the experiences of deaf refugees indicates that barriers to equal participation do indeed exist in practice, in a range of settings. However, particular positive examples also offer insight into better practices. Notably, and unsurprisingly, these studies demonstrate the value of investing in, empowering, and listening to deaf people themselves – including refugees and asylum seekers, local deaf organizations, national and international civil society, and deaf researchers.

Research

A wealth of research on linguistic considerations in RSD processes has provided valuable insight for scholars, legislators, policy-makers, and decision-makers and arguably has influenced some improvements in international and local policy and practice. Additional empirical studies involving people with disabilities and deaf people seeking asylum would prove an important addition to this growing body of scholarship and likewise provide an important foundation for continuing reform, and some such studies are already underway (see Holmström & Sivunen 2022 for an overview of such studies).

Such research would help to identify examples of good practice that may be happening on a domestic level, within UNHCR or government asylum agencies. Domestic asylum agencies may also have law, policies, or guidelines that more comprehensively address the participatory rights of deaf asylum seekers throughout the decision-making process. A comparative study across different jurisdictions – on the level of both policy and practice – and/or a comparison between the two levels in one or more jurisdictions could be a good point of departure.

Further studies could also identify potential challenges that have not been found or examined in the existing broader language-in-asylum scholarship. Ethnographic research examining RSD interviews with deaf and other disabled refugees would complement comparative legal and policy studies. While there are institutional challenges with gaining access to be able to collect data in this setting, and linguistic challenges conducting research with deaf refugees, scholars who have worked in this area show that it is possible and provide a promising model for future projects. In existing research, this has included mobilizing their own linguistic skills in the research and using innovative communication methods with their research participants. These methods can also provide important insights into best practice for decision-makers in terms of communicative choices and interpreting meaning from their encounters with deaf participants (see Sivunen & Tapio, 2020, for an important discussion on these points). Such research would help develop crucial evidence to inform, and to advocate for, more positive changes. It would thus contribute toward making procedural rights real for deaf refugees.

Women and Girls with Disabilities in the Heart of the COVID-19 Crisis: Safeguarding Sex and Reproductive Health Rights

90

Edwin O. Abuya and Naomi Njuguna

Contents

Abstract

The COVID-19 pandemic exacerbated the human rights challenges that women and girls with disabilities faced (and continue to face). This chapter reviews the impact of the epidemic on this vulnerable population. It focuses on their sex and reproductive health rights, using Kenya as a case study. Although these entitlements are guaranteed by the international human rights framework and provisions of domestic law, the situation on the ground is precarious for this cohort of individuals. In the wake of the COVID-19 crisis many have continued to face several human rights violations, including discrimination and stigma, as well as the inability to access health facilities or obtain appropriate information on the

pandemic from the officials. These infringements compromise their sex and reproductive health rights. In order to stem these infractions, the chapter reviews some of the interventions that duty bearers can take. To conclude, the chapter contends that these players need to take practical steps in order to deal with the challenges caused by pandemics such as the COVID-19 crisis.

COVID-19 · Women and Girls with Disabilities · Sex and Reproductive Health Rights · Violations · Interventions

Introduction

Persons with Disabilities have faced (and continue to face) several violations of their fundamental rights and freedoms (see, for instance, Abuya and Githinji (2020–2021) and Gulnara et al. (2015)). The situation is precarious for women and girls with disabilities ('WGWD'). Despite legal guarantees, practical experience shows that State and Nonstate actors often violate their basic rights (see Olaleye et al., 2012; Opoku et al., 2016). In the developing world, the situation is more worrying. In the context of sex and reproductive health rights (SRHR), WGWD face serious challenges in their quest to enjoy these entitlements. Compared with able-bodied individuals, WGWD have more health care needs. During emergencies such as the current COVID-19 pandemic, the situation is more risky for this vulnerable population. Many face discrimination, violence, and threats to their dignity, economic entitlements, and privacy rights from state and nonstate actors (Al-Ali, 2020; Samaila et al., 2020; Mbazzi et al., 2021). Accessing the relevant support services is also a huge challenge during such disasters (Saalim et al., 2021).

Sex and reproductive health rights are of utmost importance for a number of reasons. Access to relevant information enhances the ability of WGWD to make informed decisions about their bodies. Further, the provision of contraceptives contributes a great deal towards WGWD making informed choices about their lives and livelihoods. These rights are critical in safeguarding the rights of WGWD to manage their sexuality. In addition, these entitlements are integral in arming individuals with information on the avenues available if their rights are violated. Further, information on SRHR enables WGWD to avoid or deal with the consequences of sexually transmitted diseases. Moreover, these rights are useful in securing the right of WGWD to enjoy sex like any other individual. For these reasons it is essential that the SRHR of WGWD should be protected and promoted at all times. Failure to safeguard these rights has serious consequences.

In order to advance the SRHR of WGWD robust international and domestic legal frameworks have developed. These frameworks, which apply in all situations, create two obligations – a positive and a negative obligation. Under the terms of the former Governments are required to take steps to ensure that WGWD enjoy their SRHR at all times. The negative obligation prohibits the State from taking any measure that will erode the enjoyment of this right.[1] To this end, the international legal framework contains a rather comprehensive regulatory framework, which sets out the obligations for the realization of health rights for all individuals. This includes the SRHR for WGWD. Under the international legal framework, Governments are required to guarantee the right to health at all times. Beginning with the 1948 *Universal Declaration of Human Rights* (UDHR)[2] subsequent treaties, including the *United Nations International Covenant on Economic and Social Cultural Rights*[3] (*ICESCR*), *Convention on Elimination of All Forms of Discrimination Against Women*[4] (*CEDAW*), the *Convention on the Rights of the Child*[5] (*CRC*), and the *African* (*Banjul*) *Charter on Human and Peoples Rights* (*ACHPR*)[6] secure the right of every person to health. The *ICESCR* and *CRC* in articles 2 and 4 respectively capture the general obligations framework at the international level.

These treaties envisage that member states will utilize both domestic (public and private) and international resources (that is, the 'maximum available resources') to achieve the realization of SRHR for WGWD. At the continental level, article 16 of the *Banjul Charter* requires States in Africa to ensure that 'every individual' enjoys the 'best attainable state of physical and mental health.' Further, this positive obligation calls on Governments to 'take necessary measures to protect the health of their people and to ensure that they receive medical attention when they are sick'.[7] Under the terms of this treaty African States bind themselves to, primarily, 'recognize the rights, duties, and freedoms' contained in the Charter.[8] Further, they undertake to implement these obligations through adoption of 'legislative and other measures'.[9]

For WGWD in particular, the 2006 *Convention on the Rights of Persons with Disabilities* (*CRPD*),[10] contains a robust protection framework. The preamble

[10] *The UN Convention on the Rights of Persons with Disabilities*, Adopted by the United Nations General Assembly Resolution 3447 of 13 December 2006, Opened for Signature on 30 March 2007 (Entry into Force 3 May 2008) ('*CRPD*').

recognizes the importance of WGWD being able to access health facilities. This is seen as a way toward enabling them to 'fully enjoy all human rights and fundamental freedoms.'[11] Article 25 of the *CRPD* demarcates the boundaries of the right to health for WGWD. In addition to recognizing this right, the article also calls on States to ensure that WGWD enjoy this entitlement at all times, without discrimination.

It is simplistic to claim that, because the international legal framework does not expressly mention the SRHS for WGWD, these rights are not recognized by international and regional laws. This reasoning is simplistic. On the contrary, these rights, which are provided for by reference, are captured under the wide umbrella of the right of access to health. The second reason why this claim fails lies in the primary objective of these legal instruments. This framework was designed to promote, protect, and safeguard human rights for all persons at all times, and in all spaces. Consequently, would it not be absurd to contend that the SRHR of WGWD are excluded from this corpus of law? Last, state practice affirms the principle that WGWD are entitled to protection of all their rights under the terms of the international and regional laws (Committee on the Rights of Persons with Disabilities (2018); *Protocol to the African Charter on Human and Peoples' Rights on the Rights of Persons with Disabilities in Africa*, adopted at the Thirtieth Ordinary Session of the Assembly, Held in Addis Ababa, Ethiopia on 29 January 2018).

Meeting legal obligations requires Governments to invest resources in programs and projects that are geared toward safeguarding SRHR for WGWD. During unprecedented times like the one the world is experiencing currently, the level of resources should be enhanced. This is essential if these rights are to be realized on the ground. Yet evidence shows that initiatives that are designed to safeguard the SRHR for WGWD are inadequately resourced. The record of countries in the developing world is quite troubling (Kabia et al., 2019; Mwimbi, 2017; Gichuna et al., 2020). In Kenya in particular, the public health system is in crisis. In its 2018 Annual Report, the United Nations Development Program noted that poverty remained at a 'high level' in the country (United Nations Development Program, 2021 at 7). According to this report, between 2015 and 2016, the poverty rate was about 36% overall (United Nations Development Program, 2021 at 7). In the northern part of Kenya the figure was almost double. About 70% of the residents in this area lived below the poverty line (United Nations Development Program, 2021 at 7). In the context of health, The World Health Organization estimated in its 2019 report that just under one third (about 30%) of Kenyans had access to basic sanitation services (World Health Organization, 2021). Government investment in the health sector has been unimpressive. In its 2018/2019 to 2020/2021 report, the Kenyan Ministry of Health Working Group identified 'inadequate funding' as one of the key challenges.[12] During the 2018/2019 period, the Ministry was allocated just over half of the funds it had requested.[13] Resource gaps are also noticeable at the

[12] World Health Organization, 2021, at 24.

[13] Ibid.

local levels. In its 2018 report, Kenyatta National Hospital, the main referral hospital in the county, reported that between 2017 and 2018 it had a financial deficit of approximately Kenya Shillings one billion (US$ ten million) (Kenyatta National Hospital, 2018 at 51). Similarly, the National Council for Persons with Disabilities reported deficits of approximately Kenya Shillings 60 million (US$ 600,000) and 500 million (US$ five million) in the 2017–2018 and 2016–2017 financial years respectively. The reduction in resource allocation had a drastic effect. Its net impact is to limit the scope of implementation of, among others, projects that are designed to benefit WGWD. When COVID-19 struck in 2019 it found a health system that was already besieged. This disaster worsened an already dire situation (Worldbank Group, 2021 at para 1.1.4 ('The health system is facing an unprecedented challenge to contain the spread of COVID-19 and care for the infected')). For this cohort, access to SRHR is crucial. Hence, the adverse health situation caused additional problems.

At the beginning of 2020, there were just over 500,000 WGWD (or 1.3% of the total population) in Kenya (Kenya National Bureau of Statistics, 2021 at 393). This chapter reviews the extent to which the Kenyan Government has met its obligations to WGWD in the wake of the COVID-19 tragedy. It focuses on SRHR. The paper contends that the State has failed to meet its primary obligation of providing sufficient resources for programs designed to meet the SRHR of WGWD living in the country. Despite the launch of the Universal Health Coverage Program (UHC) in 2018, as part of the incumbent Kenyan Government's Big Four Agenda, allocations for health care have remained significantly low.

The chapter is divided into five sections. The section "SRHR for WGWD: Rights and Obligations" reviews the obligations framework. In other words, which legal duties are placed on the Government with regard to according WGWD their SRHR? Issues surrounding the allocation of sufficient resources are also evaluated in this section. This issue is at the heart of any program that is designed to meet the right under review. As noted earlier, this cohort faces serious challenges in accessing their rights. The section "Interventions to Safeguard the SRHR of WGWD During the COVID-19 Pandemic: Three Proposed Strategies" evaluates some of these difficulties. In the section "Conclusion: Beyond the Rhetoric" the strategies that an aggrieved person can invoke to ensure compliance, are analyzed. Focus is placed on three key measures – strategic litigation, human rights education, and policy interventions. This section considers the benefits and limitations of each strategy. To conclude, the chapter contends that the law in the books needs to be matched by actual practice, if WGWD are to enjoy their SRHR during this difficult period.

SRHR for WGWD: Rights and Obligations

This section reviews two fundamental issues – the material content of Kenya's legal obligations with regard to safeguarding the SRHR for WGWD as well as according sufficient resources to these programs and projects. The section also examines key processes that the Government can adopt to ensure that the statutory rights are translated into actual practice.

Securing the SRHR for WGWD

As the situation in international law, Kenya's legal framework recognizes the SRHR of WGWD. Beginning with the Constitution, article 21(1) creates an obligation on Government agencies to 'observe, respect, protect, promote, and fulfil the rights and fundamental freedoms in the Bills of Rights.' The State is also obliged to take 'legislative, policy, and other measures including the setting of standards to achieve the rights guaranteed under Article 43,'[14] which includes SRHR. State agencies are also required to 'address' the needs of WGWDs, as a category of 'vulnerable' persons.[15] Further, the national values that guide operations in the country include 'human dignity, equity, social justice, inclusiveness, equality, human rights, and non-discrimination'.[16] These are basic principles that all institutions need to embrace at all times. More specifically, WGWD are entitled to be treated with dignity and respect in all areas,[17] including realization of their SRHR. They should also have access to materials and devices that can enable them to overcome the obstacles created by their disabilities.[18]

Like some countries in Africa,[19] Kenya has passed a national disability-related legislation. The 2003 *Persons with Disabilities Act* ('*PDA*') is a comprehensive piece of legislation that is designed to address the special needs of WGWD. Although this statute does not recognize directly the right to health services, it makes reference to this entitlement. Section 20 entitles the National Council for Persons with Disabilities ('Council') to be represented in the Ministry of Health national health program agenda. The terms of reference of this policy framework are rather broad. Among other tasks, it is designed to:

(a) Enable persons with disabilities to receive free rehabilitation and medical services in public and privately owned health institutions;
(b) Make available essential health services to persons with disabilities at an affordable cost;
(c) Make available field medical personnel to local health institutions for the benefit of persons with disabilities;
(d) Ensure prompt attendance by medical personnel to persons with disabilities.

Against this background, it is apparent that the *PDA* covers health rights in general. This position is consistent with the overall objective of the statute, namely,

[17] Article 54(1)(a) of the Constitution.

[18] Ibid article 54(1)(e).

[19] See, for instance, the *Discrimination Against Persons with Disabilities (Prohibition) Act, 2018,* (Nigeria), *Persons with Disability Act, 2006* (Ghana), *Disability Law No. 10* (Egypt), *Disability Act* (Sierra Leone).

to ‘provide for the rights’ of WGWD.[20] Further, as a signatory to the *CRPD* and the *ACHPR*,[21] Kenya is obligated to safeguard the rights of WGWD, including their SRHR.[22]

Other domestic pieces of legislation, particularly the 2017 *Health Act*, also contain a robust legal protection framework. Under this statute the Health Minister is charged with the responsibility of implementing the constitutional right to health.[23] Like the Constitution, this statute mandates the State to ‘observe, respect, protect, promote, and fulfil the right to the highest attainable standard of health.’[24] More specifically, section 68(1) of the *Health Act* requires the Minister to ‘devise and implement measures to promote health and to counter influences having an adverse effect on the health of the people.’

The *Health Act* also recognizes the importance of guarding SRHR. To this end, this legislation requires the Minister to formulate a comprehensive legal program that will guarantee protection of these rights. According to this Act, an appropriate plan should cover the following key areas[25]:

(i) Effective family planning services.
(ii) Implementation of means to reduce unsafe sexual practices.
(iii) Adolescence and youth sexual and reproductive health.
(iv) Maternal and neo-natal and child health.
(v) Elimination of female genital mutilation.
(vi) Maternal nutrition and micro-nutrient supplementation.

In October 2019, Kenya’s Senate House introduced the *Reproductive Health Bill 2019* (‘*RHB*’).[26] Although the Bill is yet to be passed, it is notable that it sets out a robust framework for the facilitation of access to reproductive health services by WGWD. The *RHB* seeks to expand on the foundational principles that are set out by the *Health Act*. In its preamble, the proposed legislation outlines three central objectives. In the first place, it seeks to ground the right to reproductive health care into Kenya’s legal framework. Further, the proposed legislation is designed to set local standards of reproductive health. Last, the *RHB* seeks to provide for the right to make decisions regarding reproductive health. These are the overarching

goals of the intended legislation. In terms of meaning, the Bill defines in clause 2 several terms, including:

> "Reproductive health" means a state of complete physical, mental, and social well-being, and not merely the absence of disease or infirmity, in all matters relating to the reproductive system and to its functions and processes.
>
> "Reproductive rights" include the right of all individuals to attain the highest standard of sexual and reproductive health and to make informed decisions regarding their reproductive lives free from discrimination, coercion, or violence.

These frameworks are crucial at many levels. Primarily, they flesh out the material content of this SRHR. Additionally, they set standards for compliance. Further, they demarcate the boundaries of this entitlement. For duty bearers these canons are important because they mark out the boundaries of their obligations. Justice seekers can also invoke them to assess the extent to which SHRS have been met (or remain unmet), and measures that they can take to promote compliance. In the case of any violation these principles provide useful leads regarding individuals against whom an aggrieved party can seek remedies.

Human Rights in Provision of Adequate Resources Framework

What obligations does Kenya have in relation to allocating sufficient resources for programs and projects that are designed to promote the SRHR of WGWD? This is the central question, which this section evaluates. Usually, Governments fund their operations from loans (external and internal) as well as taxes and other levies. Taxes on income are imposed typically on residents and nonresidents who meet set legal criteria.[27] Upon collection, the income is distributed to various expenditure streams. Kenya's Constitution has an elaborate system for revenue collection and allocation.[28] In their resource allocation mandate, the Constitution requires national and county governments to take into account the special needs of WGWD. Article 201 of the Constitution outlines principles and frameworks of public finance. Governments at all levels must observe these fundamental rules. In keeping with this rule, they are required to have a system that seeks to promote 'an equitable society.'[29] Among others, the resource allocation framework should make 'special provision for marginalized groups and areas.'[30] Meeting this legal obligation requires both levels of government to ensure that sufficient resources are allocated to WGWD. In times of emergencies, the level of support should be increased to match the growing needs.

[29] Ibid Article 201(b).

[30] Ibid.

Initiatives designed to allocate sufficient resources to health programs play a key role in the realization of SRHR. Adequate resources are always needed to achieve the progressive realization and implementation of the socio-economic rights of all members of society. The concept of progressive realization acknowledges the resource challenges that low- and middle-income countries face in seeking to realize and implement these rights.[31] Even so, this language should not be used as an excuse by countries such as Kenya to delay according WGWD their SRHR, and, thereby, expose them to the adverse effects caused by the denial of health care. On the contrary, meeting legal requirements requires the Government to demonstrate the steps it had taken to comply with its basic obligations.[32]

Kenya's domestic law imposes an obligation on the State to provide sufficient resources for programs designed to meet SRHR of WGWD. As mentioned earlier, article 43 of the Constitution guarantees this right. Special provisions are also made for vulnerable individuals such as children. Under article 53, girls with disabilities are entitled to, among other rights, 'health care.' Granted, article 54 of the Constitution, which focuses on persons with disabilities (PWDs), does not mention the right to health. This is not to imply, however, that the framers of the Constitution failed to appreciate the value of access to SRHR by WGWD. On the contrary, and in keeping with article 21(3), the Constitution requires all individuals as well as State and non-State agencies[33] to treat WGWD 'with dignity and respect.' Courts in Kenya have also construed this fundamental right broadly.[34] Consequently, it is apparent that this umbrella provision covers the fundamental obligation to accord WGWD their SRHR. A contrary interpretation would be absurd, considering the clarion call of Kenya's National Anthem – *Haki iwe Ngao na Mlinzi* (translated: Justice be our Shield and Defender). An aggrieved party can also invoke the general right to health provision contained in article 43(1) of the Constitution to advance a case for the Government's compliance with this fundamental right. An obligation is also imposed on county governments to safeguard the SRHR of WGWD,[35] including providing adequate resources for the actual realization. Other local laws, including the *Children Act*[36] and the *PDA*[37], reinforce the constitutional framework.

Attorney General*, Cause No. 2408 of 2012 [2014] eKLR (where the High Court (Justices Majanja and Mbaru respectively) defined the right to dignity to cover employment rights).

[35] Articles 185–187 of the Constitution read together with part 2 of the Fourth Schedule.

[36] Section 12 ('A disabled child shall have the right to be treated with dignity, and to be accorded appropriate medical treatment').

[37] Under section 20 'health' is one of the rights of children with disabilities.

The Constitution obligates the Government to implement all the rights due to WGWD. Meeting this test requires an examination of the measures the Government has taken. The standard for evaluating these measures, as Judge Mumbi established in *Consumer Federation of Kenya (COFEK) v The Attorney General and Others*, is that of reasonableness.[38] One of the preliminary steps the Government has to undertake is to allocate sufficient resources to meet the SRHR of WGWD. It is not enough for the State, which bears the burden of proof,[39] to claim that it has insufficient resources to implement this right. Rather, it must demonstrate that resources are unavailable.[40] In the context of resource allocation, again, the burden of proof is on the Government. This time round it will have to demonstrate that it gave 'priority to ensuring the widest possible enjoyment of the right or fundamental freedom, including the vulnerability of particular groups or individuals'.[41] The Kenyan High Court (Ngugi J) in *Luco Njagi & 21 Others v Ministry of Health and 2 Others*[42] was emphatic on the State's obligation:

> It is thus undisputed that the state has the primary obligation to ensure that the petitioners and other citizens enjoy the highest attainable standard of health. The state has a duty to make the necessary budgetary allocation, as well as to take the necessary legislative and policy measures, to ensure that the right to health is realized.[43]

Other domestic laws contain provisions governing the allocation of resources for health programs. In particular, the *Health Act*,[44] which was designed to, among other things, regulate the provision of health care services, creates an obligation for the State to allocate resources to finance health projects across the country. This piece of legislation dedicates an entire part to this aspect, hence underscoring the importance that the Government should attach to issues relating to the implementation of SRHR for WGWD. Compliance with this basic rule requires Government to take the following measures:

- Develop policies and strategies for the realization of universal health coverage;
- Undertake cost-sharing mechanisms at the county level;
- Develop an appropriate public health financing framework that caters for reimbursements of health care providers who respond to disasters and emergencies;

---

[44] No. 21 of 2017.

- Develop a standard health package that is financed through prepayment;
- Provide a framework to secure health care needs for vulnerable groups and indigents.[45]

Although the *PDA* lacks a comprehensive allocation framework, it underlines the value of resources as a way of fulfilling the rights due to WGWD. Section 20 of this legislation recognizes the importance to implementing SRHR. The Council is charged with the responsibility of advancing the special needs to WGWD in the implementation of the national health program. Issues surrounding resource allocation and utilization would ordinarily fall under this provision.

Resource Allocation and (Prudent) Utilization

Several pertinent questions arise when one examines processes and programs that are designed to fulfil the SRHR of WGWD in general and in times of crisis. What are the potential sources of resources? Once they have been sourced, how are resources to be utilized? Why? Are there any needs that should be prioritized? What is the basis for placing or excluding an item from the list? Which resources are required for each item? The third question relates to sustainability of the resource streams, which have been identified. How long can the sources last? Last, there are questions relating to the monitoring and evaluation of the target projects. How will these projects be assessed in order to determine whether or not they have delivered on their mandate? Were the resources used in an efficient, transparent, and accountable manner? How will the impact of a project be measured? The remainder of this part responds to these questions.

The highest allocation of resources to the health sector in Kenya has been seen during the coronavirus epidemic. A portion of the allocated resources were dedicated to the Universal Health Coverage ('UHC') program (Health Policy Plus, 2021). Interestingly, within those allocations, there is little direct mention of or provision for SRHR for WGWD. Like many low- and middle-income countries, Kenya has over the years relied on donor aid to finance its budget for health. Following the global coronavirus pandemic, the level of funding from the international community shrunk drastically. In order to cushion WGWD from the risks and vulnerabilities caused by the epidemic, the Government had to step in. Its allocation was necessary to plug the gap that had been left in the budget. Even so, the amount of resources allocated fell short of the proposed budget. Although the government identified the National Health Insurance Fund ('NHIF') as the vehicle through which the UHC project would be delivered, this State agency has had several challenges. In addition to governance issues, the fund has over the years been riddled with corruption scandals (R v Director of Public Prosecutions and 3 Others, Ex Parte Meridian Medical Center Ltd and 7 Others, 2015; Ethics and Anti-Corruption Commission, 2019).

---

[45] Section 86 of the *Health Act*.

Moreover, the NHIF has an insufficient population base to make sufficient contributions for its purposes (Barasa et al., 2018 at 11). These factors cast serious doubts on the ability of the NHIF to deliver on this crucial mandate.

With decreased funding for health programs, Kenya has had to explore quickly alternative sources. Failure to take this step has serious consequences for WGWD. Local funding streams must, therefore, be explored and tapped to the fullest extent possible. Further, incidents of corruption must be reduced to an all-time low. Robust measures must be taken to combat this ill (see also Rispel et al., 2016 at 248). The resources that are saved from these initiatives should be ploughed into projects focusing on WGWD as well as the multiplier effects, which COVID-19 produced.

Once resources are generated they need to be allocated to various cost centers. Because resources are finite, it is imperative that the Government sets its priorities. The most pressing needs during the COVID-19 pandemic must be identified and addressed. Owing to scarce resources, one would expect the Kenyan Government to develop a priority list. All interested persons must be involved in this process (Africa Disability Alliance, 2015 (drawing a similar conclusion)). Gunjeet Kaur and others remind us that priority setting 'calls for processes that decide about allocation of resources between competing health programs' (Kaur et al., 2019 at 1). For the process to deliver, a bottom-up approach should be adopted (Mtapuri & Giampiccoli, 2016 at 162). Top-down approaches, by contrast, rarely meet the needs of the target community. In order to deliver the goods, the recepients must be involved at all stages of the planning process. As the well-known slogan in disability studies goes: "nothing for us, without us" (In Latin, they say, "*Nihil de nobis, sine nobis*"). Article 201 of Kenya's Constitution, which draws on article 13 of the *African Charter*, requires participation by stakeholders in all financial matters involving the State. Courts in Kenya have affirmed this basic rule.[46] This article also sets out the principles that should guide all aspects of management of public resources in the country, namely, transparency, openness, equity, and prudence in the way that State resources are used. Salome Bukachi and others (2014 at 349) assert that decision makers should consider the following factors as a guide toward setting priority areas: the importance of the health problem; availability of additional funds; cost effectiveness; cost-sharing measures; and core activities to be undertaken. The prevailing political climate is also a crucial factor that cannot be ignored.

In theory, the process of resource allocation appears simple and straight forward. However, in practice there are usually a lot of back-and-forth discussions before a budget is drafted, debated, and agreed upon. Orao-Lawrence and Wyss contend that priority-setting decisions are 'complex, value-based, and highly political' (Orao-Lawrence & Wyss, 2020 at 183). Priority consideration should be in the context of population demand, needs, and values. But in Kenya, unfortunately, priority setting

---

[46] *Phillip Nyandieka (Suing on his own Behalf and on Behalf of the General Public) v Non-Governmental CDF-Bomachoge Borabu Constituency*, Petition No. 237 of 2018 [2019] eKLR.

is usually secretive (Barasa et al., 2017 at 105), ad hoc, and inefficient. This leads to insufficient and ineffective use of health resources. It also causes inequities in health resource distribution, leaving out the most vulnerable people, such as WGWD. As experience shows, their SRHR are yet to be prioritized within the health budgets of the country. During the COVID-19 pandemic, the bureaucratic processes had to be executed expeditiously. Unlike in a normal situation, the Government had very little time on its hands. Thus, quick action had to be taken. At the same time internal accountability controls had to be adhered to, from start to finish. Otherwise, the rights of WGWD would continue to be severely undermined.

Sustainable Development Goal number 3.c reminds countries of the need to 'substantially increase health financing . . ., especially in least developed countries.' Meeting this goal requires stakeholders to include a sustainability plan in each project. This is a key factor that the Government (County/National) cannot afford to ignore. A wider perspective is important in ensuring that any health initiative delivers in the long term. Donor funding is quite fluid and 'unpredictable'.[47] This stream depends on the politics of the day. If the receiving and donating Government fall out, there is a high chance that funding will be immediately withdrawn or significantly reduced. We also need to be aware of the phenomenon that is commonly referred to as "donor fatigue." For donor-funded interventions, there is a need to formulate an alternative plan should these resources dry up. In other words, SRHR projects for WGWD must be designed to survive beyond the donor funds. Those projects that take a narrow financial approach are likely to face serious monetary challenges as time goes by. The end loser in such circumstances tends to be the target population. Proper planning is, therefore, crucial, if an SRHR project for WGWD is to survive in the long run. Following the COVID-19 catastrophe there were significant budget cuts. Most traditional donors diverted funds to their in-country programs. The knock-on effect of budget cuts was to drastically reduce resources for WGWD projects in Kenya. As mentioned above, these were already struggling. Hence, the reduction in international resources exacerbated further the vulnerabilities and risks that WGWD continue to be exposed to.

According to a 2019 report conducted by Pharos Global Health Advisors, Kenya is yet to develop a viable strategy to address the declining financial assistance in sexual and reproductive interventions, particularly family planning commodity supply (Pharos Global Health Advisors, 2019 at 56). There is also a lack of a transition strategy. Despite the fact that Kenya had attained the target of a 58% national modern contraceptive prevalence rate, the disparities across the regions cannot be ignored. For instance, in the northern part of the country, the prevalence rate is at 2%, whereas in central Kenya it is 80%. The report argues that these disparities 'may have diluted technical support for [Family Planning, FP], as partners have concentrated efforts and resources at the county level without commensurate

engagement at the national level, where FP is technically stewarded' (Pharos Global Health Advisors, 2019 at 56).

Monitoring and Evaluation ('M&E') is an essential tool for checking whether the outcomes envisaged by certain interventions and programs are actually being met. "Monitoring" refers to 'the routine tracking of the performance of key elements of a program or project,' whereas "evaluation" means 'the systematic and objective review of an on-going or completed project to assess its effectiveness and impact' (Oyediran et al., 2014 at 443). Some of the M&E indicators that have been identified as useful for SRHR programs are clarity, relevance, specificity, and comparability. M&E facilitates transparency and accountability in the utilization of project resources. It is a strong weapon in the fight against corruption. When properly executed, this initiative can contribute significantly to the realization of SRHR by WGWD. Let us now look at some of the violations that the lack of inadequate resources leads to.

Violations Associated with the Lack of Inadequate Resources

For WGWD the lack of adequate resources in the health sector has caused further problems. The current system is ill designed to meet their unique needs. PWDs are generally excluded from health policies, strategies, and programs. In its 2008 research ($N = 14{,}569$), the National Co-ordinating Agency for Population and Development found that only 14% of women with disabilities aged between 12 and 49 years received family planning services.[48] Research conducted by Human Rights agencies based in Kenya drew a similar conclusion. The Kenya National Commission on Human Rights established in its 2014 study that women with disabilities faced several difficulties accessing reproductive health services (Kenya National Commission on Human Rights, 2014 at part 3.3.2). These included the negative attitude of health providers as well as the lack of information and proper facilities (Kenya National Commission on Human Rights, 2014 at part 3.3.2.). Similarly, the Government of Kenya acknowledged this exclusion in its 2021 report to the UN Committee on Persons with Disabilities:

> Women with disabilities encounter numerous barriers to accessing quality reproductive health care services. Some of the barriers include inaccessible equipment and service points, limited contraceptive options and insensitivity by health care workers among others.[49]

The COVID-19 pandemic worsened this situation. Although the law in the books requires the Government to allocate sufficient resources to programs that are designed to promote the SRHR of WGWD, the situation on the ground is markedly

---

[49] U.N. Committee on the Rights of Person with Disabilities, Consideration of Reports Submitted by States Parties Under Article 35 of the Convention: Kenya, (3 April, 2021) para 256.

different. How does the inadequate resource situation impact the realization of SRHR by WGWD? The remainder of this section responds to this vital question. It discusses some of the effects caused by the inadequate or improper utilization of resources in the wake of the current pandemic.

Discrimination and Stigma

In its 2021 'Disability Inclusion Status Report',[50] the Kenyan Government identified stigma as a cause of concern. The nonprioritization of the health needs of WGWD exacerbates the stigma and discrimination that they face. Despite having sexual feelings, WGWD are seen as being asexual or in some cases hypersexual or incapable of having sexual relations or to reproduce (Powell and Stein (2016 at 56). See also Serges Kamga (2018)). This misplaced perception hampers any meaningful efforts for these individuals to realize their SRHR. Soft law, as reflected in the 1994 United Nations Standard Rules for the Equalization of Opportunities for Persons with Disabilities (UN General Assembly, 1994), is emphatic that the sexual relationships of WGWD must be respected and protected at all times, including during the COVID-19 situation. Rule 9(2), which deals with family life and personal integrity, states that:

> Persons with disabilities must not be denied the opportunity to experience their sexuality, have sexual relationships and experience parenthood. . . Persons with disabilities must have the same access as others to family-planning methods, as well as to information in accessible form on the sexual functioning of their bodies.

WGWD also face various socio-cultural barriers. Their sexuality is systematically stigmatized. They are seen as being without sexual desires and the ability to have marital and parental relationships (Schaff, 2011; Schenk et al., 2020). In their research on Kenya, Christopher Johnson and others argued that this belief eventually leads to 'their exclusion in many sexual and maternal health programs, including HIV/AIDS prevention, in developing countries' (Johnson et al., 2012 at 105–118 at 110). Contrary to legal requirements for equality, inclusion, privacy, and dignity to all persons, in some instances WGWD are reprimanded for having sexual relationships or getting pregnant (Morrison et al., 2014 at 1135). The cultural perception about a woman being the one who takes care of the home and her husband makes the situation worse for women with disabilities in Kenya. Research has documented that some WGWD face bullying and harassment at the hands of health care workers (Chinnery & Westboork, 1995). Yet article 27 of Kenya's constitution outlaws all forms of discrimination.

[50] On file with the authors.

Lack of Autonomy, Dignity, and Informed Consent

As a well-known adage says, information is power. Article 35 of Kenya's constitution provides for the right of access to information (for a deeper discussion, see Abuya (2017)). The international human rights framework contains a similar provision.[51] Even so, there is a key difference between the enjoyment of this right at the local level and its international counterpart. In Kenya, the right of access to information is limited to 'citizens,'[52] whereas on the international plane there is no such limitation. Under the latter framework, the right of access to information is available to every person. This variance has a grave impact on foreign nationals living in Kenya. Under Kenya's Constitutional framework, State and non-State actors can lawfully withhold information in their custody from non-national WGWD. The impact of this is drastic, considering the many benefits that accrue from this entitlement (see Abuya (2013) at 215 to 244 at 215).

This state of affairs, however, is not to imply that Kenyan WGWD are in a better position. Although they are entitled to information, research shows that they, too, are denied access to knowledge and information about their sexuality, sexual behavior, and sexually transmitted diseases (Gona et al., 2018; Ingstad & Grut, 2021). Adequate data on the COVID-19 virus and its effects was, unfortunately, not provided (Ndavula & Lidubwi, 2021). This in turn is a huge barrier to accessing SRHRs (Ganle et al., 2020a). Absence of accurate and timely health information often leads to sexual marginalization of WGWD, irrespective of whether one is in or outside of an emergency. Their lack of awareness and proper information is likely to deprive them of the ability to exercise autonomy/self-determination over the medical decision-making processes regarding their sexual and reproductive health. Incidents of forced sterilizations and abortions as well as forced/unnecessary caesarean sections against WGWD have been reported (Durojaye, 2017; Wairimu, 2010). In some instances these violations take place with the collusion of family members (Faith Kasiva, 2021 at 5). Clearly, these practices are discriminatory. Eventually, they deny WGWD the right to make decisions regarding parenting and motherhood.

As a result of inadequate health personnel with specialized training, WGWD continue to face challenges with regard to their rights to confidentiality and privacy. Many are forced to attend hospital in the company of a family member, who usually offers escort and/or translation services (Lusweti & Wanyonyi, 2021; Owuor, 1995, Chap. 9). Although they may facilitate the hospital visit, this mode of operation is quite troubling. This state of affairs is less ideal as it tends to seriously erode one's confidence and esteem. Does this situation accord WGWD their fundamental rights to human dignity and equality, which the Kenyan constitution guarantees to all in articles 28 and 27? The response to this question must be in the negative. For patients who are unable to find a relative or any other person to accompany them to hospital,

the situation can be very precarious, particularly if they require urgent medical attention or specialized facilities, as is the situation during the current epidemic.

During this pandemic, the Kenyan Government, as many States, imposed several restrictions. A dawn-to-dusk curfew was imposed in the country. Additionally, protocols requiring social distancing in all public spaces were introduced. Although these containment measures were designed to check the spread of the virus, their unintended consequences on WGWD were drastic. In the first place, because public vehicles were now forced to carry fewer passengers, many hiked their fares in order to break even. Owing to years of marginalization, most WGWD have meagre resources (Trani et al., 2015; Ndlovu, 2016; Chitereka, 2010). Hence, many are unable to afford the increased fares, and, thereby, access health facilities. Second, these restrictions led to a reduction in the number of sitting spaces available in public vehicles. This in turn meant that one had to fight in order to board a vehicle. This reality caused significant problems for WGWD. Unless their escort was strong, they had to wait for several hours before they could travel to obtain medical services. Further, the fact that fares had increased meant that one required more resources in order to be accompanied. Moreover, the fact that one had to reach one's destination before the curfew hours kicked in presented further problems. Owing to these difficulties, it is reasonable to assume that some WGWD chose not to seek medical attention in facilities that required them to use public transportation. The consequences of such decisions can be life threatening.

Women and girls with disabilities are also at a greater risk of gender-based violence (Opini, 2012; Combrinck, 2017). The current disaster, as the authors established during informal conversations, worsened this situation. Combating this violation requires a number of interventions, including allocating adequate resources for establishing specific centers where victims or justice defenders can lodge official complaints. To bear any fruit these initiatives must take into account the particular susceptibility and vulnerabilities as well as unique needs of the victims in this case. Real and exhaustive investigations must be conducted for any complaint that is lodged. To be effective, law enforcement officials must be involved in these processes. If it is established that an offense was committed, the perpetrator must be charged and prosecuted in a court of law. Thus far, the government of Kenya is yet to establish such centers. The lack of access to the prevention sites can end up exposing further an extremely vulnerable group of its membership to acts of violence.

Barriers of Access to Health Services by WGWD

For WGWD to fully enjoy fully their SRHR they need to access health facilities with relative ease. Unlike their counterparts who are able bodied, special facilities have to be erected to enable them to gain entry and navigate any physical environment. Compliance with the legal requirements requires health facilities to ensure that the environment is accessible to all users at all times. To guard against discrimination, the *PDA* contains specific provisions. In the first place, the Minister of Health is represented in the Council.[53] As mentioned earlier, it is expected that the council will champion the SRHR of WGWD. Additional requirements exist in the context of access to and mobility within a health care facility. The *PDA* in section 21 requires public and private health facilities to provide a 'barrier-free and disability friendly environment'. This position is consistent with article 25 of the *CRPD*, which guarantees WGWD the right to health care.

Despite these legal guarantees, the situation on the ground is markedly different. As mentioned above, because of local transportation issues, accessing health facilities was very problematic during the pandemic (Neetu et al., 2021 at 65). WGWD continue to face barriers owing to the lack of disability-sensitive environments. In some settings where ramps are available, they are either built from the wrong materials or are too steep. These undesirable facilities pose several problems to those with mobility challenges (Mwirigi, 2017 at 70 (accessed: 7 November 2021; proposing construction of suitable ramps in order to improve 'accessibility of building infrastructure and sanitation accommodation')). In other instances, the examination beds are unsuitable for some patients, as they are too high or are ill designed to meet the needs of patients with disabilities. In her research on experiences of women with disabilities in health facilities in Nairobi City County ($N = 22$), Grace Mukasa found that high examination beds are a barrier in accessing facilities (Mukasa, 2008 at 31 (accessed: 7 November 2021)), especially for those with physical or mental disabilities. Some health facilities lack lifts (Ngugi, 2012). For WGWD with mobility challenges this is a huge impediment. Other amenities such as washrooms and beds can also be a challenge for those with physical disabilities. In many public sector health facilities, the washrooms are usually in a latrine format. Accessing these facilities requires those with physical disabilities in particular to crawl on the usually dirty floors (Asfaw et al., 2016). This undesirable condition is very troubling during the current COVID-19 pandemic. Indeed, it is a vector for spreading the virus. Doubtless, these circumstances are likely to lower the self-confidence and esteem of any individual. These violations also erode one's rights to dignity and respect (see also Zuurmond et al., 2016; Wasonga & Bukania, 2015). Further, the lack of sign language translators in most medical facilities is another area of serious concern, particularly for the deaf community (Lusweti et al., 2020). This situation is not unique to Kenya. See, for instance, (Ahumuza et al. 2014). Appropriate literature in braille, or in simple language, pictures, etc., for the intellectually disabled are also known to be lacking (Kenya National Commission on Human Rights, 2012; Ganle et al., 2020b).

Following the outbreak of the COVID-19, most governments established isolation/quarantine centers. These facilities were designed to house those who had tested positive or who were suspected of having been exposed to the virus. Once they tested negative they would be released. Although these steps were designed to check the spread of COVID-19, the centers posed serious challenges for WGWD. Compared with persons without disabilities, these individuals require special attention when

---

[53] Section 4(1)(c) of the *PDA*.

admitted into hospital. As the isolation wards are closed to the public, all patients are required to fend for themselves. For WGWD, who rely on others for support, accessing drugs or amenities within these facilities was a nightmare (Nzeribe et al., 2018).

We also need to examine the personnel at a health facility. This inquiry requires us to review the staff composition within a health facility. Several questions come to mind: Does a particular health facility have enough personnel? Are they aware of the special needs of WGWD? Are the staff qualified to handle sex and reproductive challenges that WGWD face? Do the health care service providers have the requisite experience, training and skills for the job, especially during this global pandemic? These are some of the questions that could be asked to gauge the suitability or preparedness of a health facility.

Despite legal requirements for the provision of adequate resources for projects and programs for WGWD, unfortunately, many public hospitals in the country lack qualified health workers to handle patients with disabilities (Ndetei et al., 2011; Bor, 2021). Yet, in the wake of the pandemic, health care workers were required to possess special skills to handle patients. The lack of disability mainstreaming within the health services caused additional problems to WGWD who were admitted into these facilities. In addition to services, it is possible that confidential and sensitive information relating to sexual health was compromised. This could have discouraged some patients from seeking services in public hospitals. Patients who have visual and audio disabilities are particularly vulnerable as they have to rely on touch as well as mouthing words. This means they could not be masked at all times even though the COVID-19 containment protocols called for the wearing of masks by everyone in all public spaces.

Costs, including medical fees, are also a barrier to access to health services by WGWD (Kariuki et al., 2015; Kirigia & Sambo, 2003). Each time a patient needs medical care, there is a cost implication – transportation, consultation, drugs, and/or food. These are likely to escalate, depending on whether or not one is admitted into hospital. If admitted, one will be required to settle their medical bill before they can be discharged. If they don’t or fail to provide a guarantee of payment, a hospital facility can detain them.[54] They will only be released once they pay the bill.

Interventions to Safeguard the SRHR of WGWD during the COVID-19 Pandemic: Three Proposed Strategies

The barriers evaluated above must be checked, if WGWD are to enjoy their SRHR. This is more pressing in the COVID-19 environment. The task is huge. It cannot be left to WGWD alone. Rather, all human rights defenders must join hands. In this section the paper addresses strategies that stakeholders can deploy to ensure Kenya

---

[54] See, for instance, *MAO & Attorney General & 4 others*, Petition No 562 of 2012 [2015] eKLR; *Emmah Muthoni Njeri v Nairobi Women’s Hospital,* Petition No 352 of 2018 [2021] eKLR.

complies with its legal obligations. It focuses on three interventions – strategic litigation, human rights education, and available policy interventions.

Strategic Litigation: Potential and Challenges

Strategic or public interest litigation[55] is one the strategies that WGWD and/or human rights defenders deployed to check infractions of the law by national or county governments during this global threat. This route can be used to hold these duty bearers accountable for their obligations to WGWD. This initiative is also a powerful advocacy tool (Roa & Klugman, 2014). The success of strategic litigation depends on at least three factors. In the first place, a country needs to have a robust legal or regulatory framework. Within this structure, the rights and duties of WGWD should be spelt out. For the legal framework to be effective it must identify the duty bearers. To put it in another way, which department(s) is/are responsible for allocating resources to programs, which are designed to safeguard the rights of WGWD during this difficult period? In the absence of these pointers it would be difficult to hold a duty bearer accountable in instances of alleged noncompliance.

The presence of an autonomous judiciary is the second key factor. Judges and magistrates who hear cases must be guided by the law, and the law alone.[56] Nonlegal considerations should be ignored when arriving at a judicial decision. Fidelity to the law is an important aspect of any objective judicial system. In Kenya, the National Anthem is emphatic that “haki iwe ngao na mlinzi.” When translated into English it means, “Justice be our Shield and Defender.” In keeping with this fundamental call, decision makers must have solid knowledge of the entitlements of this vulnerable group (Ashagre, 2020). A deep understanding of the domestic and international rights frameworks is also critical, if one were to decide a case progressively. One must apprise oneself regularly on the jurisprudence, which emerges from regional and international courts and tribunals.

Third, we need to consider the claimants who seek to air the rights of WGWD in domestic and international legal fora. As is well-known, the burden of proof usually lies with the moving party.[57] Jeremie Gilbert contends that those who lodge claims in court should be able to ‘articulate their rights.’ (Jeremie Gilbert, 2017 at 665) Although this author does not break down this assertion, WGWD, whether through counsel or in person, are required to bring on board sufficient evidence when they make allegations of violations of SRHR of WGWD. They must show instances of noncompliance with particular provisions of the law. Once they marshal this

---

[55] This refers to a suit commenced in which a plaintiff is able to establish a special interest in the subject matter, notwithstanding that the subject matter also involves issues of public interest. See Peter Nygh and Peter Butt, *Butterworths Concise Australian Legal Dictionary* (Butterworths: Sydney, 1998) at 356.

[56] Article 160(1) of the Constitution (emphasizing that the Judges are subject to the ‘Constitution and the law’).

[57] Section 107(1) of Kenya’s *Evidence Act*.

evidence the burden shifts to the Government to show how it has met its legal obligation. Like decision makers, the legal representatives must have a solid grasp of the law (Sileoni, 2011 at 99). They must appreciate the entitlements that the Constitution sets out in the Bill of Rights. A solid understanding of the legal framework governing the protection of SRHS of PWDs, both at the local and international levels, is crucial, if the litigation process is to deliver for this clientele.

Courts are an important avenue for guaranteeing the protection of the SRHR of WGWD. When a case is properly framed and conducted, a court can grant a litigant the remedy they have sought. But this route is prone to several limitations. Litigants must take these, too, into account before they invoke this route. Primarily, the litigation process is expensive. In most legal systems the costs of hiring experienced counsel is not cheap. For litigants this is a huge barrier. WGWD are in a worse off position, considering that they have inadequate means. In the absence of pro bono legal services, many would be unable to enforce their SRHR. One would argue that in instances of violations these victims should represent themselves in court. This argument is simplistic. The Kenyan legal system is quite complex. It would be quite difficult for a lay person to navigate this maze. Hence, the need for a victim to be represented by experienced counsel. Further, court processes in Kenya tend to be very protracted. Despite the legal requirement that these procedures should be expeditious,[58] the reality is that cases take several years to be heard and determined.[59] This is expensive not only in terms of money, but also when one considers the time spent running a case. Yet the concern at hand, meeting the sex and reproductive health needs of WGWD in the current COVID-19 environment, requires urgent action. The fact that a losing party in the High Court can challenge an unfavorable decision in the Court of Appeal,[60] and, eventually, the Supreme Court[61], means that the road to an effective remedy can be quite long. In the meantime, the SRHR of WGWD will continue to be violated. It is also questionable whether this state of affairs prevents the well-known adage – justice delayed is justice denied.[62]

The third limitation of the court system lies in the kind of remedy a judge can hand down. Article 22(1) of the Kenyan Constitution states that:

> Every person has the right to institute court proceedings claiming that a right or fundamental freedom in the Bill of Rights has been denied, violated or infringed, or is threatened.

---

[58] Section 1A(1) of the *Civil Procedure Ac* (Cap 21) and article 47(1) of the Constitution.

[59] The Kenyan Judiciary accepts this reality. See *State of the Judiciary and the Administration of Justice Annual Report, 2018/2019*. Available at file:///C:/Users/USER/Desktop/Financing%20Reproductive%20Health%20and%20PWDs/SOJAR%20REPORT%202,018%20_%202,019%20final.pdf (Accessed: 28 May 2021) at 24.

[60] Article 163 of the Constitution.

[61] Ibid. article 164.

[62] Article 159(2)(b) of the Constitution requires courts to be guided by the principle that 'justice shall not be delayed.'

Under article 23(1) of the Constitution, the High Court of Kenya is given authority to hear and determine such claims. After hearing a case a judge should grant an 'effective remedy.'[63] In Kenya, the following reliefs are available:

(a) A declaration of rights;
(b) An injunction;
(c) A conservatory order;
(d) A declaration of invalidity of any law that denies, violates, infringes, or threatens a right or fundamental freedom in the Bill of Rights and is not justified under Article 24;
(e) An order for compensation;
(f) An order of judicial review.

The concern here is not the nature of the reliefs, which a court can hand down. Rather, it lies in the fact that once a case is lodged in court, a judge has the final say, unless the litigants reach an agreement. Parties to a suit will thus have to contend with the court's decision. Herein lies the problem, particularly for common law legal regimes, which follow the precedent system. Under this framework courts are bound by previous decisions. Further, lower courts are bound by decisions of higher courts. Likando Kalakula describes litigation as an 'important strategy.' (Kalakula, 2013 at 169) But this author fails to appreciate the fact a court can set an unhelpful precedent. For common law systems the rules established by such precedents have to be followed by lower courts, unless the decision is reversed on appeal or review. Decisions from the apex court can only be overruled by the court itself. Otherwise, they are binding on the court and all lower courts.

Serges Kamga reminds us that litigants need to take into account the 'threat of litigation.' (Kamga, 2014 at 452) Invoking alternative dispute resolution mechanisms is one way that WGWD can explore to avoid courts creating "dangerous" precedents. In Kenya, article 159 of the Constitution recognizes reconciliation, mediation, arbitration, and traditional dispute resolution mechanisms as possible avenues for dispute resolution (see also Alternative Justice Systems Baseline, 2020). Considering the dangers associated with litigation (discussed above), it is prudent for WGWD seeking to enforce their SRHR to invoke these frameworks, prior to engaging the court framework. If they decide to lodge claims in court, the legal representatives running these claims should re-evaluate the evidence on record. They should give priority to the alternative justice modes. In addition to saving on resources, the alternative justice resolution tools give parties a chance to explore the most appropriate remedy for the dispute at hand. Moreover, a lay person can air his or her claims in these forums as the rules of evidence are not strictly followed (Yet these systems have attracted significant criticism. See, for instance, Kiplagat, 2016; Asunah, 2020; Amasah et al., 2015–2017).

---

[63] Articles 8 and 2(3) of the *UDHR* and *ICCPR*, respectively.

The last limitation lies in issues surrounding compliance by the Government with court orders. This is yet another area of grave concern. Usually, when a Judge hands down a decision he or she will direct a party to the suit to perform a certain act or refrain from specific conduct. In the context of SRHR for WGWD during this period of the COVID-19 epidemic a court could make orders compelling a particular government official to take certain steps within a prescribed time-line. If it fails to abide, the aggrieved party can commence contempt proceedings against the official who has failed to comply with the orders of the court.[64] Failure to comply can lead a court to make additional orders. The issue of noncompliance with court orders is of grave concern in Kenya. Unfortunately, the record of the Government shows that it does not always comply with court orders.[65]

The trend of noncompliance with court orders by the Executive arm of the Government is extremely worrying. It sets a bad example for a country that prides itself in having a progressive Constitution. The preamble to Kenya's Constitution recognizes the aspirations of all citizens for a State based on 'essential values of human rights, . . . social justice and the rule of law'. The caseload cited in this section exhibits the Executive's reluctance to protect and preserve the Bill of Rights or abide by the justice call, which Kenya's National Anthem emphasizes. The open defiance of Court Orders casts serious doubt on the Executive's intention to embrace basic rule of law principles as well as promote a human rights culture in the country. Simply put, it is a 'culprit of human rights violations' (Mubangizi, 2005 at 179). The upshot of this trend is to potentially compromise a great deal the realization of SRHR by WGWD during these uncertain times.

Beyond Litigation: Human Rights Education

In Kiswahil they say, "Elimu ndiyo mwanga uongozayo kila shani." When translated to English it means, "With knowledge one can emerge from a difficult situation." Promotion of human rights education ('HRE') is the second strategy that justice seekers can deploy. According to the United Nations General Assembly, HRE refers to:

---

[64] See the *Contempt of Court Act* (2016).

[65] See, for example, *Miguna v Dr. Fred Okengo Matiang'i and Others,* Constitutional Petition No. 51 of 2018 [2018] eKLR (where Judge Mrima quashed a decision by the Minister to revoke the petitioner's citizenship and suspend his passport); *Adrian Kamotho Njenga v The Attorney General and Others*, Constitutional Petition No. 369 of 2019 [2020] eKLR (where the High Court found that delay by the president to appoint individuals the Judicial Service Commission had proposed for judgeship was 'unreasonable and unconstitutional'); *Okiya Okoiti and Another v The Public Service Commission and Others* and *Law Society of Kenya v The Office of the Attorney General and Others*, Constitutional Petition No. 42 of 2018 [2021] eKLR (where the court declared unconstitutional the creation by the President of certain state offices and nomination of officials to these offices), and *Law Society of Kenya v The Office of the Attorney General and Others*, Constitutional Petition No. E283 of 2020 [2021] eKLR (where the court nullified an Executive Order by the President to transfer the responsibilities of a State Corporation to the Military).

> [T]raining, dissemination and information programs can have a catalytic effect on national, regional, and international initiatives to promote and protect human rights and prevent human rights violations (UN General Assembly, 2000).

In the context of WGWD this initiative is the learning process that focuses on their SRHR. The overall goal of HRE is to ensure that WGWD can appreciate, and, consequently, are able to advocate for their entitlements (see also Sibusisiwe Mavuso & Pranitha Maharaj, 2015 at 83). This is not to imply, however, that WGWD do not know what is good for them or what they would like to achieve. On the contrary, the goal of this strategy should be to ensure that the rights of these individuals are guaranteed in all spaces, by all persons and at all times. Emphasis should be on access to SRHR by WGWD. To this end, these educational platforms should seek to build on the current knowledge base that WGWD possess. Among other objectives, the trainers should provide new and 'innovative' (Burnett, 2021 at 12) strategies for addressing current challenges. Further, the platforms should be an avenue via which WGWD share their knowledge, skills, and experiences.

Moreover, these forums are useful for the wider community to appreciate the SRHR entitlements of WGWD. For those who deal with WGWD, these sessions are a powerful tool for arming them with relevant information and knowledge, which they use to engage their clientele. The overall objective is to empower these individuals to become 'subjects [or promoters] of rights' (Abraham Magendzo, 2005 at 140). This strategy promotes the *CRPD* call for health professionals to 'provide care of the same quality to persons with disabilities as to others, including on the basis of free and informed consent (article 25(d)).' In order to be effective these information exchange forums should feed into the existing channels that WGWD use. Consistent with the well-known disability theme – "nothing about us without us" – instructors should be drawn from WGWD. Although national human rights commissions[66] and 'opinion leaders' (Sondem, 2015–2017 at 84) can be part of the process, a top-down approach should be avoided. On the contrary, WGWD should drive this initiative for real change to be realized (Kiru, 2018 at 4). In addition to WGWD, other stake holders, including men, should be involved in the education drives, as a way of creating awareness and bringing change.

We also need to take into account the mode of transmission of the content for each learning session (London & Baldwin-Ragaven, 2008 at 13). To promote effective communication, debaters should break down complex material. They should also avoid technical language. Information should be easy to access and packaged into simple, plain language. Pictorials – maps, charts, photographs, figures and graphs – can be used to support the goal of effective communication. The special needs of the blind community must also be considered. Consistent with the Constitution, and in order to reach a wider audience, local languages should be used.[67] All disabilities

[66] Article 59(2) of Kenya's Constitution.

[67] Articles 7, 44 and 50(3) of the Constitution.

must be accommodated in these information-sharing sessions. Otherwise, these processes could end up being discriminatory.

Unlike judicial processes, which are adversarial or aggressive and formal, HRE tends to be accommodating and informal. The learning process can take place in any setting – academic venues, social gatherings, health centers, seminar or conference rooms, religious settings, via radio or television, among other forums. Distinct from litigation, which tends to be expensive, the costs of these sessions can be managed, especially if the instruction occurs as part of an on-going event or activity. The fact that the discussions take place in less formal settings is an additional advantage. This environment can encourage participants to speak freely, compared with a more formal setting such as a court room (Bajaj, 2012 at 125). Because they are run by WGWD, there is a high chance that the audience will engage and retain the information, which is being transmitted.

Despite these benefits, a number of limitations are noticeable. Primarily, one can attack these learning sessions on the basis that their scope is limited. One has to be in the particular setting in order to benefit from the lessons learnt. Unless the material in a particular sitting is recorded and transmitted, those who fail to attend will miss out on the information that was shared. Further, the lessons learnt can be easily forgotten, if they are not well stored or if a session fails to take into account the needs of all participants. Simply put, the information shared in these sessions should be available, accessible, and acceptable to all users. If these limitations are not addressed, the effectiveness of this intervention method will be severely curtailed.

Policy Interventions: An Additional Protection Layer

At policy level, Kenya, like many States in Africa, has several policy documents. Although some are general, others are specific to WGWD. These include the Vision 2030,[68] the Health Policy, 2014–2030,[69] the draft National Reproductive Health Policy[70] and the National Adolescent Sexual and Reproductive Health Policy.[71] There are also other guiding documents such as the National Guidelines on Management of Sexual Violence, 2014, the National Guidelines for Quality Obstetrics and Perinatal Care, 2012, and the Ministry of Health Revised Post Abortion Care Training Package. Collectively, these seek to address, among others, issues of SRHR of WGWD. They establish set criteria, which mirrors the legal obligations set by the

statutes evaluated above. Any aggrieved person can use these standards, too, to gauge the level of compliance by the relevant duty bearer.

Thus far, the country lacks a specific policy for WGWD. This is a huge gap in the enforcement regime. It is thus imperative for the Health Ministry, in conjunction with the Council and other interested parties, to come up with an appropriate guideline. The overall objective should be to protect the rights under consideration during these uncertain times. This document can complement the two enforcement strategies evaluated above. Issues surrounding the allocation of resources for SRHR for WGWD should be comprehensively covered by this protocol. The UHC agenda can reinforce this policy framework by containing within its essential services package the provision of sexual and reproductive health services to, among others, WGWD. Questions relating to the financing of non-medical costs (for example, transportation costs and costs of hiring carers) for WGWD must also be addressed, if the policy is to deliver. As the preceding discussion has demonstrated, these costs have continued to prohibit WGWD from accessing health care services, especially during this COVID-19 season. In order to address the particular needs of the target population, the regulations must take into account the intersecting factors that accompany the SRHR of WGWD, including the levels of poverty and illiteracy, their health status as well as age, gender, and sexual orientation.

Consistent with article 10 of the Constitution, the government also needs to put in place health resource tracking mechanisms to enhance the accountability of any resources that are channeled toward the enhancement of SRHR of WGWD. This tool can bolster M&E exercises. It can also promote effective and efficient utilization of resources. Collectively, these initiatives will contribute a great deal toward fulfilling the rights owed to WGWD.

Conclusion: Beyond the Rhetoric

In the 1927 United States case of *Buck v Bell, Superintendent*,[72] Justice Holmes of the Supreme Court held that a piece of legislation, which permitted the forced sterilization of persons with mental disability, did not violate the equal protection and due process clauses of the Constitution.[73] Today this view is unsustainable. WGWD are entitled to all the fundamental human rights and freedoms accorded to all human beings. The lofty commitments that governments make regarding the SRHR of WGWD need to be translated into actual entitlements. Although countries like Kenya are on the right track by putting in place constitutional, regulatory, and policy frameworks, as well as having a progressive judiciary, these fundamental

[73] According to the Judge, ‘It is better for all the world, if instead of waiting to execute degenerate offspring for crime, or to let them starve for their imbecility, society can prevent those who are manifestly unfit from continuing their kind’ (at 207).

rights are yet to be fully realized. This chapter has flagged some of the difficulties that WGWD face.

In Kenya, article 186 of the Constitution, read together with the fourth schedule, demarcates the role of national and county governments. Although the former is responsible for policy making, the latter is charged with the responsibility of delivering health services across the country. This means that strategies that are aimed at addressing SRHR need to be implemented by the county governments. The resources required to meet this obligation come from the national government to the counties. This framework presents several problems. Primarily, it has been plagued by serious delays. Additionally, in some instances, the national Government has purported to perform some roles that fall within the mandate of county governments. This trend has to stop. The mandate of county governments should be respected and strengthened. Otherwise, how will they effectively deliver on the health rights of WGWD? As mentioned above, donor funding is unreliable. Hence, new resource streams must also be explored by Government and justice defenders. Local sources must be tapped into. These will contribute immensely toward plugging the current resource gaps.

Data on WGWD are also crucial. In addition to identifying and establishing their numbers, these statistics are crucial for planning purposes, especially in the current pandemic. As mentioned earlier, official statistics estimated that, as of December 2019, WGWD constituted 1.3% of Kenya's total population. According to the World Health Organization, about 15% of any given population are PWDS.[74] Women and girls constitute just over half of Kenya's population. Consequently, this renders the data on WGWD somewhat questionable. One would have expected their population to be significantly higher. The current state of affairs affirms the assertion that PWDS are still somewhat lost and forgotten.[75] Failure to collect proper statistics sits uncomfortably with articles 45(1)(a) of the *Banjul Charter* and 31 of the *CRPD*. Like any other population, WGWD should be properly identified and counted.

The COVID-19 pandemic has created new challenges for WGWD. Consequently, stakeholders must come up with a new tool box to meet these difficulties. In terms of action points for implementation, investment in health projects must be made in a disability friendly infrastructure (e.g., adaptive medical examination beds or chairs) within health facilities, as well as the relevant medical equipment, commodities (such as contraceptives, etc.) and medication. It also important to ensure that there is an adequate health workforce trained to deal with the unique vulnerabilities of WGWD during this time of crisis. Collectively, these initiatives will contribute immensely to their enjoyment of SRHR. Through this route, Kenya may inch closer to its commitment to achieving universal health coverage by 2022. Bearing in mind the discussion in this chapter, will this important milestone be reached as per schedule for WGWD?.

Conclusion

Disability Advocacy in Uncertain Times: An Interview with José Viera

91

José Viera and Peter Torres Fremlin

Contents

Abstract

This chapter brings you a conversation between Jose Viera and Peter Fremlin – two vehement and internationally influential disability advocates and activists. The conversation is an interview by Peter to capture Jose's view on how the disability movement can navigate uncertainty. Many thanks to Aliyah Esmail, Áine Kelly-Costello, Greta Gamberini, Elizabeth Lockwood, Stefan Tromel, and Nick Corby for making this interview possible.

https://doi.org/10.1007/978-981-19-6056-7_104

Introduction

Sometimes, it's easier to argue for inclusion while everything is going well. But in an economic downturn, or with other uncertainties, people might not be willing to try something new, or make an investment in inclusion.

This chapter brings you a conversation between Jose Viera and Peter Fremlin (a freelancer and disabled person working with international organizations to try to make the world a better place for disabled people). Their conversation aims to understand how we can continue to make change and get others to come with us in the disability movement.[1]

Jose has been at the heart of the international work that has brought governments and civil society together. In this interview, he shares the way he approaches advocacy and how he navigates the challenges the disability movement faces.

Highlights

One of the motivations for doing this interview is to get an inside view on how people are making change and how they understand the work that they do. Jose describes how his advocacy approach is closely tied to the way he understands the disability movement and our opportunities:

> I try to confront people with the reality in front of us. If you don't know what the reality is, how can you change it? Once we frame the conversation through bringing what the reality is, the next element is that you can be a partner to people with disabilities to change that reality. The element that I always like to share and not to convince people of, but at least to share, is that the reality that we are trying to change will bring better things for all.

This is the approach that ran through their conversation too: basing things in the context that we're in, making sure change is based on people's choice, and pointing toward the opportunities that are there.

Being able to understand both where we are and where we need to be makes Jose more interested in change as a process, rather than destination. Jose understands the disability movement as one that has grown out of people who looked for solutions to what limited them in their own lives, and then taken that forward:

> This lack of free decision making processes made us think that we need to be the leader of the change if we want to see something improved. That's why we didn't stop, or many of us didn't stop. We got what we went to the organizations looking for, and we took that flag and carried it out in different ways.

---

[1] The original interview took place on November 21, 2022, and can be found here: https://www.disabilitydebrief.org/debrief/advocacy-in-turbulent-times/

As that journey implies, the disability movement is made up of grassroots organizations and activism, and those who took that flag forward deep into working with or inside establishment organizations. Sometimes, these different positions and perspectives can lead to tension within our movement, and Jose acknowledges this directly:

> We are part of a political movement with interests, different interests, money behind, power behind, reputation. Why wouldn't that be part of a social movement of a person with disabilities if that is part of the daily conversation of other movements? The fact that those tensions exist speaks to the fact that we are definitely creating something big or we are pushing for something important.

Jose argues that living in tension "is not a bad thing" but also that it can "make us better." It is especially important as we face an economic crisis that "will definitely impact the inclusion of persons with disabilities." Our movement is faced with two tasks simultaneously:

> We as the disability movement will have to play two games, from now on, and I would say for the next five or ten years. One is to create better opportunities, and the other is, at the same time, to ensure that what we've achieved doesn't get lost.

One of the familiar frustrations in advocacy on disability is the feeling that the movement has not gone far enough. Jose's point about the second game means that sometimes even staying put can be a victory, for defending where we are. Jose's message isn't that we should "sit back and relax and wait, but to be aware of the time that social change requires":

> Sometimes we are too hard on ourselves as activists wanting to change quickly. It makes sense because when you come from a world of denial, everything for you is urgent and you want it for yesterday.

This guidance for activists is also accompanied by the invitation that Jose makes for people to join in and share "the responsibility for positive change," especially to those of us who have been able to access opportunities to different resources. How do we start? Jose, as he promised, grounds it in the concrete:

> "Start with something that probably you need, that is close to you, is tangible and that you can see a change." . . .

Conversation in Full

"Everyone's Afraid of What's Going to Happen"

Peter: You've been traveling to Germany and Qatar and many other places trying to get governments and international organizations to pay attention to disability issues. How's it going?

Jose: We are living in such turbulent times. It doesn't really matter the region that you're in, everyone's afraid of what's going to happen. People are uncertain about the future. When you live in times of uncertainty, you try to reduce your exposure, to home again and be as safe as you can. In that context, I think the disability agenda can be affected.

At the same time, people want to have good news. The only thing that can push you forward is that you think there is a better future. By trying to include disability issues in different agendas, that can be good news for many. I'm not saying, of course, anything related to charity or social responsibility or corporate responsibility. But being more aware of the needs of others, like persons with disabilities, being conscious of the challenges that people are facing, can make you take different actions that bring good news.

That is my feeling. A lot of uncertainties, but a lot of hope and a lot of need for good news.

Showing People They Can Be Part of the Change

Peter: Your work deals with high-level policy and complex bureaucracies. How do you advocate with them?

Jose: There are still a lot of people that have different understanding of inclusion. Not the understanding where the person with disability is the center. What motivates me to talk to governments, to talk to high level officials, etcetera, is to show that they can be part of this change. They should be part of this change and that what we are talking about is possible. It's a matter of how we harmonize resources and political will to get that change that I'm talking about.

I try to confront people with the reality in front of us. If you don't know what the reality is, how can you change it? Once we frame the conversation through bringing what the reality is, the next element is that you can be a partner to people with disabilities to change that reality. The element that I always like to share and not to convince people of, but at least to share, is that the reality that we are trying to change will bring better things for all.

This can have different forms and shapes. Your language, your tone change according to who you have in the room because there are definitely differences among who is responsible, who is the most responsible, from social obligations to legal obligations, to whatever type of obligations. In the end, it's a matter of being willing to change the reality.

I avoid talking about my personal experience. I'm a bit skeptical of building the case for the movement from my own personal experience. I don't even know if my personal experience is reflective of the challenges that people with disabilities face.

I think my personal reality allows me to be clear on what is the reality of most of the people with disabilities. I always like to build a case from that concrete reality and invite people to be part of the change.

Choice as a Foundation for Change

Peter: Something running through your advocacy messages is the element of partnership and people's choice. Can you tell me more about how you see choice and agency?

Jose: I don't know if the right word is responsibility because I think that the connotation of responsibility sometimes can be turned negative. An opportunity to be part of the change. Beyond legal obligations, beyond political obligations, beyond financial obligations, there is always an opportunity to be part of a change.

I don't think that I would be doing what I do if I didn't believe that a change is needed. I know that the change that I have dreamed of will never happen. I'm just trying to get closer to that change or to the positive effects of the change.

I'm more interested in the change as process. Through being exposed to people who think differently, who do things differently also makes you think differently and interact differently. Keeping in mind that I have a good change to work for, but the process, the way, the path to change is equally enjoyable.

Of course the most extreme situation is if you are forced to live in an institution. But if you have to pay extra for your transport to go to meet with your friends because the local transport is not accessible, that is also a lack free choice. Of course, there's no comparison between being able to go to a party and what people with psychosocial disability experience living in institutions.

But in the end, the denial of free and autonomous choice, of decision-making, is what should make us all pursue change. To respond to your question, for me, change has a precondition of giving the chance to people to freely choose what they want to do. There is no possible change without the right to freedom.

A Common Root: Getting Support from Disability Organizations

Peter: It's interesting seeing the process of change as vital to us as the result. I guess it's partly because the process of change is of people realizing their choices, realizing their dreams, transforming themselves as individuals and as groups. You've struck on something that's a beautiful being part of the disability community, to be able to witness so many people doing that.

Jose: I see ourselves as a social movement. I think we started by trying to cover the absence of States [governments]. We all have the common root of going to disability organizations to get what we couldn't get from who was supposed to be responsible to provide services and support. We have been ambitious to transform that first connection with the disability movement into a political movement.

Peter: You mean transform these relationships that are supporting people in day-to-day lives into something that's much wider?

Jose: Yes and impactful. We come again to the right to choose, the right to freedom. This lack of free decision making processes made us think that we need to be the leader of the change if we want to see something improved. That's why we didn't stop, or many of us didn't stop. We got what we went to the organizations looking for, and we took that flag and carried it out in different ways.

Tensions in the Movement and Representation

Peter: I am glad you brought up the disability movement. Both you and I are in quite institutional parts of the disability sector. A lot of your work is deep into the establishment, with UN meetings, with governments. Do you see tensions between some of the institutions that are representing disabled people and that social movement side?

Jose: Saying that I don't see the tensions is basically ignoring part of the reality. I would say one of my developed skills is to be able to read quite effectively different realities. I do see tensions, and sometimes we perceive those tensions as barriers for us to work together. But actually I think that those tensions are part of the DNA of the disability movement as any other movement. Why should we be different from other movements?

Peter: What you mean by it being part of the DNA?

Jose: Living in tensions, coexisting with tensions. We are part of a political movement with interests, different interests, money behind, power behind, reputation. Why wouldn't that be part of a social movement of a person with disabilities if that is part of the daily conversation of other movements?

The fact that those tensions exist speaks to the fact that we are definitely creating something big or we are pushing for something important. One example is representation. Are the organizations that lead the conversation around persons with disabilities enough representative of the movement?

Peter: Good question, I was going to ask you that. Are they?

Jose: In my opinion, yes. But the tension in representation makes those who believe that the organizations that we currently have are representative [should] do our best to be representative: and that we don't claim to be representative by default. Those who do not believe that the existing organization infrastructure is representative of the movement, have the role of helping us to know what is not good enough, what is wrong.

Living in tension is not a bad thing. It's part of the movement, the reality, the process. It makes us better.

We Will Have to Play Two Games from Now On

Peter: Let's go back to how we started this conversation and reflecting on turbulent times. There's this very strong association between inclusion and resources that might play out in the economic crisis that the world is going through. It can lead to a step back in inclusion.

Jose: It's important to clarify. If inclusion was only about resources then inclusion wouldn't be as hot a topic as it is in many more advanced countries. Resources are needed to be more inclusive, but that's not enough.

Inclusion requires resources. Let's say it. Why do we have to say that if you're poor, but you have good will from your teachers, you will be included? No. You're going to be included in a different way or at the expense of the efforts of your family, for example.

The second thing to say is that inclusion is more than having resources available. With the use of technology we believe that inclusion is all about allocating more resources. But it's about the process again. It's about how we start and where we get to.

The economic crisis that we are experiencing and that we will experience more and more will definitely impact on the inclusion of persons with disabilities. We as the disability movement will have to play two games, from now on, and I would say for the next five or ten years. One is to create better opportunities, and the other is, at the same time, to ensure that what we've achieved doesn't get lost.

These two games require different skills and understanding of the reality. We need to continue expanding our frontiers but at the same time ensuring what we achieved does not get lost.

Peter: Unfortunately the experience in the UK over the past 10-15 years shows how important that second game is and how trying to respond to it can send you backwards in messaging. You have to talk about need and how badly we'll do if it's taken away. It can really take you off of rights.

Understanding the Progress that's Been Made

Peter: A lot of achievements on disability are at quite a high level and not necessarily reaching the lives of people with disabilities. How do you reflect on the different levels change has happened on?

Jose: If you look at the change from a holistic point of view, there has been a lot of progress. You can see it in many countries, many of the organizations that are fighting for the rights of people with disabilities are now better equipped to advocate for inclusion and at the same time many of those organizations provide basic services that otherwise we will not have access to.

Change takes time. The urgency that we see and that we have been talking about on this call makes us always anxious and feel that we are behind on things. If you see this from a holistic point of view, things that are currently impacting on persons with disabilities are possible because we discussed disability many years ago.

I'm not saying we should sit back and relax and wait, but to be aware of the time that social change requires. I don't think that is by accident that the Convention [on Rights of Persons with Disabilities] has the concept of progressive realization. We cannot be worse than we were before. For many of us, we started so low that any little improvement should be seen as the roadmap for improvement, for progress.

What is concerning, is that you and I cannot talk in five years' time and keep talking about the same things and concluding that no progress have been made. That's why I was telling you about these two games that we have to play in these turbulent times.

Peter: You're saying we need to get better at seeing the progress and sometimes the progress in terms of that second game is about defending what we have won. You can be in the same place and you've won many battles because you've defended where you were.

"We Need to Perceive Ourselves as Constantly Moving"

Peter: I think a lot of what you're saying is inviting us to be clearer those tensions and to avoid getting too frustrated by them.

Jose: We need to perceive ourselves as constantly moving and probably Peter, you and I are talking from the comfort of our house and with basic needs fulfilled, and I'm sorry if that doesn't describe your situation. However, I would like to have more things to be more included. Of course, they are different from the needs of children in Argentina.

We need to focus on what we see as progress. What is changing, what is moving, what is improving? Sometimes we are too hard on ourselves as activists wanting to change quickly. It makes sense because when you come from a world of denial, everything for you is urgent and you want it for yesterday.

A good example of what I'm saying is that the fact that we are discussing representation is already a symptom of progress. If we were not smart enough to make the movement grow to the level that it has grown, we would potentially be talking about anything else but representation. The fact that we are now fighting to access resources, positively fighting, constructively fighting to claim who is more representative, who is more effective, would the change be bottom-top, or top-bottom, etc. It's an example of the progress made.

Sharing the Responsibility for Change

Peter: I appreciate this chance to reflect together. To close out, Jose, what are final reflections that you'd like to share?

Jose: First of all, thank you for the interview. I really appreciate it.

I am by nature a positive person, and I would like to clarify that as positive, but responsible. I am not naive to say that that change will happen without me pushing for it. I think anybody who has decided to be an activist has the DNA to not feel comfortable in the situation that we are in.

I would like me to be more comfortable and comfort here means inclusion. At the same time, I see my brothers and sisters with disabilities even further out from what I think should be a minimum level of inclusion. This makes me be positive, but responsible for the change.

I would like to share that responsibility with others. The more we share that positive responsibility to promote change, the more effective we will be. You cannot expect that a mother of a five year old child who cannot access education will be an advocate. It’s already too much that she has to deal with.

There is another part of the movement, people that have experienced that and have the chance to live a different experience and have opportunity to access different resources. Those are the ones that have to be more positive, responsible for the change.

“Start with Something Small, Close to You”

Peter: Many people would agree with you, but they might not see how they can contribute to change. Is there any message you would share if someone feels that way?

Jose: I don’t know, and I don’t know if anybody will know what is the best way to start. My answer would be to start with something small, close to you and tangible.

My first experience with an organization of a person with disabilities was when I wanted to read a book, not even recorded by my mother, by someone else. My mom had to record the textbooks for the school. How can I ask her, on top of everything to read literature. I went to the local library and I said, "I want a book," and they said, "There’s no book. Let’s do something." I didn’t start it. I met with people who had started to record books for blind people.

Start with something that probably you need, that is close to you, is tangible and that you can see a change.

Peter: That’s a beautiful way to wrap up, Jose.

Jose: Thank you very much, Peter. Interviews are part of the advocacy.

Conclusion: Moving Forward

Abstract

This final chapter of the *Handbook of Disability: Critical Thought and Social Change* captures the central ideas contained within this volume of work. We highlight the challenges and barriers that impede the progressive realization of human rights and disability justice and outline how this book envisions a sort of "normative paradigm," not in a positivist sense, but whereby disability is the norm. This paradigm is inherently critical of present social arrangements and translates reasoning into practical measures. The presence of disability is no longer an exception or rarity but a commonly accepted characteristic of the population. We describe how all the authors of this handbook embed their work in the social, human rights, and/or disability justice models of disability while noting that there is a need for ongoing paradigmatic development. We conclude with an invitation for utopian thinking, practice, and activism based on a collective vision for the future. A way in which to further the dialectical argument and paradigm shifts that reflect our current and future situations, conditions, environments, and forms of living.

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_102

Introduction

This book is about transformational change. It is about changing the way institutions, media, government, communities, and individuals view and engage with disability. This is not a minor issue because – in the words of Colin Barnes – "disability is not a minority issue." People with disabilities comprise a large portion of our population, and many of us will experience disability in one form or another over the course of our lives – either directly or indirectly with those we love. Yet this critical mass of people is minoritized, minimized, dismissed, persecuted, oppressed, harmed, and given much less power and priority than they rightly deserve.

In line with the disability movement, we strive for transformative action to change systems and their underlying values and assumptions, with a focus on the redistribution of power relations and the elimination of oppression. This is different from the more commonly accepted and visible incremental or ameliorative actions we have mostly witnessed. With only a few exceptions, ameliorative interventions have been implemented with small strategic improvements or adjustments that generally secure continuation of the status quo into the future. We must be suspicious of ameliorative and technological fixes to the problems facing people with disabilities and critically look at who profits from these fixes, as well as who is included in the design, development, implementation, and evaluation of solutions and who is still missing.

This book explores these challenges from various disciplines and geographic and social locations. It identifies the visible and hidden barriers entrenched in our ableist societies. It traces the history of the myths, misconceptions, attitudes, laws, policies, practices, and portrayals of disability over the ages. It makes us cognizant of systemic forms of colonialism, imperialism, neoliberalism, fascism, sexism, racism, etc.

This book also provides us with hope.

Here, we define hope not as a call for cheerful optimism nor a denial of the urgent issues we collectively face but as wise and realistic hope. We embrace materialist insights that acknowledge how historical developments are created and constrained by concrete, existing material conditions. We believe that knowledge about these conditions is a form of power that justifies and amplifies hope. Ernst Bloch (1995) describes hope as a process that captures the moment of potentiality surpassing into actuality which opens up opportunities for interventions of active engagement and decision-making. According to Bloch, the right way to relate to these opportunities is through an active approach toward real tendencies with the goal to realize them. This approach is not merely a subjective combination of desires and beliefs but rather a reflection of metaphysical possibilities in the world. In a sense, this form of hope is reflected in the convention on the rights of persons with disabilities (CRPD) as a guiding framework for transformative change.

There have been numerous successes that have resulted from the field of critical disability studies, advocacy, and activism. These include the aforementioned CRPD, SDGs, national laws on disability, etc. Perhaps most importantly has been the CRPD. Although not perfect, this international treaty has been a template for national and subnational laws and continues to be an aspirational goal for groups and individuals with disabilities. With a strong focus on the implementation and monitoring of the CRPD, we are living in Bloch's described moment of potentiality surpassing into actuality.

One of the areas that Marcia Rioux was most interested in – and most effective at – was the process by which people with disabilities who had essentially accepted their fate of social exclusion could become advocates for change for themselves and for others. It was part of the underlying ideology that she and Bengt Lindqvist used in creating Disability Rights Promotion International (DRPI). They cocreated a training program, methodology, and mechanisms whereby disabled people themselves could learn about and monitor their experiences and violations of human rights. The DRPI initiative inspired hundreds of advocates first reporting on their experiences and violations of human rights and then taking political action at the local and national level and on the international stage at the UN.

This book is based on a belief that knowledge is power and a process that can be used for many purposes. Knowledge can be used to increase the gap between the rich and the poor or unleash the creative potential of every human being. As such, knowledge is a powerful resource (Laszlo & Laszlo, 2002). We believe it is up to those with access to knowledge to decide how to use that power. It can be used as power over others so that only an elite few can enjoy indulgent lifestyles or power to empower others to engage in meaningful and sustainable forms of social organization.

Stakeholders with various interests have created the ultimate form of the North-South interface relying on colonialism, imperialism, capitalism, globalization, foreign policy, diplomacy and international aid, mass migration, and disaster relief. The issue of disability, and disability studies and activism, has seeped through these countless channels and is hugely influenced by technological innovations such as the Internet. Virtual communication has configured disability policy and activism in unique ways, which has been explored in several compositions in this volume.

Current issues of intersectionality, increasing inequality, climate change, migration, and AI are pushing the boundaries of the CRPD and present new risks, challenges, and opportunities for transformative change. As noted by the contributors to this book, intersectionality has sometimes been taken up uncritically or co-opted in contemporary scholarship to limit the essentialized understanding of identity (Erevelles & Morrow). The rate of poverty and economic exclusion of people with disabilities is stubbornly high (Tromel). People with disabilities are chronically ignored in addressing issues related to climate change and migration and associated increases in emergencies and conflict situations (Crock & McCallum). The development of the study of the human genome and neurotechnologies is giving rise to ethical and legal dilemmas with increasing capacities for genetic manipulation, to intervene in the brain to enhance its state, erase fragments of memory, prevent behaviors, etc. (Bariffi & Quinn). The proliferation of AI is a mirror to our societal perspectives wrought with biases, exclusions, and neoliberal ideologies. As Treviranus aptly points out:

> The proliferation of artificial intelligence relying on statistical reasoning to guide and make decisions amplifies, accelerates, and automates these discriminatory patterns (Gupta & Treviranus, 2022; Treviranus, 2022). AI automation removes the option to make exceptions. Mechanizing decisions such as hiring, academic admission, loans, medical triage, urban planning, security, probation among other critical decisions exonerates the implementers of

> the harm these decisions do to outliers and marginalized minorities. One positive side effect of AI is that AI makes manifest the potential harms, such that these harms gain the attention of hard scientists and cannot be dismissed as unempirical soft science.

The third decade of the twentieth century is being claimed to be transformative of human society. In fact, the rise of artificial intelligence is compared to the introduction of the printing press or the introduction of the internal combustion engine. So we asked an artificial intelligence chatbot about the future of people with disabilities. The response we got was the following:

> There is a growing awareness and understanding about the needs and rights of people with disabilities, and this is leading to increased opportunities and advancements in technology, accessibility, and inclusion. While there are still challenges that need to be addressed, such as ableism, discrimination, and lack of resources, progress is being made towards a more inclusive society.
>
> In terms of specific areas, employment opportunities for people with disabilities are expanding, with more companies recognizing the benefits of having a diverse workforce. Education and training programs are also becoming more accessible, allowing individuals with disabilities to acquire the skills and knowledge needed to succeed in various fields.
>
> Additionally, there has been a push for greater accessibility in public spaces and transportation, as well as advancements in assistive technologies and medical treatments. All of these developments suggest a hopeful future for people with disabilities, where they can live independently, participate fully in society, and achieve their goals.

This response reflects both a narrative of optimism and biases toward viewing people as valued according to their educational and employment status. It presents a partial truth in terms of accessibility and inclusion and yet also picks up the medical model as a persistently stubborn paradigm for the way in which we think and act toward disability. The growing awareness and understanding about the needs and rights of people with disabilities is true – and worth noting for the sake of hope – in some parts of the world. It is a goal, a dream, and a vision for others.

This handbook touches on these emerging issues and to us reflect the grand challenges for the disability movement. Disability art and literature are – to various extents – operating outside the boundaries of capitalism and neoliberalism which provoke the criticality of disability and are discussed throughout the many chapters of this text.

We are living in turbulent times, and people are uncertain about the future. Many governments, organizations, and individual activists argue that we need a collective response and collective action to address the multiple and intertwined social, economic, and environmental crises of our time. It requires wealthy nations of the Global North to take more responsibility for the implications of their actions on the Global South and move away from individualist and nationalist ways of thinking and living.

So what does the future hold? The disability rights model is growing and clearly the disability justice paradigm will become more prominent. What does it mean to achieve disability justice? What will be the characteristics of a new model beyond disability justice?

This book begins to envision a sort of “normative paradigm,” not in a positivist sense, but whereby disability is the norm. This paradigm is inherently critical of present social arrangements and translates reasoning into practical measures. The presence of disability is no longer an exception or rarity but a commonly accepted characteristic of the population. Disability would be widely considered to be a fundamental and natural part of human diversity. Disability would no longer be considered a condition associated with disadvantage and discrimination. The goal would be to create an inclusive and equitable society that values and supports all individuals, regardless of their abilities and where their productivity does not determine their worth. People with disabilities have firmly claimed spaces of power. This is where social, spatial, political, economic, and climate justice meet. It is both practically and theoretically useful in the realization of sustainable change.

This paradigm does not accept the status quo but seeks to change it. This paradigm exists in the imaginations of activists, advocates, and scholars. It is not just the reduction but the elimination of oppression, poverty, violence, discrimination, and marginalization of people with disabilities.

All the authors of this handbook embed their work in the social, human rights, and/or disability justice models of disability while noting that there is a need for ongoing paradigmatic development. The paradigm they describe is:

- Rooted in diverse written, oral, visual, and archaeological knowledges of disability history led by those outside the Western (particularly Anglo-Saxon) context
- A refusal and reconciliation of the epistemic and overt erasure of people with disabilities
- Informed by the values and principles of inclusive research, Black feminist conceptualizations of intersectionality, and indigenous ways of knowing and being
- Facilitated by epistemic collaboration for disruptive knowledge production as a strategy to foreground, critique, and challenge the hegemony of the many forms of structural oppression
- Enacted through “reciprocal relationships of learning, being, belonging, doing and becoming” (Lorenzo introduction)
- Driven by the politics of difference and inclusive design that eliminates the need for accommodations and adaptations for people with disabilities

This imagined paradigm focuses on translating ideas into practice and putting ideas to work with adaptability and flexibility and responsiveness to the particularities of temporal, geographical, environmental, political, cultural, and social context. We must also recognize the self, feelings, and emotional truths experienced by individuals. In this way, we appreciate a post-normative critique that avoids being dismissive of experiences and aims to find a way to enable the articulation of the gap between the “is” and the “ought” (Illouz, 2018). What is beautiful about a post-normative critique – and what aligns with the idea of disability as the norm – is that people would be free to be their authentic selves, free from the social constructions imposed upon them, and free from what others think and tell them that they “ought” to be. “A post-normative critique of emotional authenticity then has no fixed a priori normative position. . .it wants to abolish the distinction between subject and objects. . .it uses immanence as a tool to unsettle cultural hierarchies” (Illouz, 2018, p. 209).

The handbook emphasizes that thinking about and understanding disability and responses to body/mind differences drive change in advocacy, activism, practice, policy, and law. Our collective group of authors highlight the need for conscientization and challenge the ways in which the existing institutional order of the world's economy generates inequalities and poverty and underlies current international human rights and development mechanisms.

This is, of course, an incomplete discussion of the future of disability. Indeed, it is not intended to be complete. There already are signs of the development of a post-normative critique. One of the principles of this post-normative view is that people are free to be their authentic selves without being admonished by a critic who stands on an Olympic Mountain (Illouz, 2018; Walzer, 2002). A post-normative critique embraces ambivalence and emotional authenticity, moving away from socially imposed constructions of the self and of communities. We similarly embrace ambivalence with deep respect and appreciation for the complexity of disability and diversity.

Finally, this book is an invitation for utopian thinking, practice, and activism based on a collective vision for the future. A way in which to further the dialectical argument and paradigm shifts that reflect our current and future situations, conditions, environments, and forms of living.

In conclusion, the coeditors are optimists for the future. We believe that there will be a new paradigm that will combine with recent paradigms in other sectors of society such as employment, law, domestic and international policy, etc., to work on the grand challenges of our time. We must work together as a human species, with (rather than subordination of) other species, microbial populations, and water systems.

With that in mind, we thank you for your time and attention to the *Handbook of Disability: Critical Thought and Social Change in a Globalizing World*, and we leave you with a poem written in honor of Marcia Rioux by Pavan Muntha, a vehement disability and climate justice activist and scholar from India.

Augmenting rhythms of nature
When I got the idea of narrating my experiences, I sat down to speak;
I could listen to the murmurs of entangled clouds;
a breeze walking all over my body, again there is a murmur rolling right over my head;
Just before lunch this afternoon,
I am asked to inspect a fallen tree,
Which blessed all of us with its fragrance for years:
So disturbed I am, a thought instantaneously came,
The thought of tree,
Hit by a thunderstorm just an year ago,
On that deadly night it almost fallen on me.

But, I now realize, that tree saved me;
which stood out for years,
She was endlessly tall,
And wide with splendid branches,
Her canopy gave shade to windy corridors of life,
She was always a big host, for honey bees, squirrels,
Monitor lizards and red jungle fowl,
All of them are always,
chased relentlessly by kittens and monkeys;

She was a launching pad for monkeys,
To jump on the tiled roof from south-west:
Her white flowers with petals pink on borders,
Bedded the soil under her canopy,
Stretched all around her trunk,
Topsoil were soft under her,
splendid branches,
flowers, leaves, bark and fallen branches,
Offering food to microbes and insects;
A layer of humus is created,
hosting ants and other insects,
To energise them with cookies and nectar with special fragrance;
Hidden in the tissue barrels of flowers,
We often taste them but, with Ant bites on lips,
what a seductive host!

It was ruthlessly chopped off, a month ago,
But, now I see thousands of her children,
Covering the topsoil with a green carpet of saplings.

Can I augment these rhythms in the performing art of nature?
Mastan Vali, a seven-year-old brown tomcat,
Acquired his name after a young mountaineer,
Majestically walked into the dining hall with the demands,
Not just for food, also for cleaning of his left ear,
which he cannot clean by himself;
He lost Control over one of his back legs,
As a result of nails like teeth,
Of a pack of wild dogs,
Forced into his back spine;
He was given steroids to infuse strength,
He spent a few days in pain,
Recovered and joined the play of healing nature:
In a matter of weeks, he became the tiger, His Majesty!
But this time he is highly vigilant,
He started taming dogs, the class enemies;
During one of his battles, he killed a wild cat,
Who was much bigger than him;
His Majesty! Respected for his valour and wisdom;
He is a very responsible father,
He provides accommodation to all his lovers and their children,
He protects and nurtures them;
Sometime ago he was training his children to climb a tree,
Following the father, children also climbed the tree with three legs;
What an adaptation of skill?

Is this not mimicking of nature?

All of them are our co-travellers,
Teaching us diverse skills embedded in nature;
Chasing survival, day in and day out in the wild,
Skills are not about the number of limbs,
But our sense perceptions alone,
mother nature provides places for us,

No question of looking back and never think of any compromise;
Mastan, the hero of mountaineering, succumbed to the weather conditions;
At times our valour in the wild,
Take sides on the tipping point,
Our illusions play a role of judging mother nature,
Human knowledge works in ideal conditions,
When speculation transgresses the transcript of calendars:
Three, two or four, limbs doesn't matter,
Mastan, the two-legged animal,
And the tomcat named after him,
Are part of nature's circular economy;
They are redefining the performing art of nature,
Both of them are warriors of our times,
Each of Nature's judgement is towards regeneration and matter before admitting to nature;
Can I augment the rhythms in the performing art of nature?
