The VNRs are a central feature of the HLPF and are regularly undertaken by countries in the Global North and South. The VNRs provide a platform for partnerships, including through the participation of major groups and other stakeholders in which persons with disabilities are represented via the Stakeholder Group of Persons with Disabilities. Each year, countries that volunteer to present a VNR at the HLPF hold national-level consultations to prepare their VNR. These reports demonstrate a country's progress in achieving the SDGs and also identifying gaps in national policies. Voluntary national reviews also provide opportunities for civil society stakeholders, including OPDs, to engage with their governments and present opportunities to ensure stronger civil society coordination at the national level, advocate for united implementation, break down silos and open doors, participate in new institutional arrangements, secure funding, bring attention to civil society messages at the global level, engage in national dialogues, and hold governments accountable (Together 2030 et al., 2018).

The VNRs are presented at the global level at the HLPF, but build on a monitoring process at the national and regional levels. Voluntary national reviews are voluntary and country led, and thus there is no formal structure or follow-up mechanism for these reports. There are voluntary common reporting guidelines for member states that were initially prepared by the UN Secretary-General in 2015 and have been updated adapting to lessons learned. These only serve as a guide and are not formal guidelines (UN General Assembly, 2016, 2019). Many OPDs have followed their government's SDG implementation plans and have engaged in the review process to push for the inclusion of persons with disabilities and to address the gaps that persons with disabilities face.

The Importance of Disability Data to Measure the SDGs

Data provide essential information on the status of the implementation of the rights of persons with disabilities. Moreover, data can identify existing policy gaps and barriers faced by persons with disabilities to support policymakers to amend existing policies, regulations, and programs.

Countries are mandated to collect data on persons with disabilities. Specifically, CRPD Article 31 calls for States Parties to collect appropriate information, including statistical and research data, to enable them to formulate and implement the Convention. Moreover, the 2030 Agenda calls for significant increase of "the availability of high-quality, timely and reliable data disaggregated by income, gender, age, race, ethnicity, migratory status, disability, geographic location and other characteristics relevant in national contexts" (target 17.18). In addition, follow-up and review processes at all levels "will be rigorous and based on evidence, informed by country-led evaluations and data which is high-quality, accessible, timely, reliable and disaggregated by income, sex, age, race, ethnicity, migration status, disability and geographic location and other characteristics relevant in national contexts" (UN General Assembly, 2015: para 74, g). Additionally, the global indicator framework has 11 disability-inclusive indicators.

Despite these global mandates, disability data overall are *not* being collected by national statistical offices for SDG monitoring. In some cases, a lack of resources thwarts household-level surveys to include adequate levels of disaggregation. While there are many efforts to improve the disaggregation of data, challenges remain such as a notable lack of disaggregated data on persons with disabilities (IATF, 2017, p. 118). Currently, the lack of data, particularly for marginalized groups, is a considerable impediment in fulfilling the SDGs.

There is not a firm process yet on how to address the gap of gathering disability data, but statistical offices are engaging more on marginalized groups and their experiences. In many cases, there is a mechanism to gather disability data at the national level, but getting this information from the global level is much more challenging. As a consequence, there is a lack of information on the experiences of persons with disabilities creating a major barrier for inclusion and exacerbating inequalities (IAEG-SDGs, 2020).

There has been recent progress at the global level with custodian (UN) agencies finding solutions to start collecting disability data to measure the SDGs. There is a greater focus on unofficial data to measure the SDGs, including citizen-driven data to address data gaps, especially for marginalized groups. There is an increased focus on data disaggregation and to reach the furthest behind. The regional focus is becoming more evident and we should support partners to engage regionally in these processes. The topic of disability data is increasingly included in the IAEG-SDGs meetings, which is a tremendous improvement from the start of the meetings in 2015 (IAEG-SDGs, 2020; Stakeholder Group of Persons with Disabilities et al., 2020).

Ensuring that the rights of persons with disabilities are included in all development efforts requires the routine collection of evidence-based data across all sectors as a means to monitor and ensure that persons with disabilities are fully participating in society. Below are some key recommendations from the Stakeholder Group of Persons with Disabilities (2020b) for governments to address data and monitoring gaps:

- Official statistical bodies should collect and disaggregate data by disability using the Washington Group short set of questions and the Washington Group and UNICEF Child Functioning Module. These modules are internationally comparable, efficient, and easy to incorporate into ongoing data collection of national statistical systems, making them sustainable and suitable for disaggregating by disability status and monitoring progress in attaining the Sustainable Development Goals on an ongoing basis. It is important to note that other tools are appropriate when a more detailed understanding of sectors or barriers and enablers to inclusion is required. Also, to adequately capture information on psychosocial disabilities, more complex questions are needed than what are included in the short set.
- Use community-driven data to complement official statistics to contribute to SDG implementation inclusive of persons with disabilities.

- Invest in data for disability-inclusive development and to build capacity in stakeholders, especially organizations of persons with disabilities, to be better prepared to survey their communities.
- Consult and meaningfully include persons with disabilities and their representative organizations on the design, implementation, and monitoring of SDG plans in line with the CRPD.
- Allocate budget for the inclusion of persons with disabilities and to measure inclusion to leave no one behind.
- Ensure that statisticians, policymakers, OPDs, and allies have dialogue and exchange to learn from each other and use available data to address challenges and gaps in policies.

The 2030 Agenda and OPD Advocacy

Organizations of persons with disabilities have an important role to play nationally, regionally, and globally on advocating for disability rights whether to assess how the CRPD is being implemented or how the implementation of the SDGs is including persons with disabilities. The 2030 Agenda provides the space for the disability movement to engage in the sustainable development dialogue, which is explored next.

Advocacy Efforts Prior to the Adoption of the 2030 Agenda

Organizations of persons with disabilities and partners, such as the International Disability Alliance (IDA)[1] and the International Disability and Development Consortium (IDDC)[2] were instrumental in engaging in joint advocacy during the negotiations leading to the adoption of the 2030 Agenda. It is important to highlight that this chapter focuses on the collaborative advocacy efforts carried out by IDA and IDDC with recognition that other initiatives and organizations also contributed to efforts to promote the inclusion of persons with disabilities in the process leading to the adoption of the 2030 Agenda and subsequent implementation.

Joint advocacy efforts by IDA and IDDC were carried out with member states to influence negotiations in the open working group on sustainable development goals and post-2015 intergovernmental negotiations. The open working group on sustainable development goals was composed of 30 member states and held meetings from early 2013 to July 2014 followed by the post-2015 intergovernmental negotiations with all member states from January 19 to August 2, 2015.

---

[2] More information on the International Disability and Development Consortium: https://www.iddcconsortium.net

Since persons with disabilities were excluded from the MDGs, there was ample evidence of how and why this exclusion occurred and how this could not happen again in the new global agenda. Strategically, the World Health Organization and the World Bank world report on disability (2011) provided the important evidence that the world is comprised of one billion persons with disabilities of whom 80% resides in the Global South, and consequently are disproportionately left behind in sustainable development. This report was an incredibly important tool in advocating for the inclusion of persons with disabilities in the new global agenda since it provided evidence on the situation of persons with disabilities worldwide.

In March 2014, IDA, in partnership with IDDC, hosted a conference in Nairobi, Kenya, to deepen the dialogue on the African continent between national, regional, and global OPDs. More than 100 participants from 17 African countries; regional representatives from Latin America, Europe, Australia, and Asia attended the meeting. At the end of the conference, the participants among high-level governmental representatives and United Nations agencies, adopted the event's outcome document, the Nairobi Declaration (International Disability Alliance, 2014). The Declaration highlighted the priorities of persons with disabilities on the African continent within the context of the post-2015 development agenda.

The conference played an important role to influence the open working group on sustainable development goals, and also to provide support to African OPDs to activate some African governments to engage in the post-2015 agenda process. Afterward, there was a significant increase of support from African countries on the inclusion of persons with disabilities in the open working group at the UN in New York, perhaps stemming from the conference and the Nairobi Declaration (Cuk, 2019).

When the report of the open working group on sustainable development goals was released in July 2014, it contained 9 references to persons with disabilities. The International Disability Alliance and IDDC activities greatly contributed to the outcome of this report. During the open working group negotiations, IDA and IDDC delivered 15 statements, organized five strategic events, and prepared five written contributions to consultation processes. IDA organized two high-level side events and carried out 70 bilateral meetings with governments (Cuk, 2019). During this period and following, IDA and IDDC were in regular contact with approximately 80 member states. This outcome symbolized that the joint advocacy strategies were an effective way to create inclusion (Bartha & Lockwood, n.d.).

In time and with experience, advocates learned to ensure a balance between effective and focused advocacy and not overburdening member states with too many requests. In the process, the disability constituency had become one of the stronger stakeholder groups in terms of advocacy and visibility. This both created competition between some stakeholder groups, but also increased collaboration with others, such as Indigenous peoples, older persons, volunteers, and other groups (Bartha & Lockwood, n.d.).

The open working group on sustainable development goals concluded its work with the adoption by acclamation of a set of sustainable development goals in its final session on Saturday, July 19, 2014 after 26 h of uninterrupted negotiations.

Ultimately, member states supported a report (not legally binding) containing 17 goals and 169 targets. This document served as the basis of intergovernmental negotiations that took place from early 2015 until August 2, 2015 concluding with a draft outcome document of the post-2015 development agenda agreed by consensus by member states. This document, with only a few changes, was the final document officially adopted by the UN General Assembly a little over a month later on September 25, 2015 and now known as the 2030 Agenda for Sustainable Development.

Throughout the aforementioned negotiations, discussions of an indicator framework emerged and advocates from IDA and IDDC engaged closely to ensure persons with disabilities were included in what would become the global indicator framework. In addition, the constituency advocated for civil society to have an active, rather than an observer status with the group that would become the IAEG-SDGs. Initially, disability advocates were not actively included in the development of the SDG indicator framework, and in fact were excluded along with other stakeholders, including older persons and volunteers. Advocates continued to push for inclusion and an active role in the subsequent IAEG-SDGs meetings. The aforementioned outcomes are excellent examples of long-term advocacy and effective multi-stakeholder collaboration to create inclusion, meaningful participation, and representation.

Advocacy Efforts in SDG Implementation

Importantly, the 2030 Agenda also amplifies CRPD implementation since the SDGs and their implementation are interconnected and relevant for many Ministries, rather than focusing on only one part of the government. This allows the space for OPDs to approach different Ministries to discuss SDG implementation and at the same time advocate for CRPD implementation, which strengthens the advocacy messages. For example, the implementation of SDG 8 can be linked to CRPD Article 27 to provide information on how to implement this SDG and in addition to strengthen advocacy efforts and inclusion.

At the national level, governments are encouraged to conduct consultations with civil society and other groups, including organizations of persons with disabilities to contribute views on SDG implementation to prepare the voluntary national review that will be submitted later to the HLPF. Inputs into these consultations should feed into the VNR, but this is not guaranteed, as evident in some country reports (International Disability Alliance and Stakeholder Group of Persons with Disabilities, 2017).

After the adoption of the 2030 Agenda, the dissemination of information and trainings from the global level to national OPDs increased awareness about the SDGs and assisted OPDs to more effectively get involved in the VNR process. This information sharing also encouraged the formation of regional constituencies of persons with disabilities to get active in regional SDG processes, such as the Asia Pacific Disability Constituency. Furthermore, organizations of persons with disabilities have used regional forums for networking and advocacy, sharing national-level experiences, and conducting bilateral meetings with governments. Often OPDs at the regional level have contributed to the regional SDG and disability plans and raise awareness on issues related to persons with disabilities to governments, UN agencies, and other civil society groups. This, in turn, has influenced positive change at the national level. Organizations of persons with disabilities have been involved in national consultations, and increasingly so since 2016, through various forms of engagement, which are explored below.

One way to engage in national consultations has been via national OPD umbrella organizations with a collaborative SDG strategy and recommendations for the inclusion of persons with disabilities. The most significant barriers to participation in these consultations have been the lack of accommodations provided by the government for OPDs to attend these consultations, as well as not being invited to the consultations and/or not receiving relevant information (International Disability Alliance and Stakeholder Group of Persons with Disabilities, 2017).

In some countries, disability and development NGOs working on disability rights and disability-inclusive development have been included in OPD advocacy efforts to strengthen advocacy initiatives, create synergy, provide resources and support, and to avoid duplication of efforts, such as the case in Togo, which is an interesting case since it volunteered to report on SDG implementation 3 years in a row (2016, 2017, and 2018). The CBM office in Togo worked in partnership to support the umbrella DPO in Togo, Fédération Togolaise des Associations de Personnes Handicapées (FETAPH), to participate in the VNR consultation process. For example, in 2016, the CBM office in Togo organized a meeting with FETAPH's program department to raise awareness regarding the SDGs. This meeting and further exchanges contributed to the enhanced participation of OPDs in the national SDG implementation process. In 2017, CBM and FETAPH collaborated to complete a form distributed by the Ministry in charge of the National Development Plan to stakeholders, financial partners, and other civil society members. This helped in part increase FETAPH's participation during the second VNR consultation process, which was linked to the National Development Plan, 2018–2022. As an outcome of advocacy efforts at the national level, the government of Togo referenced persons with disabilities three times in the 2017 VNR (Lockwood, 2018).

The UN is also an important avenue for OPDs to engage in national consultations. The UN, including UN agencies at the country level, are mandated to support SDG implementation, and in some situations, the UN has served as a bridge to connect civil society to government on SDG implementation. It has also been strategic for OPDs to build or join national coalitions with other civil society organizations and other stakeholders creating powerful coalitions with unified messages and providing strategic opportunities to engage, learn, and exchange information, such as in Bangladesh, and Kenya.

In Bangladesh, in order to get persons with disabilities engaged into the SDG implementation process, a collective platform called "Disability Alliance on SDGs" was formed on March 9, 2017. The Disability Alliance on SDGs is an alliance comprised of national and international OPDs and NGOs working in the field of disability and development in Bangladesh, and that are also aligning programs with at least one of the 17 SDGs. In May 2017, the Disability Alliance on SDGs released a report on different SDGs under review through the lens of persons with disabilities. It was prepared after several consultations with organizations of persons with disabilities across different parts of the country. This report was shared with the government to influence the country's 2017 VNR, which includes almost 30 references to persons with disabilities and, more recently, in Bangladesh's 2020 VNR, there are 80 references to persons with disabilities. Spotlight reports on the SDGs, such as these, highlight the gaps on the inclusion of persons with disabilities in relevant processes, policies, and programs. While these reports are not officially accepted at the global level at the HLPF, they can be strategic for OPDs to bring attention to issues at national, regional, and global levels and provide a good record for OPDs and governments to monitor progress over time. The Disability Alliance on SDGs continues to be active and is in discussions to conduct in-depth study on COVID-19, the SDGs, and persons with disabilities (CBM Bangladesh, 2020; Government of the People's Republic of Bangladesh, 2017, 2020; The Disability Alliance on SDGs, 2017).

In Kenya, OPDs have been involved in the SDGs Kenya Forum that brings together over 350 civil society organizations working across the 17 Sustainable Development Goals to influence multi-stakeholder policies and actions for the achievement of the SDGs in Kenya. The Forum is a voluntary membership entity open to civil society organizations, government entities, academia, media, and the private sector who focus on the 2030 Agenda, particularly, the Sustainable Development Goals. Since 2017, civil society organizations Society have been submitting progress reports to inform Kenya's Voluntary National Review (VNR). The umbrella organization of organizations of persons with disabilities in Kenya, United Disabled Persons of Kenya (UDPK), is an active member in the Forum.

OPDs have also engaged with their government following the HLPF to assess outcomes and build partnerships at the national level. Not all countries have HLPF follow-up mechanisms established, but OPDs importantly have reminded political leaders that the VNR is not a one-time obligation, but rather an ongoing permanent dialogue. An example of this is from Tajikistan. In 2017, Tajikistan presented its VNR at the HLPF. An OPD representative from Tajikistan with support from the UN, attended and presented at the HLPF. While at the HLPF, the representative learned firsthand the meaning and relevance of the SDGs. As a follow-up outcome after the HLPF, the national OPD organization signed a memorandum of understanding on the SDGs with the relevant Ministry. This action, subsequently accelerated and amplified Tajikistan's ratification of the CRPD in 2018 (Stakeholder Group of Persons with Disabilities, n.d.).

Disability Data Advocacy in the SDGs

The role of OPDs and civil society organizations in filling data gaps is increasingly important since official disability data largely are not being gathered to measure the SDGs with limited available internationally comparable data (IAEG-SDGs, 2020).

Organizations of persons with disabilities are participating in and monitoring the use of data reported at national, regional, and global levels and are advocating for the improved use of data nationally based on the commitments of the SDGs. Organizations of persons with disabilities have an important role to play in highlighting persons with disabilities as a group that has been left behind. Some ways this has taken place are outlined below.

One way has been participating in national-level consultations and providing an analysis with suggestions to address of data gaps in achieving the SDGs. Second, OPDs have worked with national statistics offices to advocate for national improvements to disability disaggregated data and better use of the SDG indicator framework in national reporting on the SDGs. Third, OPDs have engaged in regional forums and the global HLPF to push for improvements to disability disaggregated data and gaps in achieving the SDGs. Fourth, OPDs and advocates have presented and shared key information at global events such as the meetings of the Inter-agency and Expert Group on SDG Indicators, UN World Data Forums, and the UN Statistical Commission sessions largely via the Stakeholder Group of Persons with Disabilities. Fifth, OPDs collaborate with the Washington Group on Disability Statistics, international non-governmental organizations, and the UN system to ensure disability data disaggregation is implemented across policies and programs. And, sixth, in 2019, OPDs and allies via the Stakeholder Group of Persons with Disabilities established a global platform for information exchange, learning and dialogue, sharing of good practices, and collaboration on disability data collection, disaggregation, and analysis called the disability data advocacy working group. From this emerged the first comprehensive disability data advocacy toolkit for OPDs that was launched in November 2020 (Stakeholder Group of Persons with Disabilities et al., 2020).

An example of collective advocacy efforts over time that led to increased participation was how IDA and IDDC pushed for inclusion and an active role in the IAEG-SDGs meetings that were only partially open to civil society and UN agencies. Real change finally took place at the sixth meeting of the IAEG-SDGs in Bahrain in November, 2017. At this meeting, the IAEG-SDGs co-chairs, in response to stakeholder recommendations, agreed to adjust the meeting format for the seventh meeting to allow civil society to have active participation and make presentations along with national statistic offices. This was indeed implemented at the seventh IAEG-SDGs meeting in Austria in April, 2018, and has remained in place as of today. It is important to note that this change also benefited UN Agencies that had also been excluded from the previous closed IAEG-SDGs meetings. Furthermore, at the eighth meeting of the IAEG-SDGs in Sweden in November, 2018, OPDs via the Stakeholder Group of Persons with Disabilities were included as official panelists for the first time, and have continued to regularly be official panelists in the IAEG-SDG meetings since (e.g., in Lebanon and Ethiopia in 2019) and have built a collaborative relationship with the United Nations Statistics Division since, and which continues to this day (Stakeholder Group of Persons with Disabilities et al., 2020).

Influencing National Disability Policies

It is the responsibility of governments to implement the CRPD to fully realize economic, social, and cultural rights of persons with disabilities, yet this does not always come to fruition. CRPD implementation linked with the 2030 Agenda's commitment to leave no one behind in global sustainable development can help move disability rights forward in countries. In fact, the SDGs and the political will behind them can provide new opportunities for OPDs to advocate for the implementation of the legally-binding CRPD in their countries, and using the CRPD and SDG frameworks jointly can help drive advocacy messages. This can strengthen the commitment to the inclusion of persons with disabilities from government officials. Some ways to do this are by building partnerships, using data to inform evidence-based policymaking, supporting development finance, and ensuring accessibility.

Building partnerships and coalitions, especially multi-stakeholder (comprising of non-governmental and governmental actors) partnerships, can provide key opportunities to ensure the rights and inclusion of persons with disabilities into social, economic, and political aspects of society through various forms. Multi-stakeholder partnerships encourage the spirit of the 2030 Agenda by fostering open, transparent, effective, participatory, and inclusive processes and dialogue that promote accountability to citizens, support effective international cooperation, and truly leave no one behind to achieve the 2030 Agenda. Multi-stakeholder partnerships in support of SDG implementation can track progress of implementation to exchange best practices and provide mutual learning.

Stakeholders can learn about various initiatives, implementation methodologies, coordination mechanisms, governance structures, resources, and other valuable information. This includes disability-targeted partnerships with other stakeholders in which persons with disabilities and their representative organizations are key actors in cross–sector dialogues, multi-level platforms, and capacity-building.

Carrying out disability data collection, disaggregation, research and analysis at the national and global levels are instrumental in identifying the gaps and challenges of persons with disabilities and informing evidence-based policies. As recommended earlier and noting some limitations, data disaggregated by disability should be collected using the Washington Group short set of questions and the Washington Group and UNICEF Child Functioning Module while also consulting persons with disabilities and their representative organizations on the design, implementation, and monitoring of SDG plans in line with CRPD Article 33. In addition to disability, data should also be disaggregated by other social categories such as age, gender, ethnicity, migratory status, class/caste, Indigeneity, and other characteristics. Statisticians, policymakers, OPDs, and allies need to learn from each other and use available data to address challenges and gaps in policies.

In terms of development finance, there needs to be better mobilization and use of public resources for the inclusion of persons with disabilities keeping in line with the CRPD. Moreover, governments must allocate budget for the inclusion of persons with disabilities and to measure inclusion to leave no one behind. Cote and Meeks

(2017) found that in most low and middle-income countries in which few significant inclusive policies or programs exist, significant additional public spending is required so persons with disabilities are not left behind. Thus, there is a need for a significant increase of domestic resource mobilization and public spending for the inclusion of persons with disabilities, and at the same, no public expenditures should create or perpetuate barriers for persons with disabilities.

The following section includes two examples of how advocacy led by and/or in partnership with OPDs has influenced national policies in making them more inclusive of persons with disabilities.

The Participation of Organizations of Persons with Disabilities at the HLPF

The 2030 Agenda has increased participation of persons with disabilities in global sustainable development processes. Since the first HLPF after the adoption of the 2030 Agenda in 2016, OPDs have actively advocated for the inclusion of persons with disabilities in national VNR consultations, regional gatherings, and at the global HLPF. This advocacy and participation have strengthened over the years through coordination, coalitions, and exchange of information and learning between the global, regional, and national levels. For example, in 2016, 22 persons with disabilities and advocates attended the HLPF as representatives of the Stakeholder Group of Persons with Disabilities, in 2018, 31 OPDs and advocates attended, and, in contrast, in 2019 (2020 HLPF was in a virtual format so not comparable), 72 persons with disabilities and advocates attended the HLPF. Additionally, in 2018, there were 675 disability references included the 46 VNR written reports and in 2019, there was an increase of 1959 disability references in the 47 VNR reports. This increased inclusion indicates an outcome in part from increased advocacy and participation at all levels (International Disability Alliance, 2016; Stakeholder Group of Persons with Disabilities, 2016, 2017, 2018).

In the 2020 HLPF, persons with disabilities were also meaningfully included despite the online nature of the forum. Persons with disabilities were referenced in key opening sessions throughout the 2 weeks highlighting that disability was a priority area, particularly since the HLPF was linked to the COVID-19 pandemic. More than 30 countries highlighted persons with disabilities in various events, statements and in VNR presentations, such as consulting with persons with disabilities in the VNR process and examples of inclusion of persons with disabilities at the country level, including the implementation of the UN Convention on the Rights of Persons with Disabilities. For example, Comoros, the Kyrgyz Republic, and the Republic of Moldova all highlighted the implementation of the CRPD in their VNR presentations at the 2020 HLPF (UN High-level Political Forum, 2020).

There were excellent examples of meaningful participation and inclusion of persons with disabilities in some VNR presentations, which has begun to increase via advocacy and awareness raising since 2016. For example, The Gambia included a video of The Gambia Federation of the Disabled (The Gambia, 2020) and Seychelles included a video of a young man with a disability from a family with three persons with disabilities who explained how the social protection system has provided accessibility measures, such as ramps in their home creating a more inclusive life (Seychelles, 2020). Additionally, there were stellar examples of accessibility in VNR presentations. Panama included its own captions and a sign language interpreter in its pre-recorded video (Panama, 2020); Slovenia included captions in its pre-recorded video presentation (Slovenia, 2020); and Uganda (2020) included a sign language interpreter in its VNR presentation (Lockwood, 2020; Stakeholder Group of Persons with Disabilities, 2020a).

This is a significant achievement, and with this there is an increased understanding and willingness of persons with disabilities and their representative organizations to engage in the 2030 Agenda implementation, monitoring, and follow-up processes. This growing recognition stems from collective action led by the disability movement, including leaders and members of organizations of persons with disabilities in partnership with disability rights advocates and other partners.

The Leave No One Behind Partnership

The Leave No One Behind partnership hosted by the International Civil Society Centre was launched in late 2017 as a partnership of 12 international civil society organizations. In 2018, the partnership set up national coalitions in five pilot countries in Bangladesh, India, Kenya, Nepal, and Vietnam bringing together national NGOs and civic platforms, as well as community-based organizations.

The partnership's main goal is to make SDG implementation more inclusive and accountable toward those who are furthest behind in society particularly marginalized groups, including persons with disabilities, older persons, youth, women and girls, ethnic minorities, transgender people, street dwellers, and other marginalized groups. The objectives are to have more inclusive SDG implementation that addresses the needs of marginalized groups effectively; use a participatory approach that involves people from communities in data generation and retrieving direct feedback; and carry out dialogue with authorities on policy change, informed through the use of community-driven data and feedback.

Each country identified data gaps and then collected data on the most marginalized groups. Data on the situation of persons with disabilities was collected in each of the five countries, and for example, in India, organizations of persons with disabilities led and collected the set of disability data.

As a result of the communities working with authorities and public service providers at the national and local levels, various policy recommendations emerged on how to make SDG implementation and monitoring more inclusive and accountable. They include: (1) foster collaborative research to close data gaps, (2) strengthen inclusive decision making, (3) improve reporting and accountability; and advocate for budget allocation and government commitments to ensure inclusive SDG implementation and monitoring. These recommendations can be replicated in other countries to ensure inclusive SDG implementation and monitoring.

Conclusion

The adoption of the 2030 Agenda for Sustainable Development and its Sustainable Development Goals has created the space for persons with disabilities and their representative organizations to be at the center of global sustainable development processes. Organizations of persons with disabilities have increasingly engaged in the follow-up and review processes to ensure that persons with disabilities are included in SDG implementation. Since 2015, there has been a marked increase of representation of OPDs in global sustainable development processes, and in turn, in some cases, this has influenced national disability policies and CRPD implementation.

Yet, despite collaborative and persistent advocacy efforts, persons with disabilities remain left behind after 5 years into the implementation of the SDGs, particularly in terms of lack of disability data to monitor the SDGs. This situation has only been exacerbated with the COVID-19 pandemic that is increasing inequalities and creating new and additional barriers for persons with disabilities (Stakeholder Group of Persons with Disabilities, 2020b).

The SDGs cannot be achieved without including those most left behind, including persons with disabilities. Implementation of the CRPD linked with the 2030 Agenda's commitment to leave no one behind in global sustainable development can create a truly inclusive society for all.

Contents

Abstract

Allegations are emerging that certain groups of people, including persons with disabilities, are being disproportionately affected by the COVID-19 pandemic and that governments have failed to adopt a disability-inclusive response, resulting in serious human rights violations worldwide. In order to collect

evidence on the (lack of) state measures concerning the impact of COVID-19 on persons with disabilities, a coalition of seven disability rights organizations launched a major global initiative, the COVID-19 Disability Rights Monitor ("COVID-19 DRM"), soon after the pandemic was declared. Under the framework of COVID-19 DRM, a three-component survey, containing three questionnaires, was created to collect information (i) from governments, (ii) from national human rights monitoring mechanisms, and (iii) from persons with disabilities and their families and representative organizations. The questionnaires were made available in 25 languages on a website established especially for the COVID-19 DRM, and this remained open from 20 April to 7 August 2020, during which period 2,152 online responses were collected from 134 countries around the world. In this chapter, we give an overview of how and why the COVID-19 DRM was created and present the methodology we applied. We show the findings of the survey and share representative testimonies from persons with disabilities and other respondents. We give an overview of the impact of the survey and then we conclude with proposals for consideration of different stakeholders.

Introduction

In January 2020, news reports and academic papers had started calling attention to a novel coronavirus called SARS-CoV-2 which causes the coronavirus disease (COVID-19). Chaolin Huang et al. reported in the *Lancet* that by 2 January 2020, 41 SARS-CoV-2 infected patients were admitted to hospital in Wuhan, China (Huang et al., 2020). The virus spread rapidly, and on 30 January 2020, Dr. Tedros Adhanom Ghebreyesus, the Director-General of the World Health Organization (WHO), declared that the outbreak constituted a Public Health Emergency of International Concern under the International Health Regulations (World Health Organization, 2020).

The COVID-19 pandemic has created complex and multifaceted issues for people all around the world and has demanded immediate and wise reactions from all sections of society. Governments began taking unprecedented steps including locking downtowns, cities, counties, and even countries. States of emergency have been declared by numerous countries, and serious restrictions have been placed upon the exercise of fundamental human rights in order to try to halt the spread of the virus.

Advocates for persons with disabilities quickly saw that many of the urgent restrictions instituted by states would have a profound impact on persons with disabilities. In May 2020, António Guterres, Secretary-General of the United Nations (UN), highlighted in a policy brief that:

> Even under normal circumstances, persons with disabilities are less likely to access health care, education, employment and to participate in the community. They are more likely to live in poverty, experience higher rates of violence, neglect and abuse, and are among the most marginalized in any crisis-affected community. COVID-19 has further compounded this situation, disproportionately impacting persons with disabilities both directly and indirectly (United Nations, 2020).

Information collection and monitoring of human rights are even more crucial during periods of emergency, assisting policy-makers to effectively target their responses, allocate scarce resources, and prevent disproportionate impacts on segments of the population with enhanced vulnerabilities. In the worrying context of the pandemic, a coalition of seven disability rights organizations joined forces and worked together to develop and launch a major global initiative, the COVID-19 Disability Rights Monitor (COVID-19 DRM), to rapidly collect evidence on the impacts of the pandemic and related state measures on fundamental human rights guarantees.

In this chapter, we present the COVID-19 DRM. We focus on the methodology of the survey that was deployed, and then we show the findings of the survey and share representative testimonies from persons with disabilities and other respondents. We also provide an overview of how the findings from the survey have been used in concrete advocacy initiatives. Finally, we conclude with proposals for consideration of governments, national human rights monitoring mechanisms, as well as to relevant international entities. We address the urgent need for concrete measures to be taken to prevent further violations in the midst of the pandemic, which continues apace at the time of writing, and with a view to preventing widespread human rights violations during future emergencies.

The COVID-19 Disability Rights Monitor

In the first months of 2020, as SARS-CoV-2 started to gain ground globally, national-, regional-, and international-level organizations of persons with disabilities and disability rights organizations began receiving testimonies and complaints about the serious consequences persons with disabilities, their families, and support persons were facing, indicating the emergence of widespread violations of human rights guarantees. These reports related to various aspects, including concerns over the total lockdown of residential institutions, inter alia, for persons with disabilities, the lack of support and reasonable accommodation measures in hospitals and in community settings, a high number of suspended court procedures, a lack of continuity and availability of community-based services, a distinct scarcity of independent human rights monitoring visits to residential institutions for persons with disabilities, multifaceted problems related to the closure of schools and workplaces, etc.

In March 2020, the Validity Foundation reached out to other disability rights organizations and proposed cooperation in order to develop a tool for rapid independent monitoring of state measures concerning the impact of COVID-19 on the rights of persons with disabilities. In part, this call was driven by the lack of coordinated action at an international level and a lack of focus on the part of decision-makers in addressing some of the predictable and immediate consequences of restrictive measures and emergency responses on persons with disabilities. In response to this call to action, seven organizations joined together and formed the COVID-19 DRM Initiative. The seven organizations were as follows: the Validity Foundation-Mental Disability Advocacy Centre, the European Network on Independent Living, Disability Rights International, the Disability Unit at the Centre for Human Rights at the University of Pretoria, the International Disability Alliance, the International Disability and Development Consortium, and the sister organizations Disability Rights Fund and Disability Rights Advocacy Fund. The coalition was international in scope, driven by the objective of gaining an international picture.

A Coordinating Group was established comprised of representatives of the seven organizations, mandated to develop the questionnaires and distributing these as widely as possible. In addition, the Coordinating Group resolved to create a website to promote real-time information-sharing, consciously highlighting the voices of persons with disabilities themselves throughout the survey period. During regular coordination meetings, member organizations met to produce weekly briefs based on data collected and agreed to issue joint statements to call for rapid action concerning emerging themes from the data.

The COVID-19 DRM was endorsed by the then UN Special Rapporteur on the Right to Health, Mr. Dainius Pūras; the then UN Special Rapporteur on the Rights of Persons with Disabilities, Ms. Catalina Devandas-Aguilar; and the UN Independent Expert on the enjoyment of human rights by persons with albinism, Ms. Ikponwosa Ero.

Endorsing the initiative, Mr. Pūras said:

> The COVID-19 pandemic and emergency measures taken by States around the world raise many challenges and concerns with regard to persons with disabilities, especially for those in residential care. Measures undertaken to stop the spread of the virus may increase risks that the human rights of these people are violated. In such situations, when closed institutions are becoming even more closed, the need for independent monitoring becomes more important than ever before.

In her endorsement, Ms. Devandas-Aguilar highlighted:

> The COVID-19 pandemic represents a threat to the lives of people with disabilities. COVID-19 is hitting hard in our community, feeding on and deepening the historical and structural discrimination against people with disabilities. Social care institutions, nursing homes and psychiatric facilities, where people with disabilities are often institutionalised or detained against their will, have become hotspots of the pandemic, accounting for half of the fatalities in some countries. Governments across the world must act fast to guarantee that all COVID-19 responses are accessible and disability-inclusive.

Ms. Ero emphasized the serious consequences of COVID-19 for persons with albinism:

> The COVID-19 pandemic is brewing a perfect storm that could facilitate violations for many people with disabilities who are subject to harmful practices; in particular, those with mystified or relatively rare conditions such as persons with albinism. Their situation, already precarious due to harmful stigma and physical attacks, is exacerbated by the closures caused by the pandemic. As many harmful practices increase in times of uncertainty and economic downturn, and are often perpetuated by relatives and friends, it is more important than before to ensure that national protection measures are inclusive of persons with albinism and others vulnerable to such harmful practices.

Launch and Methodology of the Survey

The Coordinating Group of the COVID-19 DRM conducted extensive online meetings during March and April 2020 to develop three related sets of questions quickly and efficiently concerning the impacts of COVID-19 and related state measures on persons with disabilities for different stakeholders. The surveys were jointly released on 20 April 2020.

The survey had three components, each targeting distinct categories of stakeholders. The first questionnaire requested official information from governments. The second targeted national human rights monitoring mechanisms, including National Human Rights Institutions (NHRIs), National Preventive Mechanisms (NPMs) under the auspices of the UN Optional Protocol to the Convention against Torture (OP-CAT), and national monitoring mechanisms and frameworks operating under Article 33 of the UN Convention on the Rights of Persons with Disabilities (CRPD). The third questionnaire targeted persons with disabilities and their families and representative organizations (organizations of persons with disabilities, OPDs).

The survey aimed to gather both quantitative and qualitative information on the experiences of persons with disabilities, on how states were responding or failing to respond to this specific population. To achieve comparability among the three categories, *core questions* were designed which were integrated across all three questionnaires, building on a set of core human rights guarantees agreed by the Coordinating Group. These questions covered the right to life, the right to liberty, the right to health, the right to live independently in the community, the right to access services, the right to accessible and appropriate information, and the right to access to justice. The responses to these core questions enabled the COVID-19 DRM to triangulate and compare responses between and among different categories of stakeholders.

The questionnaires also contained *additional*, *tailored questions* for each category of stakeholder. For example, national human rights monitoring mechanisms were asked whether they were continuing to visit and monitor institutions and group homes where persons with disabilities were detained and whether remote monitoring of abuses of persons with disabilities was taking place. Only persons with disabilities and their representative organizations and national human rights monitoring mechanisms were asked about whether penalties resulting from breaking state of emergency rules (fines, sanctions, arrest) were imposed on persons with disabilities or their personal assistants and carers.

Beyond this, the survey sought to highlight the experiences of persons with disabilities who are particularly marginalized, including those living in institutions, children, older persons, homeless persons, women and girls, and those who live in rural locations. To gain some level of disaggregation, questionnaires requested personal data such as gender, country of residence, and disability category. However, respondents had the option to withhold personal information and to remain anonymous.

The survey was translated into and published in 25 languages, including five official UN languages, namely, Arabic, English, French, Russian, and Spanish. The other 20 languages were Albanian (Shqip), Amharic, Bahasa Indonesia, Bangla, Bulgarian, Croatian, Czech, Dutch, German, Greek, Hungarian, Italian, Lithuanian, Maltese, Nepali, Portuguese, Romanian, Serbian, Slovak, and Slovenian. The questionnaires were mostly translated by volunteers.

The questionnaires were published on a specially designed website and were disseminated extensively through the Coordinating Group's international networks, social media, and direct outreach. In an effort to reach out to those persons with disabilities and OPDs with limited or no access to the Internet, print versions of the questionnaire were also made available. Throughout the research, all data was collected and processed in compliance with the European Union (EU) General Data Protection Regulation (GDPR).

The COVID-19 DRM survey employed a human rights-based approach at all stages, from planning, drafting, and dissemination through to data gathering and analysis phases. The Coordinating Group consciously centered the active participation of persons with disabilities and OPDs at all stages and maintained a strong grounding in international human rights law.

Data Collection and Analysis

The survey remained open from 20 April to 7 August 2020. During this period of 3.5 months, 2,152 individual responses were received from 134 countries around the world, representing over two-thirds of UN member states. Although the Coordinating Group distributed the questionnaires as widely as possible, only 26 responses were received from governments, and only 12 responses came from national human rights monitoring mechanisms, indirectly confirming the concerns of Coordinating Group members that states and national human rights monitoring bodies had not placed a high level of priority on the situation of persons with disabilities during the pandemic. The vast majority of responses came from persons with disabilities themselves and their family members and OPDs, enabling the COVID-19 DRM to frame a global picture of the personal experiences of persons with disabilities during the first wave of the pandemic.

The data gathered through the survey is presented on a visual data dashboard on the COVID-19 DRM website (https://covid-drm.org). The data can be filtered by type of respondent and by country. Furthermore, responses can be filtered by using the keywords "children" and "institution." An interactive map makes it easier to get access to basic information about countries from which responses were received, and there is a function enabling comparison across different countries.

The questionnaires contained both open- and closed-ended questions, making it possible for the COVID-19 DRM to gather large sets of qualitative and quantitative data. The quantitative data were analyzed using Microsoft Excel. The qualitative data coming from responses to open-ended questions provided often vivid depictions of the lived experiences of persons with disabilities and the impact of COVID-related measures implemented by states. In total, the survey received over 3,000 testimonies in different languages, and non-English responses were translated into English mainly by using Google Translate. These testimonies were then coded and analyzed.

The quantitative data were examined in light of the qualitative data, and an inductive research approach was adopted to identify key themes, subsequently providing the structure for a final report which was published in October 2020 (Brennan et al., 2020). The four themes were (i) the inadequacy of measures to protect persons with disabilities in institutions; (ii) breakdowns in the provision of community support; (iii) disproportionate impacts on underrepresented populations of persons with disabilities; and (iv) denial of access to healthcare.

Demographic Profile of the Respondents

In total, the survey received 2,152 responses from respondents in 134 countries, representing the single largest global effort focused on collecting data concerning the impact of the pandemic on persons with disabilities. Of these, 1,325 respondents identified themselves as female, 695 identified as male, and 92 identified as others or did not disclose. Eight hundred sixty-three responses were received from persons with disabilities, 525 responses from OPDs, 448 responses from family members of persons with disabilities, and 276 responses from others, including people working in services and institutions for persons with disabilities.

The largest number of responses (943) was received from persons self-identifying as having a physical impairment from whom 943 responses were received. Five hundred twenty-four responses were received from persons with intellectual impairments and their advocates. Four hundred forty-seven responses were received from persons with psychosocial disabilities and their advocates, 418 from deaf persons and their advocates, 403 from persons with autism and their advocates, 388 from blind persons and their advocates, 351 from persons with Down's syndrome and their advocates, 348 from persons with hearing impairments and their advocates, and 161 responses from deafblind persons and their advocates. These statistics are all based on self-identification.

In terms of geographical scope, the highest number of responses (225) was received from Germany. One hundred thirty responses were received each from Italy and France, followed by 105 from Austria, and 94 from the United States. The highest level of responses from the African continent came from South Africa (83), while the highest number of responses in Central and South America came from

Mexico (73). From Asia, India was the country with the highest number of responses, from which 50 responses were received.

Findings of the Survey

In this subchapter, we address the human rights violations persons with disabilities reported to have experienced during the COVID-19 pandemic. First, we provide findings drawing on quantitative data collected through the survey, and then we provide a selection of testimonies received from persons with disabilities and their families and OPDs.

The high level of responses and global spread of respondents made it possible to identify cross-cutting themes. One of the stark conclusions was that persons with disabilities worldwide had experienced similar barriers, restrictions, and direct impacts of state measures concerning the pandemic, including across countries of vastly different levels of socioeconomic development. Consistent concerns were raised by persons with disabilities that they had either been left out of national response efforts or that they felt completely abandoned by public authorities who had failed to implement disability-sensitive or disability-inclusive responses. Beyond the thematic analysis described above, the richness of the datasets enables focused analysis of specific human rights guarantees.

Violation of the Right to Life of Persons with Disabilities

Responses to the survey support the conclusion that large-scale and small-scale institutions became hotbeds of infection during the early stages of the pandemic, resulting in large numbers of deaths of persons with disabilities resident in such facilities. Nearly a quarter (486) of the total number of respondents to the third questionnaire, which targeted persons with disabilities and their families and OPDs, said that their government took no measures to protect children with disabilities in residential schools. Furthermore, 22.5% (476) of the total number of the respondents to the third questionnaire said that their government took no measures to protect the lives, health, and safety of persons with disabilities in institutions. Sadly, respondents also explained that the right to life of persons with disabilities in the community was also insufficiently protected.

Respondents from around the globe reported that governments did not put measures in place to prevent or control the spread of COVID-19 in institutions. More precisely, respondents reported that governments did not take sufficient steps to safeguard the right to access food, basic medical supplies, and personal protective equipment or to implement measures (such as social distancing) in order to minimize infections and deaths in institutional settings. The COVID-19 DRM received testimonies indicating that deaths in institutions could have been prevented by immediate, emergency government measures. The COVID-19 DRM also received responses that many deaths could also have been prevented in the community, particularly had access to life-saving treatment for COVID-19 been guaranteed. Sadly, respondents reported that access to basic and emergency treatment, including for COVID-19, was instead discriminatorily denied to persons with disabilities.

A survey respondent with disabilities in Canada described the situation with these words:

> [Institutions] were dangerously understaffed, and there were people dead in their beds, others laying on the floor, and some others with three layers of diapers and dehydrated.

Another respondent with disabilities from the same country said:

> The government of Nova Scotia refuses to consider that there is any issue with care in the community and ignores any examples to the contrary. We have people in our community dying of neglect, but the province will not accept the fact that their deaths are related to covid b/c their care was terminated due to covid-19.

A respondent from a Ugandan organization of persons with disabilities said:

> I know two PWDs who have been shot at because they were outside in curfew time. These were deaf people and didn't know what was happening.

Another respondent with disabilities from Nigeria shared with the COVID-19 DRM that as a consequence of the total lockdown of an institution, people were *effectively imprisoned*. According to this respondent:

> A lot of people died because of this.

Violation of the Right to Liberty and the Right to Live Independently and be Included in the Community of Persons with Disabilities

Of those respondents who stated that they were aware of the situation in institutional settings for persons with disabilities, 69% (819) said that residents of such facilities were restricted or banned from leaving the institutions. A further 84% (1,172) said that the government had banned or restricted visits from family, friends, or others to social care facilities. Eighty-two percent (984) of those who knew reporting being aware of the situation in psychiatric health facilities said that their government had banned visits.

Deprivation of liberty in institutions for persons with disabilities has been a long-term concern of disability rights advocates, but the spread of COVID-19 has exacerbated the situation and brought heightened levels of awareness of the inherent dangers in congregate living settings. The very low numbers of responses received from national human rights monitoring mechanisms indicate that residential institutions were cut off from the rest of society, without any independent monitoring mechanisms in place. When residents presented with COVID-19 symptoms, they reported being quarantined and isolated. A particularly telling example is the November 2020 collective complaint under the European Social Charter *Validity v. The Republic of Finland* on the violation of the rights of persons with disabilities in institutions during the pandemic (European Committee of Social Rights, No. 197/2020).

The survey received responses from family members of persons with disabilities and OPDs expressing grave concerns for the safety and well-being of their family members within institutions. A Greek OPD described psychiatric institutions as:

> hermetically sealed with more absolute restrictions than before, with no possibility of visits, with no advocacy services and with no independent monitoring.

Similarly, a Bulgarian OPD reported that while the implementation of lockdowns on institutions might prevent infection:

> it is also a measure that can lead to a lack of care, lack of transparency and concealment of dangerous abuses.

According to an Australian OPD:

> The government has taken a very 'hands off' approach to group homes, hostels and larger institutions, allowing those residences to self regulate how they respond to the crisis. A lot of people are now 'locked in' with all visitors suspended including community access, medical professionals and families.

Similar lockdowns were introduced in institutions for children with disabilities. A person with disabilities in Belgium reported:

> From what I know, children in institutions are strictly confined, can no longer have contact with their families. They are really imprisoned while the providers bring the virus. Very significant mental consequences.

Violation of the Right to Health of Persons with Disabilities

The right to health includes many aspects, and the right to access to healthcare, including access to treatment for COVID-19, is of prime significance to persons with disabilities in the context of the pandemic. A clear finding of the survey is that persons with disabilities reported being denied access to healthcare on an equal basis with others on a discriminatory basis. The COVID-19 DRM received more than 550 written testimonies worldwide regarding problems in accessing to healthcare. These testimonies suggest that persons with disabilities experienced discriminatory triage policies and denial of access to essential healthcare and medication.

Forty-five percent (958) of the total number of respondents to the third questionnaire said that people in their country could not access therapies, and a further 43.4% (918) said that people in their country did not have access to rehabilitation. Over

30% (641) of the total number of respondents to the third questionnaire reported problems in accessing medication during the pandemic. Furthermore, 37.8% (799) of respondents complained that their government had taken no measures to ensure that persons with disabilities could access specialized medical care.

In relation to lack of access to healthcare, a person with disabilities from Colombia said:

> The very low level of accessibility to health services, which do not have the corresponding reasonable adjustments, and in the case of Deaf people, they have not been able to provide the sign language interpreting service either virtual or in person.

Discriminatory triage guidelines were addressed by a large number of respondents. According to one testimony, a Canadian child with autism was denied a test for COVID-19:

> because the attending physician deemed him too difficult to assess. He had all the symptoms of Covid-19 but was refused confirmation.

An OPD from the United Kingdom put it this way:

> A eugenics programme has been undertaken covertly... Do Not Resuscitate Notices (DNRs) were placed on people with no consultation, especially older persons and persons with learning disabilities.

Many respondents highlighted that persons with disabilities living in institutions did not receive appropriate medical treatment for COVID-19, and in some cases hospitals directly refused to treat residents. A French pointed out the discriminatory character of triage policies adopted in relation to people with disabilities in institutions:

> The SAMU (Urgent Medical Aid Service) and the care services in the event of infection with Covid-19 have explicitly said to no longer come to institutions. Hospitals have issued recommendations for triage of patients, which said to leave them in an institution.

The COVID-19 DRM received some testimonies from staff members concerning the position of people with disabilities who were left inside institutions and experienced enhanced restrictions on their liberty. Respondents reported that residents were overmedicated, sedated, or locked up. An OPD from Andorra reported:

> self-harm has occurred and the solution by the institution has been overmedication.

Regarding access to medication, a person with disabilities from Zimbabwe said:

> To get medicine is not easy in my community, pharmacies demand United States Dollars which the majority don't have and the medicines are very expensive beyond the reach of many persons with disabilities.

Violation of the Right to Accessible Information of Persons with Disabilities

Almost a third (621) of the total number of respondents to the third questionnaire said that persons with disabilities did not receive sufficient information about how to protect themselves from infection with COVID-19. Furthermore, 21.2% (448) of the same respondents shared that information about COVID-19 was not available in accessible formats. With regard to closed settings, 322 respondents to the third questionnaire said that persons with disabilities living in institutions were not even informed about declarations of a state of emergency, about bans and restrictions on visitors, nor about how to protect themselves from COVID-19. The lack of information was mentioned in relation to specific types of information, including preventive measures, lockdown rules, testing and treatment, and access to social assistance schemes. In terms of the qualitative data, 345 testimonies were received concerning access to information during the pandemic.

Some respondents were concerned that persons with disabilities did not have access to information when they were hospitalized. An OPD from Hong Kong said:

> Insufficient information has been released by the government or the information released was not in any accessible format to the deaf and hard-of-hearing community. [. . .] the official sign language interpreters assigned REFUSED to show up at the hospital in this crisis.

The lack of access to accessible information was reported to be a problem in the community as well. An OPD from Lesotho shared with the COVID-19 DRM:

> No measures have been taken to inform persons with disabilities about the virus especially in areas where such individuals can't access information through radio or television.

Similarly, a person with disabilities from India highlighted:

> There isn't enough information available to what is happening to persons with disabilities, the lockdown is making it impossible to step out and access information. It can be said that information is just not available either to or about persons with disabilities in this situation, on a public or general level. Few things have been put up online at relevant govt portals but most persons with disabilities have no access to these staying in institutions. Perhaps they don't even know what is going on outside!!

The experience of a person with disabilities from Canada is this:

> Information provided is all from an able-bodied perspective and ignores the disability experience.

An OPD from the Republic of North Macedonia reported:

> All information from the media is not in accessible formats. Beside the press conferences that are made in sign language, all other information is not in accessible formats.

An OPD from India shared with the COVID-19 DRM:

> There are no specific measures to address the issues of persons with disabilities. Lack of information in accessible formats. No specific assistance.

A person with disabilities from Uganda said:

> The government has not done anything in particular to help people with disabilities during this period of Covid-19. In fact, we have been left out. The information is not adequate since no sign language interpreters have been allocated.

Violation of the Right to Freedom from Violence, Neglect, Exploitation, and Abuse of Women and Girls with Disabilities

The COVID-19 DRM survey received 25 written testimonies addressing violations of the right to freedom from violence, neglect, exploitation, and abuse, including sexual assault, domestic violence, and concerning police brutality against women and girls with disabilities. Although respondents raised concerns about police harassment, intimidation, and violence as a result of strict enforcement of curfews in general, women and girls were reported being disproportionately affected due to the failure of states to take targeted protective measures. Respondents reported that the COVID pandemic had exacerbated the pre-existing high levels of violence faced by women and girls with disabilities and, in some cases, had given rise to different forms of gender-based violence.

A number of respondents from Kazakhstan, Namibia, Nepal, Nigeria, Rwanda, Uganda, and Zimbabwe noted significant increases in cases of gender-based violence, including rape.

An OPD from Nepal reported:

> Recently, a girl child aged 10 years who lives with intellectual disability has been raped. Hence the government should take measures.

Women and girls with disabilities experienced violence from the police too, for example, when they went to seek food and were left in the situation of being forced to break curfew rules. An OPD from Nigeria said:

> A mother of a child with Cerebral Palsy was harassed by policemen on her way to collect food relief at one of the distribution centers.

Similarly, an OPD from Uganda reported:

> Women with disabilities have undergone violence of their rights. A woman with disability was beaten up after curfew time. She was looking for food.

Domestic violence has been on the increase during the pandemic. A respondent from Zimbabwe said:

> Since the lockdown women with disabilities just like any other women have been facing domestic violence and the government has not made any (special) provisions for women with disabilities in order to protect them.

An OPD from Uganda pointed out:

> Domestic violence is on the increase during this period, and this placed PWDs at higher risk too.

An OPD from Kazakhstan shared with the COVID-19 DRM:

> With the locking down the city and its infrastructure (so, even people were not allowed to go outside for a walk, only for grocery and emergency case) many people were facing domestic violence. I think since social workers were not allowed to visit homes this issue went out of control.

A respondent from Rwanda highlighted:

> My biggest concern is that since the pandemic and subsequent lockdown, cases of gender-based violence have increased and although this issue is affecting every woman, girl and child, it is doubly affecting women and girls with disabilities but due to the lockdown they may not be able to report these cases.

Violation of the Right to Education of Persons with Disabilities

Almost a third (623) of the total number of respondents to the third questionnaire said that their government took no measures to protect the health and safety of children with disabilities in institutions, including those in residential schools and in respect of those in the community. Furthermore, 41% (867) of the same respondents said that their government had taken no measures to support families of children with disabilities during the pandemic.

The findings of the survey revealed that children with disabilities did not have access to education worldwide since they were often excluded from remote learning, as well as due to lack of access to technology. For example, a person with disabilities from the Republic of Moldova said:

> Children with disabilities did not have access to online education due to lack of information technologies and internet access.

A person with disabilities from the United Kingdom reported:

> There is no help for adapting to distance learning education, particularly for children with mental health, ADD, autism, etc., where the challenges are often behavioral rather than access to info. Parents are abandoned and need help.

A respondent with a disability from Vietnam highlighted:

> There is a serious shortage of equal opportunities for PWDs in education, employment, and many others.

The COVID-19 DRM received numerous testimonies from families of children with disabilities. For example, a family member of a person with a disability from Canada said:

> We are being denied the right to access education. While nothing is normal at the moment the plan to continue educating children without providing the necessary supports to children with disabilities means they are left behind unable to access education. [. . .] children cannot access online education independently and is not conducive to supporting them.

Indicative of the multiple challenges faced by children with disabilities and their families, the family member of a person with a disability from Ireland reported the following:

> We have been left to work it out ourselves, the only support is a community phone line we can ring. Financially we have been left and therapy workers have been moved to the frontline and so we are without therapeutic support, education support is non existent, home support is gone. We are very much on our own.

A family member from the United States shared this with the COVID-19 DRM:

> Families of children with disabilities have been left behind in this situation. With the transition to online learning, most children with disabilities have not received the educational instruction needed. Teachers have done a great job but have not been given the support they need to provide the education needed.

Violation of the Right to Adequate Nutrition and Food for Persons with Disabilities

More than 30% of respondents were concerned about the lack of access to food and nutrition. Serious problems were reported from all around the world including the highly developed countries as well as from low-resource states. The COVID-19 DRM received 131 testimonies concerning aspects including a lack of access to food, having less food because of increased food prices, and limitations on diet, such as only having access only to canned food. The findings of the survey revealed that persons with disabilities in remote and rural areas faced additional barriers to accessing food and nutrition.

One person with disabilities from Kenya said:

> They have not yet come to the ground to provide basic needs like food to people with disabilities. They only do it in the major cities. Even those in the streets are still suffering.

A respondent from India shared the following information about closed residential settings:

> Institutions have been locked down as a measure to prevent contamination. However, the lockdown has created problems like scarcity of food supplies and basic essentials.

In relation to lockdown policies, an OPD from Nepal said:

> The government announced the stay at home order and lockdown, but could not think of poor daily wage earners who are not getting even a meal a day. People are deprived of food and are in financial crisis and the government has not provided any benefits.

According to an OPD from Pakistan:

> Persons with disabilities are stuck at homes because of lockdowns, they need specific services and food for survival, they are not provided food items during distribution, limited people get food bags but persons with disabilities have no access to get food bag from government or private point.

And further concerning the impact of lockdowns, a Ugandan OPD said:

> There is no access to food and financial support due to lockdown in homes.

Respondents from countries with high levels of development also reported serious problems with accessing food and nutrition. For instance, a person with disabilities from Canada said:

> Food insecurity is always an issue, as is increasing rents. Now, I'm finding it impossible to survive, because I always relied on store sales to buy food, soap, and toilet paper, and there are simply no sales to be found.

A respondent with disabilities from Australia reported:

> My main concern is that the living expenses of all people with disabilities have gone up, and continue to go up, and the Australian government insists that they haven't. Many of us are getting to the point of missing meals altogether, choosing between food or medication, etc. We're finding out the hard way just how negative the government's attitude is towards people with disabilities, and our collective moral is very low as a result.

A respondent with disabilities from the United States said:

> Typical services used by PWDs [persons with disabilities] to maintain independence are now being used by others. Grocery delivery usually available that day, now not available for 5–6 days. I cannot go to the store in my power wheelchair without typically available transportation. I am forced to eat canned and processed food, which is high in salt, and dangerous for my health.

According to an OPD from the United Kingdom:

> We understand that many disabled people were unable to access food deliveries as they were not in the high-risk groups.

Violation of the Right to Community-Based Services for Persons with Disabilities

More than a third (777) of the total number of respondents to the third questionnaire said that their government took no measures to protect the life, health, and safety of persons with disabilities living in the community. Thirty-five percent (742) said that their government took some measures and only 12% (207) said that their government took significant measures. Many persons with disabilities felt that they were abandoned and that essential community-based services were not available for them during the first wave of pandemic. For example, 38.3% (809) of the total number of respondents to the third questionnaire said that persons with disabilities did not have access to personal assistance. 33.5% (708) said that persons with disabilities did not have access to informal care in the community, meaning that essential support generally received from family members, community members, and friends were severely curtailed. 28.6% (604) said that persons with disabilities did not have access to home-based support.

In those countries where persons with disabilities did have access to community-based services before the pandemic, respondents reported that access to these services was almost completely suspended following the imposition of public health restrictions. Together with those countries where such services were rarely available prior to the outbreak, respondents reported that the situation of persons with disabilities became life-threatening. For example, a respondent with disabilities from Mongolia said:

> DPOs [Disabled People's Organisations] are complaining there's no support and operations to families with PWDs [persons with disabilities] in their home.

An Italian respondent with disabilities shared:

> I am afraid that my mum will die of exhaustion and then I will die without her assistance.

A person with disabilities from the United States shared the following:

> Social distancing has become the norm, but getting usually gotten community support [is] nonexistent.

Persons with disabilities in Canada reported:

> I have not seen or been able to access any additional support or information.
>
> The government has not taken any measure at all to support PWDs [persons with disabilities] living in the community.

A person with disabilities from New Zealand said:

> Isolation is their only solution but this does not work for those needing community supports to maintain independent living if you have no family or friends to rely on, and many community services were removed from people's lives quickly as lockdown began.

OPDs and family members of persons with disabilities shared similar concerns. For instance, an OPD from Zimbabwe said:

> We are still waiting for the support schemes but nothing tangible. We are now on a second lockdown and the first one we never received assistance.

An OPD from Trinidad and Tobago pointed out:

> I am not aware of any special measures being taken for persons with Down Syndrome. Social service support is focused on special areas.

Another OPD in South Africa was concerned about a lack of mental health services in the community:

> Mental health services which are community based are not available, this put beneficiaries at risk of relapse.

A family member of a person with disabilities from the United Kingdom said:

> I have removed my son from all day services and respite provisions but have received very little in support. Two phone calls and no offer of any extra support for us at home. We've been left to get on with it.

Impact of the Survey

From an early stage of implementation, members of the Coordinating Group recognized the crucial importance of engaging in ongoing and coordinated advocacy to respond to issues as and when they were emerging in connection with the survey. During the data collection phase, the Coordinating Group published three statements which were widely circulated concerning the serious issues emerging inside residential institutions worldwide (COVID-19 DRM Coordinating Group, 2020a); significant numbers of reports of violence and abuse at the hands of police and security forces, including due to the strict enforcement of lockdowns (COVID-19 DRM Coordinating Group, 2020b); and the catastrophic breakdown in provision of food, nutrition, medicine, and other essential supplies (COVID-19 DRM Coordinating Group, 2020c).

Already by early April 2020, initial members of the COVID-19 DRM had written to the Director-General and regional directors of the WHO requesting information concerning the collection of disaggregated data regarding persons with disabilities and COVID-19, as well as information and guidance being produced for states. A response received 2 months later did not directly address the data questions but welcomed the efforts of the Coordinating Group to establish the COVID-19 DRM. The WHO is reliant upon states collecting and reporting such datasets, but it was apparent that there had been no concerted action to develop information collecting and reporting protocols about the situation of persons with disabilities, leaving the COVID-19 DRM to fill a crucially significant gap.

Prior to publication of the final report, the Coordinating Group was also able to report on emerging themes and priorities at the international level. In August 2020, the UN Committee held a virtual session, during which the COVID-19 DRM Coordinating Group was invited to present multiple written and oral briefings (Allen, 2020). The Chairperson of the Committee reflected concerns of the Coordinating Group in his closing remarks at the session:

> [The] pandemic had exacerbated the pre-existing exclusion against persons with disabilities, both those living in their communities as well as those still in institutions. Measures to contain the pandemic had curtailed persons with disabilities' access to basic services in the community. These measures had reportedly broken pre-existing support for persons with disabilities in the community, including support measures and personal assistance[. . .]. The Committee also received allegations of different forms of violence against persons with disabilities, including gender-based violence. Particularly worrying was the reported violence by law enforcement officers in a number of countries[. . .]. It was appalled by accounts indicating the lack or ineffectiveness of measures to safeguard the right to life of persons with disabilities throughout the pandemic period (UN Office of the High Commissioner for Human Rights, 2020).

Expressing serious alarm about the emerging findings pointing to institutions as hotbeds of contagion, the CRPD Committee resolved to establish a working group to support deinstitutionalization, including in the context of emergencies, with international consultations planned to take part in 2021 (UN Committee on the Rights of Persons with Disabilities, 2021).

The findings of the survey and final report were released at a high-profile online event attended by over 300 participants worldwide on 22 October 2020. The event featured testimonies from persons with disabilities from Europe, Latin America, Africa, and Asia, as well as interventions from members of the Coordinating Group. The event also included responses from a wide range of international experts, including the newly appointed Special Rapporteurs on the Right to Health and on the Rights of Persons with Disabilities, a representative of the World Health Organization, and a representation of the Global Alliance of National Human Rights Institutions (GANHRI).

The findings of the survey have been publicized internationally and have been widely cited by international experts (see, e.g., Quinn (2020)), disability rights activists, and more recently mainstream international media (see, e.g., Al Jazeera (2021)). The authors are also aware of some efforts by the WHO to place a stronger focus on developing tools to assist states in collecting disaggregated data on the basis of disability in the context of its work under the International Health Regulations (World Health Organization, 2008).

Proposed Recommendations

The Coordinating Group of the COVID-19 DRM proposed recommendations to the CRPD Committee and to state parties in its joint submission for consideration at the 23rd Session (resumed) of the Committee on the Rights of Persons with Disabilities (Allen, 2020) and to decision-makers in the COVID-19 DRM global report "Disability rights during the pandemic" (Brennan et al., 2020). These recommendations included:

(i) Calling on all relevant stakeholders to take concrete measures to protect the rights to life, health, freedom from all forms of abuse, inclusion in the community, and education in ongoing recovery and response efforts.
(ii) Enactment of emergency plans for deinstitutionalization, including immediate measures to prevent new admissions into residential settings in the context of the pandemic.
(iii) Ensuring immediate access to essential supplies, foods, and medicines.
(iv) Guaranteeing nondiscriminatory access to healthcare and removal of discriminatory triage procedures.
(v) Enhancing the direct involvement of persons with disabilities in response and recovery plans on a systematic basis.
(vi) Strengthening the availability and accessibility of information.

At the time of drafting, it was not yet possible to assess the extent to which states and other actors had begun to act on the outcomes of the COVID-19 DRM. Nevertheless, the study provides a clear and concrete baseline from which members of the Coordinating Group and others can assess progress as the world continues to grapple with this ongoing international emergency.

Conclusion

The COVID-19 DRM was the largest and most comprehensive effort to collect information concerning the impact of the pandemic on persons with disabilities, as well as the effects of related state measures. The initiative was developed rapidly by a wide range of organizations of persons with disabilities and disability rights advocates to respond to a perceived and actual failure on the part of international organizations and states to collect such data in real time. Indeed, this lack of data collection is both symptomatic and causal of a lack of responsiveness to the disproportionate impacts of the pandemic on persons with disabilities.

Disability rights advocates are strongly aware of the limited public significance placed on issues of policy concerning persons with disabilities. An important tool in the box is independently organizing, monitoring, and responding to the actions (or inactions) of key duty bearers. Explicitly grounding initiatives such as the COVID-19 DRM in human rights norms transforms the quality of advocacy, moving the focus beyond the direct humanitarian consequences of public emergencies, instead proceeding to frame recommendations grounded in binding international obligations. The unprecedented nature of the pandemic forced unprecedented speed and scale in order to provide a meaningful picture which could positively contribute to making during the first wave and to inform ongoing emergency response and recovery operations.

The fact that such an initiative was necessary in the first place should give us pause for consideration. Now 1 year into the pandemic, increasing evidence is emerging tending to confirm the findings of the COVID-19 DRM, showing with remarkable consistency that persons with disabilities have not merely been disproportionately affected but are in fact substantially overrepresented in terms of mortality and infection and are bearing the brunt of longer-term consequences of the deadly disease. The warning signs of these impacts were identifiable even during the early stages. The surveys confirmed many of the fears of persons with disabilities and advocates and point to a truly concerning level of serious consequences worldwide. Despite the commitments of global leaders to "Build Back Better," very few have taken concrete steps on the basis of the body of evidence, including the findings of the COVID-19 DRM, that the pandemic has acutely affected people with disabilities in every country in the world. Despite the concerted advocacy of OPDS, including the Coordinating Group, institutions continue to be locked down in many countries, policy-makers continue to make discriminatory decisions which deny people with disabilities access to healthcare, and few responses and recovery plans are sufficiently grounded in protecting human rights.

The COVID-19 DRM was implemented entirely by the partners on their own initiative and within their limited existing means, stretching the capacities of the partners in ways never before experienced. We are proud of what we could achieve with such limited resources but nevertheless would take greater pride if and when states sit up and declare that protecting the rights and lives of persons with disabilities is a genuine priority and act on it.

Independence and Its Meaning: ENIL's Monitoring of Article 19 as a Struggle for Hermeneutical Justice

41

Teodor Mladenov

Contents

Abstract

This chapter explores the efforts of disabled people's independent living movement to negotiate the meaning of independence. It focuses on the work of the European Network on Independent Living (ENIL) – a user-led, user-controlled initiative of disabled people and independent living organizations that has led the fight for independent living in Europe since 1989. I conceptualize ENIL's monitoring of the implementation of Article 19 of the Convention on the Rights of Persons with Disabilities (CRPD) as a struggle for hermeneutical justice. ENIL has challenged the conventional understanding of independence as self-sufficiency. This conventional understanding has undermined disabled people's right to live independently and be included in the community. In its stead, ENIL has promoted an understanding of independence stemming from the independent living movement and incorporated in Article 19 of the CRPD. According to this alternative understanding, independence means that one has choice and control in one's everyday life, including choice and control over one's support – rather than coping without support. This alternative understanding of independence has guided ENIL's monitoring of deinstitutionalization reform and personal assistance schemes in Europe that are discussed in the chapter as instances of disabled people's organized collective struggle for hermeneutical justice.

Independent living movement · Deinstitutionalization · Personal assistance · European Network on Independent Living (ENIL) · Hermeneutical injustice · Hermeneutical marginalization · Article 19

Introduction

For disabled people, as for other oppressed groups, negotiation of meaning is often a power struggle against social hierarchies and for individual and collective emancipation. A central element of this struggle has been the contest over the meaning of independence. In the modern period, independence has been understood predominantly as the ability to cope on one's own, without external support (Mladenov, 2016). Medical and other "helping" professionals have reproduced this understanding in their treatment of disabled people. Professionals have put their efforts into fixing disabled people's bodies and minds so that disabled people become independent by becoming self-sufficient. Those who could not be fixed in this way have been confined to residential institutions or their homes (Oliver & Barnes, 2012).

The one-sided interpretation of independence as self-sufficiency is hermeneutically unjust. Hermeneutical injustice is a kind of epistemic injustice defined by the philosopher Miranda Fricker (2007: 158) as "having some significant area of one's social experience obscured from collective understanding owing to hermeneutical marginalization." The conventional understanding of independence as self-sufficiency obscures the experiences of interdependence that underpin self-sufficiency. Historically dominant groups such as men and abled-bodied people have benefitted from this obscurity because the infrastructures of interdependence have privileged them. For example, feminization of care has privileged men while obscuring their dependence on women's caregiving (Fraser & Gordon, 1994); and ableist building conventions have privileged walkers while obscuring their dependence on environmental adaptations such as stairs (Oliver, 1993). Similarly to women, disabled people have historically been prevented from challenging the one-sided interpretation of independence as self-sufficiency due to hermeneutical marginalization – their oppression has prevented them from participating on equal terms in meaning-generating practices such as research and policy-making (Oliver, 1992).

Women have been able to overcome their hermeneutical marginalization by engaging in collective action for individual and social change. A key instance of such collective mobilization has been the activity of consciousness rising through peer support. The practice of group "speak outs" has helped to awaken "hitherto dormant resources for social meaning that brought clarity, cognitive confidence, and increased communicative facility" (Fricker, 2007: 148). As a result of such collective hermeneutical efforts, women were able to overcome taken for granted interpretations of their experiences and "to realize resources for meaning that were as yet only implicit in the social interpretive practices of the time" (Fricker, 2007: 148).

A similar rise in "cognitive confidence" and "increased communicative facility" leading to realization of new "resources for meaning" occurred among disabled people when they started speaking out among themselves about their experiences of institutional care and their desire to have more choice and control in their everyday lives (Evans, 2002). Eventually, this gave rise to a new social movement.

The disabled people's independent living movement emerged in the late 1960s and early 1970s in the United States, spreading quickly to other parts of the world in the subsequent decades (DeJong, 1979; Evans, 2002; Ratzka, 1993). The movement has opposed the segregation of disabled people in institutions for social care and has advocated for personal assistance and other forms of user-led, community-based support that enable disabled people's full and equal participation in social life. A central part of this activism has consisted in challenging the one-sided understanding of independence as self-sufficiency, imposed on disabled people by medical and other "helping" professionals, service providers, policy-makers, public administrators, and the wider society. In this way, the independent living movement has initiated a process of rectifying a hermeneutical injustice suffered by disabled people. Article 19 of the UN Convention on the Rights of Persons with Disabilities (CRPD) has been an important milestone in this struggle.

In their fight for hermeneutical justice, the activists of the independent living movement have insisted that independent living is not about self-sufficiency. It is not about one's ability to cope on one's own, without external support. Rather, independent living is about choice and control in one's everyday life that, importantly, includes choice and control over one's own support:

> Independent Living does not mean that we want to do everything by ourselves and do not need anybody or that we want to live in isolation. Independent Living means that we demand the same choices and control in our every-day lives that our non-disabled brothers and sisters, neighbors and friends take for granted. (ILI, n.d.: n.p.)

In its General Comment No. 5 on Article 19 of the CRPD, the Committee on the Rights of Persons with Disabilities (2017: 4) concurs: "Independent living is an essential part of the individual's autonomy and freedom and does not necessarily mean living alone. It should also not be interpreted solely as the ability to carry out daily activities by oneself."

The spread of the independent living movement in Europe resulted in the creation of the European Network on Independent Living (ENIL) in 1989 by a group of visionary disabled activists (Evans, 2002: 13–14). Since then, the organization has served as a user-led, cross-disability forum for disabled people, independent living organizations, and their non-disabled allies on the issues of independent living. Currently, ENIL has 72 full and 42 associate member organizations from more than 40 countries, most of them in Europe but some in Asia and Africa (see https://enil.eu/about-enil/our-members/). ENIL's mission is to advocate and lobby for independent living values, principles, and practices such as the provision of personal assistance, deinstitutionalization, barrier-free environment, and adequate technical aids. The organization is financially supported by the European Commission, the Open Society Foundations, and its Nordic allies in Norway and Sweden.

ENIL has joined disabled people's struggle for hermeneutical justice by creating its own definitions of independent living and kindred disability policy concepts such as personal assistance, deinstitutionalization, and community-based services (ENIL, n.d.). These definitions have been based on ENIL's monitoring, research, and advocacy work and have incorporated the testimonies and lived experiences of ENIL's members. They have been adopted by ENIL's Board in 2012 and since then have been actively disseminated and promoted by the organization. ENIL's definitions have been aligned with Article 19 of CRPD, and their aim has been to guide and enable the monitoring of disability policies on European and national levels. They have also been used to clarify misunderstandings and to prevent the hijacking of the language of independent living advocates:

> The terms 'independent living' and 'personal assistance' have often been exploited and misused to profit organisations, charities and disability business which are not run and controlled by disabled people. These organisations do not appear to want to fully understand the concept of independent living as developed by the independent living movements across Europe and internationally. (Jolly, 2009: 2; see also Angelova-Mladenova, 2017: 11)

In addition to guiding and overseeing the deployment of the independent living discourse in Europe, ENIL has monitored the implementation of Article 19 of the CRPD by collecting and assessing country-specific information about the translation of independent living concepts into social policy practices. The organization has systematically gathered and analyzed data on deinstitutionalization reform and development of personal assistance schemes as key areas of Article 19's implementation. I will first discuss ENIL's definition of independent living and then present the organization's work on deinstitutionalization and personal assistance. My analysis will be guided by Fricker's (2007) concepts of hermeneutical injustice and hermeneutical marginalization because the struggle over the meaning of independence has been a central concern of the independent living movement and, by extension, of ENIL's work.

Before proceeding, a note on my positionality. Although I have not yet identified as disabled, I have been involved in the independent living movement since 2000, and I consider myself an ally. In the period 2000–2009, I did action research and advocacy work for the Center for Independent Living - Sofia, and in 2017–2019, I was Marie Curie Individual Fellow at ENIL, where I was funded by the European Commission to conduct research on personal assistance in Europe. I am currently based in Scottish academia, at the University of Dundee, where I maintain close links with the independent living movement through my continuing collaboration with ENIL that has included the writing of this chapter. The views presented here are my own, but they have been informed by my work with ENIL, and my colleagues at the organization have been consulted on and support this account of ENIL's monitoring and advocacy.

ENIL's Definition of Independent Living

At the heart of ENIL's work is its understanding of independent living that has been captured in a definition (ENIL, n.d.). In order to pay heed to the significance of this definition for the organization's struggle for hermeneutical justice, I will discuss it here statement by statement. ENIL's definition begins by suggesting that independent living is about the implementation of rights-based policies, in concert with Article 19 of the CRPD that frames independent living as a human right: "Independent living is the daily demonstration of human rights-based disability policies" (ENIL, n.d.: n.p.). In disability studies and activism, the rights-based approach to disability policy has sometimes been opposed to the needs-based approach, and the shift from "needs" to "rights" has meant a transition from charity to entitlement, from passivity to activity, and from professional domination to self-determination of disabled people (Oliver, 1996: Ch. 5). Indeed, the CRPD has been described on its official website as an embodiment of precisely such a hermeneutical shift by taking:

> to a new height the movement from viewing persons with disabilities as 'objects' of charity, medical treatment and social protection towards viewing persons with disabilities as 'subjects' with rights, who are capable of claiming those rights and making decisions for their lives based on their free and informed consent as well as being active members of society. (United Nations, n.d.: n.p.)

The second statement of ENIL's definition of independent living makes the point that independent living policies pursue two strategies simultaneously, in combination: "Independent living is possible through the combination of various environmental and individual factors that allow disabled people to have control over their own lives" (ENIL, n.d.: n.p.). The first strategy is to design or modify mainstream environments – including buildings, housing, transportation, schools, and workplaces – to make them accessible and accommodating for disabled people. The creation of specialized services such as sheltered workshops or day-care centers, even when physically located within the community rather than on its margins, does not enable independent living but perpetuates segregation and exclusion (Angelova-Mladenova, 2017: 12). Instead of such services, independent living requires personalized support in the community that includes personal assistance, communication assistance, and assistive technologies, among others. These solutions comprise the "individual factors," the second policy-making strategy that makes independent living possible.

ENIL's definition then emphasizes that disabled people should be able to make "choices and decisions regarding where to live, with whom to live and how to live" (ENIL, n.d.: n.p.). This point suggests that independent living excludes housing and servicing arrangements where disabled people are forced to live in designated buildings and groups, as well as to follow everyday routines determined by service providers or disabled people's "helpers." In policy terms, housing and support should be decoupled – otherwise, "people who need support are forced to accept a ‘group home’ type living arrangement, and vice versa – people who need a place to live are forced to accept the support provided there” (Angelova-Mladenova, 2017: 26). This is crucial when considering ENIL’s fight over the meaning of deinstitutionalization, discussed below.

Independent living calls for redistribution of resources toward universally available and accessible services (positive measures), as well as for non-interference and respect of privacy (negative measures) – support should not be imposed through hard or soft power but freely chosen through informed consent: “Services must be available, accessible to all and provided on the basis of equal opportunity, free and informed consent and allowing disabled people flexibility in our daily life” (ENIL, n.d.: n.p.). Together with being universal and consensual, support should be flexible – its opposites are the rigid routines and one-size-fits-all solutions of residential institutions and other provider-led services (Evans, 2002). This point will be revisited in the discussion of ENIL’s monitoring of personal assistance schemes.

The fifth statement of ENIL’s definition of independent living iterates the environmental factors and the individual factors that make independent living possible: “Independent living requires that the built environment, transport and information are accessible, that there is availability of technical aids, access to personal assistance and/or community-based services” (ENIL, n.d.: n.p.). Finally, since independent living is a human right, support for it should be unconditional rather than restricted by identity categories or degree of needs: “It is necessary to point out that independent living is for all disabled persons, regardless of the gender, age and the level of their support needs” (ENIL, n.d.: n.p.). Here, we find a response to the common critique that the independent living movement prioritizes physically disabled people of working age (Westberg, 2010: 14–15) – rather, independent living is meant to be universally applicable, as also stated in Article 19 of the CRPD.

In sum, ENIL’s definition of independent living suggests that independent living is a human right that requires both mainstream adaptations and personalized solutions in which housing and support are decoupled and which are universal, consensual, flexible, and unconditional. From this perspective, to be independent means to have unrestricted access to mainstream environments and personalized support that is organized in such a way so that one has maximum choice and control in one’s everyday life. This understanding of independence excludes institutional care and rectifies the hermeneutical injustice suffered by disabled people when independence is one-sidedly interpreted as the ability to cope alone, without external support, or to be self-sufficient. To overcome their hermeneutical marginalization and to assert their own understanding of independence, disabled people have organized in a social movement and have set up organizations such as ENIL.

ENIL’s Advocacy for Deinstitutionalization

The fight against disabled people’s segregation in residential institutions has been a hallmark of the independent living movement since the time of its inception (DeJong, 1979; Evans, 2002; Ratzka, 1993). Institutions have been exposed by the members of the movement and their allies as sites of abuse and oppression that have deprived their residents of choice and control in their everyday lives. In concert with this struggle, Article 19 of the CRPD has been oriented toward challenging and preventing institutionalization by asserting the right of all disabled people "to live in the community, with choices equal to others." Subparagraph (a) of Article 19 clarifies that this right presupposes "the opportunity to choose their place of residence and where and with whom they live on an equal basis with others." Since the 1960s, first in North America and Europe and later in other parts of the world as well, there have been various policy responses to institutional horrors and injustices that have been subsumed under the general heading of "deinstitutionalization" (Mladenov & Petri, 2020).

ENIL (n.d.: n.p.) has defined deinstitutionalization as "a political and a social process, which provides for the shift from institutional care and other isolating and segregating settings to independent living." The organization has advanced deinstitutionalization reform in Europe in a number of ways. Since 2008, ENIL has managed the European Coalition for Community Living (ECCL) – a Europe-wide initiative that has promoted community-based services as alternatives to institutional care (Parker & Bulic, 2010). ENIL has also been an active member of the European Expert Group on the Transition from Institutional to Community-based Care (EEG) – a coalition of advocacy organizations, international bodies, and service providers established in 2009 and supported by the European Commission to guide deinstitutionalization in the European Union (EU). As part of this collaboration, ENIL has led the development of two highly influential reports on deinstitutionalization that have had a significant impact on deinstitutionalization policies at EU level (EEG, 2012, 2014).

ENIL has also monitored the use of the European Structural and Investment Funds (ESIFs) for projects ostensibly committed to deinstitutionalization in EU countries. ESIFs have been the main financial instrument used by the European Commission to help and/or nudge EU member states toward developing their economies and welfare systems in sustainable and socially just ways (European Commission, n.d.). ENIL has monitored the use of ESIFs by collecting and assessing country-specific information on deinstitutionalization reform, which has resulted in a number of reports and policy briefings (e.g., Parker & Bulic, 2010, 2013; Parker et al., 2016). In gathering evidence, ENIL has prioritized the testimonies of disabled people and their local organizations. Thus, rather than confining its monitoring to legal and policy analysis, ENIL has relied heavily on evidence generated on the ground by its members and stemming directly from the lived experience of disabled people. This has been a defining feature of ENIL's monitoring and has differentiated its policy work from that of other international organizations that have relied on expert fact-checking missions to develop their reports. Since 2016, ENIL has been doing this work in the framework of its EU Funds for Our Rights campaign, financially supported by the Open Society Foundations (Bulic & Kokic, 2018; Parker et al., 2017).

At the heart of these campaigning and monitoring activities, one finds a fierce hermeneutical struggle over the meaning of deinstitutionalization, which overlaps with the more general struggle over the meaning of independence. In Europe, deinstitutionalization reform has routinely been framed by the most powerful stakeholders in the process – service providers, policy-makers, and big disability charities – either as a renovation of the old, large residential institutions or as a relocation of residents to newly created smaller institutions (Mladenov & Petri, 2020). These smaller setting such as small group homes, even when better resourced and placed within communities, have nevertheless reproduced key features of institutional life such as lack of control over one's assistance, rigidity of routine, bloc treatment, paternalistic approach to provision, and surveillance (for a comprehensive list of such features, see Committee on the Rights of Persons with Disabilities, 2017: 4–5).

In addition, the providers of segregated services have appropriated the language of independent living to serve their own ends by claiming that their settings are "independent living institutions" – for example, by offering training in "independent living skills" (Jolly, 2009: 2–3), more appropriately described as training in "daily living skills" (EEG, 2012: 128). Such appropriations have been criticized by independent living activists as misuse and misrepresentation of the concepts developed by the independent living movement (Jolly, 2009: 3). In its General Comment No. 5 on Article 19 of the CRPD, the Committee on the Rights of Persons with Disabilities (2017: 4) has also stated that neither large-scale institutions nor smaller group homes can be called "independent living arrangements" if they deprive their residents of choice and control in their everyday lives through rigid routines, bloc treatment, surveillance, and other practices characteristic of institutional care.

ENIL's hermeneutical struggle over the meaning of deinstitutionalization has been a central aspect of its monitoring of the use of ESIFs. The organization has repeatedly asserted that according to EU regulations, guidelines and reports, ESIFs should be used to promote independent living and inclusion in the community, in concert with Article 19 of the CRPD – accordingly, ESIFs should not be invested in building new residential institutions or renovating the existing ones, except in life-threatening circumstances and as part of ongoing efforts at deinstitutionalization (Parker et al., 2016: 43). To rectify the hermeneutical marginalization of disabled people in interpreting and assessing deinstitutionalization initiatives, ENIL has advocated for the inclusion of disabled people's organizations in the monitoring of deinstitutionalization programs (Parker et al., 2017).

Hermeneutical marginalization of disabled people has led to flawed deinstitutionalization. ENIL's monitoring of ESIFs has revealed that many countries have used ESIFs to maintain and renovate institutional settings and/or to build new institutions under the heading of "deinstitutionalization" (Parker & Bulic, 2013). Most (although not all) of the cases of such misuse of ESIFs identified by ENIL have been located in newer EU member states in Central and Eastern Europe, including Croatia, Czech Republic, Bulgaria, Hungary, Romania, Latvia, Lithuania, Slovakia, and Slovenia (Bulic & Kokic, 2018: 9–10; Parker & Bulic, 2013). These countries have strong traditions in institutionalization of disabled people, inherited from their state socialist past – although state socialism disintegrated in the region at the end of the 1980s, its legacy of institutional segregation has continued to shape disability policy over the following decades (Mladenov & Petri, 2020: 1206–1208). One way to maintain the status quo of segregated provision has been to interpret the creation of smaller institutions as deinstitutionalization:

> We have received numerous reports of plans to replace large residential institutions with small group homes and similar residential facilities, as well as with foster care for disabled adults. While these services may be located in the community, they perpetuate the segregation and social exclusion of disabled people by failing to provide disabled people with the opportunity 'to choose their place of residence and where and with whom they live on an equal basis with others' [as stipulated in Article 19 (b) of the CRPD]. ENIL is also concerned that Member States are not using ESI Funds to invest in mainstream services, such as housing, employment or inclusive education. (Bulic & Kokic, 2018: 7)

To summarize, interpreting deinstitutionalization as maintaining old or building new institutions is a case of hermeneutical injustice inflicted upon disabled people. In this process, powerful stakeholders such as service providers have imposed an understanding of the shift from institutional care to "living independently and being included in the community" (Article 19) that has served their own interests while depriving disabled people of choice and control in their everyday lives. ENIL has struggled to rectify this hermeneutical injustice by exposing the interpretations of deinstitutionalization propagated by the dominant disability policy actors as false. In its monitoring of the ESIFs, ENIL has sought to overcome the hermeneutical marginalization of disabled people in negotiating the meaning of deinstitutionalization by formulating and promoting an understanding of deinstitutionalization rooted in disabled people's independent living movement. According to this (still) marginalized understanding, effective deinstitutionalization requires access to housing, mainstream services, peer support, and personal assistance (ENIL, n.d.: n.p.). The next section focuses on personal assistance, which has been yet another site of fierce hermeneutical struggle for independent living advocates.

ENIL's Advocacy for Personal Assistance

The activists of the independent living movement consider personal assistance (PA) to be key for independent living (Ratzka, 2004). Article 19 (b) of the CRPD concurs by stipulating that the states parties should ensure access to PA in order to realize disabled people's right to living independently and be included in the community. However, the meaning of PA has been as contested as the meaning of independence and deinstitutionalization (Jolly, 2009; Ratzka, 2004). ENIL has been involved in this hermeneutical struggle by creating its own definition of PA. This definition identifies PA as "a tool which allows for independent living" and describes key features of PA such as cash allocations; provision on the basis of individual needs and circumstances; rates of pay that ensure adequate salaries for the assistants and cover additional expenses such as employer contributions, administration, and peer support; and, ultimately, the right of PA users to recruit, train, and manage their assistants (ENIL, n.d.: n.p.).

ENIL's definition of PA builds on previous efforts at defining PA from the perspective of the independent living movement (Ratzka, 2004). Such user-led initiatives have contested provider-led interpretations which have branded as "PA" support available only in kind and/or covering only a limited set of needs, with inadequate rates of pay and other restrictions – in essence, support that deprives its users of choice and control over recruitment, training, and management of their supporters. Independent living activists have insisted that provider-led, limited, conditional, and/or inflexible support schemes may amount to home care, or nursing, or companionship, but not PA (Westberg, 2010). By making such distinctions possible, ENIL's definition of PA has been a vehicle for the advancement of hermeneutical justice – it has provided hermeneutically marginalized people with a means to challenge interpretations of individually provided support that may actually restrict disabled people's choice and control under the guise of maximizing them.

ENIL has used its definition of PA to guide its monitoring of PA services in Europe, the outcomes of which have been presented in several reports (ENIL, 2013, 2015; Mladenov et al., 2019). At the beginning of the 2010s, ENIL conducted a study of PA that included desk research of existing national legislative provisions, as well as a survey among disability experts from 22 European countries about the availability and the characteristics of PA schemes provided in their countries (ENIL, 2013). In this study, experts from 14 of the countries in the sample reported on the availability of relevant legislation, but the characteristics of the services provided under the heading of PA varied widely, and in many cases, these characteristics were in contradiction with ENIL's understanding of PA. This analysis was updated in a follow-up study conducted in 2015 that identified lack of progress or deterioration of existing PA services:

> The challenges that PA users throughout Europe meet nowadays have not changed much since 2013. Disabled people are still fighting to receive more hours of assistance, better salaries for their assistants and access to PA regardless of the type of their impairment. One of the main reasons for these challenges is financial, but not less important is the difficult transition from the medical to the social model of disability. Changing the mindset of society and decision makers is a challenge that needs to be tackled persistently. (ENIL, 2015: n.p.)

More recently, in 2018, ENIL developed and implemented the PA Checklist (Mladenov et al., 2019). Similar to ENIL's previous two studies of PA, the PA Checklist was designed at ENIL specifically for assessing PA schemes from the perspective of independent living. The tool included a set of criteria informed by ENIL's definition of PA and corroborated by PA users and independent living advocates in a preliminary survey.[1] The PA Checklist was piloted in eight

---

[1] The PA Checklist consists of 61 statements describing typical characteristics of PA which either enable or hinder the choice and control of PA users in their everyday lives. These characteristics were selected on the basis of a survey conducted among ENIL's members and subscribers of ENIL's newsletter during the initial stage of the project, in the period January–March 2018. The survey asked the participants to assign scores to a longer list of 138 characteristics of PA, formulated by the project leader based on literature review and consultations with colleagues at ENIL. The

European countries by local independent living experts who were also PA users. They were purposively selected by ENIL by considering their expertise in PA, and they were personally invited to assess PA schemes that they use and/or know well. Most of these experts have also participated in the development of the schemes they assessed. Based on their assessments, each PA scheme achieved an overall mean score, indicating the degree to which the scheme enabled or hindered users' choice and control. In addition to the overall scores, mean scores were calculated for five different dimensions of PA. Table 1 summarizes the results – more detailed information about the study is presented in Mladenov et al. (2019), where the PA Checklist is also included as an appendix. It should be noted that the specific information provided by the experts in their assessments has not been cross-checked or further verified, so it must be taken with caution.

The results from the application of the PA Checklist confirmed a key finding reported in the previous two studies of PA implemented by ENIL (2013, 2015). This finding concerns the sheer variability of support schemes identified (in some cases misleadingly) as PA in different European countries. The checklist provided a quick, easy, and quantifiable way of assessing and comparing support schemes parading as PA, and it did so from the (hermeneutically marginalized) position of the independent living philosophy. The mean scores presented in Table 1 allowed to judge at a glance whether a PA scheme conformed to a definition of PA created and supported by the members of the independent living movement in Europe. Thus, for example, the PA schemes available on the national level in Sweden and Serbia were assessed as highly compatible with this definition, whereas the PA schemes available on local level in Bulgaria and on national level in Ireland were assessed as incompatible. Instead of enabling disabled people's choice and control, the latter were actually suppressing them. Similar to flawed deinstitutionalization, flawed PA deprives disabled people of their independence.

ENIL has continued the work of monitoring PA schemes by launching its first Independent Living Survey in June 2020 (ENIL, 2020). The survey contains general questions about independent living and more specific questions about PA that draw on its previous two studies (ENIL, 2013, 2015) and the PA Checklist (Mladenov et al., 2019). At the time of writing this chapter, the results of the Independent Living Survey were still being analyzed. What is clear is that ENIL's latest study is yet another intervention in the negotiation of the meaning of PA. Through such interventions, ENIL has sought to advance hermeneutical justice in disability policymaking by asserting an interpretation of PA grounded in the experiences of disabled people who use support from others on an everyday basis.

---

participants in the survey scored each characteristic of PA according to the degree to which they considered the characteristic to be enabler or hindrance to independent living. Of the 138 initial characteristics of PA, the 61 highest-scoring ones were included in the PA Checklist. An example of such a high-scoring enabler is "The users can keep their assistance when moving to another region or local authority within the country" and of a high-scoring hindrance: "Under the scheme, assistance is bound to a location (for example, it is provided only at the user's home)." The implementation and outcomes of the survey are reported in Mladenov (2019).

Table 1 PA checklist – summary (Reprinted from Mladenov et al., 2019)

Country, region	PA scheme (in local language in brackets)	Coverage[a]	Overall mean score	Mean score by dimension				
				Context	Funding	Needs assessment	Provision	Working conditions
Belgium, Flanders	Personal following budget (PVB Persoonvolgende budget)	Regional	**0.30**	−0.23	1.05	0.89	−0.94	0.73
Bulgaria, Sofia[b]	Assistant for independent living (Асистент за независим живот)	Local	**−0.71/ −0.91**	−0.69/ −1.30	−1.87/ −1.87	0.23/0.20	−0.05/ −0.24	−1.19/ −1.33
Ireland	Health service executive scheme	National	**−0.61**	−1.60	0.06	−1.32	−0.18	−0.03
Serbia	Personal assistance service (Usluga personalne asistencije)	National	**1.13**	1.98	−1.14	1.41	1.43	1.97
Slovenia	Independent living (Neodvisno življenje)	National	**1.03**	0.88	−1.14	1.73	2.05	1.64
Spain, Andalucía	Pilot project of independent living (Proyecto piloto Vida Independiente)	Regional	**0.03**	0.76	−1.87	0.52	0.98	−0.23
Sweden	Personal assistance direct payment (Assistansersättning)	National	**1.34**	0.64	1.87	0.18	2.08	1.96
United Kingdom[c]	Direct payment – Personal budget	National (local funding)	**−0.42**	−1.33	−0.43	−0.43	−0.02	0.10

Notes

[a] All of the PA schemes included in the sample are publicly funded, although levels (national, regional, local) and forms of funding vary (i.e., they can be annual, project-based, social insurance based, requiring users' contributions, including charity contributions)

[b] Two assessments were completed in Bulgaria by two experts who assessed the same PA scheme independently of each other. Therefore, the corresponding cells of the table contain two values for mean score each

[c] The UK assessment concerns the national policy of providing "direct payments" for PA as a whole, rather than any particular version of the policy implemented by a particular local authority

Conclusion

In this chapter, I conceptualized disabled people's advocacy for independent living as struggle for hermeneutical justice that has sought to overcome the hermeneutical marginalization of disabled people in meaning-generating practices concerning disability policy. These practices have traditionally been dominated by medical professionals, service providers, politicians, and others occupying positions of power in areas such as disability-related research and policy-making that have affected disabled people but have historically excluded them. Powerful disability policy actors have perpetuated a one-sided interpretation of independence as self-sufficiency – an interpretation whose reproduction has constituted a hermeneutical injustice inflicted on disabled people. The conventional understanding of independence as self-sufficiency has been so pervasive that even prominent disability studies scholars have reproduced it: "Dependence is the reality, and independence grandiose thinking" (Davis, 2002: 31). Independence is grandiose thinking only when interpreted one-sidedly as self-sufficiency.

This interpretation has been challenged by the independent living movement through an alternative interpretation of independence that has rendered independence in terms of choice and control in one's everyday life, including choice and control over one's support – rather than ability to cope without support. To iterate, from the perspective of the independent living movement, to be independent does not mean to cope without support or to be self-sufficient but to have access to support that is organized in such a way so that the person who uses this support has maximum choice and control in their everyday life.

This alternative understanding of independence has been incorporated in Article 19 of the CRDP, which represents a major – although not decisive – achievement in disabled people's struggle for hermeneutical justice. The achievement of Article 19 has been consolidated by the Committee on the Rights of Persons with Disabilities (2017) in its General Comment No. 5 that has interpreted Article 19 along the lines of the independent living movement. However, it has not been a decisive achievement because there is still a lot of work to be done in order to translate the meanings implied in Article 19 into actual disability policies. The domination of "helping" professionals and service providers in defining disability issues continues to be strong, and it takes an organized and consistent collective effort to articulate, maintain, and safeguard a truly transformative and emancipatory reading of the CRPD that is in line with the values and principles of the independent living movement (Mladenov, 2013).

In her analysis of hermeneutical injustice, Fricker (2007: 174) points out that hermeneutical marginalization results from unequal relations of power that exceed the domain of communication. The interpretation of independence as self-sufficiency is underpinned by material interests – most obviously, by the interests of providers of traditional services such as institutional care, who strive to maintain their competitive advantage over user-led, community-based alternatives. Hermeneutical injustice cannot be overcome by virtuous individual action alone – it is not enough that a decision-maker is willing to listen to the ideas of those who use services and to be convinced by their arguments or by their reading of Article 19 of the CRPD. The very structure of decision-making needs to change so that the members of the group whose interpretations have so far been marginalized become equal participants in meaning-generating practices. For this to happen, argues Fricker (2007: 174), collective political action is needed.

The work of ENIL represents such an organized collective effort at becoming an equal participant in the negotiation of meaning that guides contemporary disability policy. As a user-led, user-controlled initiative, ENIL has developed and promoted definitions of independent living and kindred disability policy terms such as deinstitutionalization and personal assistance that draw on principles and values espoused by the independent living movement. In this way, ENIL has advanced hermeneutical justice in disability policy-making in Europe and beyond.

ENIL's monitoring of actual deinstitutionalization and personal assistance policies has been part of this hermeneutical struggle. The organization has used its interpretation of independent living in order to expose as flawed "deinstitutionalization" programs that renovate institutions or move people to smaller institutions, as well as "personal assistance" schemes that effectively amount to home care. Such policies have been exposed as flawed because they do not maximize disabled people's choice and control in their everyday lives. ENIL has advocated for their substitution with policies of deinstitutionalization and personal assistance that reflect the meaning of independence elaborated by the activists of the independent living movement and incorporated in Article 19 of the CRPD.

Dr. Teodor Mladenov is currently Senior Lecturer at the School of Education and Social Work, University of Dundee. Previously, he was Marie Curie Individual Fellow at the European Network on Independent Living (2017–2019) and Leverhulme Early Career Fellow at the Centre for Public Policy Research, King's College London (2013–2016). Teodor has research expertise and interests in disability studies, disability theory, international social policy, (post)socialism, and critical theory. He is author of *Critical Theory and Disability: A Phenomenological Approach* (2015, Bloomsbury) and *Disability and Postsocialism* (2018, Routledge). In the period 2000–2009, Teodor was actively involved in campaigning for disability rights in Bulgaria.

Disability Rights Monitoring in Practice: Applying Holistic Participatory Methodology

42

Sonja Vasic and Emma Matreniuc

Contents

Abstract

This chapter is a short summary of the personal experience of participation in the Disability Rights Promotion International (DRPI) project in Europe by two women disability rights advocates with the living experience of disability. The DRPI project is a global collaborative project aiming to set up an independent monitoring framework using holistic participatory disability rights monitoring methodology. In doing so, it seeks to empower grassroots Disabled People's Organizations and to equip them with the knowledge and tools to monitor their rights. The authors explore the emancipatory potential of DRPI holistic participatory monitoring methodology, reflecting on their personal experience of involvement with the DRPI project in the region of Eastern Europe. With a time distance, they offer critical reflections on the advantages and shortfalls of DRPI methodology. Sonja was the trainer in the DRPI country monitoring

training in Serbia, Bosnia & Herzegovina, and Moldova. She followed the process of elaborating country monitoring of holistic reports in these countries, which facilitated her understanding of the broader picture and thus her own endeavors in her country of origin. Emma was a participant in the DRPI country monitoring training and later conducted interviews with persons with disabilities and reported their experiences of human rights violations. She founded a non-governmental organization for young people with disabilities and presented Moldova's alternative report in Geneva. These developments considerably changed the situation in her hometown and contributed to the shift of perception of disability in Moldovan society as a whole.

Keywords

Disability rights · Monitoring · Participatory · Disability Rights Promotion International · UN Convention on the Rights of Persons with Disabilities

Introduction

The scope of this chapter is to give a short summary of the personal experience of participation in the Disability Rights Promotion International (DRPI) project in Europe[1] and to share some lessons learnt from the perspective of two participants with different backgrounds and roles in the DRPI project. We hope that by doing so, we could contribute to the process of capitalization on the experiences gained through the DRPI project in Europe and globally and to enhance the capacities of Disabled People's Organizations (DPOs) to monitor the implementation of the UN Convention on the Rights of Persons with Disabilities (UNCRPD). The DRPI project enabled us to compare the development of the life situation of persons with disabilities people with disabilities and the state of play of their human rights in different countries with regard to reporting on their national disability issues and to follow-up on the UNCRPD Committee's concluding observations sent to different countries. All of this facilitated our understanding of the broader picture and thus our own endeavors in recognizing which concrete actions in our countries could lead to good outcomes.

Worth noting in the introduction of this chapter is a little background information about the DRPI project before we move on to reflect on our personal experience and roles in the project and in the process of disability rights monitoring. DRPI is a global collaborative initiative that was set up to develop a holistic, participatory, and emancipatory methodology of disability rights monitoring. It was supported by the Swedish International Development Agency and led by York University of Toronto

---

[1] Note that the DRPI country monitoring projects were implemented in more than 40 countries worldwide and that the DRPI operated through four regional centers: Europe, Africa, Latin America, and Asia-Pacific with the headquarters in Canada. See more about the structure and geographical coverage of the DRPI project at: https://drpi.research.yorku.ca/

under the auspices of its co-directors: Prof. Marcia Rioux and Bengt Lindqvist, former UN Special Reporter on Disability, who sadly died in 2016. The DRPI project rested on an emancipatory research paradigm equipping persons with disabilities with the knowledge and tools to monitor their rights instead of being mere objects of research and the source of information to other human rights experts and organizations. That being said, the holistic participatory methodology of disability rights monitoring was developed and used to build the capacities of national and local DPOs worldwide to monitor the implementation of the UNCRPD. The methodology was called "holistic" because it sought to gather data across three elements of disability rights monitoring: monitoring of individual experiences of persons with disabilities; systemic monitoring, which involved a review of national laws, policies, and regulations; and the monitoring of media reporting on persons with disabilities (Rioux et al., 2016, 2019; Rioux, 2017).[2] It was deemed "participatory," because DRPI provided training and capacity building[3] for national and local DPOs that wanted to engage in the monitoring process so that they could be the ones to conduct all phases and elements of holistic monitoring, collecting data on human rights violations of their peers and reporting on them, and using such evidence for advocacy to advance social changes in their local contexts.

Sonja's Experience with the DRPI Project

As a former Handicap International (HI) staff member in the South East Europe (SEE) region, it was natural for me to accept the role of the trainer in DRPI country monitoring training in three countries (Serbia, Bosnia and Herzegovina, and Moldova) and to support and follow up further processes of elaborating country monitoring holistic reports in these countries and the country of my origin, Montenegro. It was at that time that the UNCRPD was freshly ratified by the countries of the region. For us, activists in the disability movement, the ratification of the UNCRPD was a big step forward, welcomed by all the stakeholders in the region as the beginning, but with no clear vision of how to grasp the opportunity. The DRPI project was a privilege and lucky synchronicity for me to become quickly familiar with the monitoring as a sophisticated tool and probably the most demanding and also the most refined way of advocating the human rights of people with disabilities. The knowledge gained thanks to the DRPI project enabled me to compare the development of the life situation of people with disabilities in different countries with regard to reporting on their national disability issues and to follow-up the UNCRPD Committee's concluding observations sent to different countries.

The opportunity to summarize the impact that collaboration with the DRPI project had on me on a personal level and for the monitoring process of human

rights of people with disabilities in Montenegro, which is the country of my origin and citizenship, came in summer 2020 through communication with the former DRPI Regional Officer for Europe, Mr. Rados Keravica (editor of this section of the volume). The reason for accepting his call to make a recapitulation of the experiences I had during joint country training on disability rights monitoring aimed at DPOs in the SEE region as part of the DRPI project in the period 2011–2013 was mostly based on my conviction that these activities were beneficial for my own understanding of the monitoring itself as a successful advocacy tool in the endeavors of people with disabilities to fight against discrimination, inequality, and in achieving better conditions in all aspects of people with disabilities lives. I wanted to capitalize on and share what I have learnt through this experience and to give some input into the continuation of using DRPI methodology and refining training materials.

My first contact with the DRPI project happened in 2011 during the regional training in Serbia from 26 April to 4 May. The organizers of that event were the Centre for Society Orientation (COD) and the Serbian Society of Autism, national disability organizations who were hosting the DRPI project and its regional center for Eastern Europe. COD was first established to take on project activities run previously by HI when the organization withdrew from the SEE region. COD inherited links with DPOs which were built between DPO regional movement and former Handicap International Regional Office in South East Europe. In the first decade of the twenty-first century, HI SEE led a very successful regional SHARE-SEE Project[4] aimed mainly at capacity building and empowerment of DPOs. The training in Serbia was organized to build the capacities of 30 DPO representatives from Serbia, Bosnia and Herzegovina, Croatia, Macedonia, and Montenegro in the field of human rights monitoring of persons with disabilities by introducing the DRPI methodology of holistic monitoring. The trainer was Mrs. Marcia Rioux (DRPI Co-Director). The DRPI project's concept was to first organize the regional training to make DPOs familiar with DRPI monitoring methodology and to set up national DPO coalitions, which would engage together in CRPD monitoring. Setting up the partnership and cross-disability coalitions was one of the main goals of DRPI methodology in order to provide for the unified voice of the movement. That was not an easy task and was challenging owing to existing issues surrounding disability politics within the national disability movements. Once the idea of working in a partnership was accepted, fundraising was set up together to ensure the funding for country monitoring projects. This is how the funds were secured later on (from various international donors and development agencies) for DRPI country monitoring projects in Montenegro, Serbia (both supported by DRPI and SIDA), Bosnia and Herzegovina, and Moldova and North Macedonia. I was invited by the regional host organization COD to join the trainers' team in delivering country training in Bosnia and Herzegovina (B&H) in 2012. The country training in B&H was organized in cooperation with the nongovernmental organization (NGO) MyRight – Empowers

---

[4] Share SEE is an acronym for self-help, advocacy, rights, and empowerment.

People with Disabilities local office in B&H (previously known as Swedish organisations of disabled Persons international Association (SHIA), with whom I have already cooperated).

The training gathered representatives from several DPO coalitions active across all parts of B&H. In November 2012, I joined the trainers' team engaged in leading the country training in Moldova, hosted by the "MOTIVATIE," a leading DPO and service provider for persons with disabilities in Moldova. Prior to that time, I had no contacts or insight into the Moldovan disability community.

Finally, I was a member of the trainers' team that led the country training in Serbia in 2013, which was hosted by COD. The training workshop for the monitoring of rights of people with disabilities was held, with the participation of 28 participants – persons with disabilities from 14 different DPOs.

In the continuation of DRPI activities in Europe, I took an active part in writing the first Serbian holistic monitoring report (Keravica et al., 2013) and was the author of the Serbian media monitoring report. For the purposes of the report on media monitoring, articles in the print media in the period from September 2012 until June 2013 were analyzed, covering the topics of the rights of persons with disabilities. Nine hundred (900) articles from 53 printed media that appeared during this period were processed.

In 2015/2016, I went on my expat mission with HI, this time in Central Asia. Coming back to Montenegro in 2016, I continued to be active in the disability movement as a freelance consultant and disability expert, and I had a clear overview of the processes with regard to monitoring of the human rights of persons with disabilities in Montenegro. I trained local DPO representatives, those of the social protection sector, educational staff, media, and local authorities' representatives in monitoring the rights of persons with disabilities in the course of several training sessions during the period 2017–2021. My recent focus is on the gender-based multiple discrimination of women and girls with disabilities in Montenegro through involvement in a project supported by the American Consular Representative Office in the capital Podgorica.

Emma's Experience

My name is Emma Matreniuc, I am a person with reduced mobility, from the Republic of Moldova. My main profession is foreign languages lecturer, most of the time communicating and teaching various groups of people. At the same time, I am the founder of a nongovernmental organization VIVERE for people with disabilities, actively promoting the rights of people, dealing with issues such as accessibility, discrimination, diversity, acceptance, and participation for all in social and cultural life.

Back in 2013, I was living in the capital of Moldova, working as a university teacher, and facing a lot of difficulties as a person with reduced mobility. That was connected mostly with transportation and accessibility to infrastructure. Unfortunately, I did not know any terminology and rules or laws that could assist, understand, and promote PwD rights. My only help came from colleagues and friends who assisted me when I needed it. In the university where I worked, with the same non-existent accessible conditions as in the rest of country, the only thing the administration could do was to offer me a room to deliver my lectures on the same floor, so that I wouldn't have to go up and downstairs. That was a period when I was desperately looking for information and possibilities for studies or work connected with the domain of disability. Somehow, accidentally, I found an internet announcement about an upcoming training course about DRPI and about human rights monitoring. That was a starting point for me because I immediately decided to apply and was invited to participate. During the training, I felt extremely happy, for various reasons: first of all, from the very beginning it was a well-thought out, informative, and instructional course that touched many domains, such as cultural, political, but tightly connected with disability. Second, I felt very comfortable in that a huge number of people with various types of disability from different corners of my country, with whom we made acquaintance and became colleagues and friends forever. That made me feel much more confident that there were more people of the same mindset and that could be an important cornerstone for my personal and public goal. Moreover, the trainers who delivered the seminars proved to be great specialists who managed to give a considerable amount of information, explain the details of our upcoming work, and construct the sessions in such a way, that more and less experienced participants could become part of that big group, with no one left behind.

In the beginning, when the participants gathered, within several sessions, it became clear that all of them had a different level of knowledge, from some specific issues to special skills in one or another professional field and held different views about disability as a notion and phenomenon. That was a real educational course that included many different points to be learnt: models and approaches to disability, law and juridical issues, administrative aspects, personal attitudes, human rights, psychological aspects, lobbying and advocacy,, etc. This process also included concrete guidelines and instructions on how to travel through the country and organize interviews with our peers – people with disabilities. We also learnt the aspects of psychological, intercultural, language, national, and intrapersonal approaches to interviewing as a qualitative research method. There were certainly difficulties connected with the lack of basic information among a number of participants, but with the thorough and detailed explanations delivered by the trainers, there was a considerable improvement and leverage of needed information. There was another group of participants, who were from the fields of activities, partially connected with the sphere of disability, such as social workers or the members of those few organizations who by that time had already been active. However, monitoring activities in the field were a real starting point and implementation of the knowledge received at the training.

Talking about lessons learnt, I would like to mention that it introduced many new and important issues connected with the sphere of disability. Even if I am a PwD myself, the entire process of travelling in my country, looking for and getting connected with many other people with disabilities whose existence I did not know of, opened up a horizon for me and somehow outlined the way I wanted to do things in the future. To be more precise, the work of monitoring, communicating with people with disabilities, seeing and observing their behavior, conducting the interviews, and writing my small reports made me want to found an NGO that would promote the rights of people with disabilities. At that moment, another important discovery was that people with disabilities constitute a large category of people in our country and that monitoring was just the beginning of another grandiose approach. That was my personal feeling and attitude, which throughout the entire process had transformed into the desire to continue that path even after the project was over.

I had at that period gone through my personal development and learnt the strategies of lobbying and advocacy, which later helped me to work. At the same time during the training, I found out that a holistic approach to all the work and reporting was a core issue both at that moment and for the next period of life, where many of the other participants and myself started to work deliberately and consistently in this domain. I am convinced that that was a starting point that changed our attitude on a personal, local, and national level.

Among the issues we learnt was the approach of working in collaboration, connection, and cooperation. That became a focal point for both work on monitoring and as a follow-up to this monitoring process.

Insights from the Ground: Value, Effectiveness, and Challenges of DRPI Holistic Methodology of Human Rights Monitoring

DRPI Promotes a Holistic Approach to Monitoring

Sonja, Montenegro

I witnessed that the DRPI holistic approach to disability was in line with the previously promoted principles with regard to approaching disability in the region. A similar approach was mainly supported by the disability international donors and organizations that were actively present in the region (UN agencies, Save the Children UK,HI, SIDA – SHIA, Embassies, EIDHR, EU funds, EDF – Project CARDS, etc.). The added value of the DRPI project was a strong focus on the monitoring of human rights, which, as a tool, was a little neglected in the early phases of the empowerment of the DPOs in the region (which started in the late 1990s and the first decade of the twenty-first century). The fact that the strongest DPOs in each country of the former Yugoslavia were mainly oriented toward the social model of disability and a rights-based approach, was favorable for the implementation of the model proposed by the DRPI project. Moldova was also very receptive to DRPI methodology in spite of my low expectations before arriving there and facing the real situation. The monitoring of human rights is a challenging and demanding process and only high-profile DPOs were capable of internalizing and using it successfully in advocating for the rights of persons with disabilities and other causes they were oriented toward. One of the challenges that I identified as a trainer during working with DRPI original training material was that it was prepared for participants with an average level of familiarity with the human rights concept.

Those with a more advanced level had a feeling that their previous experiences were not sufficiently respected by the trainers and those with less experience were overwhelmed with the quantity of information to be digested in a short time. That is why I would prefer to conceptualize DRPI initial country training as the training of trainers. SHARE SEE had very good results, with a cascading approach to transferring knowledge in the SEE region. After a group of domestic trainers were trained by international trainers, the next cycle of training was led by the local trainers in their own countries and at the end of the process, the information about the methodology reached the broader public. This approach is empowering both in the field of gaining knowledge about monitoring but also with regard to good training and presenting skills within DPOs.

Emma, Moldova
As a participant in the training that took place in my home country, Moldova, there is an important moment to mention. It was during a period when the rights of people with disabilities had just started to be paid attention to. The ratification of the UN CRPD in Moldova had been a hot issue for discussion and started to be implemented very slowly. Thus, all the work and activities in terms of training that we received were due to the time and conditions in which our country had been at that moment. If we bear in mind those conditions, it is worth mentioning that there was a deeply entrenched medical approach toward people with disabilities, that presupposed a well-known vision as if those are sick people, with diseases, curable or not, but definitely not able to work, to be a part of society or participating at any activity or leading independent lives they wanted. Thanks to the implemented DRPI project and through the sessions delivered by the experts from Serbia and Montenegro, we learnt that people with disabilities could also be the experts of their lives, not only living it. Taking into account that people with disabilities are considered to be the biggest minority group, the DRPI project opened up the space to discover yourself as a citizen and as a person with disability who is doing something considerable and significant in his/her community, town, and country. Thanks to this project and the long sessions we had, there were opportunities to learn a lot of notions, ethical rules, historical background and examples from other countries and other people with disabilities, and the disability movement as a whole. This knowledge contributed to the success of the subsequent process of disability rights monitoring, including the interviews with our peers with disabilities we conducted with an aim to collect data and evidence of human rights violations in our country.

DRPI Promotes the Empowerment of Persons with Disabilities to Become the Leading Force of the Change

Sonja, Montenegro
First, talking about my own awareness, the DRPI project definitely improved my perception of the functioning of the system of human rights protection in general and about CRPD monitoring specifically. It also gave me a practical roadmap for follow

up the oscillation in enjoying the concrete effects of the legislative changes, the improved media depiction of disability, and to research the situation of persons with disabilities in my country. My recent engagement in assessing the situation of girls and women with disabilities in Montenegro is strongly based on interviews with girls and women and their family members and inspired by the Middle East adaptation of DRPI methodology led by the organization Stars of Hope.[5]

My experience is that all three countries targeted by country monitoring training succeeded in creating the Holistic Country Monitoring Report. It is a document that comprises all the results of monitoring components according to DRPI methodology (monitoring individual experiences, systemic analysis, and media monitoring) and is the final product of the monitoring processes conducted in one country where the project was implemented. The Country Monitoring Report is elaborated by the representatives of the DPO coalition at the country level and is the joint product of all the field workers, monitors, country coordinators, site coordinators, partner organizations at the national level, and the Regional DRPI Officer.

Participating DPOs in all three countries were later leaders in drafting shadow reports of their countries and presenting them in front of the CRPD Committee in Geneva. However, my opinion is that it would be very beneficial if DRPI training were offered simultaneously to non-disability human rights organizations and other compatible actors in targeted countries in order to facilitate the strong cooperation of different stakeholders. This could facilitate the creation of one high-quality and united shadow report, which was not the case in Montenegro, where two shadow reports were reported, one formulated by DPOs and the other one by human rights nongovernmental organizations. In general, I would be happier to see strong alliances between DPOs and other human rights defenders and their joint involvement in capacity-building activities and later activities in the field. That is why I see DRPI Project continuation in Montenegro as a combination of several strong links between DPOs and academia (for example, York University from Toronto, Canada, which led and coordinated the DRPI project and the Faculty for International Studies in Podgorica or other disability studies scholars and their universities), leading national human rights NGOs (for example, CEDEM[6]) and governmental monitoring bodies (for example, Monstat,[7] a parliamentary HR body). The financial support could come from government funds, which on an annual basis supports DPO projects aimed at fighting discrimination of people with disabilities and the promotion of equality. Of course, the individual interviews and monitoring of individual experiences of people with disabilities should stay exclusively in the hands of persons with disabilities themselves. Peer relationships could be more suitable for developing the relationship of trust and to mitigate the imbalance of power that might be evident between "expert" researchers and disabled people when treated as objects of

---

[5] See more about DRPI's work in the Middle East at: https://drpi.research.yorku.ca/mid-east-news-3/

[6] See more at: www.cedem.me

[7] See more at: www.monstat.org

research. To mention the model of good practice, the Government of Montenegro adopted in 2016 the Analyses of compatibility of regulations in Montenegro with the Law on Prohibition of Discrimination of Persons with Disabilities and the UN Convention on the Rights of Persons with Disabilities, together with recommendations for harmonization. The document contains overall analyses of the Montenegrin legislation and covers 13 areas of legal regulation in almost 60 laws. The document was formulated by the working group in which representatives from the Government, Parliament, disability movement, human rights sector, Organization for Security and Co-operation in Europe (OSCE), and European Commission (EC) took part in the process whereas the text itself was elaborated by an expert.

Emma, Moldova
DRPI monitoring objective for that time was to organize interviews of people with disabilities also effectuated by other people with disabilities and that was precedence in our country. Its value was in the fact that people with disabilities were unexpectedly, for themselves and for the whole of society, taken out of their usual conditions, their context of life, their comfort zone, and literally from their homes. To my mind, that was a real breakthrough. Its value was to open up many issues that had been covered under the ash of history and society's attitude and maybe because of attitude of people with disabilities to themselves as well. During the training, several questions occurred: what is it to be a person with disability? What does the life of a PwD look like in our small country? The stereotypical approach, outdated and dry thinking and a vision through the prism of pity – all these and many other factors brought to the surface all the vices and clichés. Some of them for instance are: people with disabilities are poor, sick, and intellectually weak, cannot get a profession, should stay at home, do not earn money, cannot create a family or have no friends, are extremely vulnerable, have no good taste or cannot admire art or science, etc. We discovered at some point that people with disabilities are rights-holders, but in reality, they do not enjoy the same rights as others. It became obvious and sad at the same time, that disability is a label, a stigma, and it leads to isolation. It seems to be a voluntary exile.

After the training, as we approached the challenges of the entire process, it should be admitted that it was really tough. First of all, none of the participants had ever been in the role of the human rights monitor or an interviewer or have a tangential occupation or education in the given domain. Second, it was the first time that such a big number of people with disabilities from different regions of the country, various organizations, of different age, gender, profession, occupation or nationalities had gathered together for one objective. However, at that moment, people with disabilities were interested in learning something new that they had never done before. That was one of the first challenging moments.

From my personal observation, I have to admit, that was my first experience in participating in the activities organized by and for people with disabilities in my country. Moreover, the activities organized within the DRPI project were a novelty for all the participants and for the whole of society as well. I am also convinced that it moved the minds of many people and made a considerable shift in the understanding of what disability actually means.

Personal challenges had been faced while the real interviews took place. Even during the first stage, while recruiting and looking for the lists of people, talking and discussing with them about the eventual meeting – that was all new and unusual work. However, I have to admit that, personally for me, it had a profound impact and I founded an NGO for young people with disabilities and began a new path in my life and career as well. These things changed the situation in my hometown considerably and the attitude of the entire society as well. And for many other participants in the project, all the steps undertaken became the equivalent of deep life changes, vision, a decrease in negative attitudes including internalized ones, acceptance, breaking the stereotypes, environmental barriers, social and juridical knowledge, information, and it led to the liberation and desire to live further and in a different way, make the social changes that we are hoping for and to live fully as all other people without disabilities live.

So, talking about DRPI value in terms of methodology and the steps undertaken, as well as the total inclusion of people with disabilities, we can surely confirm that the monitors – the people with disabilities themselves – managed to understand all the procedures and to engage in disability rights monitoring for the first time in their lives. We practiced an elaborate procedure and the interviewing strategies before we started the fieldwork and we simulated interviews between ourselves in a group before we went in the field to interview others. It helped a lot to understand how the data collection of human rights violations works, what reactions we might expect, and how to handle all the challenges that we might face during data collection.

DRPI Promotes Solidarity and Networking of DPOs

Sonja, Montenegro

Speaking about the level of activity of disability movements, in the SEE region, the activism of DPO members varies across and within the organizations. More active members profile themselves and sooner or later the process of stratification inside the organization starts. The pool of people with disabilities or parents of children with disabilities who are providers of knowledge and skills become leaders and those people with disabilities who are at the receiving end are left behind. Inside the very same DPO field, we have the antithesis of the model that DRPI is promoting. Persons with disabilities, members of DPOs are often passive recipients of support rather than activists and resource persons positioned to emancipate others. Emancipation is a really long-term goal, and it takes time to achieve broad mobilization of people with disabilities to fight coordinately for their rights. To mention the model of good praxis, I would stress that high quality Montenegrin Shadow Report to UNCRPD, which was presented in Geneva in 2017, was mainly drafted by the persons with disabilities, members of DPO Youth with Handicap of Montenegro- UMHCG. The content of this Alternative Report had serious influence on the Concluding Observation of UN Committee on the Montenegrin Initial Report on UNCRPD.

Last, the level of DPO coalitions, the cross-disability approach is not fully put into practice in the region. Disability politics is mostly based on competition over access to scarce funds but also over better positioning in regard to the decision-makers. In the DRPI training material, the importance of working in coalitions should be covered more extensively, exposing the key challenges of disability politics within the movements.

Emma, Moldova
After founding the DPO VIVERE, I managed to get connected with other active NGOs and to gain more knowledge through active participation, self-study, and various projects. We concentrated our attention on accessibility in the entire northern region of Moldova, delivering seminars and personalized support. Thus, from a simple university lecturer, I transformed my life into a synergy of teaching and human rights promotion. I also started to work in the domain of inclusive education, travelling through the region and promoting accessibility in educational institutions, at polling stations, in all the other places. During my tenure as the NGO founder and director, collaborating with both beneficiaries and decision-makers, my commitment became to demonstrate exceptional service and professionalism in the domain of disability along with teaching, educating, and coordinating the communities and people with different needs and aspirations. Such synergy brings results in terms of interdisciplinary work and a multidimensional view on human rights and diversity, applying innovative techniques and approaches, creating a proper environment for persons with disabilities. All these had become real because of that DRPI training where I learned about disability rights for the first time, a training that literally taught people with disabilities to respect their rights, to be stronger, and to be grounded in knowledge, rules, the UN Convention, and human rights approach. In recent years, many people with disabilities got jobs, started to be more visible, became local counsellors in their communities, and actively participated in political and social life. We can openly and easily talk and voice different issues, no longer being afraid that our status as disabled persons will be the reason for us to be discriminated against or humiliated. That monitoring experience brought visible results and pushed forward many issues that had been covered under society's fear and lack of awareness of the role and rights of people with disabilities. The knowledge we acquired cascaded from one organization to the other. Even though there is still much work to be done, we can surely admit that changes took place.

DRPI Promotes a Bottom-Up Model of Activism of Persons with Disabilities

Sonja, Montenegro
From my point of view, the DRPI project's ultimate worth lies in its bottom-up character. Nobody knows better than people with disabilities what is convenient for them, what should be a priority, what the most troubling barriers are to their inclusion and participation in the community. When we estimate the level of awareness about the right on the autonomy of people with disabilities perceived by the decision-makers, public opinion, and people with disabilities themselves,

including their family members, Montenegro is still far from implementing the "Nothing about us without us" motto. There are exceptions, both within the DPO community and decision-makers, of course. Montenegrin official policy is based on that same principle that gives the chance to international supporters to insist on it when investing their resources in projects with a strong component of empowering people with disabilities and their organizations. To mention the model of good practice, I would stress the high quality of the shadow report presented in Geneva in 2017, which was completely drafted by DPO representatives[8] (cross-disability DPO Youth with Handicap) and which highly influenced the Concluding Observations of the UNCRPD Committee for Montenegro. Our Government's second report is due in 2023 and now is the right time to initiate the second holistic monitoring report (the first one was elaborated in 2013), with at least two components, monitoring individual experiences and media monitoring, while the legislative (systemic) analysis could be done in the working group, which was already the case in the aforementioned analysis carried out in 2016.

Emma, Moldova

A significant period had started when the training was over. We immediately moved on to work and in my situation, I decided to come up with the personal initiative to take under my responsibility the part of the country that had not actually been planned before. That decision came about because it could enlarge the area of monitoring throughout a bigger territory. I realized that it could be much harder to organize, but I dared to take charge, and after we got approval from the coordinator, we began the work. I assume that was partially because of a dose of motivation from the training that inspired me, as a person with disability, to contribute to the creation of change for my fellow citizens with disabilities. During the process of interviewing, I met so many people with disabilities in the northern part of the country, and the interviewing process was so significant for me that I took the decision to continue down that path. I wanted to change our lives. Within a year, I left the capital of the country, moved to another, smaller town, founded an NGO for people with disabilities, and started a new path in my life, where I became a civil rights activist and a human rights promoter.

Here is the point at which to mention the importance of that DRPI training delivered by Sonja Vasic and Rados Keravica, who were also persons with disabilities with whom we could identify, for Moldovan participants. It was a turning point in broadening my horizon in knowledge about disability, human rights, enlarging the circle of people with whom we started to collaborate, and encouraged me to found an NGO for people with disabilities, to work and inspire the others, to listen to the voices "from the field," and to produce the changes. As a result of all the aforementioned points and my direct involvement in disability rights monitoring, one can now see multiple ramps constructed in my town and parking lots for people with

disabilities. Owing to my activism, I had the honor of being invited to present the Moldovan alternative report in Geneva.[9] Thus, contributing to this chapter is an honor and a chance to share with the audience how the involvement in disability rights monitoring and the training in the sphere of disability can change your personal and professional life, your world vision, and participation in the life of the country, changing the lives of people with disabilities for the better, promoting empowerment, equality, and accessible conditions for all.

In summary, I was a participant in the training, who later became a PwD who monitors human rights and who interviewed other people with disabilities throughout the country. This had a considerable impact upon both sides (me as an interviewer and the people I interviewed, creating the opportunity for their voices to be heard) and upon the entire country as well.

Conclusions and Recommendations

Monitoring is a very sophisticated process in implementing the human rights concept in society, aiming to reach equality for all and respect for diversity of any kind. This includes claiming the rights of people with disabilities. DRPI methodology helps to create an independent monitoring system for disability rights, based on three priority areas: (1) individual experiences of persons with disabilities; (2) systemic monitoring that studies legal frameworks, tracks case-law before the courts and statutory human rights bodies, and analyzes general government policies and programs; (3) media monitoring that involves tracking media imagery and coverage of disability. It increases the capacity of DPOs to be able to collect, analyze, and use data to report and advocate, and facilitates cross-disability cooperation and coalitions with other human rights actors.

In the countries of former Yugoslavia and the ex-Soviet zone of influence in Europe, the time for the idea of equal rights for persons with disabilities has come and is strongly supported by the UNCRPD. Persons with disabilities need to learn how to use monitoring skills (collect data, analyze them, and make the best use of the results of monitoring at the right moment, in the right format, and in front of the right actors). DRPI methodology gives clear instructions on how to do so from the very first step to the final success. The methodology is based on gaining knowledge of persons with disabilities, as well as material resources, to become owners of strong arguments and to become prepared to voice their concerns to highly positioned decision makers. Not all people with disabilities or their DPOs would be able to take part in the full process, but all of them can participate partly in the process of monitoring. Knowing that and taking into consideration the fact that the DRPI project has already been implemented in five countries of the mentioned region (Montenegro, Serbia, B&H, Moldova, and North Macedonia), it would be

recommended to continue with the monitoring to start up a new cycle of monitoring, and to compare the findings reported in 2015 with those in 2021/2022. That would reflect the main trends. The pull of people with disabilities who have already been trained should be included in the training of trainers, which could be regionally conceptualized or even delivered in an online format. Dissemination of their knowledge to others should be supported through the nationally financed projects and should include not only DPOs and people with disabilities but also representatives of other human rights organizations, governmental bodies, media representatives, political parties, etc. Elaboration of the holistic monitoring reports should be financed by the governments as part of the preparation of the shadow reporting to the UNCRPD Committee as part of the existing cooperation of the governments and DPOs through the funding streams for DPOs. Clear priority given to this topic must be emphasized in the criteria for project grant awards. Training materials should be slightly adapted to the level of knowledge of the leading DPOs with demonstrated experience in the theoretical and practical dimension of DRPI methodology. Intensive international cooperation should be fostered between academic institutions and DPOs in order to give more scientific credibility, rigor, and visibility to all the aspects of the implementation of the methodology. For the countries of the former Soviet zone of influence, it would be useful to be incorporated in the DRPI project. When I (Sonja) was engaged in the Central Asia Program of Handicap International in Kyrgyzstan and Tajikistan during 2005/2016, I initiated HI Central Asia’s application to the European Instrument for Democracy and Human Rights call for project proposals with the idea of promoting DRPI methodology of monitoring and reporting human rights of people with disabilities in Central Asia, but this application was not listed as the priority of the donor. I think that, on the contrary, it would have been a chance to spread the human rights approach to disability in Central Asia. For many other participants of the project, all the steps undertaken became an equivalent of changing a life, vision, a decrease in negative attitudes, acceptance, liberation, breaking the stereotypes and environmental barriers, acquiring social and legal knowledge and information, and it led to empowerment and an awareness that we have a right to live full and happy lives just like everyone else. In order to spread the positive influence that the DRPI project had on the countries in the accession process to the European Union (EU), it is worth making another effort to present the methodology and the content of DRPI to other regions worldwide and also to support the implementation and scaling of the skills and knowledge gained in European countries that are still not part of the EU.

Protecting Women and Girls with Disabilities from Violence and Upholding Their Rights: Making It Work Methodology

43

Sophie Pecourt and Silvia Quan

Contents

Abstract

The adoption of the Convention on the Rights of Persons with Disabilities (CRPD) marked a milestone in recognizing women and girls with disabilities as full rights holders and in explicitly identifying the multiple discrimination they are subjected to, including gender-based violence. Nevertheless, advancing these rights has posed significant challenges due to the lack of comprehensive disability laws and policies addressing them, or protecting women's rights. The Making It Work (MIW) methodology, applied to the initiative to prevent, eliminate, and respond to violence against women and girls with disabilities, has shown that placing persons with disabilities, particularly women with disabilities, as central actors in the implementation and monitoring of the CRPD, is a successful road for their empowerment and key to upholding their rights. It has also proven to be a useful tool for mainstreaming disability in the broader women's rights movement.

Introduction

With the adoption of the Convention on the Rights of Persons with Disabilities (CRPD) by the UN General Assembly on December 13, 2006, the participation of persons with disabilities became an essential element in any decision-making process. During the ad hoc Committee sessions (2002–2006) that developed the text of this new human rights treaty, the voices of civil society were strong and unprecedented (UN Special Rapporteur on the Rights of Persons with Disabilities, 2016), and it was not any kind of civil society: It was the voices of persons with disabilities who had long been silenced and taken over by others, mainly service providers and so-called "disability professionals." It was the motto "Nothing about us, without us!" put into practice at its highest standards, and persons with disabilities worldwide celebrate the long-cherished result, a human rights treaty which recognizes the dignity and fundamental rights and freedoms of all persons with disabilities.

The CRPD is not only unprecedented because of how it was drafted and the unique way in which the knowledge and experience of its rights holders were tightly knit into it, but also the CRPD is broad and comprehensive, and by being so, it has captured intersectionality in its essence. Its Article 6, women with disabilities, which recognizes that women and girls with disabilities are subjected to multiple forms of discrimination, is just one example of how comprehensive this fundamental treaty is, and how powerful its use as an advocacy tool can result. Article 6 and other provisions which are fundamental to basic concerns relating to gender-based violence, such as Article 16 – freedom from exploitation, violence, and abuse, Article 17 – personal integrity, Article 23 – respect for home and family, and Article 25 – the right to health, were also drafted with the unprecedented voices of women with disabilities being heard during the discussions of the Ad Hoc Committee, and today, over 14 years after its adoption and 12 years since its entry into force, women with disabilities who played a key role in the early turn of the millennium have stayed active in its enforcement.

The CRPD Committee has also played a fundamental role with its monitoring tasks. With its ongoing work developing jurisprudence, it has adopted seven general comments so far, its general comment no. 3, adopted during its 16th session in September 2016, being on women and girls with disabilities (Committee on the Rights of Persons with Disabilities, 2016). GC3 stresses the importance of intersectionality when dealing with major concerns of women and girls with disabilities; in particular, it points out how some of the most perverse and widespread forms of violence against women and girls with disabilities, such as forced sterilization, cannot be fully understood unless using an intersectional lens for its analysis.

The restriction to the enjoyment of full legal capacity, the absence of free and informed consent that leads to forced treatment and violation of sexual and reproductive rights, the persistence of institutionalization, and prevailing stigma and misinformation are only some of the rights of women and girls with disabilities which are continuously and systematically violated. The fundamental nature of human rights as being universal, interrelated, and indivisible means that protecting women and girls with disabilities against violence, exploitation, and abuse can only be achieved if full legal capacity is recognized, nondiscrimination becomes a cornerstone in the development of policies and legislation in the prevention, elimination, and response to gender-based violence, including access to justice with a gender and disability perspective, and gender-sensitive de-institutionalization, and independent living schemes are put into place, including personal assistants to facilitate access to sexual and reproductive health and rights, and access to inclusive education and social protection with gender and disability perspective.

General comment no. 7 on the participation of persons with disabilities and their representative organizations in the implementation and monitoring of CRPD, adopted by the CRPD Committee (Committee on the Rights of Persons with Disabilities, 2018), has also acknowledged the importance of women and girls with disabilities constituting their own organizations, and in particular, to be included in consultations referring to issues that will affect them more disproportionately. In addition, women and girls with disabilities should also be able to fully participate in monitoring mechanisms of human rights, particularly in independent monitoring mechanisms for the CRPD. Special attention should be paid to the independent monitoring authorities appointed in conformity with Article 16, para 3, on the right to freedom from exploitation, violence, and abuse.

The former UN Special Rapporteur on the Rights of Persons with Disabilities, Ms. Catalina Devandas Aguilar, also a woman with disability herself and an outstanding actor in the development of interpretation standards for the rights of persons with disabilities, in her 2017 thematic report on sexual and reproductive health and rights of young women and girls with disabilities (Special Rapporteur on the Rights of Persons with Disabilities, 2017), has pointed out how women and girls with disabilities have been subjected to widespread gender-based violence, harmful and forced practices, prevailing stigma and stereotypes due to gender and disability, and multiple and intersectional discrimination that limits or fully restricts their access to sexual and reproductive health and rights, many of these related to the lack of autonomy and disempowerment, arbitrary deprivation of liberty, and nonaccessible facilities and transportation, to the lack of education, information, and communication, and the lack of policies recognizing the full legal capacity for all persons with disabilities. The risks of gender-based violence against women and girls with disabilities significantly increase in contexts of irregular migration, in conflict settings and humanitarian situations caused by natural disasters.

These major concerns and the subsequent recommendations that have been issued by these two expert bodies, referring to women and girls with disabilities, have been echoed by other international experts and human rights organs, including the Office of the High Commissioner for Human Rights (OHCHR), the Special Rapporteur on violence against women, its causes and consequences, the Special Rapporteur on the right to physical and mental health, and the Committee on the Elimination of all Forms of Discrimination Against Women (CEDAW Committee), among others. There is an increasing need to monitor the compliance of human rights of women and girls with disabilities, and to make them enforceable; in particular, these needs are accompanied with growing evidence that follow-up and monitoring policies and legislation to prevent, eliminate, and respond to the gender and disability-based violence should be designed and conducted by rights holders, that is, by women and girls with disabilities and their representative organizations.

The positive outcomes of the participation of persons with disabilities, and their representative organizations in the ad hoc Committee and subsequent adoption of the CRPD, encouraged the participation of a strong movement in the process to assess the disability-lacking millennium development goals (MDGs), and to draft and adopt, in mid-2015, the 2030 sustainable development agenda and its sustainable development goals (SDGs). The success of this lobbying was demonstrated with the 17 goals being fully inclusive, and with an unprecedented number of explicit references to persons with disabilities in several of the adopted indicators.

Many efforts have been set forth in order to achieve effective monitoring of CRPD compliance, and as there has been a growing tendency to link human rights provisions to the UN sustainable development goals (SDGs), more initiatives are being implemented by diverse stakeholders, from different approaches and perspectives, and using diverse methodologies. Monitoring human rights and building indicators for this purpose has been challenging, and the lack of data on persons with disabilities has been a major barrier. In order to tackle this, the OHCHR has established some standards, and in late 2020, as part of the EU-funded project "Bridging the Gap I" (see https://bridgingthegap-project.eu/crpd-indicators/), it launched a tool kit, including a set of CRPD-SDGs human rights indicators, that had been piloted in five countries of the world, one country per UN region. Other relevant monitoring initiatives include the ten gold indicators developed by the Danish Institute for Human Rights (see https://www.humanrights.dk/news/gold-indicators-measuring-10-key-thematic-areas-improve-situation-persons-disabilities), which were closely selected in consultation with persons with disabilities and their representative organizations, or the set of indicators proposed by Disability Rights Promotion International resulting from the monitoring projects led by persons with disabilities (Rioux, 2017).

This chapter's aim is to show how a methodology developed to collect and replicate good practices in CRPD implementation has been used by persons with disabilities, and more recently, by women with disabilities, to monitor progress. It has also served to scale up local efforts to national, regional, and international levels, and to mainstream women's organizations. By learning with successful examples of how persons with disabilities have tackled violence against women with disabilities by involving men through education, or have shown their governments how to implement supported decision-making in access to justice, others have found practical guidelines on how to progress within their own context.

The MIW Methodology

In 2008, the international development and disability organization Humanity&Inclusion (HI), former Handicap International, developed the “making it work” methodology (MIW) consisting of identifying, documenting, and analyzing good practices that have proven to be successful models in CRPD implementation, to serve as a guiding tool for organizations of persons with disabilities (OPDs) in other contexts or countries to replicate, or even to scale up. MIW offers persons with disabilities and OPDs a more practical methodology to monitor CRPD progress, an added value to more academic approaches such as monitoring through human rights indicators. Through the identification, documenting and analysis of practices, and the possibility of replicating them, persons with disabilities feel empowered by demonstrated evidence that change is possible through their participation.

During 7 years, HI in collaboration with partners worldwide had been implementing over 60 projects in 25 countries using the MIW methodology in almost any topic contained in CRPD, including legal capacity and access to health, education, employment, water, and sanitation. The MIW methodology comprised several criteria, but the fundamental elements include the following: Persons with disabilities are the key actors of the experience or good practice in implementation of one or several articles of the CRPD; the practice has resulted in significant change for persons with disabilities, change being defined in the adoption of laws or policies, discriminatory customs or practices put to an end, increase in budget allocation that improves inclusion of persons with disabilities, and/or increased accountability.

While CRPD awareness at the international level is advancing quickly with more jurisprudence and legal changes taking place, women with disabilities still face enormous gaps and inequalities, given the persistence of multiple and intersecting forms of discrimination and the lack of gender perspective in CRPD implementation and enforcement. With an increasing number of organizations of persons with disabilities (OPDs) using MIW methodology, in 2014 HI decides to launch its gender and disability MIW initiative to prevent, eliminate, and respond to violence, abuse, and exploitation of women and girls with disabilities that lead to their empowerment, reflect their diverse experiences and preferences, and promote their equity.

The gender and disability MIW initiative was first launched with the establishment of a technical advisory committee (TAC), comprised of 17 local and global independent experts on gender and disability, of whom six members are women, four are women with disabilities, four are based in the USA, one is from Europe, one is from Latin America, and one is from Africa; this composition would later be modified as the TAC expanded its membership. The TAC would work jointly with the HI project coordinator and management. To select the TAC members, the MIW coordinating team considered the lived experiences at the intersection of gender and disabilities, knowledge and experience at the international level, and diverse backgrounds such as academia, international development and cooperation, global humanitarian action, and human rights.

The main responsibilities of the TAC are the following: to review the project design and provide recommendations to the MIW coordinating team; to advise on gender and disabilities issues; to help define the focus of the good practice collection, including good practice criteria and scope of good practices; to review and select good practices; to promote the value of the project in diverse settings and within diverse networks; and to assist the MIW coordinating team in the dissemination and application of the good practice findings to key international level actors and within key international events. The TAC aimed to build a bridge so that women with disabilities from local grassroots organizations could reach out to mainstream local, national, and international women's organizations and to the broader international organizations of persons with disabilities, State actors, and multilateral organisms, so their voices and concerns can be heard.

In order to do so, the TAC has been drawing recommendations from good practices. In the 2015 Report, for instance, the TAC made recommendations to governance and justice reform programs and human rights institutions in order to enforce the realization of articles 4 (General obligations) and 12 (Equal recognition before the law) of the CRPD. Denouncing the insufficient links between disability-focused civil society organizations and States and/or multilateral actors, the MIW TAC called States, disabled people's organizations, mainstream civil society organizations, and UN agencies to give greater room to the voices of women and girls with disabilities in global and local conversations on gender equity. According to article 4.3 of the CRPD, experts were calling for systematic consultation between State actors and gender-focused civil society organizations of women with and without disabilities and their organizations are needed during policy-making and tools development, such as action plans.

Focusing on the topic of empowerment (individual as well as organizational empowerment), the MIW Technical Advisory Committee highlighted the need to increase and upscale capacity development programming for disabled people's organizations, States, UN agencies, and service providers engaged in the protection and redress of gender-based violence. TAC called on States to allocate sufficient resources on capacity development in these areas, including through funds dedicated to international cooperation and emergency situations, in realization of articles 11 and 32 of CRPD.

In 2014, the gender and disability MIW TAC discussed how to strengthen the leadership of women with disabilities and their representative organizations, who were struggling to visibilize the enormous gaps that the majority of persons with disabilities, almost 60% according to the World Health Organization and the World Bank (2011), are facing due to noncompliance with the CRPD provisions referring to preventing, eliminating, and responding to gender and disability-based violence. They aimed to demonstrate that placing women and girls with disabilities at the center of these advocacy efforts could be successful and, even better, be replicated by peers worldwide.

The first international call for good practices defined the following priority areas:

(i) Issues of access for women and girls with disabilities in order to prevent and eliminate violence, exploitation, and abuse, which included the following: access to and education in health, including sexual and reproductive health, access to education and employment, access to justice, and access to support services and reasonable accommodations (CRPD articles 2, 5, 13, 16, 24, 25, and 27)
(ii) Issues of rights protection of women and girls with disabilities in order to prevent violence, abuse, and exploitation, which included the following: autonomy and right to live in the community, forced medical treatment and forced sterilization and informed consent, and legal capacity (CRPD articles 12, 15, 16, 17, and 19)
(iii) Tools and strategies that support the prevention and elimination of violence, abuse, and exploitation of women and girls with disabilities, which included: data collection on violence, abuse and exploitation disaggregated by gender, age and disability, and other identities, identification of girls with disabilities in relation to education, access to information, awareness raising and public education on the elimination of gender and disability stereotypes, and practices that address violence, abuse, and exploitation of women and girls with disabilities in situations of risk, humanitarian emergencies, and natural disasters (CRPD articles 8, 11, 16, 21, 24, 31, 32)

The TAC also defined the following criteria to select the good practices: (i) practices that show evidence of having made a positive change, wherein change could include policies/legislation, practices, attitudes, changes in the community, in budget allocation, and increasing visibility and/or commitment in mainstream organizations and/or governments; (ii) practices that promote diversity of women and girls with disabilities; (iii) practices that show demonstrated leadership of women and girls with disabilities in the design, implementation, monitoring, and evaluation of the practice; (iv) practices that show evidence toward achieving gender equity; and (v) practices that promote collaboration with women and girls with disabilities.

The MIW methodology was built by appropriating the motto “nothing about us without us.” In the wake of CRPD elaboration where persons with disabilities and their organizations played an unprecedented role, persons with disabilities are put at the center. The MIW methodology, and its subsequent use in particular by the Making It Work Gender and Disability initiative, was innovative in many ways:

- First, MIW has been reaffirming that women with disabilities are not only “subjects of law” but rather also informed and engaged rights holders. This has been done through placing the leadership of women with disabilities as a mandatory criterion for being a good practice.
- Second, selecting good practices implemented at community and local level, MIW has been bringing them as evidences to different human rights bodies and major regional and international human rights fora, using a bottom-up approach that was not so frequent years before the localization was put at the center of the conversation.

- Third, the MIW gender and disability initiative has also considered that preventing, eliminating, and responding to gender and disability-based violence against women and girls with disabilities crosses over to compliance with the Convention on the Elimination of all Forms of Discrimination Against Women (CEDAW) and the sustainable development goals (SDGs). This has been a crucial step to engage women with disabilities outside the disability rights movement and monitoring processes.

Focus on the Making It Work Gender and Disability Project

Since its formal launch in 2014, the Making It Work gender and disability initiative has been conducting three rounds of good practices selection.

The first global call for good practices resulted in the selection and further documentation of 11 good practices in ten countries (Fiji, Colombia, Costa Rica, Guatemala, Mexico, Uruguay, Israel, Kenya, Canada, and Burundi), presented in the 2015 Making it Work Initiative Report entitled, "Gender and Disability Inclusion: Advancing Equity for Women and Girls with Disabilities" (Handicap International, 2015a). Those practices, mostly implemented by local and grassroots organizations, were operating in three areas: legal advocacy and policy change; awareness raising; and empowerment.

As stated in the key findings from those ten practices, women with disabilities across the globe who report cases of violence and abuse to the police face multiple barriers in accessing justice, seeking violence prevention and response services, and exercising their legal capacity. The different barriers faced are illustrated by the practices, of which the good practice titled "InFocus: Bringing people with disabilities into the picture—A National Pan-Canadian Community Leadership Initiative implemented" is by DisAbled Women's Network/Réseau d'action des femmes handicapées (DAWN—RAFH), Montreal, Canada. DAWN developed an assessment tool, the "National Accessibility and Accommodation Survey" (NAAS), and undertook an accessibility assessment of domestic and gender-based violence shelters and programs. From there, the Project raised awareness on experiences of women with disabilities with regard to violence throughout Canada, focusing on local OPDs and relevant context in each community. Some workshops focused on disability sensitivity training for healthcare providers, violence prevention workers, teachers, police, and other frontline workers. Information sessions were held to understand challenges and barriers, and how to practically address inclusion in the workplace. The second group of workshops raised awareness among women and girls with disabilities on risk factors for gender-based and sexual violence, explored proactive steps women could take in such situations, and enhanced the understanding of women with disabilities with respect to addressing violence and obtaining services.

Another good practice implemented by Disability Rights International Guatemala and titled "Protecting the lives and integrity of women with disabilities detained at the National Mental Health Hospital, Guatemala, through the Inter- American Human Rights System" focused on the topic of legal protection of women with psychosocial disabilities against violence, abuse, and exploitation. MIW documented the process undertaken by DRI and many stakeholders (families, patients, staff, local advocates, and mental health experts) to thoroughly document human rights abuses occurring in the Federico Mora hospital in Guatemala and ultimately file a precautionary measure petition to the Inter-American Commission on Human Rights (IACHR) with the aim of protecting the physical and sexual integrity of those housed within the hospital. The petition outlined abuses ranging from arbitrary detention; lack of appropriate supervision; routine physical, sexual abuse and the use of forced contraception; dangerous use of isolation rooms; inadequate and dangerous medical treatment; inhuman and degrading conditions; and a general lack of food and water. Women with psychosocial disabilities were found to be at very high risk of sexual abuse and exploitation which made this hospital especially dangerous for women. This is an aspect of violence against women that is rarely investigated, and it has helped raise the profile of the vulnerability of women and girls with disabilities in institutions around the region. As a consequence, the Government of Guatemala has been pursuing efforts to implement the precautionary measures as prescribed by the IACHR. It also engaged with Pan-American Health Organization (PAHO) to draft a new mental health law.

The good practice titled “Mainstreaming disability in the governmental programs addressing violence against women in Uruguay,” implemented by the Ministry for Social Development – Gender Unit of the Disability Program, helped illustrate how to conduct disability mainstreaming within governmental programs, with a focus on women with disabilities and access to sexual and reproductive health (related to CRPD Articles 6, 16, and 25). Through the capacity-building “Sweeping Barriers” program, both the civil society and staff from the health sector were targeted. The seminars for OPDs and civil society organizations included the rights of persons with disabilities emphasizing the sexual and reproductive rights and the right to have a life free of gender-based violence. The civil society organizations were consulted to promote the direct participation of women and girls with disabilities. The seminars aimed at health professionals and Ministry staff included topics such as the social model of disability, the legal framework protecting the rights of persons with disabilities, and violence against persons with disabilities. A strategic alliance with the Health Services’ State Management was developed. Among the key successes of this practice, one can highlight a guide has been published on sexual and reproductive rights of persons with disabilities, with a gender focus. It is compulsory reading for university students pursuing careers in medicine, nursing, and gynecology. Once data on gender-based violence began to be collected, women and girls with disabilities who were legally incapacitated and also were victims of violence started being assisted with no need for their legal representative to speak for them. Although this practice did not challenge a denial of legal capacity, this change in practice has been an advancement in the protection against gender-based violence in Uruguay and the enforcement of Articles 6 (Women with disabilities), 16 (Freedom from exploitation, violence, and abuse), and 25 (Health).

The good practice titled “Advocacy for legal education in Colombia,” implemented by the coalition made of Profamilia, Fundamental Colombia, ASDOWN, and University Los Andes' Action Program for Equality and Social Inclusion (PAIIS), focused on protecting women and girls with disabilities from forced sterilization. The report explains that when this practice began the legal representatives or guardians had the right to decide to sterilize the person whom they represented. Sterilization was often performed as a form of "protecting" the person with disabilities against sexual abuse, or this was the argument often used for this type of intervention. Once Colombia ratified the CRPD and became a State Party, the coalition started questioning the legality of forced sterilization. Then it decided to legally challenge forced sterilization, using CRPD article 12 and 17 as a legal framework and arguments. Among a series of action, the coalition led by Profamilia designed an advocacy strategy which included the following: awareness-raising activities aimed at health professionals and practitioners, judges and judicial staff, families of persons with disabilities, and persons with disabilities themselves; a legal strategy aimed at challenging a denial of legal capacity and forced sterilization based on this criteria; promoting the autonomy and respect of the will and preferences of persons with disabilities; and promoting choices in sexual and reproductive health services. The legal strategy included discussions with judges who had declared persons with disabilities as legally incapable, informing them about the CRPD, particularly the scope of article 12 (Equal recognition before the law), and article 17 (Protecting the integrity of the person). The outcome of these actions, in addition to legally challenging all legal provisions allowing for the restriction of legal capacity for persons with disabilities, was a decision of the court to allow forced sterilization only in cases when this medical intervention had been authorized by a judge's order.

The MIW Report gained significant attention as it was giving an unprecedented visibility to women with disabilities and their organizations actively engaging in inclusion, gender equality, and the fight against GBV. At a time where intersectionality was not commonly referred to in the global conversation, in particular when articulating discrimination based on disability as one of the intersecting factors, the 2015 MIW Report was an eye-opener to many; it showed that women leaders with disabilities were actually contributing to an increased enjoyment of their rights as enshrined in the CRPD. The Report also highlighted key recommendations drawn by good practice holders and TAC members all together, focusing on States obligations with regard to several articles of the CRPD as well as commitments expected by nonstate actors, NGOs, etc. In line with the MIW methodology aimed at bringing lasting change through documented successful good practices, the report helped showcasing women-led practical initiatives to enhance the fulfillment of States' obligations and further commitment of civil society actors.

In 2015 and 2016, a series of events and publications subsequent to the MIW report's publication brought together women leaders with disabilities to effectively advocate for change using good practices as evidence. Those were addressing rights violations and human rights monitoring using legal instruments such as CEDAW, CRPD, and the SDGs.

First, the HI-Making It Work initiative organized a session at the Commission on the Status of Women (CSW) at the United Nations in March 2015. This session brought together women leaders implementers of good practices from Kenya and Mexico and Guatemala (namely, Milanoi Koiyiet, on behalf of the Kenyan Association for the Intellectually Handicap (KAIH) and the Kenyan Coalition on Violence Against Women (COVAW); Priscila Rodriguez, on behalf of Disability Rights International (DRI); and Natalia Santos ESTRADA, representing the Collectivo Chucan, an organization of self-advocates for the rights of women and men with psychosocial disabilities from Mexico City) as well as global advocates such as Stephanie Ortoleva, Director of Women Enabled International and member of the TAC, Ms. Catalina Devandas, UN Special Rapporteur on the Rights of Persons with Disabilities (via video), and Jeong Shim Lee, of UN Women. It helped to highlight some practical successes in an effort to fight gender-based violence targeting women with disabilities, as well as advocating and inspiring more action on ending violence.

Second, 2015 was the year of the Beijing+20 review of the Beijing Declaration and Platform for Action. At that occasion, HI-Making It Work together with Women Enabled International and Syracuse University College of Law (Disability Law and Policy Program) published a review of 15 Country Reports to CSW, titled “Where are the girls and women with disabilities: an analysis of the country reports submitted to the Commission on the Status of Women 59” (HI, 2015b). The document recalled the disability-inclusive nature of the Beijing Declaration and Platform for Action, as well as the recommendations from the 2000 Special Session of the United Nations General Assembly, reviewing the progress of the outcomes of the Fourth World Conference on Women, stating that Governments should: “Adopt and promote a holistic approach to respond to all forms of violence and abuse against girls and women of all ages, including girls and women with disabilities, as well as vulnerable and marginalized women and girls in order to address their diverse needs, including education, provision of appropriate health care and services and basic social services (General Assembly 2000).” After a cross-comparison of the recommendations of the BPfA and the provisions of the CRPD, the analysis of the Country Reports from Colombia, Costa Rica, Czech Republic, Fiji, India, Ireland, Israel, Japan, Kenya, Mexico, Russian Federation, Rwanda, South Africa, United Kingdom, and Uzbekistan concludes that “the vast majority of country reports do not even mention women and girls with disabilities at all or what the State has done under each of the critical areas of the Beijing Platform for Action with respect to girls and women with disabilities. And, only two country reports involved organizations of people with disabilities (OPDs) to some extent in the preparation of their reports.” Putting the spotlight on what they call a “nearly complete failure of this sample of countries to mention women and girls with disabilities” in country reports yet focusing on women’s rights, the Making It Work Initiative and its partners call for “Women with disabilities [to be] included in all discussions with governments, women’s rights organizations.”

That same year, the MIW initiative raised the voice of women and girls with disabilities at the Civil Society Forum during the Third International Conference on Financing for Development, Addis Ababa, July 2015. It was represented by Yetnebersh Nigussie, Technical Advisory Committee member, and Fatma Wangare from Kenya Association for the Intellectually Handicapped (KAIH). A statement was published, titled "Including women and girls with disabilities in Financing For Development –Towards an all-inclusive and effective Sustainable Development Goals" (HI-MIW, 2015), signed by twenty women-led organizations, academics, and the Technical Advisory Committee of MIW. Although the Action Agenda adopted did not eventually reflect on the gaps experienced by women and girls with disabilities, it was the first time that women with disabilities were represented in such a forum.

In 2016, a delegation of Women with disabilities among the good practice holders of the Making It Work Initiative joined the 2016 AWID (Association for Women's Rights in Development) Forum. Natalia Santos Estrada from Colectivo Chucan, Mexico, Fatma Wangare from Kenya Association for the Intellectually Handicapped, and Priscila Rodriguez from Disability Rights International were actors of a significant change happening in this major event. They led a panel titled "Strengthening our Collective Power: Engaging women and girls with disabilities to end violence against all women and girls." The number of women with disabilities attending was increased, as a result of a deliberate strategy for wider inclusion and diversity (see https://www.awid.org/sites/default/files/atoms/files/summary_report_2016.pdf). Experiences and perspectives of women with disabilities in their diversity as well as key messages to feminist organizations, donors, and policy makers were shared. Women with disabilities realized that intersectionality between gender and disability was a start meant to embrace more diversity, in particular through migrant women and trans women.

Last, the good practice holders had the opportunity to raise their issues and share their experiences within the international disability rights community at the Conference of States Parties (COSP) to the CRPD at the UN in June 2015. A dedicated side event was held to support the local practices and to call attention to the inadequacy of responses to violence against women and girls with disabilities, by highlighting the issues and promoting existing solutions in need of upscaling and replication. Global activists members of the Technical Advisory Committee, as well as the local grassroots experts from the good practices, presented their concerns, the documented successes in addressing violence, and launched a call for action to States Parties to the CRPD, UN agencies, Organizations of Persons with Disabilities, and mainstream development and gender organizations.

After a 2-year period of success where Making It Work good practice holders and TAC members gave an unprecedented visibility to the experiences of women with disabilities and their fight for human rights, the Making It Work Initiative has been enlarging its body of evidence through two additional call for good practices, focusing on countries from the African continent. To reflect on its positioning at the intersection of gender and disability, the TAC was open to a couple of new members from the feminist movements as well as a representative from the African Disability Forum. With similar criteria and the same robust methodology, 17 good practices were selected and further documented in 2017 and 2019 by the TAC members. Addressing violence and discrimination against women and girls with disabilities, good practices have been successfully implemented in nine countries

(Burundi (1); Cameroon (1); Kenya (6); Malawi (2); Mali (1); Nigeria (1); Rwanda (2); and Uganda (3)).

To illustrate the increased use of other instruments such as the Convention for the Elimination of all forms of Discrimination against Women (CEDAW), 2018 MIW report highlights both CRPD and CEDAW Articles at stake. As for CRPD, good practices in general provide practical actions to enhance the enforcement of articles 6, 8, 9, 11, 12, 13, 15, 16, 17, 18, 21, 23, 25, 26, 28, 29, and 30 (CRPD Art. 6 Women with disabilities; 8 Awareness-raising; 9 Accessibility; 11 Situations of risk and humanitarian emergencies; 12 Equal recognition before the law; 13 Access to justice; 15 Freedom of torture or cruel, inhuman or degrading treatment, or punishment; 16 Freedom from exploitation, violence, and abuse; 17 Protecting the integrity of the person; 18 Liberty of movement and nationality; 21 Freedom of expression and opinion, and access to information; 23 Respect for home and the family; 25 Health; 26 Habilitation and rehabilitation; 28 Adequate standard of living and social protection; 29 Participation in political and public life; Article 30 Participation in cultural life, recreation, leisure, and sport). CEDAW Articles relevant to the good practices are Articles 5, 7, 9, 12, 14, 15, and 16 related to sex roles and stereotyping, political and public life, nationality, healthcare and family planning, rural women, equality before the law, and marriage and the law.

Without giving an exhaustive list of good practices, one can highlight here some very emblematic ones to show how practical and diverse the practices are, uplifting the rights of women with disabilities in all their diversities. That is the case of the work of the Inclusive Friends Association (IFA) in Nigeria, located in the conflict-prone Plateau State, aimed at “restoring the dignity of women and girls with disabilities.” GBV legal framework is certainly insufficient in Nigeria, and the UN Security Council resolution 1325 on “Women Peace and Security” addressing GBV is not inclusive of women and girls with disabilities. In that context, IFA conducted a study which was published with the title “What Violence Means to Us: Women with Disabilities Speak.” Mainly conducted by women with disabilities, and focused on women with physical and sensory disabilities over the age of 17 years, in times of relative peace as well as during conflict, the study was widely disseminated and served its advocacy purpose, bringing evidence to leaders, media, and civil society. Women with disabilities gained representation in the Disability Rights Commission of Plateau State, and IFA strengthened partnerships to increase survivors’ access to services, among other results.

In Kenya, the good practice of Women Challenged to Challenge (WCC) titled “Protecting urban refugee women and girls with disabilities from abuse and discrimination” targeted women facing intersectional discrimination linked with their gender, their disability status, and their refugee situation. WCC has been working on increasing accessibility of and access to services for women with disabilities being urban refugees. Conducting training programs for urban refugees with disabilities in Nairobi, focusing on economic empowerment, sexual and reproductive health, and legal rights, WCC helped raise the voice of those women in major international events such as the Conference of States Parties of the CRPD (COSP) in 2016.

The remarkable work of the Visual Hearing Impairment Membership Association (VIHEMA) in Malawi is described in the good practice titled "Advancing the access of deafblind women and girls to Sexual and Reproductive Health." Willing to tackle the issue of forced sterilization, a procedure recommended by health practitioners to prevent unwanted pregnancy resulting from rape, VIHEMA has been raising awareness on the issues to all parties involved: families, caretakers, health practitioners, and leaders. Sensitization sessions were conducted by deafblind women from the community, helping to change the mindset of the community about the women and girls living with deafblindness. Through a range of activities also targeting economic empowerment and family planning, VIHEMA's good practice proved to be empowering at an individual level, as well as at community level, by overcoming deafblind women's isolation and denial of rights over their bodies.

Many good practices have been targeting access to justice for women and girl survivors of violence. Disabled Women in Africa (DIWA) Malawi has been working with traditional leaders to ensure that traditional bylaws are not in contradiction with the rights of the women survivors. They have been tackling the issue of cases dropped off by police through direct cases follow-up, making this possible through helping women with disabilities creating their own self-help groups. United Disabled Persons of Kenya (UDPK) has been holding dialogue forums with health and judicial professionals to enhance access to justice for women survivors. In Northern Uganda, the National Union of Women with Disabilities (NUWODU) has been establishing a community network of paralegals to develop access to justice. Again in Kenya, the Coalition on Violence Against Women (COVAW) has been long involved in access to justice for women with disabilities in partnership with the Kenya Association for the Intellectually Handicapped (KAIH). Their good practice, titled "Enhancing access to justice for Gender-Based Violence survivors with intellectual challenges through integrated legal and psychosocial support service provision," describes how they have been using their expertise and evidence gained through following cases of women and girls with disabilities to work with the justice system. A major success was obtained through their participation in the review of judicial procedural obligations in Kenya. COVAW and KAIH submitted proposals regarding reasonable accommodations for persons with intellectual disabilities in the bench book for criminal proceedings, drafted by the Judicial Committee. COVAW notably focused on the necessity of providing sign language interpreters, physical guide assistance, and intermediaries if required. Those propositions were integrated into the final draft, leading to a major increase of accessibility of justice for women and girls with intellectual disabilities, and to some extent to all women and girls.

Intersectionality is progressively recognized as an effective approach to addressing women's rights. In Kenya, MIW documented a good practice by the Kenya Female Advisory Organization (KEFEADO), an intersectional feminist organization active in Western Kenya and at the national level. Titled "Using sports and art to discuss gender-based violence with children and young people with disabilities," their practice shows how feminist organizations can practically address the rights of those with disabilities, and include their perspectives in their advocacy work, through partnerships with women-led OPDs.

Using the good practices as evidence and resources, the Making It Work initiative has been continuously contributing to enforcing the implementation of the CRPD and CEDAW in line with the SDGs, with a clear focus on discrimination and violence against women and girls with disabilities. The good practices have given substance to five submissions to Special Rapporteurs and are cited in major international resources.

Evidence from good practices was shared with the Secretary General for his Report titled "Situation of women and girls with disabilities," published in July 2017 (A/72/227). The good practice implemented by COVAW and KAIH in Kenya, documented under the title "Breaking the silence around sexual- and gender-based violence against boys and girls, women and men with intellectual disabilities in Kenya," was a resource used for the UNFPA Global Study on Young persons with disabilities (UNFPA, 2018).

In 2019, the Making It Work gender and disability initiative used documented practices and further contributions from Good Practice Holders to make submissions to several Special Reports:

- Report of the Special Rapporteur on Violence against women, its causes and consequences, at the occasion of the 25th anniversary of the mandate (A/HRC/41/42, June 2019): MIW submission has recalled the need for intersectional laws and policies, as well as sharing examples of harmful practices rooted in cultural and social norms targeting particularly women and girls with disabilities. This submission highlighted findings from the practice of VIHEMA Deafblind Malawi on the issue of forced sterilization and "unintended violence" faced by women and girls with disabilities. It elaborated on the lack of agency and ownership that women and girls have over their bodies in certain communities (HI-MIW, 2019a).
- Report of the Special Rapporteur on the rights of persons with disabilities, on the Rights of Older Persons with Disabilities (A/74/186, July 2019): MIW submission (HI-MIW, 2019b) was elaborated together with three good practice holders, namely, Cameroon Baptist Convention Health Services for Persons with Disabilities (CBCHS), Lira District Disabled Women Association, Uganda, and Women Challenged to Challenge, Kenya. Building on their practices and their extensive knowledge of their context, it elaborated on the legislative and policy frameworks and access to healthcare for older persons with disabilities.
- Report of the Special Rapporteur on violence against women, its causes and consequences on a human rights-based approach to mistreatment and violence against women in reproductive health services with a focus on childbirth and obstetric violence (A/74/137, July 2019): MIW submission combined facts from the documentation of good practices with direct contributions from four good practice holders, namely, Mubende Disabled Women's Association (MUDIWA), Uganda, Organisation pour un Développement Intégré au Sahel (ODI Sahel), Mali, United Disabled Persons of Kenya (UDPK), Kenya, and Union des Personnes Handicapées du Burundi (UPHB), Burundi (HI-MIW, 2019c). Documenting mistreatment of women and girls with disabilities during SRH care, childbirth, and prenatal and postnatal care, the submission shared stories

> illustrating how women with disabilities experience such mistreatments amounting to violence against women and other human rights violations such as the right to be free from torture or cruel, inhuman, or degrading treatment or punishment (CRPD Article 15, Universal Declaration of Human Rights Article 5). Recalling the CRPD Committee, General Comment No. 3 that focuses on CRPD Article 6 (Women with disabilities) and its links with Article 16 (Freedom from exploitation, violence, and abuse), Articles 23 (Respect for home and the family), and Article 25 (Health), the submission elaborated on forced abortion, forced contraception, and forced sterilization as well as the failure in ensuring that informed consent is sought, whether due to health professionals lacking the knowledge of needed processes, or them denying the right to informed consent to women with disabilities.

In 2019, two Making It Work good practice holders, namely, Disabled Women in Africa (DIWA) and Lira District Disabled Women Association (LIDDWA), Uganda, submitted their contributions to the Special Rapporteur on the Rights of Persons with disabilities on good practices to ensure effective access to justice for persons with disabilities. Both organizations have been building their contributions from their expertise and successful practices. DIWA Malawi, highlighting good practices in place such as free legal services provided by the Ministry of Gender in Malawi, elaborated on recent positive developments such as age- and gender-appropriate accommodations being put in place following their cooperation with the Chief Justice (DIWA, 2019). LIDDWA provided inputs on good practices in place nationally, such as Sign Language being one of Uganda's official language.

Conclusion

Since many years now, MIW country partners have been more equipped with confidence and practice to submit to treaty bodies for the monitoring of CEDAW, CRPD, and other reporting mechanisms such as the Universal Periodic Review (DIWA, 2020; UNABU, 2017). Being localized and providing inspiring and practical examples of successful practices, those contributions aim at supporting Governments and other stakeholders for a better gender perspective in the implementation of CRPD (see https://disabilityrightsfund.org/crpd-committee-publicizes-list-of-issues-for-malawi/), and more systematic inclusion of women with disabilities in CEDAW monitoring and women's rights-related efforts. Having gained their seat at the table, women with disabilities had to be present during the last major advocacy event that is the 25th anniversary of the Beijing Declaration and Platform for Action (Beijing+25).

As discussed earlier in this chapter, the 2015 Beijing+20 review had been showing a poor level of inclusion of women with disabilities. A study by Handicap International-Making It Work together with Women Enabled International and Syracuse University College of Law (Disability Law and Policy Program) published a review of 15 Country Reports to CSW. They concluded to a "nearly complete failure of this sample of countries to mention women and girls with disabilities.” The Civil Society review in 2015 was also not giving sufficient and meaningful space for women with disabilities. Five years later, the Civil Society review process in Africa demonstrated that women with disabilities could no longer be overlooked. Total 15 women-led organizations shared their updates on selected critical areas, compiled in a report titled “Perspectives of Women with Disabilities on the Implementation of the Beijing Platform for Action + 25: Africa Region – Contribution to the Africa Regional Parallel Report 2019″ compiled by MIW and IDA (Oct 2019).” As a result, the Beijing+25 Civil Society Parallel Report for Africa (FEMNET, 2019) includes women with disabilities and the intersectional approach like never before.

Making It Work has been providing a new way to uphold the implementation of human rights treaties and other international human rights frameworks; this in parallel with more traditional but necessary human rights monitoring based on national and civil society reports documenting human rights violations. The comprehensive documentation of successfully implemented good practices led by the rights holders themselves allowed the initiative to bring the perspectives and realities of women with disabilities at a higher level. The inherent credibility of women leaders advocating for their rights has been opening doors and progressively breaking barriers within different movements. When intersectionality was not yet at the center of the conversation and human rights activities were in siloes, the gender and disability initiative has been providing substance, contents, practical examples, and powerful voices to advocate across women’s rights, rights of persons with disabilities, and global development agenda. Experiences of women in their diversities have been heard and used as evidence to inform recommendations. By focusing on successful and replicable practices, MIW has been a tool to allow empowered women with disabilities to inspire and provide guidance to governments, national and local actors, on how to effectively tackle the human rights violations that they face.

Inclusive Design and Accessibility

Inclusive Design: Valuing Difference, Recognizing Complexity – Introduction

44

Jutta Treviranus

Contents

Abstract

Inclusive design demands a change in mindset. The theory and practice of inclusive design contest the assumptions regarding such fundamental concepts as success, evidence, value, truth, expertise, intelligence, completion, quality, scaling, prosperity, benefit, planning, and consistency and their associated conventions that lead to vicious cycles of disparity and inequity. Current society's assumed notions reduce diversity and deny complexity. This chapter outlines the theory and practice of the Canadian school of inclusive design, the assumptions

that must be unlearned, and the guiding values that act as a generative framework. How this school of practice is situated within complementary fields is described. The chapter also provides an overview of the chapters within this section.

Keywords

Inclusive design · Diversity · Complexity · Uncertainty · Disparity · Equity

Introduction

Diversity is our greatest asset. Inclusion is our greatest challenge.

The framing of inclusive design reflected in this section (also referred to as the Canadian school of inclusive design) comes from the recognition of a fatal flaw in the current trajectory of our civilization, the responsibility and opportunity of designers, and the imperative to reframe design to counter this flaw. Initially the flaw has differential impact, sacrificing marginalized minorities to increase the advantage of privileged majorities, but it will lead to the unravelling of the whole. Each advance, each innovation, each idea of progress has widened the cracks and stresses in the complex adaptive system that is our human endeavor. This flaw is entrenched in what and who is valued and rewarded; our civilization's sense of truth, evidence, and proof; how decisions are made and who makes them; how our society educates and employs workers; how things are designed and who they are designed for; and what lives are deemed livable and recognized as human. With globalization and colonization, the flaw is played out in both the Global North and the Global South with the Global South experiencing more intense harms.

Jagged Edges of the Human Starburst

I have described and illustrated the flaw (and the inclusive design approach to counter the harm) using the concept of a human starburst (Treviranus, 2018a). Over 40 years I have collected data regarding what people need to participate fully in our human systems. The only way to visualize or plot this data is as a three-dimensional multivariate scatterplot. This resembles a "normal distribution" or a starburst. I have termed it the "human starburst" (Fig. 1). Approximately 80% of the needs are clustered together in the middle taking up 20% of the space, and the remaining 20% are distributed throughout the jagged periphery covering the remaining 80% of the space. The needs in the middle are close together or more similar, and the needs at the jagged edges are furthest apart, meaning more different (Fig. 2). This reveals a pattern in our society's approaches to design and in societal

Fig. 1 A multivariate data plot in two dimensions of the diversity of needs of a population of people. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

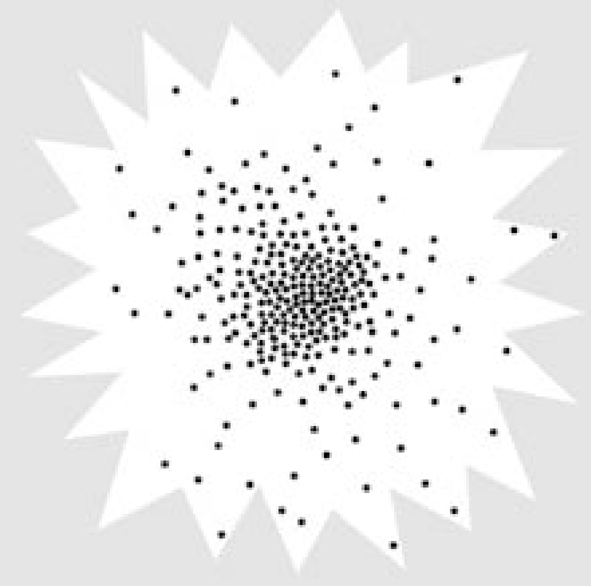

Fig. 2 The starburst plot shows a denser set of dots (representing the majority needs) in the center and more widely spaced dots the further you get from that center (the minority needs). Distance represents difference. The closer the dots, the more similar they are. The wider they are spaced from each other, the more they differ. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

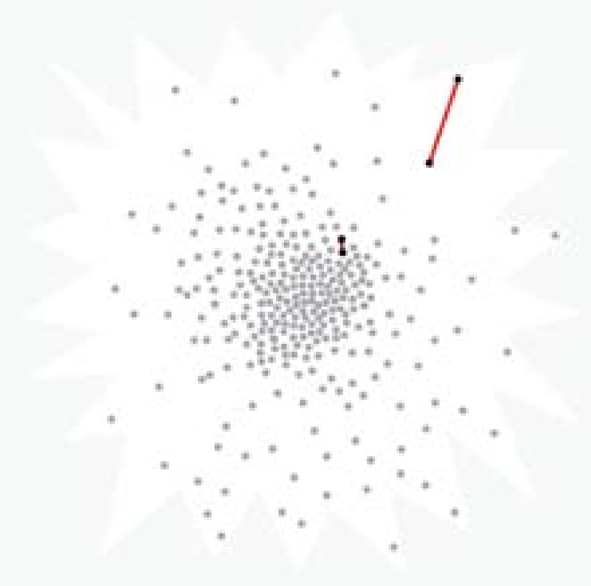

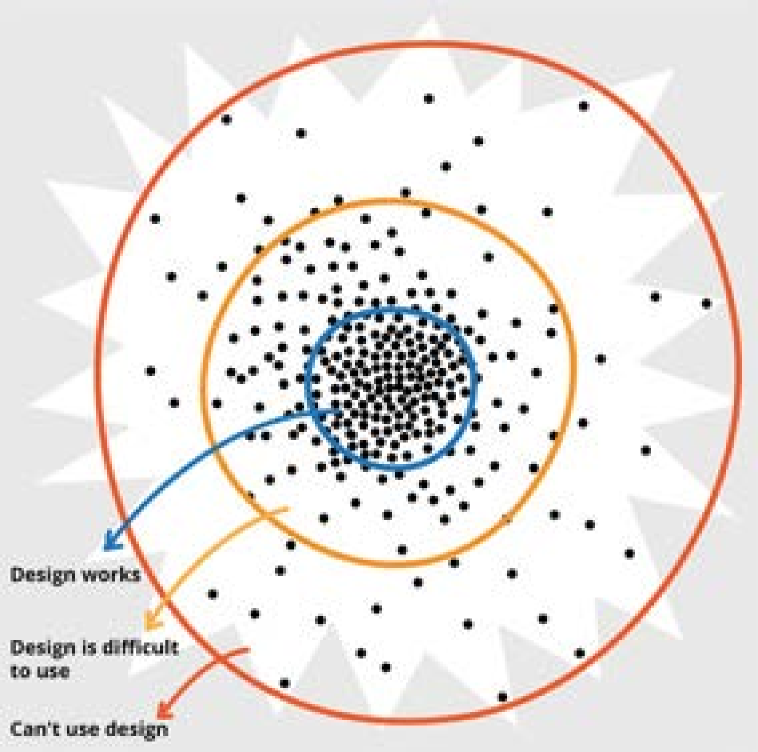

Fig. 3 Design works for needs in the middle become difficult to use as they stray from the middle and don't work for needs at the edge. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

production of knowledge or assertions of sanctioned truth. Designs of products, services, environments, or systems generally work for needs in the middle and are more difficult as your needs move from the middle, and designs do not work if you find your needs at the periphery of the starburst (Fig. 3). Similarly, the established truths, proven by statistics, hold for the middle, are inaccurate if you stray from the middle and are wrong for people whose needs are at the jagged edges (Fig. 4). The only common data characteristic of disability is sufficient difference from the average or norm that systems do not work for you. Disability is at the jagged edge of the human starburst.

Widening Disparity

These patterns set up and sustain vicious cycles of widening disparity that ripple through and affect all our societal systems and all aspects of people's lives (Fig. 5). Due in part to economies of scale, products needed by people with needs at the edge

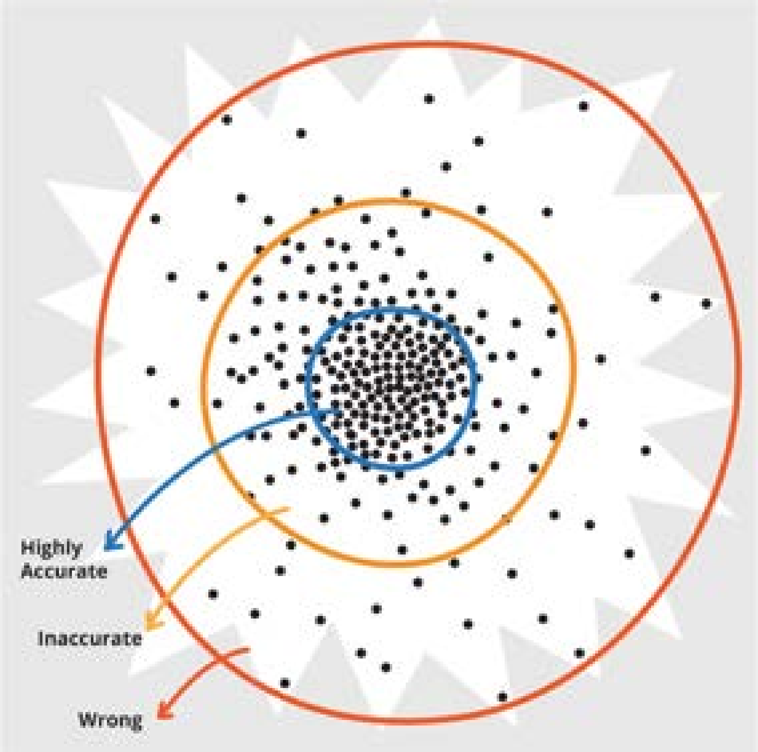

Fig. 4 The established truths, proven by statistics, hold for the middle, are inaccurate if you stray from the middle and are wrong for people whose needs are at the jagged edges. cost more, are less available, and are less reliable. If a person requires alternative access systems to access digital devices, for example, the needed access devices can cost up to ten times as much, they will not interoperate with many essential applications, and they will not be updated as frequently to keep up with the changes in the essential applications they need to control. This means that disabled people[1] cannot adequately participate in and thereby influence the digital economy. Academic impact metrics used to qualify for academic positions and funding favor publishing in high impact journals. These prefer research that shows statistical power. Outliers and diverse minorities will not garner statistical power. Conclusions

---

[1] How we describe people with disabilities or disabled people is contested, complex, and reflects a history of stigmatization and marginalization. As inclusive design recognizes the lived experience of disability as a source of valuable expertise, I have chosen “disabled person” or “disabled people” in this chapter. This is not to deny the values reflected in people-first language.

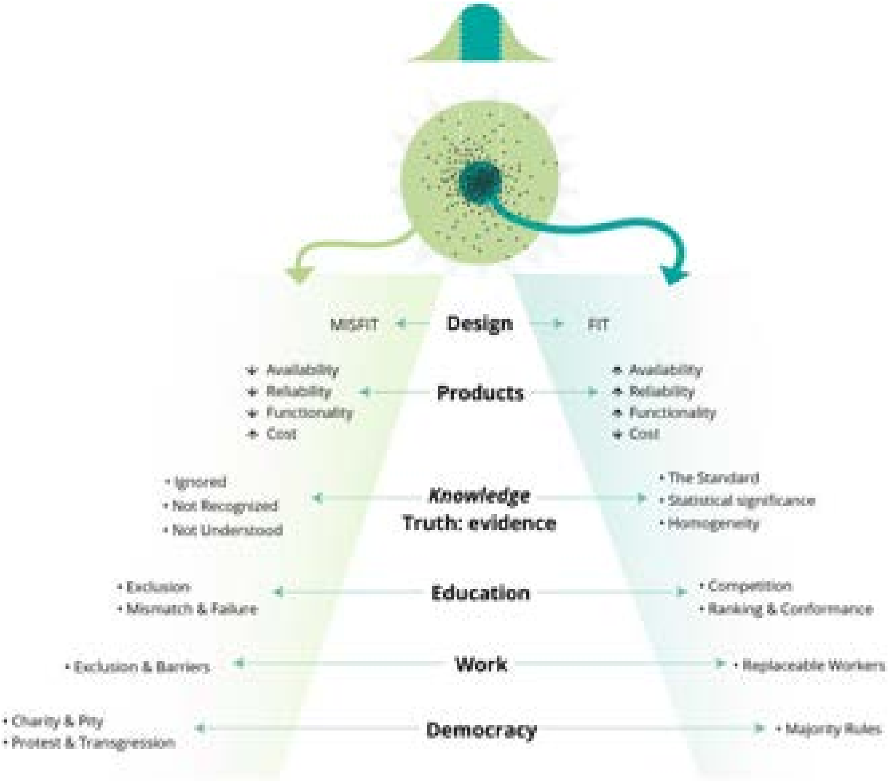

Fig. 5 The people whose needs are out at the edges face vicious cycles of disparity that affect all aspects of their lives, including education, employment, digital inclusion, representation in media, and even representation in democratic decision. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

or findings from research to understand the needs of disabled people are not generalizable and will not meet the impact metric needed to obtain funding Pfeiffer (1993). Scholars concerned with disabled people will be less likely to receive tenure or be promoted. These values are perpetuated at every stage of life and every sector of society. Education is designed to create standardized students ranked on the same scale. Employment is designed to recruit replaceable workers. Politics is designed to attract attention and appeal to the largest number of voters. The reduced democratic ideal functions using majority-rules decisions. Without asserting fundamental rights for all, this means that the trivial needs of the majority will overrule the critical needs of the minorities. Responsible and evidence-based governments make budget decisions based on formulaic measures that have an impact on the largest number of citizens.

Disabled people feel the extreme edges of these vicious cycles, increasing the vulnerability to poverty, isolation, health risks, and other harms Harris (2023).

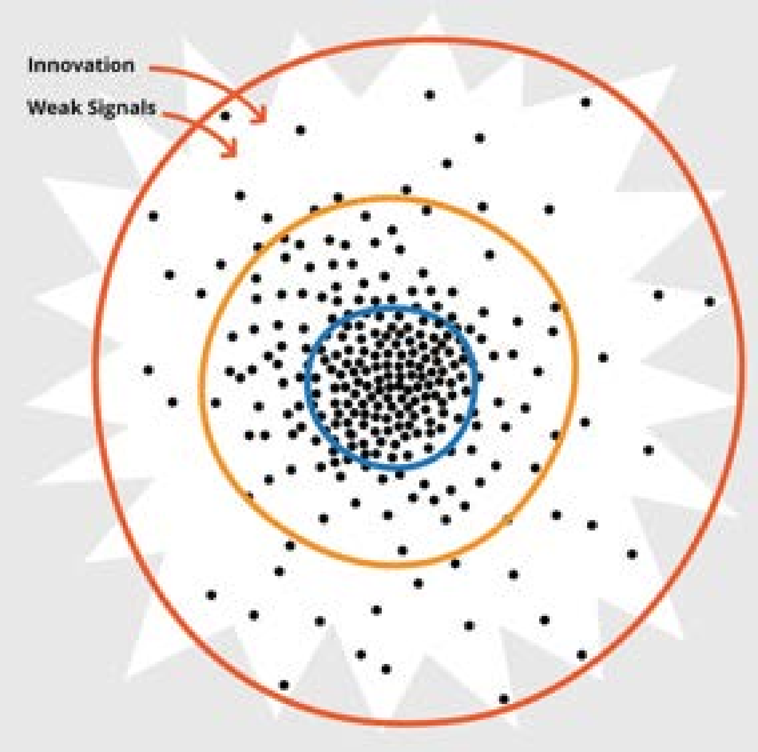

Fig. 6 People with needs at the edge are the greatest sources of innovation. They are also the most likely to detect the weak signals of risks to come. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

Scholarship into ways to address the harms is sparse and inaccurate beyond the research subjects. Services and social safety nets are inadequate and precarious. Available services frequently assume homogeneity in serving people who are extremely heterogenous. These “social safety nets” often invest more in policing to prevent suspected malingering than they do in offering needed services. However, it is out at the jagged edge that you find the greatest innovation and the earliest warning signs of emerging risks (Fig. 6) Rose (2015).

Old Ideas and Innovation

Progress, innovation, or technological advances have only intensified these patterns. It can be argued that our current notions of innovation, progress, and design are still in the thralls of the thinkers of the 1800s. Among these persistent influential ideas are Quetelet’s notion of the average human as the norm to aspire to (Quetelet, 1842; Grue & Heiberg, 2006); the social Darwinist’s misinterpretation of evolutionary theory, mistakenly identifying the “engine of evolutionary advance” as survival of the fittest and winner-takes-all zero-sum competition (Spencer, 1852); the appropriation of Pareto’s 80/20 principle to justify ignoring the difficult 20% that require 80% of the effort (Koch, 2011); or the bigoted and hierarchical categorizations of humans in Melvil Dewey’s classifications of human knowledge (Wiegand, 1996). These are bolstered by the economic and political thinking of the Gilded Age, industrialization, capitalism, and the industrial model of schooling – re-costumed in later neoliberalism.

The proliferation of artificial intelligence relying on statistical reasoning to guide and make decisions amplifies, accelerates, and automates these discriminatory patterns (Gupta & Treviranus, 2022; Treviranus, 2022). AI automation removes the option to make exceptions. Mechanizing decisions such as hiring, academic admission, loans, medical triage, urban planning, security, probation, and determination of parental fitness, among other critical decisions, exonerates the implementers of the harm these decisions do to outliers and marginalized minorities. One positive side effect of AI is that AI makes manifest the potential harms, such that these harms gain the attention of hard scientists and cannot be dismissed as unempirical soft science.

The Dilemma of Hill Climbing

To counter this dominant entrenched pattern requires a complex adaptive system understanding. Complexity theory offers the hill climbing model to demonstrate the dilemma we face as a civilization. Think of our collective human journey through history as navigating a complex, unpredictable, changing terrain of mountains and valleys that is shrouded by fog (Fig. 7). One of the dangers we face is flooding, and the water level is rising. To survive as a species, we need to find a generous high place that has room for all of us. Unfortunately, we are stuck on a small, steep spiky mountain. In our attempt to get to the top of this small mountain, we are eroding the slope, making it harder for many people to climb out of danger and destroying everything we need to survive in the long term. Because the hill is steep, and space is scarce, we think we need to compete. We believe that if one of us makes it up, others must come down, and when others win, we lose. The popular and respected message is that safety and success are to go higher up. We are told that to succeed we need to do what we have been doing more effectively, efficiently, accurately, and consistently.

The tragedy is that within the same terrain there is a large generous mountain that could fit all of us and that won’t be submerged. However, to get to it we need to reverse direction and go against much of what we have been taught, all the formula we think will lead to our success. Rather than going up our local steep mountain, we need to go down to find the more generous higher plateau where we can collectively survive and thrive. We have been taught that going down is failing, dangerous, and shameful. To reach our destination we also need to collaborate rather than compete

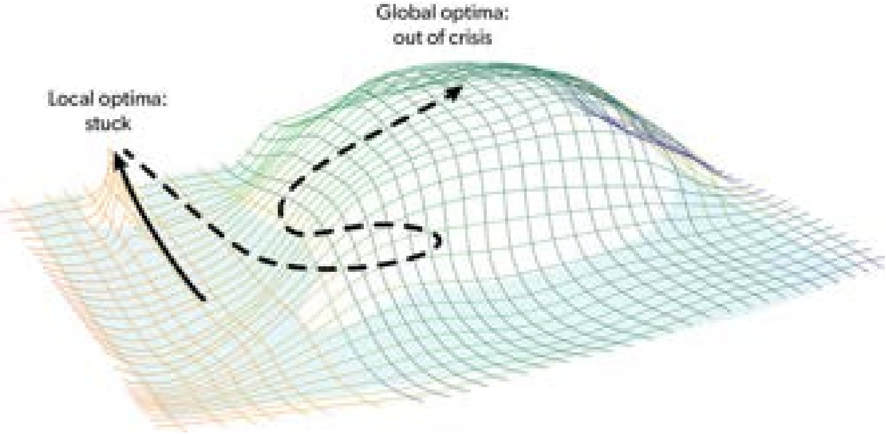

Fig. 7 As a civilization we are hill climbing a local optimum. Rather than doing the same thing more efficiently, consistently and accurately to climb a local optimum, survival requires reversing course to find the global optimum. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

and seek our collective success because to make it we need as many diverse views as possible. We need to listen to the people that are currently at the bottom. They are closest to the place we need to go, collectively they have the best sense of the most promising terrain, and they also have the best view of where the rising water is. This is hard for most people to do because the people at the bottom have been denigrated and labelled as failures. Our systems of communication, navigation, education, transportation, reward, and valuation have been designed to exclude them. Our respected systems of knowledge and evidence don't support them. We have broken their trust. We have sacrificed them in the rush to progress up our steep hill. In the process we have chosen to create systems that won't work for us when we are vulnerable, and we will all be vulnerable.

Lessons of the Pandemic

The pandemic has highlighted the fault lines in our systems. For some it became clear that "none of us are safe until all of us are safe," that attending to the vulnerable was needed to secure the common good (United Nations, 2020). For short periods there was a public understanding and demonstration of the phenomena that if we design to include people who are most vulnerable, we are compelled to create systems that work for us when we are inevitably all vulnerable. However, there was powerful resistance to these insights and a resurgence of social Darwinism (Nachtwey & Walther, 2023). Public administrations produced messaging that assumed homogeneity and argued that simple, consistent messaging was needed when the conditions and vulnerability were anything but homogenously distributed. Rather than change course, we have collectively reverted to old patterns.

Harmful Patterns in Accessibility Field

Even the accessibility field has adopted the same harmful patterns. Notions of enforcing "full accessibility" by complying to a finite checklist of design criteria deny the extreme diversity of disabled people, and the neglected needs of people are not represented in the accessibility checklist A11y Project (2013). Presenting deadlines for reaching "full accessibility" denies the complex adaptive system in constant flux that presents new barriers with every update. Web accessibility has grown a checking and repair industry dependent on the existence of the barriers, demotivating bold measures to eradicate the problem.

Laws have been crafted to support a segregated assistive technology industry, making it almost impossible to achieve interoperability in the digital realm. Given the small customer base of each product, assistive technology companies often cannot support good user experience design, training, or setup (Treviranus, 2018e). The promotion of assistive technology as a solution to accessibility ignores the fact that there is no assistive technology market in most of the world. In most countries AT is not sold, there is no training available, or AT costs more than 50% of an annual salary (World Health Organization, 2022). Digital AT such as screen readers, refreshable Braille displays, captioning, speech recognition, alternative keyboards, or word prediction are not available for most languages other than English. The promotion of a segregated market by the Global North takes the responsibility and onus away from mainstream manufacturers to address edge requirements and denies all consumers the accessible choices when they face barriers. It denies the global market of the assistive technology features needed by disabled people to access digital systems.

The Three Dimensions of Inclusive Design

To address the flawed patterns, the field of inclusive design has resisted and contested favored and entrenched forms of scientific method and democratic majority rules governance that is not accompanied by strong human rights commitments, capitalist economic theories, notions of academic rigor, forms of formal education, production, success, solutions, and progress. The field has found itself at odds with the framing of "full" accessibility and rigidly bounded human categorization in equity efforts. This inclusive design practice is also concerned by the rift between academic scholarship intended to benefit disabled people and their communities and the people and communities themselves, caused by the complex, academic expression of ideas and concepts.

Inclusive design is an evolving, adaptive field that resists dogma or doctrine. There is no set of criteria, no cardinal listicle of principles for success. Measures of success are seen as relative to the individual, the goal, the system, and the context. However, the practice is anchored by a set of values expressed as the three dimensions of inclusive design (IDRC, n.d.).

The first dimension is recognizing that we are all different and that this diversity is the true fuel of evolutionary advance. It is our greatest asset. Given the uniqueness of individuals, especially the diversity of disabled people, each person must be supported as experts in our own difference Treviranus (2021). Generalizable claims do not hold at the edges. This vast range of differences needs to be addressed in an integrated and not segregated way.

The second dimension is that the process of design must be inclusive. People who are the intended beneficiaries, and specifically individuals with the greatest challenges, need to frame the problem and codesign the process of designing, as well as the approach to addressing the challenge. Inclusive designers need to continuously ask who is missing and who have we left behind with this innovation.

The third dimension is recognizing that we live in a complex adaptive system. We need to design systems that provide benefit for all. No inclusive approach will survive if it doesn’t ultimately benefit the system as a whole. Any approach will erode if we don’t attend to the dependencies and nested layers of the system. Nothing is done in isolation. Everything is entangled and variable. Problems are not monocausal; the path out of problems is not linear or formulaic. There is no fix, solution, or success; it is a continuous process. But it is the people at the margins that are most familiar with the risks and opportunities.

We, the Canadian school of inclusive design, apply these dimensions in what we call the Virtuous Tornado (Fig. 8) Treviranus (2019b). Unlike the design thinking squiggle (Newman, n.d.) which iterates to a winning solution (or the UK School design waterfall) (Clarkson et al., 2007), we cocreate an adaptable system that stretches to encompass more and more of the missed needs, by asking at each design iteration “who are we missing?” Each iteration builds upon small successes, providing opportunity to try out and constructively critique (Inclusive Design Research Centre, n.d.-a, n.d.-b). We appreciate the imperfect, impermanent, and incomplete and know that mistakes and failures yield the greatest learning Treviranus (2010). We also contest the traditional notion of scaling or the formulaic replication of a “winning” design. We recognize that any inclusive design system must be scaled through diversification. Traditional scaling of technology developed in the Global North to the Global South replicates the colonial hubris of the past. The designs and implementation must be community led and bottom-up.

Practicing Inclusive Design

The following section describes the practice of inclusive design applying the three dimensions in greater detail. These practices are adapted, localized, and contextualized according to the people that will be impacted by the decisions and the contextual environment and goals.

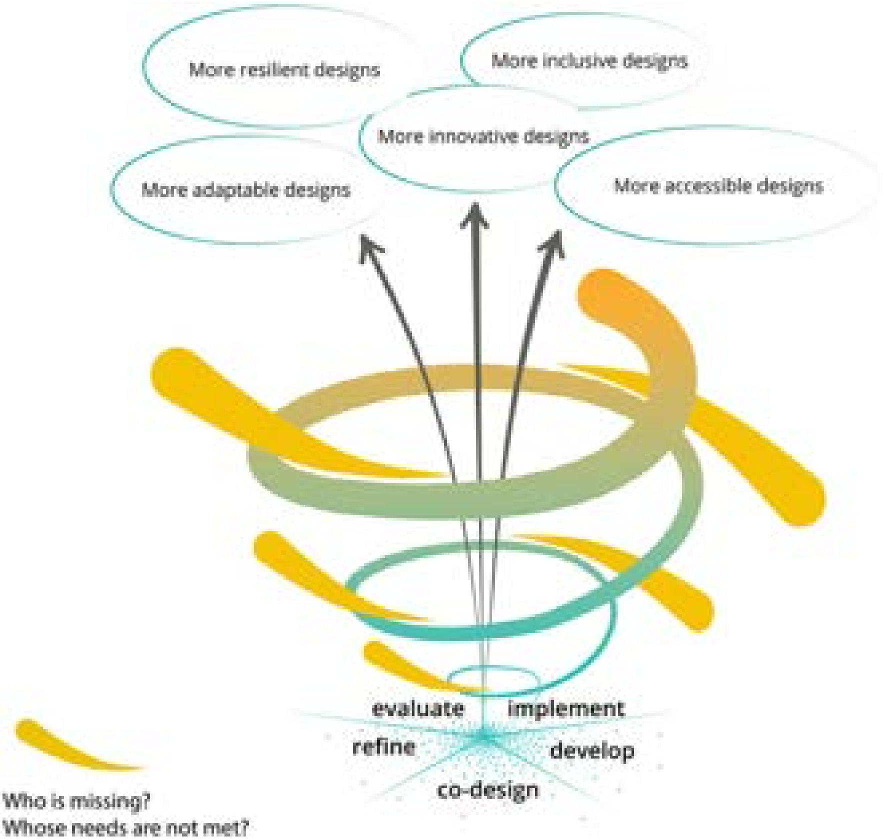

Fig. 8 The Virtuous Tornado is an iterative planning process. Once the initial needs are identified by individuals and communities the cycles begin, iterating further and further to the edge, injecting further needs and characteristics at each cycle, constantly recalibrating and evaluating progress, and asking "who are we missing" to recruit the necessary knowledge and lived experience still to be included. (Attribution-NonCommercial 4.0 International License with attribution to the Inclusive Design Research Centre, OCAD University)

Dimension One: Human Difference and Variability

Value Human Difference or Variability

The first dimension is to recognize that we are all different, variable, and unique (Treviranus, 2018b). This diversity is valuable. Traditional design, planning, and decision-making processes attempt to reduce that difference and variability to simplify the process. The range and spectrum of difference are conventionally reduced to an average, the most profitable, the most popular, or the most powerful. All these forms of reduction lead to ignoring and devaluing the spectrum of diversity and the needs and strengths at the edges experienced by the people who will feel the greatest impact and offer the greatest insights.

Discover the Full Spectrum of Needs and Traits

Inclusive design research and planning do not attempt to find the statistical average, the highest incidence disability, the easy wins, the highest return on investment, or the winning vote. Inclusive design seeks to understand the full spectrum of differences and range of variability, making sure not to miss the needs and strengths at the edges of the human starburst that have not been served by existing designs. The needs at the edges will include and encompass the average needs at the center of the starburst.

People Are Multifaceted

In recognizing the full range of difference and variability, inclusive design does not sort needs and characteristics into predetermined categories, classifications, taxonomies, diagnoses, or identity groups and prescribe approaches or base assumptions on these categories. Lived experience is individual and cannot be boxed; no two lived experiences will ever be the same. Lived experience includes many intersecting factors including identity, culture, gender, age, ability, and contexts. Take, for example, the experiences of a person who is blind. One person who is blind will have different experiences than another person who is blind, not only because they have their own unique life contexts (where we grew up, cultural background, etc.) but also because blindness is experienced differently. For instance, someone with acquired blindness who has experienced the world with sight will have a different lived experience in the world than someone born blind. Even from a functional perspective, does the person read Braille or prefer speech? What are their language preferences? And importantly, lived experience can only be expressed by the person who is living the experience.

This sorting and labelling of humans often means that people fall through the cracks or are stranded at the edges. People that don't fit the available categories are disadvantaged or forced to deny their differences and conform. Organizational structures used in inclusive design are supportive structures, akin to trellises, which prompt further generative exploration. Inclusive design research seeks to explore the edges and the deeper connections rather than reduce to the average or dominant characteristics.

Recognize the Ownership of Knowledge and Expertise

Professional expertise usually focusses on the average traits, probabilities, and dominant patterns. By its very nature professional expertise cannot encompass the jagged edges of the human starburst. Only the person themselves and the trusted people that are closest to them hold the unique expertise regarding requirements at the edge. Inclusive design recognizes that they are also the rightful owners of this expertise. All data about a person should be governed by the person, and the value derived from the data should vest with the person that is the subject of the data.

Integrate to Benefit All

When discovering the range of differences and variability, the goal is to arrive at integrated, adaptable systems to address the full spectrum of needs. If the edge requirements are treated as separate or special, requiring segregated approaches, those approaches will lack interoperability, and they will lack the investment needed to keep them current. Segregation also means that the majority will not benefit from the innovation and risk detection Kemper et al. (2010).

Dimension Two: Inclusive Codesign Process

Codesign with and by the Edges

For all design efforts, the greatest innovation and the best means of risk prevention is achieved when persons that have the greatest difficulty with the current state or who are currently excluded guide the design. Rather than designing for individuals who face barriers to access, which entails a presumption of knowing what people need or what will work best for them, inclusive designers support the people that will be most impacted by the design in codesigning the approaches to address barriers (Treviranus, 2018c). This may entail equipping a community that has experienced marginalization to lead a codesign process (e.g., community-led codesign), or bringing together groups of people who have experienced barriers with other helpful expertise to address a design challenge. The value of the insights and expertise contributed must be remunerated or compensated at the same level as other expertise.

Codesign the Design Process

Inclusive codesign is not achieved by inviting people to a process that is not designed with them in mind. This puts the invited participants at a disadvantage. Codesigners should be invited to help determine what process will be used, not only the outcome.

Make Sure the Design Tools Do Not Exclude

Many commonly used design tools are inaccessible. Many design tools are visually biased with no alternative ways of expressing or receiving the information. Often tools use insider language and terms that are not understood by people unfamiliar with the process. Many design conventions create typical persona or profiles that exclude the atypical. They competitively attempt to find “the best” approaches, compromising the needs not addressed by the best approach. Ensure that the tools used are not biased against people at the edges.

Find Deeper Commonality that Includes the Edges

In a group design process, it is human nature to attempt to find commonalities, affinities, or points of connection. People with needs at the edges of the starburst will have fewer shared needs or traits within a group and will often be left out. Inclusive design practice encourages finding deeper commonalities across the range of differences that include the individuals with needs at the jagged edges of the starburst. Rather than superficial affinities or obvious shared traits, inclusive codesign encourages participants to find fundamental human goals or needs that are shared across established divides.

Seek Diverse Perspectives

It is a well-documented phenomena that including diverse perspectives leads to better planning prediction and innovation (Page, 2007). This includes perspectives that may be viewed as dissonant or foreign to the culture of the organization and people with backgrounds and perspectives that have not been previously included. Inclusive design does not seek "culture fit" but "culture add." Constructive critique, an alternative, novel, or new perspective, is valued. This requires creating a respectful and caring space for potentially difficult discussions.

The one-size-fits-one system design sought in inclusive design is not the form of content personalization that shields users from diverse perspectives or recommender systems that only show us content from people like us. These forms of personalization lead to greater polarization and tribalism and demonization of people at the marginalized edges (Treviranus & Hockema, 2009). Inclusive design seeks to create an environment that makes room for a diversity of respectful views.

Who Frames the Challenge, Problems, and Goals?

The focus of inclusive design is not technology looking for an application or a hypothesis looking for verification. The parameters of inclusive design research and the research plan are not predetermined. The challenge, the associated problems to be addressed, and the goals of the design process are collectively arrived at by the codesigners. The aim is to design a system that encompasses as far out to the edges and as many edge requirements as possible. The best authority regarding these requirements are the people that have lived at the margins. Their perspective is needed to frame the challenge.

No Winners and Losers

In most forms of design, when a choice is to be made, competitive selection is used to find the consensus selection or the majority opinion. This common process entails inevitable compromises to find the "best" solution or the winning option arrived at by consensus. Most often people who are highly unique or have minority or outlying needs are the individuals asked to make the biggest compromises or left without viable options. Competitive selection inevitably means there are winners and losers. Whether through voting with majority rules criteria or less formal prioritization, it is usually the individuals with highly diverse needs at the edges that lose out. Rather than finding a winning solution, or a best practice, inclusive design is guided by diversity and flexibility and aims to create a system or infrastructure that can encompass the edge requirements identified in codesign. What is the range of adaptation needed? What are the choices that should be included?

No Solution or Fix

The deeper challenges addressed through inclusive design cannot be fixed or solved and then dismissed. There are inevitably requirements that have not been considered, unpredicted changes in the context, or ripple effects of design choices that create new considerations. Declaring that a problem has been fixed does harm to individuals that are still excluded. It reduces the vigilance needed to prevent emergent threats to inclusion and further harm. It also reduces awareness of emerging opportunities to find better approaches. Inclusive design is a continuous practice and process.

Understand the Value of Mistakes and Failures

Inclusive design involves acknowledging mistakes and failures. More importantly it involves understanding the learning value of mistakes and failures. Inclusive design also recognizes that today's solutions can become tomorrow's problems. It is easy to get carried away with considering the opportunities without also thinking about the risks.

Ask Who Is Missing and Iterate Toward the Edge

Inclusive codesign is an iterative process. Each iteration produces a design that can be evaluated by individuals with lived experience of the barriers. At the end of each iteration, the codesigners ask: "what perspectives are still missing" and "whose experience might be compromised by the design choices we have made?" These perspectives are sought to codesign the next iteration (Fig. 8).

Dimension Three: Designing in a Complex Adaptive System in Flux

Be Aware of the System

No design decision is made in isolation, and the impacts of all design decisions are felt well beyond the intended users (Treviranus, 2018d). Our world is a complex adaptive system in constant flux. Interactions are becoming more entangled and complexly connected. Actions are rife with feedback loops, viral phenomena, and multifaceted "externalities." Challenges are not just complicated; they are complex. They are not amenable to engineering or linear logic models. Most problems are not mono-causal or simple.

People with needs at the edges feel the greatest effects of both vicious and virtuous cycles. Like a spinning platform, the edges travel the furthest. Counter to fears, including and respecting edge perspectives do not lead to extremism or greater polarization. Respectfully making room for more than two sides to an issue leads to greater equilibrium.

Inclusive designers seek an understanding of the system that is the context of any design decision. Inclusive design research comes from as many perspectives as possible: bottom-up, top-down, inside-out, and outside-in. How are things connected and related? What are the assumptions being made? What are the value systems at play? Are there other ways of knowing that are being missed? Most importantly inclusive design considers the conventionally missed or devalued perspectives.

Beware of Cobra Effects

Cobra effects are the unintended consequences of oversimplistic "solutions" to complex problems. First coined by the German economist Horst Siebert, the term refers to an anecdotal tale of bounties for dead cobras to eradicate cobras in

New Delhi (Siebert, 2001). As the story goes, many cobras were turned in, and the program was considered a success. When the bounty was ended, cobra breeders, a new occupation incentivized by the bounty, no longer had a market for their cobras and released them leading to an increase in the cobra population. Not only did the program fail to incentivize the desired outcome; it also used measures of success that were misleading and failed to assess the program in a useful way.

There are many examples of cobra effects in the e-accessibility domain. Rigid and static accessibility policies that do not keep pace with contextual changes may result in more attention being paid to being granted exceptions to accessibility requirements than to how to achieve accessibility Treviranus (2019a). Accessibility certification of organizations that does not encompass edge requirements often makes it harder for people with edge requirements to request the actions needed to attain access. Accessible designs of tests of human skill or knowledge that do not consider the cognitive load of the access method can cause more harm than empowerment. Inspirational stories of overcoming barriers or miraculous new inventions that do not consider poverty or availability can make it harder for excluded individuals to advocate for access.

Go Deeper and Broader

Often the symptoms of a problem or barrier are very superficial or specific. Like a home renovation project, the symptoms are usually indicators of much deeper problems. Fixing only the superficial symptoms will hide the deeper issues and result in greater harms in the future.

Inclusive designers engage in processes to uncover the deeper origins of problems. One method is to ask successive “whys.” This is referred to as the “toddler-grandparent conversation,” after the insatiable curiosity of toddlers who are not satisfied with a simple answer (IDRC, 2015). The aim is to discover the depth of the issue and to assess whether the codesign team is empowered and resourced to make the required changes. Even if the underlying problems are not within the control of the team, awareness of the deeper causes will inform the design and help set an agenda for advocacy.

Discover the Friction Points

Even the most brilliant accessible designs will encounter friction points. Our complex systems tend to have nested domains of influence. Each layer of influence needs to be addressed, or the accessible approach will be eroded and eventually fail or be abandoned. The persons at the boundary between the changed layer and the unchanged layer will feel the greatest friction. For example, a new accessible curriculum approach for a given student requires the support of the teacher, who needs the support of the principal, who needs the support of the school board, who needs the support of educational authorities within the government. The parents and the community also play a role. The larger and more beneficial the change, the greater the threats to survival if the various levels of potential friction are not addressed.

Recognize Potential and What Is Possible

Favored research methods, such as statistical reasoning, including artificial intelligence systems, use empirical data as evidence and facts Trewin et al. (2019). Data is inevitably about the past. Evidence-based decisions are guided by past successes and designed to optimize the conditions that led to past successes. People who have edge requirements are far removed from the optimal patterns. Optimizing patterns of the past also amplifies past discrimination.

Inclusive design seeks to cocreate new knowledge, explore the data gaps, the past mistakes and what they reveal, the unmet needs, the devalued strengths, the counterintuitive, and the unexplored spaces between well-established knowledge domains. Inclusive design inverts power hierarchies to find the missed perspectives. One example is the inverted word cloud (Li, 2021) which centers and increases the size of unique, novel, minority words or phrases rather than the most popular words and phrases.

Inclusive design research is through trial and error of potential designs. Needs and conditions at the edges of the human starburst are not well understood by established research systems. Statistical reasoning leads away from outliers. Academic publishing in fields concerning humans frequently demands statistical power. This cannot be achieved when gathering data about edge requirements. Rather than optimizing past successes, inclusive design focuses on potential and possible approaches and creates iterative prototypes to enable testing in the “wild” and continuous improvement.

Scale by Diversification

One of the final stages of traditional design and development, and a conventional signal of success, is to scale the winning solution. This usually entails formulaic replication of the competitively chosen design. This form of scaling does not respect the diversity of contexts or circumstances. Often it is a form of modern-day colonialism.

Inclusive design iteratively codesigns a system that can be scaled by diversification and adaptation, not formulaic replication. If it is a software architecture, for example, it is designed to adapt, interoperate with different interfaces, translate to different languages, and work with as-yet-unthought-of personal needs and preferences. This usually entails open and transparent development that supports customization, user-continued design, and contributions from an open community Watkins et al. (2020).

Recognize the Importance of the Experience of Vulnerability and Fragility

During times of crisis, there are frequently arguments to sacrifice the vulnerable or weak for the progress of the species. This is purported to be the natural course of evolution. However, the fuel of evolutionary advance is diversification. It is during times of relaxed selection and diversification that the human species has progressed (Deacon, 1997).

Some technology leaders propose that technology can design away human flaws, including disabilities through innovations such as genetic engineering. At the most extreme, this leads to eugenics. This form of reasoning results in monocultures. Monocultures leave the species with few evolutionary choices when an unexpected crisis arises. Inclusive designers recognize that when we design our systems to work for people who are vulnerable and fragile, we prepare our systems to work for all of us when we inevitably find ourselves vulnerable and fragile.

Situating Inclusive Design

The approaches to design and disability are many. Even the term inclusive design has been used by two fundamentally different but related approaches or schools. Both are responses to universal design Mace (1997). The UK school adopted the name inclusive design as a realistic approach to universal design to encourage and support the broader adoption of accessibility features by businesses (Keates & Clarkson, 2002).

Clarkson et al. in the UK identified high incidence disability barriers, the design features that would address these barriers, and the impact on the overall customer base (Clarkson et al., 2003). From the perspective of the starburst, they argued for an expansion of the middle to encompass needs that were closer to the middle while maintaining the same business values of increasing return on investment (Clarkson & Coleman, 2010). They supported the business case for greater inclusion and "met designers and businesses where they were at." The UK school grew out of architecture and industrial design which have the constraint of choosing a single design to meet the needs of the largest group but has since encompassed digital inclusion.

The Canadian school of inclusive design was established simultaneously but emerged from digital design (IDRC, 2021). In a sense the Canadian school saw universal design as a situational compromise to the goal of a vision of inclusive design that valued human diversity. The Canadian school saw the possibility of foregoing the compromise required in choosing a single universal design required in static systems such as buildings and mass-manufactured products. The school recognized that digital systems offered the possibility of moving from a one-size-fits-all product to an integrated system that offered one-size-fits-one choices in response to human diversity and uncertainty. Rather than relying on statistical reasoning and privileging homogenous numbers, the Canadian school stressed the need to, and value in, prioritizing and iterating with or by people at the jagged edges. The Canadian school demonstrated that people with needs at the edge were the source of the greatest innovation and most aware of the weak signals of emerging threats. The Canadian school employed complex adaptive systems theory and applied inclusive design to a full range of systems, including social systems, organizational structures, services, governance systems, cities, markets, and technical systems. The school adopted Ursula Franklin's definition of technology as "technology involves organization, procedures, symbols, new words, equations, and, most of all, a mindset" (Franklin, 1999).

These two schools are complementary and have found their way into related emerging fields such as the European Design for All framework (Eikhaug, 2004).

The field of inclusive design continues to evolve in response to a changing and unpredictable context. There is a commitment to humility. The framework reflected in this section is intended to support generative growth, rather than constrain practice.

Part Overview: Diversity of Perspectives and Implementations

The chapters in this section reflect the diversity valued in inclusive design. Inclusive design requires a significant culture change. The practice contests conventions within the domains of research, development, markets, education, employment, and design itself. It is practiced within systems that are frequently a mismatch with the values of inclusive design. The process of culture change is therefore iterative, taking into account the degree of change the system will tolerate without provoking a backlash. The current practices of inclusive design cover a broad evolutionary spectrum. Some practitioners have the freedom to implement processes that reflect the least constrained values of inclusive design, while other practitioners must "choose their battles" to stretch the domain within which they operate. One of the most constraining domains is academia. The notions of what constitutes evidence, proof, knowledge, and truth and what has scholarly value within the current academic domain are biased against individuals who are minorities and outliers and systems that are complex and unstable. The sanctioned means of showing value and avoiding dismissal within the academic ecosystem often require customization of the practices of inclusive design, especially for emerging researchers.

Culture change and the evolution of a field can be constrained by proprietary practices and dogmatic insistence on adherence to standard criteria. The practice of inclusive design recognizes the value of the imperfect, incomplete, and impermanent. Perfection, completion, and stasis discourage adaptation, growth, and the participation of diverse perspectives. The Canadian school has no certification of quality or professional license, recognizing that standardizing the practice discourages continuous improvement, contextual adaptation, and learning from mistakes. (A counterargument is to prevent the use of the term "inclusive design" for superficial, diluted, and performative practices as the practice gains popularity. However, the risks of rigid standardization are greater than the risks of dilution.) The values of inclusive design are a compass to travel forward, and the practices are generative models that scaffold growth. Inclusive design is not owned or governed by any one group. This means that new practitioners can make it their own and adapt it and translate it to their unique context Adobe Inclusive Design (n.d.), Microsoft Inclusive Design (n.d.). The chapters in this section show a diversity of interpretations and attempts to adapt the practice to the context.

The coeditors of this section, Dr. Silvia Baldiris and Dr. Vera Roberts, have each contributed a coauthored chapter, from the Global South and the Global North. The section reflects only a small set of domains of current and potential application of inclusive design and the necessary adaptations shaped by contexts, individuals impacted, and challenges addressed.

Vera Roberts and David Pereyra of the Inclusive Design Research Centre in Toronto, Canada, in ▶ Chap. 45, "Inclusive Co-research with Experts with Disabilities," describe a form of codesign as co-research in which the individuals most impacted by the design are supported in taking an equal or leading role in the research and design decisions. The authors describe the application of an approach they have called appreciating, scaffolding, and keeping (ASK). Appreciating recognizes co-researchers as experts in their lived experience. Scaffolding supports co-researchers with the means to participate fully in the research process. Keeping accords ownership and builds capacity within the co-researchers and their communities in the research process and outcomes.

Silvia Baldiris et al., in ▶ Chap. 46, "CO-CREEMOS: A Strategy to Attend Diversity in Colombia," describe the important role of open access in supporting greater inclusion in education. Open Education Resources are instrumental in providing equitable economic access to educational resources, enabling the collective contribution and sharing of accessible variants of curriculum, and providing timely access to teacher resources needed to support students experiencing barriers to education.

Also on the theme of inclusive education and the role of open access, Raymundo Filho et al. describe the efforts to support accessible Open Education Resources (OER) as well as an accessible interface in the ProEDU OER repository in Brazil. They propose a model, titled accessible instructional design model (AIDM), to support OER life cycles or ecosystems that are accessible to students with disabilities.

Continuing this theme of inclusive education in the Global South, Elena Durán and coauthors in ▶ Chap. 48, "ICT to Support Inclusive Education in the Republic of Argentina," describe the current circumstances, the challenges, and the opportunities in Argentina as they relate to the many entangled intersectional considerations for students who face barriers and exclusion. They discuss the opportunities and risks associated with ICT in education. They delineate the complex and evolving circumstances within Argentina that have an impact on equity goals and the progress that has been made thus far.

Zoya Shepherd, in ▶ Chap. 49, "Inclusive and Equitable Education in Postcolonial Caribbean," explores inclusive education further, exploring the potential inherent in engaging teachers and students in cocreating more inclusive and robust local communities and the opportunity to transform education and ultimately the Caribbean society. She describes the challenges in an education system that perpetuates systemic segregation and the importance of student and teacher agency, flexibility, and creative thinking.

Virginia Rodés and Rigina Motz, in ▶ Chap. 50, "Interdisciplinary Center on Open and Accessible Educational Resources: 10 Years Building Inclusive Education in Uruguay and Latin America," complement these chapters with a longitudinal look at the work of the center in promoting educational inclusion, also stressing the supportive and necessary role of open education practices. They discuss the impact of the pandemic on educational gaps. Like other authors, they stress both the risks and opportunities of digital technologies, including the perpetuation of harm by digital colonization.

Karel Van Isacker, Petya Grudeva, and Maria Goranova, in ▶ Chap. 51, “Improving Inclusive Pedagogical Competences of Educators While Facing Pandemic Restrictions,” focus further on the impact of the pandemic on inclusive education but in the European context. They discuss the technical tools that received a boost during the pandemic and the benefits to certain students but risks to others. The authors also explore the opening of opportunities to further teacher understanding of inclusive pedagogy and a more inclusive educational mindset prompted by the disruption.

Jaime Hilditch in ▶ Chap. 52, “Pre-braille Implementation into Early Education: Tactile Activities to Introduce Braille Concepts to Kindergartners,” discusses the benefits to all students of introducing pre-Braille activities in early education. The author discusses the importance of play-based tactile exploration for developing tactile skills in all students and in developing Braille literacy for students who will use Braille. She describes the codesign and evaluation of a tactile pouch as an adaptable tool to prompt tactile exploration and understanding.

Brandon Biggs et al. in ▶ Chap. 53, “Remote Co-design in the Digital Age,” address the challenges and opportunities of remote codesign, made necessary by the pandemic. A set of resources, methods, and experiences are described in the context of four case studies of remote codesign sessions. The observations and insights gained can support engaging disabled people as stakeholders from any location around the globe in an inclusive design process.

Addressing employment barriers encountered by individuals on the autism spectrum, Mirjana Jevremovic, in ▶ Chap. 54, “Cocreating Inclusive Interviews: VR Technologies for Job Interview Training of Individuals on the Autism Spectrum and Strategies for Employers,” describes the codesign of virtual reality technologies and video self-modeling techniques to scaffold interactions between neurodiverse applicants, their support team, and employers.

James Aniyamuzaala in ▶ Chap. 55, “Inclusion of Persons with Disabilities by Design: From Product Centered to Justice and Person Centered Inclusive Co-design,” critically examines three schools of inclusive design and proposes a contextual expansion of the consideration of justice in inclusive design. He proposes justice- and person-centered inclusive codesign as a fourth school emphasizing social, political, economic, cultural, and technological justice.

Finally, in ▶ Chap. 56, “Compassion as a Tool to Enhance Communication Between Nurses and Children in the Oncology Pediatric Ward,” Tania Villalobos and her coauthors recount the exploration of inclusive design to address social and emotional connections and communication within a health setting. They recount the codesign of a communication tool in a pediatric oncology ward of a hospital in Mexico City. They stress the importance of cocreation with individuals impacted by the design.

Conclusion

The field of inclusive design evolves, adapts, and grows to address the complex emerging challenges, always asking “who is missing, who is facing barriers, how can we stretch to include, to the benefit of the whole.” The practice is anchored in values that invert power structures and determinations of worth. The tenets of inclusive design demand a different mindset and contest entrenched conventions. Resisting dogma, stasis, and boundaries, the practice adapts to the persons impacted by the design decisions, the context, and the goals. Inclusive design is founded on the tenet that it is when we are guided by the people at the edges of the human starburst that we can detect the earliest warning signs of challenges to come and we find the most authentic innovation needed to survive and collectively thrive.

Inclusive Co-research with Experts with Disabilities

45

Vera Roberts and David Pereyra

Contents

Abstract

Existing co-research methods often limit participation and perpetuate exclusion of highly diverse populations. This chapter introduces an approach to co-design research that is inclusive and supports full participation of individuals with unique or diverse needs. Co-research is presented as having moved from the "design for" perspective to the "design with" perspective, and more recently to the "design by" perspective. Design by means that the population most impacted by the design is supported in creating the design. Inclusive co-design is a mindset that is applied in three ways: appreciating, scaffolding, and keeping (the ASK approach). Appreciating involves recognition of co-researchers as experts in their lived experience. Through scaffolding, co-researchers are supported and given the means to participate fully in the research process. Keeping gives ownership and builds capacity within the co-researchers and their communities in the

research process and outcomes. Each of these three aspects are described in detail, building on our own experience from over one hundred inclusive co-design research activities, to provide guidance and approaches to other researchers who want to engage in inclusive co-design research.

Keywords

Co-research · Co-design · Participatory research · Disability research · Inclusion · Inclusive design · Accessibility

Introduction

Co-design is a commonly used approach for researchers and designers who want to use participatory research methods that enable diverse perspectives and viewpoints to inform design. Like Sanders and Stappers (2008), we view co-design as "the creativity of designers and people not trained in design working together in the design development process" (p. 12). Additionally, we understand co-design as "a practice where people collaborate or connect their knowledge, skills and resources in order to carry out a design task" (Zamenopoulos & Alexiou, 2018, p. 10). As inclusive design researchers, we recognize that everything is designed, and we think of design in the broader sense of planning with purpose. With this view, design is not limited to the look and feel or function of things; it can be more subtle, like design of a meeting or a policy. Given our definition of design, anyone who makes a decision that impacts others is a designer. Co-design, then, is useful across a broad range of activities and can be useful to individuals who do not normally self-identify as designers.

Sanders and Stappers (2008) explain that when conducting co-design research, the role of expert is switched from the designer to the individuals served by the design. Individual experience becomes the generative fuel for insights that can inform design. The role of the researcher is to support the expert by "providing tools for ideation and expression. The designer and the researcher collaborate on the tools for ideation because design skills are very important in the development of the tools" (Sanders & Stappers, 2008, p. 10). Similarly, research experience is important in the development of tools and the synthesis of insights from the co-design.

Existing Co-design Research Methods

While co-design research methods are an excellent way to gain diverse perspectives and improve design, most current co-design approaches perpetuate exclusion of highly diverse outlier populations through recruitment and research techniques that are inaccessible or that fail to account for diverse needs and preferences. Even when care is taken to invite diverse co-design researchers, researchers may not understand or learn about how those co-design researchers can participate fully.

Additionally, it is challenging to move from a "researcher as expert" to "the researched as expert" (Sanders & Stappers, 2012, pp. 23–24) power dynamic. It takes practice, commitment, and self-reflection to address power iniquities in the research process and across the research team. Co-design can slip into a traditional "researcher and researched" model without frequent monitoring and adjustments by the research facilitators. In the same way, it can be difficult for individuals who are not researchers to take on research roles, especially in the analysis and synthesis phases of research, when they have historically not been given opportunity to participate fully in research that impacts them.

Our Approach to Co-design Research

Inclusive Design Research Centre (IDRC) has been a leader in the field since 1993. We began with participatory methods that allowed for iterations based on user feedback but were based in a "design for" framework. We quickly moved to a "design with" approach and soon after realized that a "design by" approach best manifested the dimensions of inclusive design. This means that individuals who are most impacted by the design create the design. In the last 5 years, across multiple projects, IDRC researchers have carried out over one hundred co-design activities that followed this design by approach. Through these experiences, we have learned many lessons and have a great deal of knowledge to share with others wanting to carry out their own inclusive co-designs.

Inclusive Co-design Mindset

Inclusive co-design requires inclusive design thinking in all phases. Taking on a mindset of inclusive design (Inclusive Design Research Centre, n.d.-d) will support and enable inclusion throughout the co-design research process: recruitment, planning, tools, techniques, and analysis.

Co-design as a research and design approach stems from participatory research methods and the recognition that designing *with* stakeholders yields better approaches, designs, and solutions than designing *for* stakeholders. Co-design researchers recognize that everyone has expertise in their own lived experience and seek to bring that expertise directly into the co-design process. *Inclusive co-design researchers* begin even earlier in the research process to engage the expertise of diverse individuals and to better understand the needs that should be addressed by the design or research in the first place. An inclusive co-design researcher makes space at the front for other researchers or experts with relevant lived experience and provides the supports necessary to enable design *by* co-design researchers. Inclusive co-design mindset includes three aspects: **A**ppreciating, **S**caffolding, and **K**eeping. We refer to this as the ASK approach.

Appreciating: Supporting and Promoting the Role of Persons with Disabilities

An important lesson that we have learned in our many years in the field of inclusion is that people with disabilities are problem-solvers and innovators; they are challenged daily in a world that is often not designed for them and have deep understanding of the impact of design on their ability to work and play independently and with dignity.

A starting point in inclusive co-design research is appreciating the life experience and knowledge of people with disabilities. In the research process, there are several places where appreciation is expressed:

1. Seeking input from people with disabilities on what needs to be addressed by the research or the design
2. Including people with disabilities throughout the design research process to address that need
3. Compensating people with disabilities for their time and expertise at a fair rate

For many researchers and designers in co-design research, power imbalances are maintained, and the inclusive mindset is blocked by research language habits that can be hard to break. We cannot express appreciation for our co-design researchers if we continually refer to and think of them as “participants.” In our work, we refer to our co-design researchers as experts because they are experts in their lived experience. That expertise should extend to helping to determine the problems that should be addressed by design research. Many researchers see “co-designing from the beginning” as meaning from the start of the design research *after* they have determined the problem to be addressed. However, when we seek guidance on the issues that need to be addressed from experts with disabilities, we begin to remove traditional research roles and create an environment where knowledge and power are shared and expertise is appreciated. This uncovering of the need that should be addressed is, barring the research funding process, the *actual* beginning of the research process. Then, by including people with disabilities as colleagues in the research process, we continue to disrupt the power dynamic of traditional research and develop the inclusive mindset of inclusive co-design. We move from researchers and participants to researchers and subject matter experts.

Finally, we express appreciation of our co-design researchers by providing them with fair compensation for their time and expertise. We view fair compensation as a rate that is equivalent to that of an emerging scholar or what we would provide to subject matter experts in other fields.

In some cases, the expression of appreciation and value for the expertise of people with disabilities is equally unfamiliar for the expert. Some of our co-design researchers have expressed amazement to us that they have an equally, and possibly more important, role in the research process. Expressing our appreciation through our language as well as actions also supports scaffolding of co-design researchers as equals in the research process because it helps them to become aware of their expertise and strengths.

Scaffolding: Building Capacity and Fostering Success

Our co-design researchers often express surprise that their expertise guides the research and informs any findings. Many of our co-design researchers are unfamiliar with co-design activities and dynamics and may also be unfamiliar with the social model of disability that situates experience of disability as a problem of design rather than an individual deficit. Scaffolding is the steps taken to create an environment where the appreciated expertise can be exercised. The research space must be a place where people with disabilities can rightfully make and influence design research decisions with independence and integrity.

In application, scaffolding involves all aspects of creating a welcoming environment, particularly power dynamics and facilitation, activity design, necessary knowledge and activity implementation. The goal of scaffolding is to create an environment where co-design researchers can focus on being co-design researchers.

Keeping: Building Knowledge and Ownership

A measure of genuine co-design is the ability of people with disabilities to advocate and be active in design research. This ability is fostered when appreciation and scaffolding have been part of the process. Keeping is the outcome of effective appreciation and scaffolding and enables co-design researchers to take equal responsibility and equal ownership of the research process, meaning making and outcomes. In doing so, keeping builds competencies in inclusive design research and helps to shift power dynamics inside and outside of the research process away from the “academic researcher” to the “community researcher” or co-design researchers. The position of co-design researchers as advocates for the social, cultural, and economic contributions and needs of their communities and themselves is strengthened.

Applying the Inclusive Co-design Mindset

We have discovered many avenues for applying the inclusive design mindset in IDRC co-design research and will describe them in this section, drawing examples from our Future of Work projects at IDRC from 2020 to 2023 called Future of Work and Disability (FWD) (IDRC, 2022) and Equitable Digital Systems (EDS) (IDRC, 2023a). Our approaches are not an exhaustive list of things to think about, but what we know so far. We find that we continually learn and discover other ways to enhance appreciating, scaffolding, and keeping within co-designs as we work with new experts. As practitioners of inclusive design, we adapt our approaches as new understandings of inclusion and exclusion are learned or evolve within our local and global societies.

Appreciating in Action

Supporting and promoting the role of persons with disabilities first requires that people with disabilities are engaged in the research process, ideally with leadership roles. At IDRC, which is a research organization rather than an advocacy organization, we have developed and continually seek new relationships with diverse organizations that represent intersecting identities of people with disabilities.

Community Engagement and Leadership

Whenever possible, we develop our projects with disability advocacy organizations. Our partner organizations help us to find collaborators in their communities to co-research or take on other roles such as advisory panel. Our partners also provide guidance and perspectives that are important in the research. Through these networks and community lists that we have developed over time, we are able to work with diverse co-design researchers. For example, in the EDS project, the 10 partners met on a monthly basis to review research direction and project goals based on our learning from the intervening co-design activities as well as from other impacts, such as the COVID-19 pandemic.

In our work, diversity is broadly defined and includes factors such as culture, social networks, disability, income, immigration, race, and gender. Our team recognizes the importance of building a co-design group that interconnects diverse identities, relationships, different abilities, and social factors that shape people's lives. Including intersectional identities helps identify hidden structural barriers and supports understanding how individual experiences differ. Only intersectionality creates spaces for reflexive consideration and critical engagement that address the multiple forms of discrimination and barriers that people with disabilities experience.

Co-designer Researchers Are Experts

Researchers who want to engage co-design researchers may find that it takes conscious effort and practice to eradicate typical research power dynamics, where the researcher is the expert and all others are participants or subjects. Instead, it is the co-designer who is expert in their lived experience, and the researcher as co-designer is guided by these experts and may even take on a facilitation role rather than a contributor role. When we invite co-design researchers to work with us, we invite them as experts of their experience who will share their knowledge and insights based on these experiences. As part of the invitation, we usually provide a link to an accessible form so that co-design researchers can respond easily to our invitation. In our EDS project, we relied on our partners to gather experts from their communities, and in the process, we set parameters as a group to seek diverse perspectives within those communities and consider intersecting identities.

If you must recruit your co-design researchers directly without the help of a partner organization, then you may want to ask direct questions about experiences related to the problem that the co-design researchers will address. For example, in a project about barriers in the built environment related to sound, we asked potential co-design researchers about different ways that they may experience the acoustic environment:

> Please select any of the following that apply to you:
> ☐ I am hard of hearing.
> ☐ I find it hard to focus when there is a lot of background noise.
> ☐ I have sensitivity to noises (e.g., from ASD or PTSD).
> ☐ I am often frustrated by barriers related to sound.
> ☐ I benefit from sound amplification technologies like FM loops.
>
> Is there anything else about yourself that you would like us to know?

These questions helped us to better understand the kinds of experiences experts could bring to the co-design session, and we were able to choose a variety of perspectives for the limited spaces available when the number of interested co-design researchers exceeded our capacity.

A consideration when selecting co-design researchers can be the inclusion of support persons who also have relevant experience to share. In these cases, support persons are additional members of the research team rather than a replacement for the individual that they support.

Compensation

It is customary when working with experts to provide compensation as a way to acknowledge and value the experience and skills being shared. In our projects, we strive to provide co-design researchers with honorariums that show our appreciation and respect for their time and experience. At the very least, we match the hourly rates of graduate research assistants. More often, as good practice, we allot a significant portion of the project budget to co-design researchers and other contributors from the community so that expert compensation is $100 CAD/hour.

Co-design researchers should not be expected to share their time and expertise because they are an intended beneficiary of the project. It is important to acknowledge the co-design researchers' contribution to the accessible co-designs and their time commitment in ways that are understood by the community to be compensation; usually payment is financial, but there may be other forms of culturally appropriate compensation to provide as well or along with payment.

You may also ask the community what might be meaningful or useful to them as an additional benefit to participating. At IDRC, we typically offer co-design researchers other possible benefits, such as micro-badges that can be used in their profiles and resumes to delineate their work to others and/or workshops on related topics. For example, participants in a recent project looking at AI hiring tool barriers provided co-design researchers with an opportunity to attend a resume tips seminar.

Scaffolding in Action

Co-design researchers may be experiencing the research area, researcher status, process, and tools for the first time when joining a co-design. Plan ways that you can scaffold or enable their confident participation. Areas to address include design and implementation of the activity, background knowledge, and facilitation. Also, review and refine your approaches throughout the co-design research activities to improve accessibility or to be more inclusive.

We focus here on the design and implementation of the co-design approach or technique with the assumption that the research team will choose the method or technique for the co-design that will produce the desired outcome. We will not focus on what technique is best for your inclusive co-design but instead on how to think about ways to design the technique (and tools) so that it is inclusive. Design and implementation are interconnected aspects of the co-design, and neither can be planned in isolation of the other.

Once the research team has determined the technique that will work well to support the area of investigation, the next step is to begin planning the research activities. Accessibility and inclusion should be incorporated into planning for every aspect; it is not a separate step that occurs after all of the planning is done.

General Planning

In co-designs, the research team usually grows, starting with a few who have an initial idea and then building as diverse experts are identified and invited to collaborate. This variability means that at any point in the planning the decisions and thinking may involve some or all of the research team.

Collaboration Space

The collaboration space may be physical or an online platform. When selecting a physical space, choose a space that meets and, ideally, exceeds basic accessibility requirements. Choose a site that is easily accessed by public transit and has close parking. The site should have level access or an alternative like a ramp or lift *at the main entrance*, but there is much more to think about than this minimum access. Have assistive technologies on all computers being used for in-person collaboration. Assess the space carefully and think about how well your collaborators will be able to move, reach, see, hear, eat, and access washroom facilities. IDRC has some useful guidance on its BIG IDeA project site (IDRC, n.d.-a, b and there are many resources online for learning about accessibility of the built environment.

Mainstream video conferencing platforms have begun to incorporate accessibility features, but be sure to choose a platform that supports live captions, sign language interpretation (pinning or spotlighting), and translation if needed. These features must be available in all “rooms” that you use in your co-design sessions.

Recruitment

We begin recruitment for our co-designs by working with the team (this could include collaborating organizations, research assistants, and other co-researchers) to determine the gaps in the research team and consider how they can be filled. We may reach out to networks of disability organizations and other stakeholders. When these are new connections, it is important to contact them as early in the process as possible to build trust and receive their help in reaching out to their communities. Express to the organizations the goal for the activity and be transparent about what you want them to contribute and what benefits they and their communities can expect by collaborating so that they can quickly understand your need and determine how they can help.

Once we have determined the networks that we will use to reach out to potential co-design researchers, we prepare a plain language invitation that describes the project and the responsibilities of co-design researchers as well as the honorarium that will be provided. We are clear about how we are making the collaboration inclusive and indicate that co-researchers will be able to identify other needs that will support their participation when they apply. Our intention is to make it clear to those who read the invitation that we will address their participation needs (e.g., regular breaks, support person, support for childcare, or transportation). Our invitation will include a link to an accessible application form.

A sample application form that may be adapted to project needs is available at https://forms.office.com/r/ZZPLVffZ5R. The submission message for the form will include the date when we will respond as well as the email address for a project team contact. Once registration closes and the team has selected co-researchers from the applicants, then all of the applicants are notified about the decision and those invited to join the research team are provided with any further instructions or documents for the co-design workshop/process. We also use this email to ask again about participation support needs (see participation supports).

Mindset

All members of the project team must value their own and each other's expertise. In all contact with the co-design researchers, we reiterate the value of their lived experience and the expertise that they bring to the research team. We may provide scaffolding that supports co-design researchers in preparing for the co-design and builds confidence in their ability to contribute (see tools and techniques).

Participation Supports

Inclusion is about planning for and being prepared to meet the needs of each individual who is collaborating. When a participant is not able to participate fully, we see that as a design problem – that we have not provided the right environment, supports, or tools for that co-design researcher. As inclusive researchers, we always plan to have captions, accessible documents, and an accessible building. As a start, we ask our co-researchers to let us know how we can support their participation and suggest many options to make it more comfortable for co-researchers to ask for these supports. In our experience, co-researchers ask for:

1. General accessibility: large font, captions, descriptions for visuals, plain language, and other alternative formats

2. Dietary needs
3. Attendants, note-takers
4. Option to bring a caregiver or support person
5. Funding support for travel, dependent care, and support person

Other factors involved in supporting participation are:

- Timing
  - The activity start time should accommodate multiple time zones (if necessary) or longer travel times on accessible transit.
  - Breaks should be scheduled every 2 hours and must be adhered to no matter how engaged the co-researchers are.
  - All co-researchers should be aware that they may step out at any time, regardless of when breaks are scheduled.
  - Consider multiple sessions rather than one long session, especially if some co-researchers are joining remotely.
  - Share the agenda ahead of time so that co-researchers can plan for their needs.
  - Follow the agenda so that everyone including captioners and interpreters can plan their time. For remote meetings a prompt start is especially important for co-researchers waiting to be admitted to the room.
- Hospitality
  - Greet co-researchers warmly and set them at ease.
  - Engage in "chit chat" or have an icebreaker activity.
  - Offer refreshments for in-person activities.
  - Refreshments should meet a variety of dietary needs.
  - A quiet space or extra breakout rooms for remote activities.
- Additional information
  - Detailed guidance for transit and driving to the location.
  - Information about the space (e.g., washrooms, dog relief areas, accessible areas, other amenities).
  - Identify people who can assist/help.
- Necessary knowledge
  - Co-researchers may need support in learning a technique or understanding new terms or concepts. Guidance and training should be provided to create shared understandings and goals. Like sharing the rules and objectives when learning to play a new game.

Research Activities

There are many techniques that can be used in co-design research. The technique will be implemented using tools for gathering information, collaborating, and creating. Some ideas for techniques and tools can be found in IDRC's Inclusive Design Guide (Inclusive Design Mapping) (IDRC, n.d.-c). IDRC has a policy of open access, and all co-research activities undertaken at IDRC are shared under Creative Commons licensing (https://creativecommons.org/licenses/by/4.0/). All co-researchers are asked to sign a contributor license agreement and, for co-creation activities, a group attribution form.

Research Techniques and Tools

When choosing a technique, consider how well your co-researchers will perceive it and participate. For example, written narratives like letters and stories may feel foreign or awkward to someone who communicates with gestures or uses oral traditions. Narratives may also be difficult for individuals who prefer structure or are less practiced in creative writing. This consideration doesn't mean that you should avoid a technique but instead think about how the technique could be modified to suit other needs as well as what tools can support co-researcher needs. For example, when using narrative techniques as a way to gather and share lived experiences, we have used these modifications and tools:

- An expert notebook
  Prior to the first session, we provide all co-researchers with a notebook (as a downloadable doc, a Google doc (MIDP Evaluation), or paper formats) that provides some guiding questions and structures to help the co-researcher think about and collect their relevant experience (IDRC, 2020, 2023b). Completing the notebooks is optional, but we encourage all co-researchers to participate in this priming exercise. Alternatives to the notebook as a priming exercise are guided interviews or an online form. We also encourage co-researchers to collect or share their experiences with images, audio, or video if they are more comfortable. At the first session, co-researchers will bring their collected experiences or receive a copy of their entries in the online form.
- Flexible modes
  We ask co-researchers what mode they would like to use to create their contributions – audio, images, video, written, sign language video – and support their choice. Whatever mode that they select, we ensure that it will be accessible to all collaborators via captions, translations, transcripts, etc.
- Scaffolding
  To support co-researchers who may benefit from more guidance, we provide a few options with varying levels of structure. For example, some may benefit from guiding questions like: Who are your characters and what are they like? What is their goal? What happened or what was the challenge? What was the impact? How did they feel? How was it resolved? Others need more structure, like having the questions and some examples of how to respond (e.g., for What is the impact? We might have: Could they achieve their goal? Why or why not?). For even more structure and support in writing, we might use an online form to break the narrative task into smaller pieces with more precise questions to allow for simple responses that can be merged to create the narrative later. We also provide supported writing where a facilitator or support person helps create the narrative under the direction of the co-researcher.

- Small group collaborations
  Have co-researchers work in small groups of two to four plus the facilitator to create a space for them to share ideas and generate the desired outcome – in this case, a shared narrative. The facilitator may support or guide the process if needed. Small group collaboration has the added benefit of including multiple perspectives as well as protecting privacy by enabling creation of composite characters.
- Personalization
  Although we begin co-design research with flexible approaches, further personalization of the tools or techniques may be needed at any time. Don't hesitate to modify the planned route to meet your co-researcher's needs. In one of our co-designs, one of our co-researchers had immigrated to Canada from a Spanish-speaking country and communicated using ASL. Although they could prepare their work as an ASL video, they were confused about the research goals and intended outcomes, which had been provided in ASL and written English. We realized that there was a disconnect between this co-researcher and the rest of the research team and decided to reach out via email in Spanish to ask if they would like to work in Spanish instead. The co-researcher was really pleased to have the option, so we sent the instructions in Spanish and let them know that they could respond in Spanish, English, or ASL. The co-researcher was able to understand the research task better and provided input in written Spanish.

There are many tools that are commonly used in co-design research, such as, sticky notes, creative play, model building, manipulating objects like building blocks, and online tools like Miro boards. Identify the requirements for using any tool (e.g., researcher must be able to: see, reach, read, hear, grip, etc.) and consider alternatives to or modifications of the tool when a requirement can't be met. In some cases, you can use a digital tool like a table in a Google doc to organize ideas instead of a whiteboard or sticky notes. If you are using a digital tool, make sure that it is accessible and interoperates with assistive technology and that everyone has access to a device and necessary assistive technology. Be sure that all of your co-researchers can participate, and do not use tools or modifications that will segregate one or more co-researchers from the process.

Facilitation

Recall that the goal of scaffolding is to create an environment where co-design researchers can focus on being co-design researchers. Facilitators create this environment; they are the good hosts who work in the background. Like any host, the facilitator, tends to the needs of the co-researchers, makes everyone feel welcome, helps everyone find space to contribute or share, and adeptly resolves any problems that arise.

An important part of inclusive facilitation is helping all co-researchers engage in interactive styles that may feel new to them. The co-researchers with the guidance of the facilitator may discuss how interactions will occur and issues are resolved. Inclusive interactions require understanding the different needs of the group and helping others in the group to meet those needs as well.

> When we acknowledge that different levels of creativity exist, it becomes evident that we need to learn how to offer relevant experiences to facilitate people's expressions of creativity at all levels. This means leading, guiding, and providing scaffolds, as well as clean slates to encourage people at all levels of creativity. It is not always the case that we want to push people beyond their level of interest, passion and creativity. (Sanders & Stappers, 2008, pp. 13–14)

Co-researchers will need to be comfortable with longer pauses to allow individuals using captions or translation to "catch up" with the spoken words, enable remote co-researchers to unmute, and allow any co-researcher time to compose their response. Inclusive facilitation is crucial for an inclusive co-design activity; IDRC researchers helped to create an inclusive facilitation guide (https://ecampusontario.pressbooks.pub/onhumanlearn/chapter/inclusive-facilitation-guide/) that is openly available on Pressbooks (Humanizing Learning Project, n.d.).

Iterative Design

Iteration is not just for the products of the co-design research, but also for the co-design process. Co-design research should be adjusted as needed throughout the process. These adjustments are part of being flexible and may stem from observations but should also be from informal and formal feedback collection. At the beginning and end of a co-design session, the facilitator can check in with the researchers to learn how the co-researchers are feeling about the process, what is working, and what could be better. Reviewing the activities, tools, and processes as a group and making any needed adjustments is part of building trust and a sense of community so that all co-researchers are empowered and feel ownership in the work. At the end of co-design research activities, we recommend using a feedback form or a debriefing session to review the co-design and learn ways to improve it for next time.

Keeping in Action

Keeping refers to several aspects: keeping the co-research team engaged in the analysis and findings as well as keeping the knowledge, data, and research capacity within the community. Building knowledge and ownership begins in appreciation and scaffolding. In inclusive co-design research, the co-design researchers should be part of the phases where meaning is developed and disseminated. The importance of findings from co-design activities should be discovered and articulated by the co-design researchers in partnership with the initiating co-researcher. Full participation enables co-design researchers to have ownership over the research and power over how their contributions to knowledge are articulated, which will boost their trust in your research activities. Keeping is often overlooked in co-design research; perhaps because the focus in the field has been on co-design research methods rather than on co-design research analysis. Even Sanders and Stappers (2012), who have been leaders in co-design research practices, state, "One of the biggest challenges that you may face is that the people who analyze the data may not be the same people who will be using the results and they will have not been involved in gathering the data" (p. 197). Just as it takes time to shift from "design for" to "design with" and then "design by," it can take time to shift to a mindset of co-analysis and co-synthesis, but doing so fosters ownership of the outputs in all of the co-researchers.

Another challenge with analysis and synthesis is that they are typically the last phase of a research project and can take a great deal of time and effort. Sharing this effort within a deadline may feel impossible if it is not planned from the start of the research. In our own co-design research, we have had varied success in keeping. It has taken us time, experience, and reflection to better understand how we can fully share this part of the research process rather than seek feedback after the meaning-making has occurred. Now, we approach the analysis in the same way that we approach the co-research: co-analysis requires the same actions of appreciating and scaffolding discussed above.

Co-analysis and Synthesis

Data from co-design research can take a variety of forms; what you do with the data will be just as varied, but the goal is usually to create meaning from it. In the same way that a research method was chosen and adapted to meet the needs of co-researchers, the method for analysis must be selected and adapted to enable all of the co-researchers to derive meaning from the collected data. The care and planning to build capacity and foster success at the research phase (see scaffolding in action) are repeated for the analysis phase. We ensure that co-analysis can occur but plan it with our co-researchers from the start. Build co-analysis into the research activities so that it is a natural extension of the work done together in the co-design research phase.

An example of this approach is described in the EDS project research report (EDS Project, 2023) (EDS English Report; EDS French Report) (EDS Project, 2023a,b,c):

> [co-researchers] imagined ideal interactions with technology. Each group combined the experiences and set them within a narrative that they shared as a slideshow. The use of the imaginary acts as a contrast that brings into prominence the very "normal" things that people with disabilities do not expect – the kinds of things that people who are not disabled take for granted. Their stories were narrated, captioned, and shared online.

- Working with Accessibility Needs Normalized: https://youtu.be/4vosjCltLqA
- Riley's Day at Work: https://youtu.be/ok4GL9-n9_U

Later, the co-researchers met in their groups for three sessions to analyze their own and two other stories from *The Imaginary* using narrative analysis. The co-analysis was structured as a book club where people talk about things in the story that happen and how the story is told. These insights were collected and turned into recommendations for the final report.

For example, insights generated from *Jessica Looks for a Job* are shown here:

1. Job coaches need better training for people with disabilities.
2. The hiring/interview process needs to be more inclusive.
3. Workplace culture needs to be more open to people with disabilities.
4. Relevant technology needs to be available for employees to succeed.
5. Employers should understand specific employee needs (i.e., working from home if possible, working with family schedule, technology for text-to-speech).
6. Supports should be in place for accommodating service animals if necessary.
7. There should be safe spaces where work can be done privately.

Co-researchers expressed both an appreciation for participating in the co-analysis as well as a richer understanding of how the co-design research activities could generate recommendations and insights. When co-researchers do not participate in the co-analysis, a disconnect is created between the co-researcher and the outcomes; there can be a sense that their contributions had no impact. Co-analysis assures that the voices of co-researchers are maintained through the synthesis and development of the research outcomes and understandings. The increased ownership in the outcomes is ideal for dissemination and, more importantly, gives co-researchers agency to continue to use and extend the research for advocacy or other purposes.

Dissemination

Co-design research is meant to be “owned” by and have an impact on the co-researchers and their communities. Full participation in the research process from start to finish enables all co-researchers to engage in dissemination activities either formally through conferences and publications or informally through word of mouth, social media channels, and personal networks. It is important that all contributors are acknowledged in reports or other products of the co-research.

Conclusion

Adopting an inclusive mindset and applying the ASK approach – appreciation, scaffolding, and keeping – will enable co-design research activities that empower co-researchers and their communities. Inclusive co-research ensures that diverse perspectives and viewpoints inform the research process and outcomes. Inclusive co-design research requires a shift in power within the research process that can only be accomplished when the contributions and expertise of those impacted by the research or designs are sought out, included, and valued.

Inclusive design addresses the design of everything. The involvement and participation, from the beginning, of experts with disabilities is essential to applying this inclusive and participatory method. Often, inclusion and accessibility are viewed as treatments that occur at the end of a process, but this view leads to exclusion and usually remediation efforts that take more time and resources than if inclusion had been incorporated in the first place. Inclusion and accessibility should be part of all parts of the process. In research, this means that inclusion is incorporated into every decision, communication, and step of the research.

Co-design is not just a consultation, it is an engagement where those most impacted by the design or research should have a leading role – the audience is moved to the panel on the stage. Becoming adept and comfortable with "design by" research takes time and practice, especially for researchers trained in traditional research methods.

Inclusive co-design ensures that everyone is able to participate equitably and in the way that they are most comfortable and productive. Power within an inclusive co-design is either equitably distributed amongst all of the co-researchers or shifted to the co-researchers most impacted. Facilitators should be evaluating and adjusting the effectiveness and inclusiveness of the research activities throughout. With practice and thought, inclusive co-design research can become another familiar tool in the researcher's toolbox.

Abstract

The national government of Colombia has been making important efforts to serve all students in the Colombian educational system, including those with disabilities or exceptional abilities. One of the latest advances in the modeling of Colombian public policy is Decree 1421 of 2017, which regulates, within the framework of inclusive education, educational attention to the population with disabilities. Within the framework of this policy and aligned with the UNESCO calls to strengthen the processes of adopting Open Educational Resources (OER) as a means to achieve true educational inclusion in an educational system, recognized as diverse, the Fundación Universitaria Tecnológico Comfenalco has prompted the creation of an institutional strategy called CO-CREEMOS that is presented and evaluated in this manuscript. Evaluation shows promising results in increasing of the teachers' awareness for developing inclusive practices using OER.

Keywords

OER · Cocreation · Universal Design for Learning · Curricular design by competences

Introduction

One of the fundamental pillars of the 2030 World Education Agenda, coordinated and supervised by UNESCO, and which governs its normative work, is the right to education (United Nations Organization, 2015). Specifically, the agenda defines the principle of "equality of opportunity and treatment for all people, without discrimination or exclusion," reaffirming to all countries the duty to promote equal opportunities for accessing education. Among the main provisions that governments must give is the access to higher education for all, on equal terms according to their individual capacities, and with equal quality environments in terms of the education provided.

Bearing in mind that governments are responsible for ensuring that internationally established political and legal provisions are complied with, guaranteeing access to quality education for all, and designing policies and strategies in their education systems, Colombia is making great efforts to promote inclusion.

In particular, the Colombian government has defined laws and decrees to achieve true inclusion in education. These laws and decrees touch higher education institutions, which are called upon to specify actions and strategies that allow access, permanence, and quality of education offered to populations with special constitutional protection. One of the latest advances in the modeling of Colombian public policy is Decree 1421 of 2017 (Ministry of National Education, 2017), which regulates, within the framework of inclusive education, educational attention to the population with disabilities.

The Fundación Universitaria Technológico Comfenalco (FUTCO), as an institution of higher education in Colombia, has accepted international, national, and local calls that urge to advance in the processes of inclusion in education. This institution has developed an inclusion policy that comprehensively addresses the concept of inclusion and touches on the most important institutional processes that are truly accessible and inclusive to the university community.

In this context, the CO-CREEMOS strategy was born (Baldiris et al., 2017), an institutional strategy that seeks to promote inclusive education in higher education institutions, intended to be initially implemented at the Fundación Universitaria Technológico Comfenalco. CO-CREEMOS includes the definition of an institutional model for the Co-creation of Open Educational Resources (CO-CREAR), the definition of a Collaborative Model for the Evaluation of Open Educational Resources (OER-Rubric), and the offer of technological tools that support both processes.

This strategy has managed to impact the institutional pedagogical model and, together with the policies of institutional inclusion, has managed to promote the development of methodologies and tools that impact the educational system based on the proper relationship between didactics and technology, giving value to diversity and inclusion.

The present manuscript describes the CO-CREEMOS strategy and consists of the following sections: section "A Pedagogical Model to Attend Diversity" describes the pedagogical model adopted by the Fundación Universitaria Technológico Comfenalco. Section "Adopting the UDL from the Teaching Project" explains how the principles of Universal Design for Learning (UDL) were assumed from the institutional Teaching Project. Section "CO-CREAR" presents CO-CREAR, inspired by the ADDIE models (Branch, 2009) and CO-CREARIA (Baldiris et al., 2015, 2016). Section "OER-Rubric" presents OER-RUBRIC, the OER evaluation model that was adopted in the CO-CREEMOS strategy. Section "Evaluation" describes the evaluation of CO-CREEMOS strategy. Finally, section "Conclusion and Future Work" presents the conclusion and future work.

A Pedagogical Model to Attend Diversity

The Fundación Universitaria Technológico Comfenalco adopts a constructivist pedagogical model that seeks to develop the cognitive structures of the student, where the teacher is a guide and counselor, but it is the students who build their own knowledge. This is how the pedagogical processes of the curriculum work, in order to build knowledge and develop competences within a specific learning environment. Here, the methodology applied is combined with logical elements which represent knowledge expressed in laws, postulates, rules, and the physical resources constituted by the space, equipment, educational materials, and support means, as well as the student's relations with these elements and with other people, be it other students, teachers, or administrative staff (Fundación Universitaria Tecnológico Comfenalco, 2011).

The two main instruments for the realization of the institutional pedagogical model are the Teaching Project and the Classroom Project. The Teaching Project defines in detail the particular strategy of the teacher in order to lead the students to achieve their desired educational purposes. The Classroom Project is the didactic strategy of mainstreaming the competences to be achieved with the students throughout the subjects. The art classroom project is based on the competencies, the knowledge that students acquire in the subjects, putting into play the competences acquired in real problem situations to which the student must provide solutions.

The fundamental work of the team participating in the design of the CO-CREEMOS strategy, from the pedagogical point of view, was the structural and methodological intervention of the design of the Teaching Project with the purpose of adopting the principles of Universal Design for Learning (UDL) (Meyer et al., 2014) and in this way provide teachers with a way to design a flexible curriculum for their students, specified in the Teaching Project.

On the other hand, from the technical point of view, the strategy guides teachers in a collaborative process of construction of OER that allow accessible digital educational resources to be considered as technological tools within the plan specified in the Teaching Project. These OER, when accessible, guarantee access for all students to the training process, including those with sensory disabilities.

The CO-CREEMOS strategy is the commitment of the Fundación Universitaria Technológico Comfenalco for the realization of action number 5 of the policy of institutional inclusion, “Have flexible curriculums and adapted to the particularities of students.”

Adopting the UDL from the Teaching Project

As mentioned above, The Teaching Project at the Fundación Universitaria Technológico Comfenalco defines in detail the particular strategy of the teacher to allow students to achieve the desired educational aims.

The teaching project initially consisted of the following parts:

- A presentation header for the teacher and their subject
- Presentation of the teaching project
- Teaching project justification, which revels the importance of the teaching
- Competence to be developed by the student, detailing the knowledge that is sought to be appropriated by students; the knowledge, what to do and who to be that is in accordance with the project of integral education of the institution
- The planning of weekly activities

The teaching project lacked before the intervention some elements necessary in order to achieve truly flexible curricula that address diversity in the classroom, as well of providing clear guidance to teachers on how to include OER as didactic strategies to promote inclusion. In this context, the following elements of information from the UDL to the teaching project were included:

- The profile of the course is defined considering the approach of the UDL describing the strengths, weaknesses, and preferences of the students in terms of recognition, strategy, and emotional aspects.
- Initial design of Open Educational Resources to include as didactic strategies in curricular planning. In this section, teachers are encouraged to think about the digital support they require for their subject, and in particular, about which OER could support the learning process of the students. Teachers are asked to describe the resources as well as justify their use. The OER are included in the planning as tools to support the appropriation of the knowledge defined in the definition of competences.
- Planning. In this stage, the teacher is encouraged to think about the best strategies that could achieve the educational purposes defined by the course profile, also to think about a planning that makes use of the defined OER.

  Up to this point, teachers were able to design their teaching project completely. However, there was a lack of evaluation regarding the capacity of the project to address the diversity of students for whom it is designed. Therefore, the following sections were included in the teaching project.
- Identification of potential barriers. As a space for reflection on the capacity of the teaching project to be inclusive. In light of the UDL guidelines, the teaching project was evaluated and, considering each profile, the possible barriers that the defined strategies could impose to students while accessing the learning process were registered.
- Once the barriers are identified, an analysis of the possible solutions that would eliminate these barriers could be carried out.

Once defined, the teaching project allowed teachers to be aware of the characteristics of the group of students to whom the subject was addressed, achieving a curriculum that would meet the needs of all, and also include the use of accessible OER. Henceforth, teachers were motivated to follow a process of cocreation of structured and systematic OER that would allow them to generate OER that would support the execution of the designed teaching project. This process is detailed in the next section.

CO-CREAR

CO-CREAR is inspired mainly in the models ADDIE (Branch, 2009) and CO-CREARIA (Baldiris et al., 2015; Baldiris et al., 2016), welcoming the principles of both models although personalizing a series of stages that guarantee that the resources obtained are adjusted to the needs of the Fundación Universitaria Technológico Comfenalco. These stages are the following:

- **Reflection on the diversity of the population, the institutional pedagogical model (PEI), and other institutional references**. In CO-CREAR, the reflection becomes a significant moment of the whole process. The teachers are always reflecting, always looking for how and why it is important to meet the diversity of needs of their students. Because they are aware of the need, this makes teachers also become aware of the fact that they can be part of the solution to the situation of exclusion experienced in a city such as Cartagena de Indias, where the Fundación Universitaria Technológico Comfenalco has its headquarters.
- **Initial OER design**. This stage begins in the teaching project, defining the OER that can support the achievement of the competences, and in particular of the knowledge that is intended to be appropriate for the students. However, elements of the curriculum not addressed in the defined OER are further deepened; examples would be a clear and detailed definition of their purposes, didactic strategies, sequencing, evaluation, and feedback given to the student in the OER. In a few words, the OER curriculum is defined.
- **Analysis of barriers and solutions**. Digital content also presents barriers. This moment is a supremely important moment to identify those potential barriers that building OER can present.
- **Mature design of the OER**. Given the initial design and the analysis of barriers, this is the moment when possible solutions are analyzed in order to eliminate these barriers through more appropriate didactic proposals or through the analysis of the web accessibility of the contents of the OER.
- **Development of the OER**. At this moment, with the help of software tools an accessible OER is created.
- **Evaluation of the OER**. Although this particular moment has been designated a stage, what it really represents is a set of partial evaluation milestones characterized according to the nature of the specific moment being evaluated.

OER-Rubric

OER-Rubric is an evaluation model of OER, which takes elements from existing models (Baldiris et al., 2014; Bonfante, Zapata, & Suarez, 2013; Nesbit, Belfer, & Leacock, 2005), while also, emphasizing the following matters which have not been considered or have been considered very little in the previous models:

- The model verifies the capacity of the OER to meet the diversity of potential students.
- The model offers a clear evaluation methodology for each category.
- Different categories of evaluation can be verified by different professionals.
- The actors that participate in this validation process.

Fig. 1 Actors participating in the evaluation

Figure 1 summarizes the actors involved in this coevaluation process.

Figure 2 summarizes the different evaluation rubrics defined for OER-Rubric and the moment of cocreation in which they apply. The strategy considers that the organization of rubrics is a great contribution of knowledge, those involved in the planning moment: UDL rubric, attention to diversity rubric, the rubric that supports teaching, the rubric that evaluates planning, and the rubric that determines where the contents belong; also the rubrics built for the moment of the collaborative development of the OER: accessibility and usability; and the rubrics for the moment of implementation: reusability and support for learning. Together they are the evaluation model of the strategy CO-CREEMOS, OER-Rubric.

Evaluation

SCENARIO, Training in Educational Practices in and for Diversity

The CO-CREEMOS strategy was evaluated in the context of the Training in Educational Practices In and For Diversity that took place from July to December 2017 at the Fundación Universitaria Technológico Comfenalco. The training was

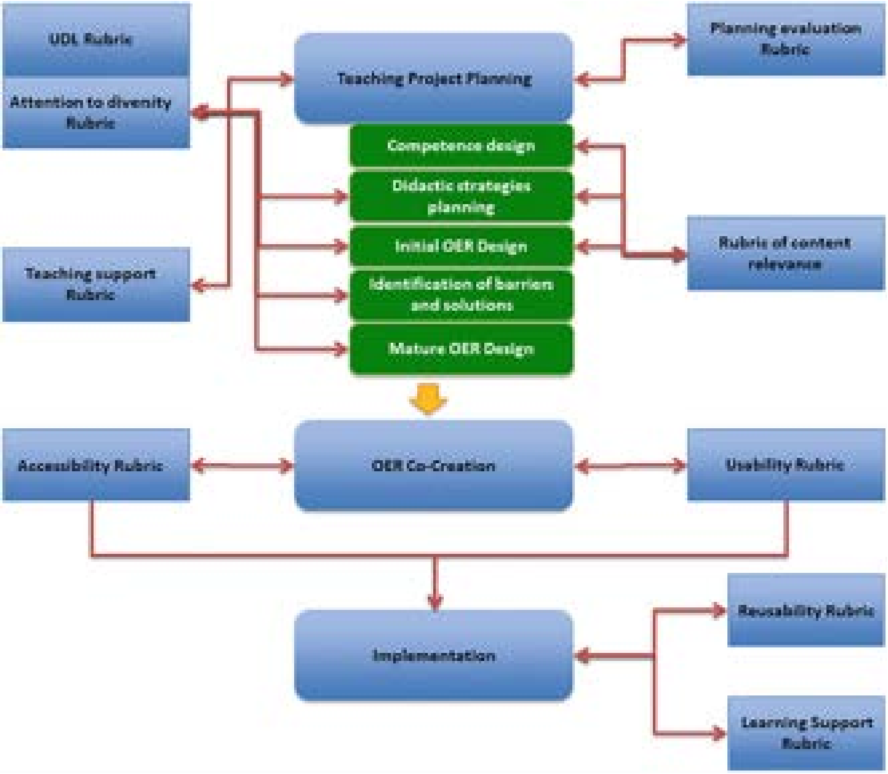

Fig. 2 OER-Rubric

offered in an open call to all the professors of the foundation. The purpose of the training was to provide teachers with concepts and tools to address diversity in the classroom, fostering the processes of cocreation of OER that meet the needs and preferences of all students. The course introduces teachers to the historical evolution of the concept of diversity, stimulating their reflection, proposes the Universal Design for Learning as the framework to be applied to address diversity, and guides the teacher in an inclusive and accessible process of collaborative creation of OER. The teacher's main challenge is to apply concepts and techniques to achieve an inclusive learning environment, in particular an Inclusive and Accessible Open Educational Resource. This resource would be one of those defined in the teaching project.

The specific competences to be acquired by the teacher are the following:

- The teacher recognizes the importance of inclusive learning for a better society.
- The teacher recognizes the diversity of the educational system and aims to propose inclusive and accessible learning scenarios considering the needs and preferences of all students.

- The teacher recognizes different conceptual models for attention to diversity in the educational context.
- The teacher plans and develops Open Educational Resources.
- The teacher applies techniques to generate accessible content for the development of the Open Educational Resource.
- The teacher evaluates the different dimensions of the Open Educational Resource developed.

The development of competences by teachers was based on the definition of an academic agenda that is presented below:

Module 1
- Epistemological framework
  - Inclusion: Historical review
  - Legal support
  - Educational perspectives at higher level

Module 2
- Methodological framework
  - Conceptual models
  - Universal Design for Learning
- Coverage in the teaching project: Competencies

Module 3
- Techniques to operationalize
  - Open Educational Resources
  - UDL guidelines by areas
  - OER design
- Coverage in the teaching project:
  - Competences to be developed by the subject (knowing, doing, being, and coexisting) and its evidences (Selecting a competence from the ones defined in the previous aspect)
  - Initial design of the didactic strategies of the OER to achieve scope of the knowledge associated with performance criteria
  - Analysis of barriers and solutions of strategies defined around the qualities of the student
  - Design of final teaching strategies
  - Programming weekly activities

Module 4
- Practical framing
  - Web accessibility
  - Mature design of the OER
  - OER Development
- Coverage in the teaching project: OER defined in the teaching project developed

Module 5

- Coevaluation
  - Conceptualization
  - Development of coevaluation

Module 6

Final presentation of the poster during a forum about OER Finally, during a pedagogical teaching induction day at the Fundación Universitaria Technológico Comfenalco, awards were given to the best experiences.

Evaluation Concept

The focus of this research corresponds to a qualitative analysis, including an analysis of discourse, which allowed to draw conclusions from heterogeneous data from a mass of textual data, from translations of interviews of participants.

From the interviews obtained from participating teachers were revised syntax, narrative form, and vocabulary used by them to obtain knowledge of some depth about their preferences, feelings, motivations, influences, and knowledge generated from the experience lived in the Training in Educational Practices In and For Diversity.

The categories of analysis in this study were of a theoretical type (Abela, 2002) and are part of the framework of the same type; they are also derived from the theory of beliefs proposed by Lewis and Passa (1998).

Lewis and Passa (1998) point out that the elements that generate beliefs are based on the organization of culture, corporate orientation, and priority in program planning. These authors consider that beliefs emanate from four circumstances:

- Reason, knowledge: Belief always supposes an element of intellectual knowledge.
- The feeling, the desire: The belief responds not only to knowledge, but also to a coexistence, to a need.
- The influence of society and environmental culture: The belief is reached from an internal driver, but, in fact, this would not be the case without the mediation of social culture, with its functions of inculturation and acculturation of the individuals.
- The individual's own will to believe: The individual is highly influenced but is never the total toy of environmental forces (Quintana, 2001). These circumstances allow us to suppose that a belief is partly intuitive, personal, and variable; intuitive because it is guided by the conjunction of rational knowledge and both rational and irrational elements; personal, because although it can occur within a given social group, it is the man himself who ultimately decides its process, settlement, change, or rejection, hence its variability according to Kleine and Smith (1987).

According to Fressier (Fressler, 1985), the individual disposition of the teacher, the organizational regulation, the management styles, the social expectations, and the professional organization determine all those phases of the life cycle of the university teacher, influencing in some way the construction of beliefs. The model includes two components, one cognitive and the other perceptual (Soto, Lacoste, Pepenfuss, & Gutiérrez, 1997).

Having a belief means that you have a truth that activates actions, both positive or negative. The term belief has the tendency to influence the individual in the generation of thought, opinions, aptitudes, and attitudes.

Participants

During the evaluation process, 24 professors from the Fundación Universitaria Tecnológico Comfenalco participated, but only 10 successfully completed the process, since many did not have enough time to attend the face-to-face meetings and b-learning mode, or to create and validate their educational resources in real classroom settings. Participating teachers submitted an initial survey, the results of which are listed below.

Initially, it is highlighted that there was a balanced participation of the female and male teaching population, as well as from various areas of knowledge: engineering, social and human sciences, administrative sciences, exact sciences, and others related to education; it is added that 75% of the participating teachers in this pedagogical and research experience have undergraduate or equivalent training, followed by 29.17% at an informal learning level, and in a lesser proportion, teachers who have performed at the secondary and primary school levels. All the teachers had more than 5 years of teaching experience.

When inquiring about their experience in the use of ICT, 8.3% stated that they had some type of economic limitation. Around 70% of the teachers consider themselves users with an intermediate level of knowledge of computers and the Internet; the rest considered themselves at an expert level.

Among the participants, 54.2% had experience with the design of Educational Resources, such as OVAs, Educational Resources, Video tutorials, Infographics, Ebook, and Programmatic Content Script, among others. Of them, 16, 7% claim to have published them on YouTube. Those who have developed OER mentioned that their resources have some type of license, showing that they are of the Creative commons Attribution NonCommercial NoDerivatives type, and around 20% of the teachers created educational resources with multiple and flexible presentation methods, expression methods, and action, as well as options for student engagement (Meyer et al., 2014).

Most teachers identify and recognize the concept of accessibility, identifying aspects such as “equal access for all, regardless of the disability that an individual has” or “giving the possibility of access to knowledge to all students, even those who have difficulties to learn” ; however, when asked about the inclusion of accessibility aspects in the development of educational resources, only 45.8% mentioned doing so, including aspects such as simple user interfaces, effortlessness and simplicity, and freedom of use.

Additionally, it was asked about the authoring tools used to create the resources, revealing that 79.2% had not used any, and those who used them used Photoshop, Fireworks, and eXeLearning. About the use of methodologies in the design process for OER creation, it was found that 50% of the participants said they used some type; however, when asking about which they used, they revealed tasks defined by themselves for the construction of the OER; the only Identified Methodology was ADDIE.

Instruments

The instrument used in the research was an interview that included the 10 following questions:

1. Professor, on a personal level, how did you perceive the course that was offered? Do you think it makes sense to address the issue of inclusion in higher education?
2. Teacher, on a personal level, what do you think were the main contributions of the course to your practice as a teacher? How did it help you improve?
3. What do you think of the modification that was made in the project to the teaching project? Do you think it is positive or negative? Why?
4. Do you think that considering the principles of Universal Design for learning as a framework for attention to diversity is a good or bad idea to apply in the university? Why?
5. Is the process of creating accessible Open Educational Resources followed adequate? Did you find it good, bad? Why?
6. Do you think that the process of creating accessible Open Educational Resources followed in the course can be carried out by any teacher? Why?
7. How do you feel about the Open Educational Resource you built? Are you satisfied? Did you achieve your goal? Why? What would be the next step for you regarding the resource?
8. Do you think that Open Educational Resources can facilitate inclusion processes?
9. What did you think of ATutor?
10. What aspects of the course would you improve? What issues do you think remained pending?

These questions were designed with the purpose of identifying the teacher's beliefs about the process that was carried out in the Training in Educational Practices In and For Diversity, which included the adaptation of the Teacher Project based on the guidelines of the Universal Design for Learning, the Methodology of

Co-Creation of Accessible Learning Educational Resources, and the use of other tools such as Atutor.

This instrument was applied to the participants, collecting qualitative information, and performing the analyzes on these data.

Method

The analysis method of the available texts from the interviews was divided into two phases, as described below.

First Phase

The units of analysis or registration were extracted for a first interpretation, for each textual expression on the 10 questions announced in numeral 2, which constitute the context unit in this work.

The assumptions made by each participant for each question were placed with relevance within a content registration matrix, compared to the theoretical aspects of Lewis and Passa's (1998) proposal on beliefs, in an interpretive exercise of recognition of their expressions around reasoning, desires, and extrinsic motivations related to their cultural environment and their personal worth on which they were projected in the learning environment recreated in the Training in Educational Practices In and For Diversity.

The result of this process is presented in the excel table hosted at the following address: https://n9.cl/tepjf in detail; their responses are categorized according to the above.

Second Phase

The interpretations identified in each of the categories were analyzed by two thematic experts in order to identify coincidences and differences, which allowed to establish solid conclusions regarding the experience of the interviewees in the Training in Educational Practices In and For Diversity.

These appraisals were subsequently reconciled among the thematic experts, allowing the identification of interesting aspects, which allowed them to identify their perception regarding the lived experience, taking into account their beliefs; this process is exposed in the excel file hosted at: https://n9.cl/pzt9e

Results and Discussion

Carrying out the analysis by the experts to the teachers' appreciations in the interview designed to find out how their experience had been in the Training in Educational Practices In and For Diversity, it was possible to obtain the conclusions presented in Tables 1, 2, and 3.

Table 1 Believe model

Category	Description
Reason	They recognize the concept of inclusion, the relevance it has in education, they recognize methodologies and strategies aimed at that goal
Feeling and desire	A great sensitivity is awakened among the participants, recognizing mental biases on the conception of disability, motivating them to generate inclusive spaces
Cultural and social influence	They recognize the need to train to handle differences in class, strengthen aspects from didactics and methodology, which allow breaking barriers and generating quality education
Will to believe	The participants see the adoption of the inclusive approach as pertinent in higher education; they propose changes at the curricular level and, going further, propose a reform in the training spaces

Table 2 Analysis of question 1

Reason	Feeling and desire	Cultural and social influence	Will to believe
They recognize the concept of inclusion, the relevance it has in education; they recognize methodologies and strategies aimed at that goal	A great sensitivity is awakened among the participants, recognizing mental biases on the conception of disability, motivating them to generate inclusive spaces	They recognize the need to train to handle differences in class, strengthen aspects from didactics and methodology, which allow breaking barriers and generating quality education	The participants see the adoption of the inclusive approach as pertinent in higher education; they propose changes at the curricular level and, going further, a reform in the training spaces

Tables 2, 3, 4, 5, 6, 7, 8, 9, 10 and 11 show the conclusions obtained from the analysis of teachers' answers to questions 1–10, considering their reasons, feelings, cultural and social influence, and willingness to believe.

Table 1 shows the description of the analysis categories mentioned above.

The next tables show the results according to teachers' response to each question.

1. Professor, on a personal level, how did you perceive the course that was offered? Do you think it makes sense to address the issue of inclusion in higher education?
2. Teacher, on a personal level, what do you think were the main contributions of the course to your practice as a teacher? How did it help you improve?
3. What do you think about the modifications that were made to the teaching project? Do you think it is positive or negative? Why?
4. Do you think that considering the principles of Universal Design for learning as a framework for attention to diversity is a good or bad idea to apply in the university? Why?

Table 3 Analysis of question 2

Reason	Feeling and desire	Cultural and social influence	Will to believe
They recognize having learned concepts such as inclusion, disability, and diversity and have appropriated methodologies and didactics that enrich their inclusive pedagogical practices, identifying barriers to handle the different needs that mark true inclusion	They recognize that the methodological and didactic contribution were significant for both the students and the teacher; this made them aware of their denial, cancellation and lack of consideration for the conditions of disability in their students, they denote a transformation that leads them to think about the needs of the students, their limitations, and especially what they must change in order to ensure true inclusion	A paradigm shift is evident with the creation of an inclusive learning environment. Additionally, they learned to support each other and work as a team independent of their disciplinary expertise, in the ICT environment "from these responses it is possible to see how they recognize their context, the way they used to lead teaching processes, and how they are influenced by the context of inclusion They are able to identify differences not only physical, but also cognitive	The participants evidenced a change of mentality, orienting their teaching practice to improve their technological skills; they recognize the value of ICT tools and resources to improve their teaching action; and in addition, they recognize their change of thought to assume it from the design, management, and evaluation

5. Is the process of creating accessible Open Educational Resources adequate? Did you find it good, bad? Why?
6. Do you think that the process of creating accessible Open Educational Resources followed in the course can be carried out by any teacher? Why?
7. Do you think that Open Educational Resources may facilitate inclusion processes?
8. What aspects of the course would improve? What issues do you think remained pending?

Table 2 shows the conclusions obtained from the analysis of question 7, which corresponds to the perception and projection of the teachers.

9. How do you feel about the Open Educational Resource you built? Are you satisfied? Did you achieve your goal? Why? What would be the next step for you about the resource?
10. What do you think about ATutor?

Table 4 Analysis of question 3

Reason	Feeling and desire	Cultural and social influence	Will to believe
Positive perception, consistent with the PEI statements, regarding the institutional model and inclusive policy of FUTCO. They are based on the UDL, allowing understanding the students' needs and the inclusion of strategies to meet their necessities	Among the participants, there is the feeling that an excellent job has been done in the adaptation, but that it is necessary to take it to the practical stage, being able to include everyone, represents a new challenge, and they recognize the effort it represents. It gives high importance to the necessary and urgent changes in the teaching project to achieve the desired inclusion of people with disabilities. Generate changes in the design, management, and evaluation of teaching activities	There is total clarity of government guidelines on inclusion. The inclusive didactic specificity is necessary in the teaching project; this improves all the planning of the teaching action and is aligned with the inclusive policy of the government	The security that this adaptation is a good reference is highlighted, that actions must be taken to make it possible from the practical point of view. Inclusive didactics and the institutional teaching project were strengthened

Table 5 Analysis of question 4

Reason	Feeling and desire	Cultural and social influence	Will to believe
They rescue aspects that are strengthened from the UDL, including planning, learning styles, and strategies to meet needs Strengthening the curriculum by competencies proposed by the institution, regarding the consideration of identifying the student's profile, and from there designing the educational action of the teaching project	They manifest the imbalance between knowledge and experience; the value of identifying people with disabilities to improve educational action in the teaching project is appreciated	The MEN demands educational inclusion, reflecting the alignment of inclusive university policy with this government mandate. The use of inclusive didactics with the implementation of new formats for diversity in disabilities is a binding element, reflected in the improvement of the teaching project	The UDL is a tool that facilitates the teaching-learning process. The UDL goes beyond academics and enables the development of a curriculum from which the needs of people are considered

Table 6 Analysis of question 5

Reason	Feeling and desire	Cultural and social influence	Will to believe
The process disassembles the theoretical from the technological support and allows the definition of clear strategies for the creation of OER	Supporting the educational process in technology facilitates it, makes it friendly, and motivates students to participate. Learning how to use technological tools for OER production was a gain. They see an opportunity to approach students in a different way, and to learn about the experience of others	Diversity has no limits for those who develop OER and for those who use them, paying attention to their needs and improving their educational processes. A change of thought, of didactic paradigm, was achieved with the use of tools for the production of OER	The need to continue training in the use of technological tools for OER production. They value the approach of the course, achieving a balance between knowledge and experience It is a collaborative construction process that must be strengthened institutionally in order to be able to implement it

Table 7 Analysis of question 6

Reason	Feeling and desire	Cultural and social influence	Will to believe
The potential of the UDL to include everyone without distinctions of any kind is valued; it gives everyone opportunities in a framework of equality. It is a process that must consider pedagogical, didactic, and conceptual-based aspects, to enable inclusion	It denotes the intention to put educational hegemony aside, and it begins to consider the heterogeneity of the student body; therefore, it values the potential of the UDL learn to recognize differences, and to guarantee everyone what they deserve	Any teacher with a certain dedication of time and minimal skills (technological and pedagogical) can understand the UDL and produce the OER	The use of the UDL would be the ideal to ensure learning There is a conviction that this process will facilitate the construction of OER, regardless of the discipline, and that this will help to develop inclusive teaching-learning processes in a framework of equality

This analysis has made possible to identify the benefits, barriers, and seriousness perceived by the participants in the course:

- Perceived benefits:
  - OER are an alternative to transform education, achieve inclusion.
  - Check the potential of OER to improve learning due to its accessibility for the benefit of the diverse educational population.
  - Learning related to the recognition of difference in terms of diversity through the definition of profiles, to generate educational processes and, above all, inclusive educational events.

Table 8 Analysis of question 8

Reason	Feeling and desire	Cultural and social influence	Will to believe
Value the inclusive potential of OER, as tools (review the use of the term; I think it is not correct) to improve learning; they are accessible, inclusive, and easy to understand OER guarantees meaningful learning, accessibility, and inclusion. They are accessible to all regardless of their limitations	The OER are an option to improve and facilitate learning in the framework of inclusive education. Teachers indicated that they believe in OER as an alternative to transform education to make it more inclusive	OER are consistent with the policy of education for all The limitations of the population are real, as are the policies that seek to promote the right to education for all, and that is why IES must guarantee these rights	Strengthens the training process

Table 9 Analysis of question 10

Reason	Feeling and desire	Cultural and social influence	Will to believe
The need to base and conceptualize pedagogically and didactically the use of technology to support the disciplinary training process is recognized They highlight the importance of supporting these spaces from both the pedagogical and technological components	The satisfaction of the teachers is clear in terms of the structure of the course and the relevance of the topics; however, they show how dedication time becomes a problem, thinking about implementing and maintaining this kind of strategies, as a guarantee of the success of this initiative and its sustainability. It is recommended to assign and respect certain times to receive this kind of training for the benefit of the process in each academic program As well as the adaptation of existing technological platforms for the parameterization of REA. A point to highlight refers to the power to contextualize the course in the university environment	It is recommended to strengthen the feedback in these training initiatives to all the teaching staff; for this, it would be appropriate to generate a reengineering process to the experience, also linking structural elements foreseen in world educational policies	The teachers created good expectations regarding the learning acquired and the development of competencies in the use of the A-Tutor platform; they also recognize their weaknesses and propose to continue with the training for the creation of OER resources, with the implementation of an institutional platform for that purpose; they recognize the importance of giving continuity to these processes, assigning the times required for the development of these initiatives, strengthening the theoretical aspects, and taking them to the practical scenario through planning, in order to measure the results

Table 10 Analysis of question 7

Perception	To improve
It denotes personal and professional satisfaction with what has been learned and achieved in the production of the OER; however, the need to make this a habit is reflected. His position is critical, he self-reflects on his experience and learning and sets himself new challenges	It is evident that they began a transformation process; they are aware that they have much to do, such as improving the resource, promoting its use, and continuing to work on the creation of OER. They recognize the potential of the UDL for the production of OER; new challenges arise for the use of tools and production of technological resources to improve their teaching performance

Table 11 Analysis of question 9

Positive	To improve
They consider that the Atutor is a fairly complete, friendly, and intuitive tool, easy to use; for this reason, they were able to overcome their weaknesses in handling web tools to support the didactic work	More training is needed to develop skills in the management of platforms to support the online teaching and learning process. They recommend improving the interface; they consider that at a functional level it complies

- Perceived barriers seen as opportunities:
  - More training is needed to develop skills in the management of platforms to support the teaching and learning process.
  - It is recommended to improve the interface of the A-TUTOR platform.
  - It is necessary to respect certain times to receive this type of training for the benefit of the training process.

- Perceived seriousness
  - Personal and professional satisfaction with what has been learned and achieved in the production of the OER.
  - The coherence and relevance of the course with the universal policy of an education for all and with all.

Conclusion and Future Work

The CO-CREEMOS strategy provides a conceptual framework supported by Information and Communication Technologies for the attention to diversity in the classroom, both virtual and face-to-face. It offers the Fundación Universitaria Technológico Comfenalco: (1) a new vision of the institutional teaching project as a curricular design instrument that welcomes diversity through the adoption of the UDL, (2) a methodological process for the development of Open Educational Resources as well as its integration in the curricular design, (4) process evaluation and associated products rubrics, and (5) technological tools to support teachers in the process of adopting the OER as a way to promote educational inclusion.

From the process of evaluation of the CO-CREEMOS strategy, a great variety of ideas have been obtained: (1) the need to favor reflection on a truly inclusive practice in the faculty it was reaffirmed; (2) the value of the Universal Learning Design is recognized as an approach and set of tools that allows the teacher to develop and implement flexible methodologies to accommodate diversity in their classroom, increasing the learning possibilities of all, contributing to education of all and for all; (3) evidence of the need to offer teachers methodologies for the development of OER that really address diversity while being truly inclusive and accessible; and (4) there is a clear need to offer teachers frameworks for the coevaluation of their educational practices.

It is important, and it is recommended to all professors of the Fundación Universitaria Technológico Comfenalco or other higher education institutions to start these curricular and didactic challenges supported by technology. They should conceptualize, escalate in the changes and visions of human thought, given that thanks to this, today the intentions in the classrooms are inclusive, and accept and respect physical, cognitive, and sensory diversity.

All that was stated above encourages teachers to conduct a research exercise in the classroom, with the purpose of knowing the potential of the student as well as their interests. They should nourish the profile of the course, the process of attention to the diversity of needs through the teaching project, and also the process of adopting OER and mature in these open practices. This exercise will inevitably lead to having clear elements that can be evaluated to validate the CO-CREEMOS strategy in an integral manner.

In conclusion, the CO-CREEMOS strategy leaves an architecture as a cocreational process, defined by clear moments, procedures, and instruments that demonstrate the knowledge management carried out. It is noteworthy that the experience was enriching in learning and feelings, generating interesting interactions at an academic level.

The following steps in the development of the CO-CREEMOS strategy will be aimed at reviewing the entire strategy in light of the UDL, the cocreation processes as well as the coevaluation, as fundamental components of the commitment to overcome the barriers that may exist in the teaching-learning process. The strategy will be further nurtured with the feedback of academic peers; this will be done in order to refine it, strengthen it, and extend its benefits.

Contents

Abstract

ProEDU is a repository with the purpose of providing Educational Resources for students, teachers and managers of the Brazilian Network of Professional, Scientific and Technological Education. With the evidence of the lack of Educational Resources with accessibility so that people with disabilities could have access to the contents deposited in the repository, an effort was started to research the process of production of Open Educational Resources with accessibility. This work presents the result achieved over these 8 years of project bringing

information about the Recommendation for the Production of Open Educational Resources with Accessibility, a technical document with guidelines on how to produce educational content with accessibility for People with Disabilities within the scope of the Professional, Scientific and Technological Education Network (PSTEN) of Brazil.

Introduction

In a systematic review of the literature carried out by the authors in the Capes Journals Portal databases on the topic Open Educational Resources with Accessibility (OER), no results were found with information on technical guidelines for the production and sharing of OER with accessibility for People with Disabilities (PwD) and who met technical-scientific quality criteria.

In order to promote barrier-free access to content, the planning and production of OER must incorporate technologies that consider content accessibility. It is also understood as necessary to share educational projects with the respective OER, in the repositories, including the knowledge about the planning and objectives, target audience, contexts, and prerequisites for remixing or adapting educational resources and their contents of in order to maintain methodological theoretical coherence. As a result, we present the effort made in the ProEDU project (proedu.rnp.br), a repository focused on the Professional, Scientific and Technological Education Network (PSTEN), which provides guidelines for the production and sharing of OER with accessibility for People with Disabilities.

Regarding the design of OER with accessibility, a series of Brazilian and international standards and recommendations were compiled in a document called Technical Recommendation for the Production of Open Educational Resources with Accessibility. This document presents parameters to be considered in the production process to promote the breakdown of barriers to OER content.

The production of quality educational resources with accessibility has a high cost considering both those developed by teachers and content production teams. Considering these aspects, it is recommended to adopt the philosophy of Open Education and to value the reuse of OER and the interoperability between different platforms. From another perspective, there is an enormous potential in the production of educational resources in Universities and Federal Institutes geographically dispersed throughout the Brazilian territory. It is not unreasonable to assume that many of these resources are developed with similar learning goals, representing an unnecessary technical, intellectual, and financial effort.

In this scenario, aiming to create a sharing culture, breaking barriers in accessing digital educational content, reuse, and collaborative work, ProEDU implements the flow for publishing Open Educational Resources with Accessibility considering different alternative formats or versions including the source code and the educational project that gave rise to the development of the resource.

Therefore, the objective of this chapter is to present the process and the respective flow for the production of Open Educational Resources with Accessibility from analysis to evaluation by real users. However, before doing a brief presentation of the concepts of open access and open education, passing through the concept of OER, a historical description of the ProEDU project (proedu.rnp.br) culminating in the model adopted by the project is summarized in the document called Technical Recommendation on Accessibility for OER Production.[1]

Open Access and Open Education

ProEDU's relationship with the philosophy of Open Access (Open Access) is presented in two perspectives: from the great influence of movements in favor of Open Access for the creation and dissemination of repositories; and through Open Education, a term popularized from the 1970s onwards, but currently adopted and disseminated (although not exclusively) by the OER movement (Santana et al., 2012). In this way, the understanding proposed by Amiel and Zancaro (2015, p. 919) is adopted when declaring:

> Of particular relevance to the concept of 'openness' is its articulation in various spheres of action, complementary to education, such as open science, open data and Free/Libre and Open Source Software (FLOSS), which are part of an area pulsating with activism in non-formal spaces that increasingly involve formal educational institutions.

With the understanding that Open Access is part of a strategy adopted since the development phase of ProEDU, including the modeling and definition of repository requirements, some historical and conceptual information that served as a basis for the adoption, development and implementation are presented. of computational resources and recommendations that make ProEDU a Repository of Open Educational Resources for the Brazilian Professional, Scientific and Technological Education Network.

Open Access Movement

In the late 1990s, some manifestos, conventions, and declarations claiming open access to scientific publications were registered. Such claim occurred due to the high costs imposed by the publishing market, corroborated by the increased rigidity of legislation regarding intellectual property (Shintaku & Sales, 2019). This led to the engagement of professionals involved in scientific communication, giving rise to movements in defense of open access.

In a more classic view, presented by Lynch (2003, p. 9, our translation): "Open access is a cost-effective way to disseminate and use information. It is an alternative to the traditional subscription-based publishing model made possible by new digital

---

[1] Document available at http://proedu.rnp.br/handle/123456789/1648

technologies and networked communications." The National Academies of Sciences, Engineering, and Medicine (2018, p. 196, our translation) proposes a more contemporary and detailed definition:

> **Open Access**: an ambitious goal aimed at ensuring the availability and usability of academic publications. Free availability on the public internet, allowing any user to read, download, copy, distribute, print, search or link to the full texts of these articles, track them for indexing, pass them as data to software or use them for any other legal purpose, without financial, legal or technical barriers that are not inseparable from Internet access.

Thus, the strengthening of initiatives aimed at promoting free access to scientific information occurred through the constitution of this international movement – MAA – which provided for the adoption of common strategies by the community involved with the generation (research) and communication of science, aiming to make available the world scientific production in open access (Costa & Leite, 2017). According to Santana et al. (2012), definitions of Open Access were presented in three declarations, known as BBB definitions of open access: that of Budapest (2002); Bethesda (2003); and Berlin (2003). Costa and Leite (2017) emphasize, however, that even though it was not the first to coin the term Open Access, the Budapest Open Access Initiative (BOAI) "[. . .] was the first initiative to discuss the central idea of open access" (Costa & Leite, 2017, p. 46). The authors highlight three precursor documents, all from the year 1999, which served as a subsidy to the MAA's conceptions: the Declaration of Santo Domingo; the Declaration on the Science and Use of Scientific Knowledge; and the Science Agenda.

From this perspective, Sebriam et al. (2017) refer to the "open movement in favor of free culture," about which they clarify:

> It is a worldview based on the freedom to use, distribute and modify cultural, scientific and technological works and works freely. The concept of open has to do with appreciation for the act of sharing and is based on the principle that the best works are made and improved collectively (Sebriam et al., 2017, p. 28).

According to these authors, the advent of the Internet as a common good, available to all of society, gave rise to: "several aspects of promoting 'open' provision [...]. The most robust of them, which gave rise to the contemporary notion of 'openness', was Free Software" (Sebriam et al., 2017, p. 28). However, this philosophy based on sharing and collaborative construction, which is configured as the "contemporary notion of openness," as the authors point out, went beyond free software and started to involve specific themes, including Open Education (Iniciative..., 2020, electronic document; Amiel, 2012; Sebriam et al., 2017).

It is possible to see that the "contemporary notion of openness" has been expanding its reach in several sectors of the digital society. Although there are movements with this philosophy not mentioned here, it is considered more appropriate, at this time, to deepen the topic of Open Education a little, due to its connection to OER and to digital educational repositories – used to expand access and enable the right to education advocated by this movement.

Open Educational Resources (OER)

Butcher et al. (2015) summarily define educational resources as any material developed for the purpose of teaching and learning. However, Mallmann and Nobre (2015, p. 623) emphasize that: “One of the conditions for a resource to be considered educational is that it becomes a conditioning and structuring element of the teaching-learning process.” Thus, they argue that an educational resource is: “[...] an organized, intentional, systematic and formal teaching material to support the teaching-learning process.” (Mallmann & Nobre, 2015, p. 624). However, Camilleri et al. (2014) clarify that there are still tensions about what constitutes an educational resource. These are related to the nature (only digital x or not) and origin (only that produced with an explicit educational objective x any resource with potential for learning) of the resources.

In this area, there is a need for clarification on the terminology adopted, as well as on the justification for the option made. For this purpose, item 2.4 presents some fundamental questions for understanding the concept of OER, as well as its historical and terminological evolution.

Although the sharing of educational content is nothing new, there has been an increase in breadth, agility, and ease of dissemination in recent decades. This is due to the possibility of producing digital content and the greater reach of the Internet (D’antoni & Savage, 2009). This theme, according to Wiley (2002), started to be part of educational guidelines more frequently from 1994, when Wayne Hodgins coined the term learning objects. Wiley (2002) also discusses the proliferation of definitions and terminological variations used since then to describe these small instructional components.

However, it is noteworthy that the formative path of the concepts to be explored in this topic – learning objects, open content, and open educational resources – brought distinctive elements to their conceptions. In this sense, Mallmann and Nobre (2015) clarify that the variations are not only terminological, but: “[...] about the formats, pedagogical principles and the role of resources/materials/objects destined to the teaching and learning process.” (Mallmann & Nobre, 2015, p. 4).

Andreia Inamorato dos Santos, in her work on OER published by UNESCO and Cetic.br, declares: “Open educational resources (OER) are often called learning objects or open content.” (Santos, 2013, p. 21). However, the author soon establishes the distinctions between the terms, starting by returning to the concept presented by Wiley (2002) about learning object (LO): “[...] small instructional component that can be reused in different learning contexts.” (Santos, 2013, p. 21). The term comes from the field of curriculum development and instructional design, especially aimed at those courses and materials supported by technologies, aiming to promote learning from small reusable instructional blocks (Wiley, 2002; Mallmann & Nobre, 2015). However, for these instructional blocks to be considered OA and used in different learning contexts, they need to present the attributes listed by Mendes et al. (2007) and complemented by Aguiar and Flôres, namely reusability, adaptability, granularity, accessibility, durability, interoperability, and metadata.

Aguiar and Flôres (2014) add an important reservation made by Wiley (2002) by emphasizing, in addition to the essential attributes to be considered an LO, an essential characteristic – intentionality – concerning the teaching-learning process. Thus, according to the authors, Wiley assumes:

> [...] a critical position regarding the profusion of digital resources that have been referred to as "learning objects", but which serve only to glorify online teaching, in the same way that decorative figures are often used, unintentionally, to decorate school newspapers. (Aguiar & Flôres, 2014, p. 13).

In this way, it is possible to see that the importance of the essential attributes of LOs is due to the expansion of the possibilities for a given object to be reused. However, intentionality is what differentiates any digital resource from a learning object.

Adhering to the principles of the free and open source software movement (FOSS), Wiley created in 1998 the concept of open content (open content) and the Open Content License and Open Publication License. It defines open content as any intellectual work (except software) licensed to allow its free and perpetual use to carry out the activities covered by the five rights (5R) (Wiley, 2019; Santos, 2013; Costa, 2014). This definition goes back to the possibility of using these "[...] educational content open in different contexts by different teachers and students and migrating through different contexts." (Santos, 2013, p. 21).

Thus, it can be seen that when the term OA was proposed (1994), the essential characteristic elements were, in short: purpose of supporting learning (intentionality); and possibility of division/regrouping in instruction blocks aiming its reuse in different learning contexts. Wiley brought the notion of openness to educational content, establishing as a condition for a content to be considered open, in addition to free and perpetual availability, the attribution of permissions for use (5R).

Then came the OER movement, supported by two fundamental initiatives: the creation of Creative Commons licenses in 2001, which allowed greater flexibility in the face of restrictions imposed by copyright legislation; and the launch of the Open Course Ware Project in 2002 by the Massachusetts Institute of Technology (MIT) (Santos, 2013; Costa, 2014). From the last initiative came the OpenCourseWare Consortium (OCW), composed of "[...] several educational institutions around the world that have come together in a consortium to foster the OER movement through the production of content and advice on policies, promotion and research." (Santos, 2013, p. 21).

The term Open Educational Resources was used for the first time at UNESCO's Forum on the Impact of Open Courseware for Higher Education in Developing Countries in 2002, assuming the following definition: "The open provision of educational resources, enabled by technologies information and communication, for consultation, use and adaptation by a community of users for non-commercial purposes." (Forum..., 2002, p. 24, our translation). Currently, UNESCO adopts the following definition on its website:

> Open Educational Resources (OER) are teaching, learning and research materials in any medium (digital or otherwise) that reside in the public domain or have been released under an open license that allows access, use, adaptation and redistribution by third parties without cost, restrictions or limitations (UNESCO, 2019, electronic document).

Since then, UNESCO has promoted forums, conventions, and projects aimed at spreading the OER movement. An example of this is the project developed by the Institute for the Application of Information Technologies in Education, UNESCO (Institute of Information Technologies in Education – UNESCO IITE) – Open Educational Resources (OER) – whose objective is to promote the OER movement in nonspeaking countries of the English language (Badarch, 2013). The strategies defined during the meeting, promoted by the Shuttleworth Foundation and the Open Society Institute (OSI), which took place in 2007 in Cape Town, bringing together advocates of open education, also contributed to the establishment of OER (Costa, 2014). The "Cape Town Declaration for Open Education" was drafted on that occasion, based on the view that education is "built on the belief that everyone should have the freedom to use, customize, improve and redistribute educational resources without restrictions." (Cape Town Open Education Declaration, 2007, electronic document).

Thus, from the creation of Creative Commons licenses, as well as the actions developed by institutions linked to the OpenCourseWare Consortium and UNESCO to foster the OER movement, there was a majority adoption of this term to designate the materials/content/resources that include the various attributes considered essential by the aforementioned movements.

ProEDU Development History

The need to have a reference place to store and share digital educational resources produced by public institutions participating in programs carried out through the e-Tec Brasil Network (current EPCT Network) that took place in the country since 2008, by induction to Office of Vocational and Technological Education of Education Department, was required for the development of a repository to give public access to this liability of materials and courses produced within the scope of the e-Tec Brasil Network.

In 2015, the ProEDU Repository for Professional and Technological Education began being conceived as partnership between the Federal Institute of Education, Science and Technology Sul-rio-grandense – (IFSul), the Federal Institute of Education, Science and Technology of Ceará (IFCE), the Federal Institute of Education, Science and Technology of Rio Grande do Norte (IFRN), and the Federal University of Santa Catarina (UFSC), but its launch took place only in 2016 (Silva et al., 2017).

In April 2016, the first phase of the ProEDU Project began, the Repository for Professional and Technological Education, having as its main function, in general terms, to gather the various digital educational resources produced by the EPT

Network, in order to facilitate access to them and preserve the intellectual memory of the Network. In October 2016, phase 1 of ProEDU was completed, containing 400 registered OER. Phase 2 of the Project was from January 2017 to July 2018. Among its advances, the increase in the total number of published objects (which exceeded the number of 1295) and the transfer of hosting of the service to the Internet Data Center stand out of the National Research Network (RNP). The Project, currently in phase 3, started in January 2019, indicated among its priority goals the establishment of content validation and use policies, as well as the preparation of manuals for different user profiles.

The project aims to preserve intellectual memory, permanently gather in a single virtual place the production of the Professional and Technological Education Network. A key factor of the project is open access to digital educational resources to expand and facilitate the dissemination of resources in general. Based on these premises, ProEDU provides Open Educational Resources focusing on teachers, students, managers, and education professionals within the scope of Federal Institutes, in particular, and for the EPT Network as a whole. Thus, it constitutes a reference source for the institutions of the Brazilian Professional and Technological Education Network.

The educational resources made available by ProEDU meet the reusability criterion, made possible by Creative Commons licenses (Ribeiro & Catapan, 2018). They have a broad thematic classification, based on the areas of knowledge of CAPES (Brasil, 2020), and can be of 10 types, defined according to the repository communities.

ProEDU Structure and Characteristics

The content published in the ProEDU Repository is structured on two levels: the Communities – defined from the study of the media nature (types) of the files that the Repository must support – and, within each community, the Collections – established from the technological axes of the National Catalog of Technical Courses. There are currently 10 types of media: animation, audio, thematic notebook, courses, image, book, web page, digital technologies, electronic text, and video. Each community is subdivided into 17 collections that represent thematic axes: Environment and Health, Control and Industrial Processes, Educational and Social Development, e-Tec Idiomas, Management and Business, Information and Communication, Infrastructure, Military, Research in Science and Technology in Education, Research in Distance Learning/ICT, Food Production, Cultural Production and Design, Industrial Production, Professional, Natural Resources, Security, Tourism, Hospitality, and Leisure.

The second stage sought to foresee conceptual, philosophical, and technological attributes that are indispensable or desirable for the design of the repository. Through this research, experts identified 66 fields or functions needed by the repository.

Among the conceptions that guided the planning of ProEDU, the definition of policies for the production process of Accessible OER, established in the Technical

Recommendation on Accessibility for the Production of Educational Resources, stood out.

In this recommendation, there is the proposition of eight seals created by ProEDU, aimed at attesting the quality of the resources made available by the Repository and signaling the end user, in a visual and practical way, regarding the quality assessment. The seals are of three types: **Instructional Design** (ID) label – indicates that the resource has been approved by a team of experts with regard to the methodology and planning applied; **Accessibility** label (AC) – attest that the content is presented in an accessible way. It is divided into six stamps, which identify the accessibility function it has (LIBRAS, audio description, screen reader, subtitling, audio transcription, e-MAG); **Technical Scientific** label (TS) – when there is participation of experts on the subject presented in the REA, such as content writer or content reviewers.

Thus, the researches and studies carried out by the ProEDU Project work teams led to the information architecture modeling, the metadata application profile, and the resource evaluation approach that best meets the objectives and differences of the EPT Network. Among these differentials, established from the functions identified as essential to the repository during the second stage, is the availability not only of the final version of the didactic resource (with its proper use permissions informed through the assignment of flexible licenses), but also of its various instances, such as: "[...] editable source files for updating, varied formats for professional or personal printing (offset, black and white and color), lightweight versions for mobile devices (e-books)" (Ribeiro, 2017, p. 18209), in addition to the instructional project that gave rise to the resource.

This differential favors technical openness (Miao et al., 2019) because, by providing editable files from different stages of development of the resources produced by the EPT Network, it allows for its updating and adaptation, thus contributing to its virtuous circle of OER (Miao et al., 2019; Amiel & Duran, 2015). In addition, the information contained in the REA instructional project (also available in the repository) complements the description of the resource (made through the metadata) and helps to fulfill a prerequisite for the resource to be considered a learning object, the explanation of the pedagogical objective. Given the need to "[...] provide clear guidelines so that the student knows what he is expected to learn when using the learning object and the teacher (as distinct from who produced the object) knows how he could use it." (Carneiro & Silveira, 2014, p. 240).

Accessibility in Repositories and in OER

Based on universal access and the autonomy of any user to access ProEDU content, it is recommended that all OER made available through ProEDU include accessibility features for PwD, as the Brazilian Law of Inclusion (Brasil, 2015) was established on July 6, 2015, it determines in its article 27 education as "the right of people with disabilities, ensured an inclusive educational system at all levels and lifelong learning," as well as in its article 28, item II, emphasizes the responsibility of the government to improve educational systems: "aiming at guaranteeing conditions of access, permanence, participation and learning, through the provision of accessibility services and resources that eliminate barriers and promote full inclusion" (Brasil, 2015).

In addition to the right to access the content of these OERs, another fundamental point for PwD to access these contents is accessibility to the computational system that make up the repository. Accessibility to the system deals with efficient navigation from screen readers and translators from Portuguese to Brazilian Sign Language (Libras), in addition to providing contrast options, font size, and proper organization of the elements displayed on the web page, font for person with dyslexia, among others (Fig. 1). In addition, the ProEDU Repository's Technical Recommendation on Accessibility for Open Educational Resources is intended to support the adaptation of OER already produced and to provide subsidies for the planning and production of new OER.

The OER deposited in ProEDU that include the accessibility features and models proposed by this Recommendation are identified from a set of accessibility seals. Each feature or template has its own label.

Accessibility seals are awarded to OER from the completion of validation processes; such processes presuppose the participation of PwD in the accessibility assessment. The synthesis of the application of resources and models can be found in the annex of the Technical Recommendation on Accessibility for the Production of Educational Resources.

Fig. 1 Accessibility features implemented in the ProEDU interface. (Source: Prepared by the authors)

Planning and Production of Open Educational Resources with Accessibility

Considering the need to develop OER with accessibility for PwD, ProEDU mapped the production process of Educational Resources for PSTE - Professional, Scientific and Technological Education, taking into account accessibility in different types of media, as presented in the section “ProEDU Structure and Characteristics.”

With the significant increase in the use of digital educational technologies, as published in the statistical notes of the School Census carried out in 2017, ID professionals can, in the current context, turn their attention to this PwD audience.

The number of enrollments of students aged 4–17 with disabilities, pervasive developmental disorders or high skills in basic education has grown substantially in recent years, and, in addition, the percentage of students in this age group included in regular classes has increased from 85.5% in 2013 to 90.9% in 2017. Considering this same age group, the percentage of students who are in regular classes and who have access to specialized educational services (AEE) also rose, from 35.2% in 2013 to 40.1% 2017 (INEP, 2018, p. 9).

So that Virtual Learning Environments (AVA) and OER that make up courses in general are accessible to students with disabilities, it is necessary that the adaptations of these AVA and the development of these OER follow specific accessibility recommendations. Therefore, the ID model of these elements should adapt to these recommendations with regard to production flows and team composition for this purpose.

The accessible ID model that will be proposed can be applied in different teaching modalities, not being restricted to Distance Education (DE), considering that the flows will be the same, only modifying the nature of educational resources and the environment in which the instruction will occur. In future works, the ID model will be presented in a generic way, that is, applicable to other teaching modalities.

In summary, this proposal suggests the adaptation of the Extended ADDIE Model where the pilot execution phase includes the validation of accessibility of courses, among other recommendations related to flows and insertion of new professionals in the educational project team.

The process takes into account two phases (Fig. 2): design and execution. In the design phase, the flow goes through three steps. In the first step (analysis), it is necessary to consider the PwD public and their specific needs for access and understanding of the content. In the second step (design), the educational resources must be designed and a team must be provided for the production or adaptation of existing materials to implement accessibility to the contents. In the third step (development), production flows or content adaptation flows must be defined for the development of the educational project for the production of Open Educational Resources with Accessibility. In the execution phase, the first step (implementation) deals with the availability of the Accessible OER, the second step (pilot execution) aims to allow access and use of the Accessible OER, and the third step (evaluation) aims to obtain feedback from the public, especially People with Disabilities, in order to improve the Accessible OER. If so, the process is restarted.

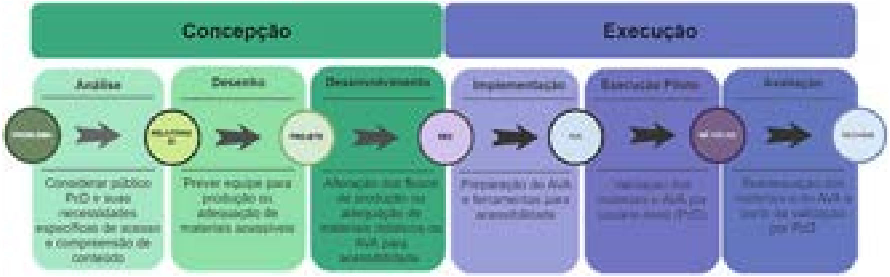

Fig. 2 Proposed instructional design template with accessibility. (Source: Silva et al. (2019, p. 747))

About the proposal, this chapter presents a synthetic model under the name of Accessible Instructional Design (AID), as a preliminary result of this research together with the proposal of team composition.

The model proposed in emerges as a result of projects that involved the insertion of accessibility routines in the production or adaptation of OER and VLE in self-instructional or tutored distance learning courses. From the pilots carried out, this model emerges as a hypothesis of Accessible Instructional Design.

Concluding the line of reasoning presented throughout this chapter, the following are presented as future perspectives: the complete development of the Accessible Instructional Design Model (AIDM) flow to support the construction of the OER project considering accessibility, as well as prerequisites for the design of accessible courses, and also the production flows or adaptation of teaching materials for commonly used educational technologies and guidance for the adaptation of an accessible VLE.

Final Considerations

Over the 5 years of the project, the lack of technical and intellectual products that deal with the production process of OER with Accessibility was evident. In this sense, an effort was started to map the process of production of educational resources, incorporating technical aspects into the flow to provide accessibility to OER. The focus of this effort was to present recommendations for production teams, especially those with Instructional Designers, to become able to break down access barriers to content and systems produced by the team or institution.

In addition to the technical recommendation for the production of OER with Accessibility, a qualification is being produced, in the distance modality, having as target audience the educational design centers of the EPT Network. This course is justified by virtue of meeting the recommendations for making content open to everyone. Providing non-excludable materials requires significant changes to the development process, from planning to final editing.

Abstract

UNESCO in its 2030 Agenda sets the guidelines that are needed from an educational point of view in order to equip all people with the knowledge, skills, and values that will allow them to live with dignity, build their lives themselves, and contribute to the societies in which they live. The Sustainable Development Goal No. 4 of the 2030 Agenda constitutes the synthesis of education's goals: "to guarantee an inclusive, equitable and quality education and to promote lifelong

learning opportunities for all." Following this mandate of UNESCO, each country assumed the commitment to act toward it. This chapter describes the situation in the Argentine Republic, placing emphasis on actions related to Information and Communication Technologies (ICTs). In particular, this chapter addresses inclusive education from aspects related to disability, gender, indigenous populations, and isolated regions. First, we present Argentina's regulatory framework in relation to the aforementioned aspects. The different resources and ICT-based learning strategies that have been implemented in our country in this regard are then addressed generally. Subsequently, we describe some technological proposals that were made in Argentine universities. Finally, we identify the strengths and advantages of these technologies in relation to inclusive education in Argentina. It is our hope that this chapter will contribute to disseminating the state of affairs in Argentina in relation to its quest to achieve an inclusive education hand in hand with ICT.

Keywords

Inclusive education · Information and Communication Technologies · Argentine legislation on inclusive education · Educational applications for inclusion

Introduction

Twenty-first-century education calls for formative actions that enhance creativity and the continuous search for knowledge from all points of view and areas related to human beings. Inclusive education reflects the search for equity and equal rights among all people; thus, it arises under the conviction that the right to education is a human right and, therefore, of all people. From this perspective, when referring to inclusive education we shouldn't think only of people with disabilities, but also think of those who live in poverty and marginality, those who belong to non-majority ethnic groups, those who speak minority languages, those who live in remote areas, and those who are marginalized because of their gender. It means, therefore, focusing on all students, especially those that are most vulnerable and who tend to be excluded from the educational system. As described by Cabero Almenara and Fernández Batanero (2014), inclusion is not the same as integration, since inclusion implies moving from an individual model, where the limitation is considered to belong to the person, toward a social model where the problems and limitations belong to the society. Thus, while the main concern of integration is to change and improve Special Education, that of inclusion is to pursue the transformation of culture, educational organization, and school practice in general.

In this way, it is not possible to put aside a resource such as Information and Communication Technology (ICT), and hence the ICT-inclusive education binomial must be understood as a strategy that allows for digital resources to be brought closer to all people regardless of their status or condition from a social, psychological, cognitive, emotional, family, economic, or geographical point of view, for instance

(Yu et al., 2016). Thus, inclusive education mediated by ICTs becomes transversal to all environments of life, providing a large number of learning opportunities, the creation of educational communities, and the search for achieving the greatest number of competencies in students of all educational levels (Freire et al., 2010). Consequently, the chief purpose of ICT in the field of inclusive education, as Marín et al. (2014) indicate, pivots around the objective of achieving the development of the maximum number of capacities and abilities of individuals, in addition to promoting the participation of citizens toward the growth of society, in a large sense.

The interaction between the digital world and educational inclusion, that is, the ways in which the digital world can contribute to the development of learning environments that take into account the diversity of students, and that promote other ways of teaching and learning, and of living together and relating, as well as the commitment to educational innovation oriented toward equity are the focus of this chapter.

The chapter is organized as follows: section "Inclusive Education in Argentina" presents an overview of the legal framework in the Argentine Republic, as well as some actions taken in relation to education for people with disabilities, education for native peoples and migrants, and education for the LGBTIQ community, which is made up of lesbian, gay, bisexual, transgender, intersex, and queer people. Section "Inclusive Education and ICT" specifically addresses the use of ICTs in promoting inclusive education, reviewing technological resources (based on both general learning technologies and assistive technologies, or ATs) and ICT-based strategies to help all students achieve their full potential. This section also presents some technological developments, carried out in Argentine universities in order to support educational inclusion, especially in the universities where the authors of this chapter are affiliated. Finally, section "Conclusions" outlines our conclusions about what was done so far and what still remains to be done regarding the application of ICTs in relation to inclusive education in Argentina.

Inclusive Education in Argentina

The educational system has made significant advances in regulations that expand and consolidate the rights of students. The National Education Law No. 26206 (LEN) is the one that sets the greater objectives of education and regulates the exercise of the right to teach and learn, which is established in article 14 of the National Constitution of the Argentine Nation from 1994 and the international treaties incorporated therein. In article 11 of the LEN, which sets the aims and objectives of the national educational policy, the following is highlighted in two of its sections: "*e) Guarantee educational inclusion through universal policies and pedagogical strategies and the allocation of resources that give priority to the most disadvantaged sectors of society f) Ensure conditions of equality, respecting the differences between people without admitting gender discrimination or of any other kind.*"

The following are regulations developed in Argentina for the inclusion of people with disabilities, indigenous peoples and migrants, and the LGBTIQ community, as well as some specific actions in relation to educational inclusion.

Regulatory Framework

People with Disabilities

Argentina has extensive legislation in relation to people with disabilities. It was the first Latin American country to recognize their rights, in 1981. In 1987 the National Advisory Commission for the Integration of People with Disabilities (*Comisión Nacional Asesora para la Integración de Personas con Discapacidad* – CONAIPD) was created. Then, in 2008, it joined the United Nations Convention on the Rights of Persons with Disabilities through Law 26378; through Law 27044 of 2014, a constitutional hierarchy was granted to the Convention.

The National Disability Agency replaced CONAIPD, as of 2017, and it is now in charge of the design, coordination, and execution of public policies on disability.

Additionally, the social model of disability supported by the World Health Organization and the United Nations is proposed in Argentina. There are different regulations for specific issues about disability, including screening, treatment, digital accessibility, and work.

Access to education for people with disabilities is protected by the National Constitution, the regulations already mentioned, and the LEN No. 26378 of 2008, which maintains that the Argentine state guarantees equal opportunities and is committed to working toward the inclusion of students with disabilities in the educational system in general and universities in particular. Specifically, higher education for people with disabilities is guaranteed by Higher Education Law 24521 of 1995 and its amending Law No. 27204 of 2015, which specifies the effective implementation of state responsibility at the level of higher education. All Argentine legislation on this issue is available in the National Disability Bulletin (*Digesto Nacional de Discapacidad*).

Indigenous Peoples and Migrants

Argentina is a multicultural, multiethnic, and multilingual country, due both to the presence of indigenous populations and to migrants who speak different languages and have different cultural origins. In the country, there are 31 indigenous peoples living in different areas, who speak different languages, out of which 15 are officially recognized and 9 are in the process of "revitalization." All this generates very diverse local environments. In the 1980s, education policies related to indigenous issues began to be analyzed. In 1994, the Constitution of the Argentine Nation was amended, including article 75, paragraph 17, which "recognizes the ethnic and cultural pre-existence of the Argentine indigenous peoples" and "guarantees respect for their identity and the right to a bilingual and intercultural education."

In addition, article 52 of the LEN establishes: "Intercultural Bilingual Education (IBE) will be featured in the educational system of the levels: Initial, Primary and

Secondary Education so that it guarantees the constitutional right of indigenous peoples, in accordance with article 75 paragraph 17 of the National Constitution, to receive an education that contributes to preserving and strengthening their cultural guidelines, their language, their worldview, and their ethnic identity." Among its lines of action, there will be teacher education and training, production of materials, scholarships for indigenous students, regional agreements with Andean countries, and monitoring and evaluation of IBE experiences and programs.

In 2007 the Ministry of Education created the National Intercultural Bilingual Education Program in order to strengthen IBE actions. In 2010, IBE was ranked as "Modality" and assigned tasks and responsibilities in each one of the compulsory educational levels and in teacher training.

LGBTIQ

In Argentina, the LEN and the National Law on Comprehensive Sexual Education No. 26150 from 2006 ensure equal conditions and respect for differences, affirming the right not to be discriminated against, based on gender or any other aspect. Special mention is made of comprehensive sexual education as one that "articulates biological, psychological, social, affective and ethical aspects" with the purpose of "promoting learning based on respect for diversity and rejection of all forms of discrimination."

In 2012, Congress passed the Gender Identity Law No. 26743, which establishes the right and recognition of people's gender identity.

In 2013, the National Law No. 26892 was enacted regarding the promotion of coexistence and addressing social conflict in educational institutions, with the aim of promoting "respect and acceptance of differences, the rejection of all forms of discrimination, harassment, violence and exclusion in interactions between members of the educational community" (art. 2) as well as preventing and acting against "abuse, discrimination, bullying or any other form of violence between peers and/or between adults and children, adolescents and young people" (art. 8). According to a study on violence in education in Latin America carried out by UNESCO (2015), Argentina is the only country in the region whose legislation addressing homophobic and transphobic, gender, and school violence is considered "sufficient."

Inclusive Education in Argentine Universities

Actions for the Inclusion of People with Disabilities

In 1991 the University Network for Special Education (*Red Universitaria de Educación Especial* – RUEDES) was established, made up of programs on Special Education in public universities. It sought to generate an interuniversity space that promotes the training of human resources and research in the field of Special Education and disability. In 1994, the Interuniversity Commission on Disability and Human Rights was formed, whose primary function was to provide an area where the insertion of people with disabilities in university life would be analyzed. Later, in 2003, the Interuniversity Network for Disability and Human Rights emerged, which made it possible to incorporate more universities, consolidating the actions carried out so far. Its fundamental objective is to promote accessible universities. It tackles topics such as physical, communicational, and academic accessibility, flexible curricula, and teacher training. It seeks to incorporate the paradigm of Universal Design in the approach to disability and it is currently called the Interuniversity Disability Network. In 2007, National Interuniversity Council approved the Comprehensive Accessibility Program (Res. N° 426/07) that includes physical and academic accessibility, which includes communicational accessibility, educational equipment, and training of the different actors within the university community.

The most frequent technical aids are bibliographic materials that are adequate, computers with voice readers, screen magnifiers for students with vision impairments, enlarged photocopies, the interpretation of Argentine Sign Language (ASL), braille material, voice magnifiers, magnetic rings, voice recognition, haptic maps, talking library, and audiovisual material (Méndez & Misischia, 2019).

Regarding the academic offer of Argentine universities that favors the inclusion of people with disabilities, there is the University Diploma in Interpretation of Argentine Spanish Sign Language (TUILSA-E), which is taught at the National University of Entre Ríos. At the National University of Quilmes there is a postgraduate degree called "Production of Digital Didactic Materials with Accessibility," and at the National Technological University there is another program in "Accessibility and Web Usability." Special Education graduates are also trained at the National Universities of San Luis and San Martín.

Actions for Aboriginal Peoples

Regarding the training of human resources in IBE there are two universities that currently provide this training: The National University of Santiago del Estero (Universidad Nacional de Santiago del Estero – UNSE) offers a diploma in IBE with a mention in Quichua language and the National University of Chaco Austral teaches a bachelor's degree in Intercultural Bilingual Education. There is also non-university higher education training with an intercultural approach in different provinces of northern Argentina (Guaymás, 2018).

Considering that large groups of indigenous populations live in rural areas, having campuses close to where they live helps their members access higher education. Guaymás (2018) published a list of actions carried out in 19 public universities with the aim of working with students and indigenous communities, especially. Among them, there are classes, centers, and programs that are open and that work with students and indigenous communities (Mato, 2020).

Since 2000, the Secretariat for University Policies has included a subprogram for indigenous students within the National University Scholarship Program, achieving greater visibility for indigenous students; in some universities, it helped form support and research programs (Mato, 2020). Something else to highlight is the Indigenous Peoples Program of the National University of the Northeast. This program, the first in the country with these characteristics, has an Advisory Commission made up of representatives of the three recognized indigenous peoples in the province of Chaco (Qom, Wichi, and Moqoit). The inclusion of indigenous youth and adults within university programs is promoted through different actions, such as offering scholarships or tutorials.

Among the programs that involve ICTs and that benefited from the participation of telecom and Stanford University, is the "Programmable Open Mobile Internet," which aims to improve access to education for the most marginalized populations, encouraging reasoning, creativity, and a scientific attitude in children and young people, by using mobile technologies (smartphones/tablets). The Ministry of Education participated along with universities, technological institutes, and social organizations. In Argentina, within the framework of this project, pedagogical strategies were generated using cell phones in the provinces of Misiones and Salta. Interactive educational games where the premise is to "learn by playing" became a reality. The applied pedagogical model is based on the design-based learning approach that aims at project-based learning.

Actions for LGBTIQ

In 2012, the National Program for Comprehensive Sexual Education began in Argentina, which has trained almost 80,000 teachers throughout the country so far. Within it, it's worth mentioning there are contents that include a "critical approach and analysis of masculinity and its dominant representations: force, aggressiveness, violence" and "reflections on the implications of homophobia."

Currently, Argentina is a member of the Ibero-American Education Network LGBTI (*Red Iberoamericana de Educación* – RIE), a group of organizations that works in favor of promoting and respecting human rights for LGBTI persons in the educational field. Its main objective is to help prevent and eliminate all forms of discrimination based on sexual orientation, gender identity, or gender expression in the classrooms of Latin American countries. RIE worked to improve the school environment of LGBTI teachers and students, promoting public policies that institutionalize educational projects that take into account human rights focused on sexual and gender diversity. The Argentine LGBT Federation, the main Argentine NGO in matters of sexual and gender diversity, created in 2005 through the Ministry of Education, ensures that all people can enjoy a multicultural and inclusive education.

In the provinces of Buenos Aires and Tucumán, there are educational centers that enroll the trans and transvestite community in secondary studies: Trans Mocha Celis Secondary School and Open Doors Trans Educational Center.

Examples of Actions in Two Argentine Universities

Starting with the national regulations mentioned above, each university began issuing its own regulations and taking action toward inclusive education. As an example, there is the case of the National University of Santiago del Estero (Universidad Nacional de Santiago del Estero – UNSE) and the National University of Tucumán (Universidad Nacional de Tucumán – UNT), two public universities in northern Argentina; being institutions of the national state, they have the non-delegable function of providing access to higher education to people with disabilities under equal conditions.

In 2011, UNSE published its Institutional Declaration on Disability and created the Disability Commission, which guarantees equal opportunities for all members of the university community. Its objective is to contribute to the inclusion of people with disabilities within the university environment, developing actions that favor full integration and eliminating physical, academic, and attitudinal barriers. In 2015, the Manual of Action and Good Practices for Inclusion at UNSE was issued. It presented a set of basic actions referring to the different instances of the teaching and learning processes that ensure access, entrance, and completion for students with disabilities.

In addition to the work carried out by the Disability Commission, it is important to highlight the work carried out by the Center for Educational Pedagogical Orientation (COEP). This center works on the implementation of Universal Design, optimizing academic accessibility. With this aim, it advises on adapting the learning paths and evaluation mechanisms for students with disabilities. It provides direct assistance to students and teachers, on the one hand, and participates in the Disability Commission where it addresses general problems, on the other. Among its most important actions, the inclusive workshop for applicants to enter UNSE stands out. The main tasks and challenges of COEP in terms of inclusive education were published by Barrera Nicholson et al. (2020).

At the UNT, the Program for Disability and Social Inclusion (PRODIS) was created in 2007, as a result of a political decision by the university to achieve the full inclusion of people with disabilities, using strategies that allow the accessibility of the institution in a comprehensive way. Among the actions carried out, the following stand out: training courses in reading and writing Braille and stenography for blind or visually impaired people, computer training for people with visual and hearing disabilities, a workshop on basic computer tools for people with intellectual disabilities, and courses in Argentine Sign Language (ASL). In addition, a Department of Digitization was created, which supports a permanent communication accessibility service by adapting bibliographic material to accessible formats such as audio and Braille. This service is also provided to students from other educational institutions. To promote communication accessibility, the support of sign language interpreters is available to students who require it.

In 2017, UNT, through PRODIS, began a set of actions aimed at the entire university community. Among them are designing UNT virtual sites that comply with international accessibility standards, digitization of material that has to do with communication accessibility, and training of personnel from different levels (teachers, non-teachers, and students) in basic notions of ASL.

UNT counts with working groups that are very committed to the issue of disability in various spaces. The Department of Special Education of the Faculty of Philosophy and Letters has investigated the barriers encountered by students with disabilities in their university careers and developed teaching strategies to favor accessibility in their educational trajectory. It produced great scientific papers on the subject, some contributions being Contini et al. (2013) and Esterkind and Hormigo

(2015, 2020). Other initiatives have to do with the Universal Design Office of the Faculty of Architecture and Urbanism, which works on physical accessibility, as well as the actions and research projects by the Faculty of Exact Sciences and Technology, which are aimed at the development of technological aids and communication accessibility tools.

Within a program funded by the SPU for public universities in 2012, all students with disabilities were provided with notebooks, adapted to their needs, which was a great advance in academic and communication accessibility.

In relation to aboriginal peoples, UNT founded the Center for the Rescue and Revaluation of Cultural Heritage in 1989, which performs a scientific task at the service of their culture, starting from the multiple problems regarding identity and cultural heritage in the northern region of the country.

In 2009, the Native Peoples Department was created within the Faculty of Philosophy and Letters of the UNT. From this space, indigenous leaders teach classes, addressing different problems that affect their communities. The department works with the Union of the Peoples of the Diaguita Nation, allowing interaction between students and members of recognized indigenous communities in the provincial territory.

Inclusive Education and ICT

The use of ICTs with regard to attention to diversity implies extending the principle of educational equity. But the importance of the use of these in the field that concerns us is found both in what they can contribute to the subject (acquisition of competencies) and in the way in which they can favor the transformation of the learning context so as to offer more and better learning opportunities and development for all (García García & López Azuaga, 2012).

At this point, it is important to highlight the distinction between what was called integrative uses and inclusive uses years ago (García García & Cotrina García, 2004). The purpose of integrative uses is more focused on the compensation of inequalities from a more individualistic approach. In the second instance, that of inclusive uses, the introduction of ICTs and their use represents an opportunity to move toward a more cooperative, meaningful, and interactive education model at the service of contexts, which allows more tailored attention to needs and interests.

In this regard, an interesting line of research is starting to open which associates ICT and inclusive education. The beginnings of it are translated into studies about accessibility, which refers to the conditions that environments, products, and services must meet in order for them to be understandable, practicable, and usable by all people (Spanish Association for Standardization and Certification, 2012). This definition is the result of a line of thought in which a specific medical problem or special need is not something that should be considered by itself, but rather this sort of thinking emphasizes the diversity of all people and their situations depending on access, and believes that access should be provided to all.

However, inclusive ICT research is currently advancing along other paths, that of Universal Learning Design (UDL) (Ruiz Bel et al., 2012). UDL precisely states that disability is in the environment and points out that it is the environment that is disabling. Among the principles of Universal Design is to provide multiple means of representation to address the multiple modes of perception and understanding of what is presented for learning. ICTs can be used to support inclusion by providing different ways of presenting information, expressing knowledge, and engaging in learning, including assessment. Thus, going more in depth regarding ICTs and attention to diversity, it is relevant to review technological resources and ICT-based strategies that support all students reach their maximum development.

Resources and Strategies

When analyzing ICT-based resources, it is necessary to refer to both general learning technologies and assistive technologies designed specifically for people with disabilities (UNESCO, 2020).

Technologies for General Learning

Regarding technologies for general learning, Passey (2017) states that there are new opportunities regarding the availability of technological solutions. Three examples are indicative of the new opportunities that are now opening.

First, there are digital platforms, computer applications that allow the integrated and related execution of a series of tasks related to school administration, communicating with families, and, of course, schoolwork. Temesio Vizoso (2016) affirms that distance education through digital platforms constitutes an opportunity to give access to people who are in a situation of disability. However, in a practical sense, none of these environments is fully accessible to these people. A growing interest in digital educational resources, in general, has arisen together with digital platforms. In relation to these, IMS Global Consortium (2012) developed an accessibility proposal focused on the adaptation and customization of resources, interfaces, and content that meets individual needs. But most content is still not accessible even with standards like Web Content Accessibility Guidelines (WCAG) and IMS Global.

The second emerging technology is the interactive whiteboard. This blackboard, connected to a computer, allows easy use of interactive and multimedia resources by the teacher. The reasons for its success are fundamentally twofold. On the one hand, it is a friendly technology with traditional teaching models because it respects and reinforces the central role of the teacher and does not require a substantial change in their teaching methods while allowing them to access a greater variety of digital resources. On the other hand, its costs are relatively low, as well as its rate of obsolescence.

The latest technology, however, represents the antipode of the electronic board because it aims to universalize access to technology by making a reality the principle of each child benefitting from a computer or a tablet. Inexpensive laptops and tablets are no longer a pipe dream, and existing offerings are backed by big hardware builders. The advantage of one-to-one policies is that they make it easy for each student to have a personal device and take it home to continue working with it. However, this idea had a lukewarm reception in the school environment because justifying the investment would be possible only by intensive use.

To these three technologies proposed by Passey, a fourth group could be added that Castro Lozano (2012) calls "Support Technologies for Ubiquitous Learning" (STUL) and that includes, in addition to supporting technologies for online learning, the mobile computing devices, ubiquitous computing devices, and natural interfaces. All of them are characterized by being non-intrusive, accessible, easy to use, and adaptive. With mobile and ubiquitous computers, a new chapter to inclusive education opens, which favors communication. Some students with diverse needs have serious difficulties in social interaction, due to a deficit in communication. Fortunately, the latest technological developments, the proliferation of mobile systems, tablets with hundreds of thousands of applications, and new trends such as ubiquitous learning (UL) systems and the "Internet of things" will help increase communication skills for students with diverse needs. But to achieve normalization and school inclusion of students with diverse needs, it is vitally important that teachers, tutors, and the family of these students understand the importance of using STUL, use them, and even develop specific activities with them, adapted to each case.

Assistive Technologies

There are several different definitions of AT. The focus here is on ICTs used by people with diverse needs and/or older people "to overcome social, infrastructure and other barriers, for independent learning, full participation in education and conducting learning activities safely and easily, and with minimal assistance" (Hersh & Johnson, 2008). Students may need support and training to use AT successfully, so it is convenient to consider AT and assistance as complementary, whenever possible, and to provide resources for students to choose from.

The use of AT enables many students with diverse needs to study and do so effectively. Thus, people who need alternative ways to access systems due to differences, for example, in dexterity, reach, or mobility can use a variety of input devices, such as large keyboards, head, foot, or eye control systems, joysticks, simple switches, sipping and blowing devices, and adapted mouse switches, along with touchscreens. Blind and visually impaired people use screen readers, screen magnifying, special glasses, and, less frequently, Braille displays to access what is on the screen of many ICT devices, and some even provide access to feedback on what is being written and the operations that are carried out on the computer. Studies show that the use of AT by visually impaired students can promote expectations of success and help them develop skills (Tuwaym et al., 2018).

It has been found in a series of studies reported by Stephenson and Limbrick (2015) that the use of touchscreen mobile devices for communication and automated prompts can be very effective for people with cognitive developmental disabilities. At the same time, however, all the studies were on a very small scale.

A meta-analysis of the impact of the use of ATs (Alper & Raharinirina, 2006) found that several of them had positive impacts on literacy skills (such as improvements in writing performance and holistic quality, spelling, and grammar); other studies have found positive impacts on math skills (Wynne et al., 2016).

In agreement with Alnahdi (2014), it is possible to affirm that general-purpose technologies have advantages over ATs with respect to benefitting from greater availability, lower costs, and less stigma since they allow students with disabilities to use the same technologies as all the other students.

In conclusion, technologies should be fully accessible to students with disabilities, and all other students, as well as take into account gender, social and cultural issues, and the values and sensitivities of the diverse populations that could use them. On the other hand, the recognition of the different and sometimes conflicting needs of different groups of people with disabilities or otherwise further gives importance to the customization of learning.

Developments in Argentina

In 2018, the Second Meeting of Technologies for Inclusion was held, organized by the Ministry of Science, Technology and Productive Innovation and the National Agency for Disability. In the event, whose main objective was to make visible the capacities and contributions of people with disabilities, projects developed in the country about inclusive technology were exhibited.

Thus, for example, a customizable reading application for young people with dyslexia and intellectual disabilities became known. The main idea was to have an easily replicable application, which is the first in a collection of stories. The National Technological University (UTN) participated in this project together with other organizations related to disability.

Tactile teaching devices for the scientific literacy of blind and visually impaired people at different educational levels were also presented. This involved the design and production of innovative low-cost tactile teaching devices for teaching and learning mathematics and science in general (physics, astronomy, geography) for use in educational institutions. Among others, the National University of General Sarmiento was part of the proposal.

“Indistin@s” (Inclusion of People with Disabilities starting from Information Technology for Everyone) was also announced. The proposal included the development of an application for mobile devices that would be used as a teaching facilitator for teachers of Natural Sciences in schools with students with hearing disabilities. Among other organizations, the Faculty of Exact and Natural Sciences of the University of Buenos Aires (UBA) participated.

In addition, the incidence of the development and implementation of prototypes using natural user interface technology as an educational, cognitive, and social complement in children with autism spectrum disorder was presented. It was developed by the National University of José C. Paz together with other organizations.

Another development that involves Argentine universities is the University Information System (UIS) to support university management. Barrera Nicholson et al. (2020) presented an analysis of this system in relation to disability. Among the main characteristics that lead to considering it as a technology for inclusive education, the following stand out:

- The SIU-Guaraní module manages the academic management of students, from when they become applicants until they obtain their diplomas. It is used massively by the majority of students, professors, and staff of the 55 Argentine universities; it contains the data of all the students, including data referring to disability. This means that every Argentine university has the necessary mechanism to collect safe, complete, consistent, and timely information regarding students with diverse needs, as well as using it to carry out concrete actions.
- Regarding digital accessibility, the UIS team takes into account, as guidelines, the WCAGs of the World Wide Web Consortium (W3C), 2020). In 2012, a thorough analysis of the portal of students and teachers of the SIU-Guarani was conducted, in order to evaluate its accessibility. The analysis was organized in three different stages: manual, automatic, and with users.
- To increase inclusion, a version that allows the application of gender identity regulations in the system was launched this year.
- Each module of the UIS ecosystem has the name of an indigenous community, also trying to include their students in some way. These modules are called Guaraní, Pilagá, Diaguita, Kolla, Mapuche, Sanavirón, Wichi, Araucano, Sanavirón-Quilmes, and Tehuelche.

Among other applications for inclusive education developed by Argentine universities, we can mention:

FINGER (Zurbrigk et al., 2012) is a computer tool based on free software meant to translate the Spanish language to ASL. It is a female humanoid who was baptized FINGER and who performs the ALS interpretation of a text in Spanish for people with hearing disabilities, allowing for a more inclusive educational proposal. This tool was developed at the National University of Comahue.

In the DANE Project of the Argentine Republic Down Syndrome Association (ARDSA) they develop applications designed for the education of children and young people with disabilities (ASL, Down, autism). Education specialists and technology programmers work together to develop these applications adapted to the specific needs of their recipients. They integrate computer technology into education, are cost-free, and can be downloaded and installed on any next-generation mobile device. The participating universities in this project are the UBA, the National University of Luján, the UTN, and the Argentine University of Business.

Ambrogio and Petris (2015) present a web application developed at the National University of the Northeast with educational games, which serve as stimulus and support to reinforce the priority learning nucleus with content related to numbers, vowels, means of transport, fruits, colors, and animals, for beginner-level students with mild intellectual disabilities.

Developments and Proposals in Local Universities

In this section, we present some developments and proposals based on ICTs that support an inclusive education, carried out by the authors of this chapter, at the UNSE and at the National University of La Plata.

Mathematics and Sounds App for Pupils with Hearing Impairment at the Preschool Level

As mentioned in "Technologies for General Learning," technologies for general learning, including mobile devices, are very important in inclusive education. In this section a mobile application for mathematics learning for preschool children is described. It facilitates learning in deaf children with cochlear implants.

Early language development in deaf children with cochlear implants has increased the number of hearing-impaired children entering mainstream schools (Kelman & Branco, 2009). But the successful insertion of these children depends on their hearing rehabilitation (De Reave, 2010). To contribute to this, researchers from the Institute for Research in Informatics and Information Systems (*Instituto de Investigación en Informática y Sistemas de Información* – IIISI) of UNSE are developing the application of mathematics and sounds. It is a multiplatform mobile application that uses 2D and 3D augmented reality visual resources to offer mathematics learning activities combined with auditory training activities. The proposal is based on the following referential framework:

- Mobile technologies have advantages in learning (Pachler et al., 2010): low cost, ubiquity, easy connectivity, situated learning, and motivation.
- Augmented reality allows adding contextual information from a scene in the real world to mobile learning applications (Arici et al., 2019). It favors attention and motivation (Brezovszky et al., 2019). Children with hearing impairments have a more developed sense of sight, which improves their visual attention (Dye & Bavelier, 2010).
- Main auditory responses for speech perception: detection, discrimination, identification, and understanding (Erber, 1982).
- Main math topics for preschoolers: number series, numbers up to 10, location (forward-backward, up-down, right-left), shapes, and measurements (large-small, curved-straight, round, square).

The main concepts of mathematics involved in the application are big-small, near-far, up-down, and numbers from 1 to 5. At the same time, the learning activities allow children to detect, identify, and discriminate sounds and phonemes that correspond to different frequencies. Some of the activities are carried out with augmented reality. Figure 1 shows the main menu of the application.

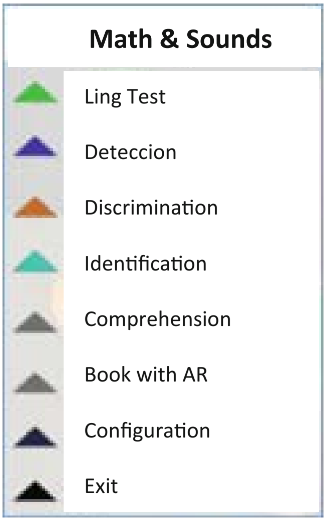

Fig. 1 Main menu of mathematics and sounds

Fig. 2 Avatar of mathematics and sounds

Since these are playful activities, they are animated by an avatar, called Mate, which was designed (color, name, texture, shape, movement) especially for children from two to five years old with hearing impairment (see Fig. 2). The application envisions that children will use the App with the assistance of adults who belong to their close environment (parents, siblings, educators, assistants).

The auditory training activities are combined with the previously mentioned mathematics contents. For example, in Fig. 3, a sound detection practice combined with the "big-small" mathematical concept is shown.

The App is in the coding and testing stage. Testing is carried out together with hearing specialists from the Hearing Impairment Program of the Province of Santiago del Estero. It should be noted that the App was included by UNESCO in the Compendium of Initiatives for Inclusive Education 2020 based on artificial intelligence and other innovative technologies (Herrera, 2020).

Fig. 3 Sound detection activity

Higher-Level Learning Environments for People with Hearing Impairment

Continuing with the developments for inclusive education based on the use of technologies for general learning, an application that runs on a personal computer and that facilitates the learning of adults with hearing loss in any area of knowledge is described below.

Chomsky (2003) affirms that speech acquired as children is a state of the power of language that belongs to human beings and of the experience of being exposed to the language spoken by their parents, teachers, and relatives, among others, which provides input that activates the mechanisms of language acquisition.

Based on this, Radelli (2001) created and designed a technique called Logogeny, where the input or trigger is the written language. It was developed in the 1990s in Mexico and extended through Italy, Spain, Colombia, Argentina, and so forth. With this technique, the subject gets to know the syntactic and semantic rules of his/her language. In Spanish they would know, for example, that the combination “ma” belongs to their language because they would have seen it in many words, but the combination “stchk” does not belong because they did not see it in any.

Based on the Logogeny method, Zampar (2019) presents satisfactory results in terms of the written linguistic understanding of those with hearing impairment. Study strategies linked to reading comprehension are defined, which accompany didactic activities in which principles of Logogeny are applied and implemented in a software tool called Logogenios.

For implementation, the first strategy study technique is created, which is well known and consists of highlighting parts of the text that are considered important. When necessary, a second study strategy is defined in brackets, which consists of a brief personal summary of the rest of the text which would not be convenient to highlight, but it would still be important to gain understanding of. This dual strategy study of both highlighting and making summaries is extremely useful for the third strategy, which consists in using the same digital pedagogical resource of the teacher, so that the people with hearing impairments can better understand the basic and fundamental bibliography used by the teacher. These study strategies are accompanied by didactic activities following the principle of Logogeny in relation to the aforementioned contents. The strategies and activities are incorporated into the software for a higher-level subject, in a four-point structure:

(A) Probable Partial Exam question (this is part of the structure, but it is not introduced into the software because the student shouldn't know the test question).
(B) Teacher notes after applying the strategies of highlighting and summary.
(C) Defining the type of minimum pair to be used in the exercise. Radelli op cit. (2001) presents the technique of minimum pairs as a fundamental part of Logogeny. These are two correctly written sentences that only differ by one element. Sarmiento and Valdeblanquez (2010) affirm that this minimal difference gives rise to the principle of opposition and allows the subject to realize the different meanings that the sentence acquires and advance in the process of incorporating their written linguistic competence.
(D) Questions that are related to points A and B are to be worked within the software. The answers offer several alternatives that the student must choose from, according to the type of minimum pair defined in point C.

Below is the name of the activity in Text Name and the number of questions in Number of questions; in this case there are six as can be seen in Fig. 4.

Fig. 4 New activity upload

Fig. 5 Response loading

lenguaje. Aparece en la publicidad.

El Par mínimo a utilizar son los lexicales: la diferencia está en una palabra. Ejemplo: Patea una caja-Patea una pelota.

2. La función apelativa es la que pretende convencer al ...
3. La función emotiva aquella que manifiesta una ...
4. La función fática es la que verifica que funcione correctamente ...
5. La función metalinguística se refiere a hablar sobre ...
6. La función poética se refiere a producir un hecho estético por medio ...

Respuesta Seleccionada: contexto

Fig. 6 Teacher's or administrator's window

The software responds with six windows as shown in Fig. 5 that allow adding the three possible answers to each of the six questions. At the bottom of the screen, the letter corresponding to the correct answer is selected.

Once the activity uploads have been carried out, Fig. 6 presents what is shown on the teacher's screen. Here we can see the buttons:

- "pass answer" to go to the next answer.
- "give turn" to give a turn to a specific student.

Fig. 7 Student's window

On this occasion, the student María Paula is chosen in the select shift box and then pressing the "give turn" button.

When a student gives a correct answer, this is reflected on the student's screen in Fig. 7, with its rating as Good = **1**. And so on, different students are given turns to participate in the activity.

The work showed there's improvement in the acquisition of written linguistic competence. Students don't have contact with all the syntax of the language. Still, they are able to perfect their linguistic understanding and incorporate new vocabulary and better structures. People with hearing impairment notice how sentences are formed and the order in which the elements of a sentence should go, even if they do not know the language entirely. This happens in all languages; people end up knowing syntactic rules because they acquire them, and amazingly, this happens without anyone explaining it to them. They are also able to learn what are the exceptions to those rules.

Inclusive Communicator for Children with Cerebral Palsy

Child-Comm (Rosenzvaig et al., 2020) is an alternative communication system (ACS) for children with mild cerebral palsy, based on pictograms. It is an application for Android OS that can be run on phones or tablets. It was designed so that children with this disability can use it both in their educational activities and in their daily lives. It was developed in 2015 by the IIISI of the UNSE.

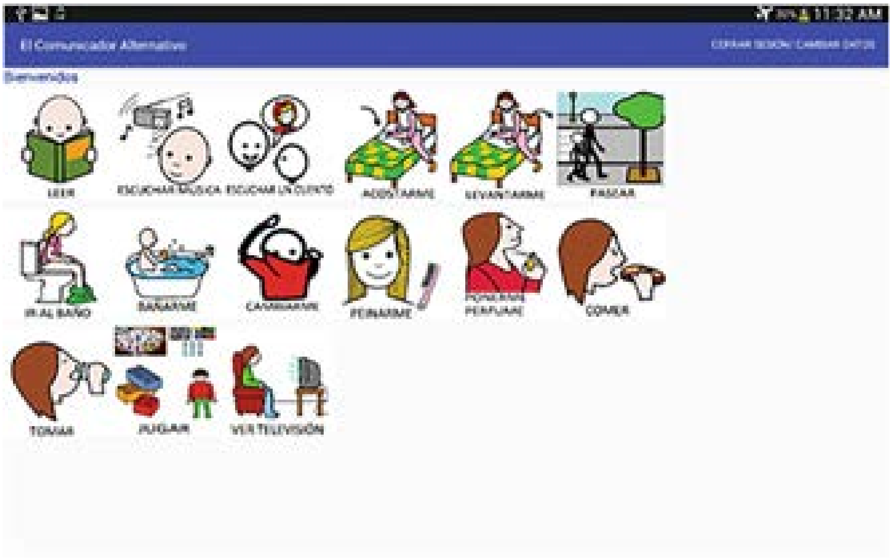

Fig. 8 Screen for a Spanish-speaking girl who is at home and wants to communicate what activity she wants to perform (Rosenzvaig et al., 2020)

ACSs allow replacing or expanding speech when it does not exist or is impaired, that is, they are tools that allow establishing communicative relationships with the environment that are put at the service of people with limited oral language (Stephenson & Limbrick, 2015). Examples of ACS are sign language, communication boards, and books with pictograms as well as electronic communicators that incorporate sound as output.

Child-Comm is framed within the tools that favor cultural diversity. The main characteristic that distinguishes it from other means of communication based on pictograms is the preservation of the Santiago culture, involving indigenous vocabulary and regional accent. Other outstanding features are the ability to adapt to some user preferences and that it responds according to location. In other words, Child-Comm offers alternatives and adapts according to age and sex, as well as according to the location of a child (educational institute or home). Figure 8 shows an example of the alternatives that Child-Comm shows a girl who is at home and wants to carry out some activities, while Fig. 9 shows the global navigation within the system.

The application has been tested in the Provincial Institute of Integral Rehabilitation of Santiago del Estero, with the collaboration of the therapists of said institution. Currently, the information storage and management module is still under development; this would allow optimizing the communication alternatives that would be offered to the child based on their history of activities and preferences.

Child-Comm was presented at national and international events with a wide level of acceptance in the scientific communities connected with technologies for people with diverse needs.

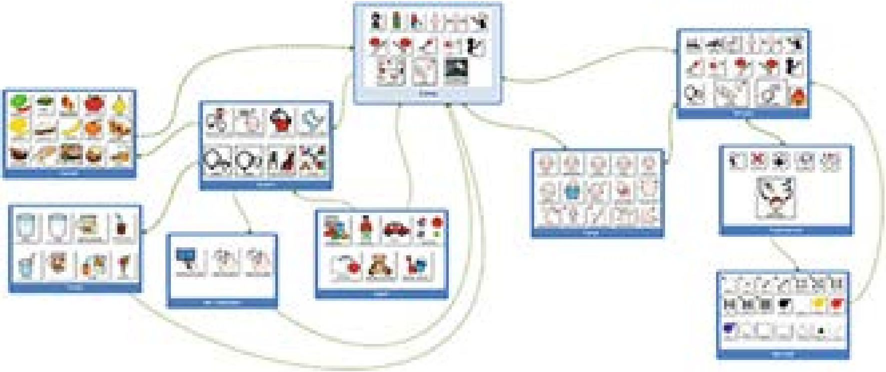

Fig. 9 Navigation scheme through the Child-Comm screens (Rosenzvaig et al., 2020)

Sustainable M-Learning Model for Isolated Regions

Argentina is a country with a large area (eighth in the world) that has isolated or remote regions that are not reached by conventional electricity distribution and communication networks. In addition it has mountains that make it difficult for these networks to arrive.

In some cases, these remote regions have alternative systems (e.g., solar-powered areas) that allow villagers to have limited power and data service. However, both the absence and the limitation of these resources prevent the normal development of basic human processes, such as the learning process. This difficulty was heightened during the COVID-19 pandemic period in these regions. A clear example of the situation in Santiago del Estero was presented to the world on the CNN news network in September 2020[1]).

Researchers from the IIISI of UNSE and the National University of Salta have been working on designing alternative, viable, and sustainable communication network models for education in these regions (Rocabado, 2020; Rocabado et al., 2013), as well as on defining effective learning strategies based on mobile devices or m-learning (Morales et al., 2018; Herrera et al., 2013).

In order to contribute to an inclusive education, which does not neglect people who live in remote areas, the aforementioned group has designed a low-energy communication network (intranet) model for m-learning in isolated rural areas.

The intranet is mainly made up of a server of services and digital educational resources, which is accessed by the actors of the learning process (teachers and students) through their mobile devices, using Wi-Fi or Bluetooth wireless communication technologies (see Fig. 10). The server is a single-board computer (Raspberry Pi). Both the server and the mobile devices are energy efficient and are powered by portable solar panels.

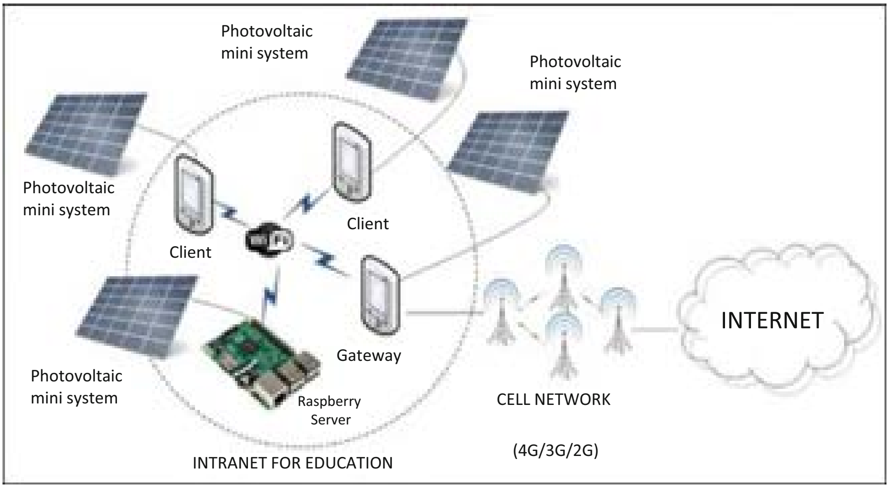

Fig. 10 Low consumption network model for education in remote areas (Rocabado, 2020)

To connect mobile devices to the Internet, a communications scenario is used, in which one of the cell phones acts as a communications gateway (between the intranet and the cellular network) and the rest of the devices connect to the Internet through it.

The full proposal – the network model plus the working procedure for educators – will be validated in educational centers in isolated areas of the province of Santiago del Estero. For this, specific m-learning practices will be designed for different areas of the curriculum, using the MADE-mlearn framework (Herrera et al., 2013). In some of the practices, the applications developed at UNSE will be used: ImaColab[2] and AlgeRA.[3] Currently, funding is expected from the national government to support the implementation and validation of the model in schools of various educational levels in the province of Santiago del Estero. In situ, other alternatives of Internet connection (satellite connection and fiber optics) will be further analyzed, as well as teaching without an Internet connection. All this will allow achieving a model that optimizes and reduces energy consumption in devices and communications, fostering sustainable learning.

Architecture Based on Ontological Models for the Development of Inclusive Ubiquitous Learning Applications

In the IIISI of the UNSE, work has been done on an architecture for the development of ubiquitous applications (Durán et al., 2014) that is validated with the construction of specific applications. Its versatility allows it to be adapted for the development of applications that are understandable, easy to use, and accessible by all people. Thus,

---

[2] https://imacolab.com/

[3] http://algera.com.ar/

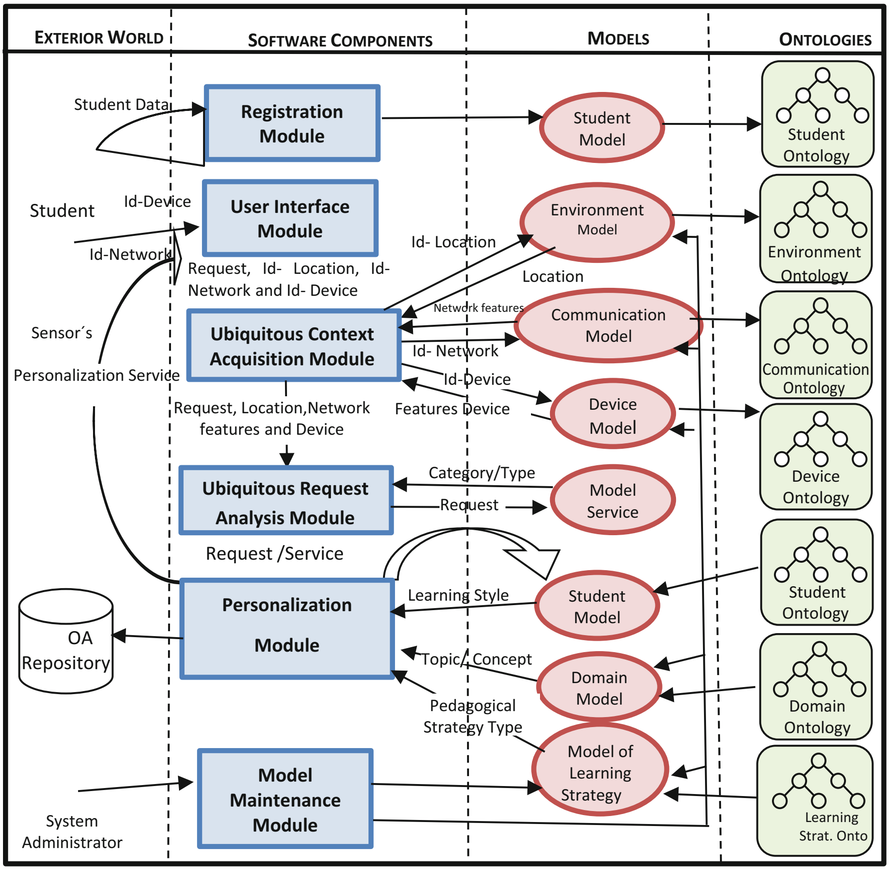

Fig. 11 Architecture for UL application (Durán et al., 2014)

ubiquitous learning (UL) applications that are developed on the basis of this architecture will favor inclusion.

Architecture encompasses four dimensions (see Fig. 11). The Models and Software Components dimensions, with the adaptation proposal for inclusion, are described below.

Models Dimension: All these models were implemented with ontologies.

- *Student Model*: describes the most relevant characteristics of the student for personalization purposes. It mainly contains information related to personal and academic data. To promote inclusion, attributes are added on diverse needs. This is essential for the customization of educational materials and services: for example, type of visual impairment (partial, slight, partial blindness and blindness), degree of hearing loss (mild, moderate, severe, deep), degree of motor disability (none, mild, moderate, severe, and very severe), and aborigines (name of the aboriginal people, language).

- *Domain Model*: represents the pieces of knowledge. Given that the model is designed taking into consideration the IEEE-LOM standard for learning objects (LOs), which does not include accessibility characteristics, it is necessary to advance in our research and make proposals that allow us to properly map the student's profile with the accessibility characteristics of the LO. Also, a transformation of the LOs already made is necessary so that they contemplate these characteristics.
- *Model of Learning Strategy*: describes the various actions that can be used to enable largely meaningful learning in the context of UL. It contains information regarding type of strategy (trial and error, with pre-orientation, full composition, etc.), tools (e.g., navigation, interaction, audio, video, and images), activities (questionnaires, tasks, problem solving, essays, etc.), and evaluation system.
- *Device Model*: describes the UL devices and those belonging to the group of assistive technologies to be used in the learning processes.
- *Communication Model*: describes the types of communication networks to be used in the learning processes.
- *Environment Model*: describes the different environments (home, university, street, etc.) in which the UL can be completed, and the interest points (IP) found in those environments. When considering an inclusive education, it is feasible to incorporate other learning environments such as rural areas, marginal areas, and aboriginal communities.
- *Social Context Model*: describes the people who can collaborate in any way in developing activities with the student (peers, tutors, experts, etc.).
- *Model Service*: describes the educational services that an application can offer to the student.

Software Components Dimension: the following software modules have been considered:

- *User Interface Module*: it oversees communication with the student, including their identification, the course to be taken, and the learning service request. In addition, it responds to the requests of the student. The user interfaces are adapted according to the needs of the student, considering the standards for accessibility.
- *Ubiquitous Context Acquisition Module*: captures the coordinates of the student's position, the network and the device used by the student, and the IP identification.
- *User Request Analysis Module*: determines the type of service that the student requests.
- *Personalization Module*: it has to do with adapting the services based on the personal and pedagogical characteristics of the student and the ubiquitous context, recommending LOs.
- *Model Maintenance Module*: provides support for initializing and updating models whose data is dynamic.

From the architecture based on ontological models, five personalized services have been designed that are offered to students in ubiquitous contexts. The following describes each of them.

Service 1: This service displays to the student a personalized list of LOs in relation to a specific IP. The first version of the application accounts for the customization of LOs based on learning style. However, it is feasible to incorporate adaptation to other characteristics of the student's profile to favor an inclusive education.

Service 2: This service offers a personalized learning path for the student, based on the selection of a learning objective and considering the current location of the student.

Service 3: This service recommends a list of nearby IPs according to the current location of the student, as long as they have not yet been visited by the student.

Service 4: The service offers the student a list of experts who are currently online or who are close to the student's location, to advise the student in the completion of a specific task.

Service 5: The service recommends a group of peers who are physically close and who can best support the applicant student in their learning, depending on the degree of progress in the task and the level of knowledge.

Thus, the architecture presented opens a way for the development of UL applications that are accessible to other groups not considered in the original proposal but that can be included with minimal adaptations.

Conclusions

Inclusive education is not limited to access to ordinary schools for students with diverse needs but rather seeks to minimize the barriers that limit learning for students from various social groups, ethnicities, cultures, and beliefs, and with different behaviors, thus avoiding exclusion and discrimination. This chapter shared a look at inclusive education in Argentina by taking these aspects into account, as well as the fact that both these barriers and the resources to diminish them can be found within schools, in the community, and in local and national policies.

The chapter began with a review of the legislation that supports all the actions that can then be carried out, since, although inclusion is the responsibility of the entire society, the state must be the one that guarantees the right to quality education for all. Currently, the Argentine educational system has made important advances in the regulations concerning the rights of students. Public policies are guided by these laws; particularly, those related to promoting equality, inclusion, and educational achievement for all students.

After this, we presented actions that were carried out by Argentine universities to favor the inclusion of different groups. In this regard, it can be concluded that actions for inclusion have increased significantly from the 1990s to the present day; this is manifested in the teaching and learning processes and in the other functions of the university—research, extension, outreach, and management—even though these advances do not occur to the same extent in all institutions and in relation to all different groups.

In addressing the role of ICTs as tools to support inclusive education, we presented some examples of developments carried out in Argentine universities in the search to increase accessibility and inclusion of students. However, at the same time, when ICTs are used in non-inclusive contexts, they are tools that can further increase the differences between people, generating more exclusion in the field of education. It is necessary to consider that these technologies have a high cost, which means that only a few have access to them. In Argentina, as a consequence of the economic crisis experienced during the last 10 years, access to assistive technologies has been increasingly expensive, since these are usually solutions that come from abroad, with costs that are calculated in dollars. Therefore, it's even more important to develop local solutions in the national territory, thus avoiding importation. Some projects that have been developed in different Argentine universities and, in particular, in UNSE and UNT help with this goal. However, even those efforts are scarce. Much remains to be done toward the inclusive use of ICTs and the development of software applications that promote inclusive education.

It can be concluded though that important advances were made in regulations and numerous concrete actions and technological developments were carried out in order to promote inclusion. All of these allow for the value of diversity to be affirmed strongly. However, there is still progress in building more accessible educational materials, in training teachers in the use of ICTs that promote educational inclusion, and in supporting the implementation of new proposals such as Universal Learning Design. UDL should be oriented not only toward changing pedagogical practices but also as a tool for developing contexts.

Inclusive and Equitable Education in Postcolonial Caribbean

49

Contents

Abstract

In a society riddled with the long-term economic effects of colonialism, access to inclusive and equitable education directly impacts that society's ability to innovate and actively participate in the rapid unfolding of our globalized futures. The present-day Caribbean education model perpetuates systemic segregation which continues to place barriers on societal growth. As a region, the Caribbean has been in a period of rapid transformation for a while, where entire industries are changing, identity is in constant flux, and the role people play in the productivity of world affairs is increasingly questionable. Considering the many

vulnerabilities that the region faces, Caribbean nations need to actively participate in creating a new kind of future for themselves.

Opportunity lies in the untapped potential of the creative economy, and thus the possibilities of redesigning education to better equip the youth to engage creative thinking in their lives is necessary. Centered in Barbados, this study aims to bridge the gap between the need for creativity in the economy and the lack of teaching adequate creative thinking methods in the school curriculum, by introducing a flexible way for teachers to explore implementing creative thinking methods in classrooms across a variety of subjects. The design of accessible and practical tools allows the shifting of critical consciousness of both teachers and students alike, to co-create more inclusive and robust local communities.

Critical pedagogy · Design thinking · Inclusive education · Decolonization · Caribbean education · Creative thinking

Introduction

In the 1960s, British Caribbean nations sprung out of colonial power into independence with a revolutionary vision: self-sustained, self-educated, and self-governed economies. In Barbados, the idea was to build a nation that operates on pride and industry and produces a quality of life capable of rivaling larger imperial nations. In many ways, this was accomplished, but the model that allowed for this growth is now over 50 years old, and the world is in a period of rapid globalization with constant technological changes that continue to transform businesses and decrease the need for traditional labor.

The Caribbean Development Bank cautions that the Caribbean could become "the poorest region in the world by 2050" if the ease of doing business is not addressed by its member states (Ram, 2020). The CDB director explained that after two decades, the region's Gross Domestic Product (GDP) per capita dipped below the world average in 2016. Their 2018 "*Sustainable Caribbean Economy*" report listed key challenges facing the region include "macroeconomic, productivity and competitiveness, human development and environmental" (Ram, 2020). No longer is it a case of just having a high quality of education, but instead it's a case of having an education that can adequately prepare students for this new global era. The same applies to employment and business, where the functionality of these roles needs to rapidly adapt to continue being useful and competitive. Failure to adapt could mean that the region loses the ability to be an active contributor to the future.

The Caribbean's sustainability lies in the intrinsic talent and values which are found there. There is a uniqueness about the Caribbean in that it's so diverse and yet so connected; fractured by distance but inhabiting all the shores of the Atlantic with shared history and customs. The region is rife with creativity, but as relatively new nations, creativity has not been the focal point of economic development. Local attitudes often consider the arts as a thing of pleasure, not a fundamental need, but research shows there is an untapped potential of the creative economy.

The Inter-American Development Bank states that “creativity is the inexhaustible resource in Latin America and the Caribbean” known as the “orange economy,” and that “creativity as a driver of innovation can contribute to diversification as a necessary tool for having a globally competitive knowledge-based economy” (IDB, 2017). In 2016, the World Economic Forum listed in their publication “*The Future of Jobs*” that the third most needed skill for work by the year 2020 was creativity, preceded only by the ability to solve complex problems and critical thinking. To put it in context, the workforce of the entire worldwide orange economy is larger than that of the European, Japanese, and US automotive industries. “In 2015, the orange economy in Latin America and the Caribbean sustained a number of jobs comparable to that generated by the entire economy of Costa Rica or Uruguay” (IDB, 2017).

The creative expressions of the Caribbean are distinct but have remained somewhat contained to a local or grassroots level. Creativity cannot be understood here without the context of class. In almost every area of the arts, there is some form of education needed to fully learn and master the craft and thus Caribbean artistry has not yet flourished into self-sustained and profitable industries robust enough to contribute to the economy. Music is the exception to this rule, possessing the unique ability to transcend the narrow pathway and access points of money, education, or social connections. Music has become a monument of the working-class structure by pushing new genres into the global consciousness that will outlive us all. The evidence of this is around the world, not just in the Caribbean.

The objective of this study is to explore how creativity can be nurtured in Caribbean culture to empower Caribbean nationals to move towards a new mirror image – one that supports cultural identity, imagination, and innovation. Given that the Caribbean is geographically vast with multiple languages spoken, this study is localized to Barbados as a starting point to inspire a model that can provide further critical examination and exploration across the region. This research tackles the education system on the premise that it is impossible to have a generation of creative innovators fueling the economy if the education system doesn’t produce creative thinkers.

Literature Review

Education and economics are deeply connected. The school environment is where people are trained and prepared to be a part of the workforce, and therefore economic futures begins in the classroom. Barbados is known globally for its high standard of education and boasts a literacy rate of over 98%, providing state owned and run education at primary and secondary school levels. In 2016, The World Economic Forum ranked the school system ninth in the world in its “*Global Competitiveness Report*,” an accomplishment for a relatively new and small nation. Success though, is not a static thing and success requires context. The Caribbean suffers from the “brain drain,” which the Inter-American Development bank questions as a possible “curse of small states” and reports that “small states had a brain drain rate five times that of all developing countries, 12 times that of high-income countries, and eight times the world average. In the Caribbean, a region dominated by small states, the percent of tertiary educated that emigrate ranks among the highest in the world” (IDB, 2016).

The brain drain in Barbados occurs because the economy is largely dependent on tourism and low-skill labor for the limited exports the country produces. The economic base is relatively undiversified, and there is less demand or opportunity for skilled labor and higher educated persons to fully utilize their capabilities. These factors mean that the government pumps millions of dollars into the education system annually but much of that investment leaks right back out of the country. This impacts local businesses trying to attract top talent, and it also thwarts the nation’s growth towards the competitive edge in a rapidly globalized future. The education model is outdated and will contribute to the nation’s inability to thrive moving forward. Understanding how this education model came into existence is important to chart where it should go to next.

A History of Exclusion

The Caribbean education system is deeply rooted in colonial practices where education began exclusively for plantar-class children. Boys of the elite plantar class were encouraged to pursue education, whereas girls were directed more towards domestic studies. “Prior to independence, colonial educational systems in the English-speaking Caribbean continued to be elitist and to serve the purpose of reinforcing economic and social hierarchies in Caribbean societies” (Pilgrim et al., 2018). This perpetuated segregation by keeping working-class people at the bottom of the social ladder preventing upward mobility and allowing only a small number of high-achieving students access to elite gender-segregated secondary schools. Post-slavery, education became charity-based for poor whites and discouraged for people of color and further progressed to a present-day system of ability grouping. “Ability grouping typically involves the separation of students into particular groups based on their perceived ability levels. In the case of Barbados, the Common Entrance Examination is used as a tool to stream students into secondary schools at different levels of perceived ability. Then, within those hierarchically based schools, further streaming of students into classes of different ability levels is also typically undertaken” (Pilgrim & Hornby, 2019).

The Barbados Secondary School Common Entrance Examination (BSSCEE) was implemented in 1959 in an attempt to achieve a more effective quality education which awarded students access to secondary schools based on ability and not on socio-economic or racial backgrounds. In Barbados, this selective schooling process (leftover from British colonialism) was developed out of a clear need to reduce discrimination to secondary school entrance by the school’s administrative boards.

In many ways, this was an act of pre-independence from Great Britain to establish local control and create a more inclusive model than what previously existed.

The Need for Change in Barbados' Education System

Despite providing more equal opportunity in sitting the Common Entrance Exam, after more than 60 years the system still reinforces aspects of segregation. This model (ability grouping) has "implications for educational outcomes, the social inclusion of all children, and the provision of an equitable education system" (Pilgrim et al., 2018). For example, the top four schools in Barbados' education system produce the nation's scholars while the majority of prison inmates come from the eight lowest-ranked schools.

In June 2019, Mia Amor Mottley, the Prime Minister of Barbados, set an initiative to restructure the school system for more inclusivity and equity by abolishing the Secondary School Common Entrance Exam. "We have reached the point where we need to reject an approach to education that was settled by the British in the 1940s" (Barbados Today, 2019). The Prime Minister proposed the introduction of middle schools which would give students the chance to uncover their strengths and have more learning options suitable to varying capabilities between the ages of 11 and 13 before moving on to secondary school. Currently, the school structure mimics the British system, where primary school runs from ages 3 to 11. The Common Entrance Exam is then done at age 11 and then sorts students into secondary school, which runs from ages 12 to 16 (Forms 1–5). The top four secondary schools have a Form 6 (Lower and Upper 6) which runs for another 2 years until graduation at age 18. Admission into sixth form is also highly competitive, as there are only four schools. Alternatives to sixth form remain the local college, polytechnic, or directly to university with an additional foundation year added to their program.

For many years in Barbados, there has been criticism of the education model's ability to produce high-level critical thinking despite being considered a leader in Latin America and Caribbean education affairs. Evidence of subpar performance presents itself at a later stage in life when students are exiting the secondary school level and either lack the minimum requirement of four certificates to enter the workforce and further haven't developed soft skills necessary for working with people. Dr. Marina Alfonso, a Senior Education Specialist at the IDB assessed research findings and shared, "We're seeing that students are not necessarily well prepared to support an economy that is based on knowledge and innovation . . . and that, based on a 2012 survey, Barbadian employers shared the same complaint as their Latin American counterparts that school leavers lacked necessary soft skills – the ability to work with other people, the ability to lead, to think critically. . ." (Barbados Today, 2016). This has always been considered a sticking point to societal growth in Barbados because as a small-island state primarily dependent on tourism for economic growth, these are obvious disadvantages to allow to continue festering for the sake of the economy.

Caribbean nations experience restrictions on economic growth due to export transport costs on goods and therefore have begun looking to the creative economy to leverage the sustainable talents of its people. Creativity in the Caribbean has untapped potential to transform the economy since it's "based on talent and creativity, which are not only renewable, but are the source of innovation and new content." However, there are limitations to growth that are rooted in the education and training on how to effectively capitalize on creative talent and "these deficiencies adversely impact the skills set, knowledge, and knowledge pool in the sector" (Hendrickson et al., 2012).

Regardless of the lens used to explain creativity, its importance is recognized on a global scale with respect to economic, political, and educational landscapes. In the Caribbean (and Barbados), creativity is engrained in daily life; with limited resources a resourcefulness is born. Social perspectives on creativity tend to be limited to creative disciplines like art or music, and these unfortunately aren't high on economic return. There is limited opportunity for creative persons to fully capitalize on their creative outputs despite passionately wanting to capitalize their ideas – there is a lack of knowledge on how to do this because it's not included in the standardized high-stakes exam-based curriculum.

Classroom Approach to Creativity

The study "*A Comparison of Barbadian and Grenadian Teacher's Beliefs About Creativity*" revealed that most teachers think of arts-based subjects to be more connected to creativity than science-based subjects, despite research studies showing that neurologically, there are no differences in brain and cognitive responses here. This is clearly connected to the cultural identity of creativity – a perspective in need of shifting. The study recognized there is a "creativity gap" between what is valued and what is actually practiced and that teachers perpetuate this when they appreciate creativity, but do not alter practices to include creative learning. Results from this study revealed that while teachers felt they were creative and understood the need for creativity, they were not optimistic or convinced about their own "strength in creative problem-solving" and "teaching creative thinking" (Jackman & Young, 2017). The disconnect between the desires of students to utilize their creativity (or even recognize they are creative) and the ability and confidence of the teachers to facilitate this process is apparent.

This begs the question, what is needed to teach creative thinking in the classroom? A study *"Creative Thinking in the Classroom"* found that teaching in a way that encourages, and rewards creativity can improve school performance. The study revealed that to a large extent, creativity is not just a matter of thinking in a certain way, but rather it is an attitude toward life. "In teaching students to process information creatively, we encourage them to create, invent, discover, explore, imagine and suppose" (Sternberg, 2003) and that part of adopting this creative attitude is to make decisions which underlie creative thinking. They identified 12 key elements that make up this attitude: (1) redefine problems; (2) analyze your own ideas; (3) sell your ideas; (4) knowledge is a double-edged sword; (5) surmount obstacles; (6) take sensible risks; (7) willingness to grow; (8) believe in yourself; (9) tolerance of ambiguity; (10) find what you love to do and do it; (11) allowing time; (12) allowing mistakes (Sternberg, 2003).

The study "*Fostering Problem Solving & Creative Thinking in the Classroom*" was conducted over 1 year with the aim of uncovering the type of learning environment that promotes creative thinking and problem-solving skills in students. The study revealed that "the classroom climates that promoted creative thinking and problem solving were: open, comfortable, relaxed, challenging, safe, supportive, trusting, humorous, energized and collaborative" (Hamza & Griffith, 2006). The researchers also observed the need for teachers to challenge the imagination and encourage innovation. "Challenge their learning through experimentation, novelty, and originality – not through their abilities to memorize. Help students to progress gradually from being memorization-dependent to become independent thinkers and problem solvers" (Hamza & Griffith, 2006).

These studies provide a preliminary understanding of the requirements to teach creative thinking in the classroom, but refocusing on the Caribbean, this area remains to be explored. As the government of Barbados prepares to restructure the school system to a model more reflective of inclusion for all students regardless of social background and academic ability, support tools are needed to facilitate this change by unearthing the value of creative thinking in the classroom setting as an alternative to the rigid high-stakes curriculum founded on a "banking model" of education that no longer fully serves its society. *Pedagogy of the Oppressed* by Paulo Freire speaks of removing this banking model in favor of more democratic problem-posing-education, as the banking concept of education is an instrument of oppression, whereas the problem-posing concept of education is an instrument for liberation.

Creative Thinking – Although there are many opinions and cultural perceptions on what creativity is, the approach for this project was to clearly define "creativity" and "creative thinking" with respect to the previously mentioned study conducted in the Caribbean by Jackman and Young. Creativity is defined as a "novel product, idea, or problem solution that is of value to the individual and/or the larger social group" (Hennessey & Amabile, 2010). Creative thinking is therefore the process used to generate appropriate and new ideas to solve problems. Based on this definition, the curriculum of the 11–13 age group was surveyed to find an entry point into the school system and found the Visual Arts curriculum listed "creative thinking" as one of its curriculum objectives. This reflected the misperception revealed in the previously mentioned study, that creativity necessarily equates to applied arts.

The teaching structure in Barbados could also contribute to failing to meet the curriculum objective of "creative thinking." Primary school teachers are predominantly "class teachers," responsible for teaching a single class all of its subjects, for the exception of more specialized subjects like music or physical education. Secondary school teachers are subject specific, responsible for a cross-section of age groups but a focused subject matter. This means that often in the primary schools, Visual Arts is being taught by someone not particularly skilled or trained in the arts. This could also contribute to the lack of confidence in teaching creative thinking and often results in art activities that have preset outcomes and don't necessarily challenge the student's thinking. Visual Arts isn't included in teacher training in Barbados, but it is very much expected on the job.

Decolonization – This study is built upon Paulo Freire's theory of critical pedagogy detailed in *Pedagogy of the Oppressed* which aims to awaken critical consciousness. The goal of critical consciousness is the ability to identify, critique, and challenge the social forces and structures that produce or perpetuate the inequity and oppression you may find yourself experiencing or witnessing. It is concerned with the mind as the key for changing circumstances and thus is a suitable theory for this study considering the identified need for creative thinking in Caribbean education. Consideration is also given to the fact that critical consciousness does not fully address the likes of decolonial theorists. As detailed in "*Decolonization Is Not a Metaphor*," "Colonialism is marked by its specializations. In North America and other settings, settler sovereignty imposes sexuality, legality, raciality, language, religion and property in specific ways. Decolonization likewise must be thought through in these particularities" (Tuck & Wayne Yang, 2012). Much of decolonialization work is concerned with the repatriation of indigenous land and life and questions the role of critical consciousness as a possible distraction for the real decolonization work that needs to be done.

There are some differences in the Caribbean being a region where most Indigenous people were eradicated as a consequence of colonialism, which somewhat changes the landscape of possible Indigenous repatriation. The vast majority of modern-day Caribbean people are of African ancestry and the reality of being a descendant of enslaved Africans is that the connection to ancestral land and identity has been lost – ruptured in the middle passage. Therefore, whereas Indigenous futures are often concerned with the revival of past life, Afrofuturism is about creating the future. It is here that the efforts of this research are focused; to consider the future that critical consciousness can awaken amongst Caribbean people, and as an act of decolonization, decide for themselves how to apply the creative thinking in this study towards changing the learning structure of the current education system.

Methods

This research asks the question: *How can we enable teachers to teach creative problem solving in the classroom?*

The purpose of this study was to prototype and evaluate a toolkit to facilitate educators in teaching creative problem-solving exercises in Barbados classrooms. This research explores a way to equip teachers to foster creativity in students by building upon the existing visual arts curriculum with the intention of empowering teachers to have the confidence to teach creative thinking skills. This study used a mixed-methods design where qualitative and quantitative data were collected by way of questionnaires and a research workshop.

This study was reviewed and approved by the Research Ethics Board (REB) at OCAD University.

Recruitment

Considering that the 11–13 age group are the students most vulnerable to educational changes which the government of Barbados proposes, a combination of primary and secondary school teachers was needed. A private school in Barbados was selected for this workshop because they have both primary and secondary schools together, which provided more flexibility in teacher recruitment and coordination for the workshop. Once REB approval was given, the school was contacted by email to participate in this study and a recruitment poster was sent out to the teachers.

Eight teachers participated and taught either visual arts, the 11–13 age group or both to ensure a cross section of teaching experience within the workshop. All participants completed an informed consent form prior to the workshop commencing and were given opportunity to ask questions before submitting their consent.

Questionnaire

A two-part questionnaire was designed to measure the efficacy of the workshop. The first part was administered to the participants at the start of the workshop which focused on capturing their confidence level teaching creative thinking as well as their beliefs and thoughts on what creativity is. At the end of the workshop, the second part of the questionnaire was administered, which captured their response to the activities in the study and their perception of confidence in teaching creative thinking moving forward.

Prototype

A prototype was designed and evaluated in the workshop to leverage the teachers' participation. A framework, teaching methodology, and subject were implemented into the prototype.

Framework

A Design Thinking framework was used to build out the curriculum. Design Thinking is described as "a non-linear, iterative process which seeks to understand users, challenge assumptions, redefine problems and create innovative solutions to prototype and test" (Interactive Design Foundation, 2020). This approach often allows people who are not in creative disciplines (such as the participants of this study) to use creative tools to solve problems. There are five stages of design thinking: (1) empathize; (2) define; (3) ideate; (4) prototype; and (5) evaluate. The stages of this framework offered an opportunity to incorporate an art activity beyond the typical approach of art lessons in Barbados. Since this framework is by nature a human-centered approach to creativity, this aligned with the need to merge art education and socio-economic matters.

Learning-by-Doing

Learning-by-doing means "learning from experiences resulting directly from one's own actions, as contrasted with learning from watching others perform, reading other's instructions or descriptions, or listening to others' instructions or lectures" (Reese, 2011). A "learning-by-doing" approach to stage 1 (empathize), stage 3 (ideate), stage 4 (prototype) was applied. Stage 2 (defining the problem space) was predetermined and framed into a project case study. Stage 5 (evaluation) was not used in this workshop.

Subject

In order to anchor this framework into the culture as an example of connecting arts to society, a cultural object was selected, and the five-stage framework was designed around it. The object of the workshop was the Bajan Snow Cone vendor, and the workshop was broken into three activities. The participants worked in two groups of four.

- Activity 1 – empathy building promoted the participants to explore an empathy map and a customer-user experience for the snow cone vendor. Following this, a different case study problem surrounding the snow cone vendor was presented to each group.
- Activity 2 – ideating and prototyping were combined, and the participants worked in their groups to generate ideas to solve the problem their snow cone vendor was experiencing.
- Activity 3 – here, the participants deconstructed what they learned and restructured how they would introduce these creative problem-solving methods to their classroom and other teachers. This prompted them to consider the immediate use of this framework in their classroom teaching.

Data Analysis

The collected data was systematically organized into concepts and emerging themes following grounded theory coding procedure. Open coding was used to reveal the key concepts from the workshop discussion with the participants.

The categories were organized similar to the questionnaire by revealing the participants' perspectives before the workshop activities and after. These participants' perspectives and themes were tracked, and the results informed the components needed for the prototype.

Results

Questionnaire

Eight teacher participants were surveyed and answered all questions in both the pre- and post-workshop questionnaires. Their responses were organized into three sections:

A. understanding where the teachers were at *before the activities*
B. the activities they found most impactful
C. what resonated with the teachers most *after the activities?*

Where the Teachers Are at (Before Activities):

Participants were asked to define creativity, to define what a creative person is and whether or not they believed they were a creative person. They were also asked to define creative thinking and whether or not they felt confident in teaching creative thinking skills.

On Creativity

While each response to defining creativity was expressed individually, the general consensus was that creativity involved having the ability to express oneself, to think and solve problems. For instance, participant 1 defined creativity as “the ability to use your imagination to problem solve or express an emotion or a concept,” while participant 2 said, “creativity is the ability to approach a problem/activity with many different perspectives, not knowing in advance what is right or wrong, and being able to solve the problem by bringing multiple dimensions to it.”

On a Creative Person

When defining what a creative person was, the responses aligned with the perception of creativity by illustrating a person’s ability to innovate or think outside of the box. Participant 2 stated that “a creative person uses anything (information or stimulus) to make something new or to enhance a particular concept using prior knowledge/experience.” One participant’s (4) definition deviated slightly here by defining a creative person as “one with a flair for colors, visual expressions, precision and fun.”

On Considering Themselves to Be Creative

Additionally, seven of the participants considered themselves to be creative, and only one participant was on the fence about calling themselves creative and explained that they had the ability to be creative but was inconsistent.

On Creative Thinking

The overall responses to defining creative thinking identified some connection to problem solving and thinking up ideas beyond the traditional expectations. Here are some examples: Participant 2 said, “creative thinking allows an individual to think ‘outside the box.’ Critical thinking skills are enhanced through the method,” and participant 6 said, “creative thinking is being able to use a variety of approaches to problem-solve or create a vision. It employs skills from all subject areas and multiple intelligences.” Participant 8 said, “creative thinking is about being able to make connections, apply emotional intelligence, be reflective about your own mental models and question generally; all of which engages problem solving.”

On Confidence Teaching Creative Thinking

Prior to engaging in the workshop activities, four of the participants felt confident in teaching creative thinking; two participants (participant 4 and 6) did not feel confident teaching creative thinking; and two teachers (participant 1 and 3) were uncertain of their ability to teach creative thinking expressing they felt somewhat capable but believed that they needed more practice or resources to build their confidence and become more effective. Participant 3 explained, "I am more confident fostering creative thinking in students who already have some – even just a little. I find it very difficult to improve creative thinking in students who are challenged in the area."

On Everyone's Capacity to Be Creative

When asked if they believed that everyone has the capacity to be creative, six of the participants replied yes, and two participants replied maybe and expressed that they felt some people had more natural ability to be creative, where as some people needed more assistance and teaching to develop the skills. For instance, participant 5 said that it "depends on what creativity means and what they are being creative about, for example the visual arts – not everyone has the ability to be creative in that field/area if they are not 'visual' or understand certain abstract concepts as they relate to the visual arts."

The Workshop Activities That Were Most Impactful:

The opportunity to reflect on the workshop lessons and activities were presented here and the participants responded to the four components. They were allowed to select more than one option in this section to indicate the most impactful and valuable activity.

- Three participants found the lesson on Human Centered Design to be most impactful.
- Six participants found that activity 1 (empathy building) was the most impactful.
- Five participants found that activity 2 (ideate and prototype) was most impactful.
- None of the participants selected activity 3 (deconstruct and reconstruct) as most impactful or valuable.

Empathy building was overwhelmingly the most impactful activity to which the teachers commented on its value. Participant 2 said about activity 1 (empathy building), "this was the most interesting part for me as I was able to explore the empathy map with the snow cone vendor and his feelings at my level of the process." Participant 4 shared "activity 1 allowed me to get in touch with the character – it gave me an understanding of the character and helped me to visualize the person's way of thinking." Participant 5 said about activity 1, "from this activity, other lessons/approaches can emerge. It gives a very deep insight into the characters/culture/situation which is crucial in understanding and solving or creating."

What Resonated the Most with Teachers (After Activities):

The participants were surveyed to understand which activity was the most immediately useful in their classroom teaching. They were also asked if felt they could recommend these creative problem-solving methods and based on what they learned from the activities, if they felt confident teaching these creative thinking methods.

On the Most Readily Usable Activity

The response showed that six participants felt that activity 1 (empathy building) was the readily useful for their existing classroom sessions. One participant opted for activity 2 (ideate and prototype), and one participant responded that both activities 1 and 2 were most immediately useful for their classroom sessions.

On the Most Usable Activity for Visual Arts Lessons

Upon reflection, four participants felt that within an art class they would immediately use activity 2 (ideate and prototype), two participants opted for activity 1 (empathy building), and one participant felt all of the activities were usable. The final participant noted they were unsure, and it can be noted that this participant met the participation criteria of teaching the 10–13 age group but did not teach visual arts at all and thus felt reluctant to answer specifically to visual art classes.

On Their Confidence Teaching Creative Thinking

The response showed that seven of the participants felt they could implement the methods they learned into their class teaching and existing curriculum, and the same seven participants now reported feeling confident in teaching creative thinking. Only one teacher said they could not implement these methods into their class and also said no to feeling confident teaching creative thinking. This was participant 5, who also said no to feeling to confidence teaching creative thinking at the beginning of the workshop, but expressed that while they understood the concepts and methods taught in the workshop, they still lacked confidence because they felt they needed more practice with these new methods before implementing them with students. Other participants who answered yes to feeling confident teaching these methods did also note they would still like additional sessions to become more familiar with the material.

On Recommending These Creative Problem-Solving Activities

All participants said they would recommend the methods taught to them in the workshop to other teachers.

Themes from the Research Workshop

The workshop facilitated two mini-discussions before and after the activities, and from this dialogue and their responses to the concepts they learned throughout the workshop, themes were identified.

Before Activities

The participants already felt a need for change in teaching methods as they regularly face many challenges with students and resources. They were open to learning something new with regards to creative thinking but held a lot of apprehension with the current school system and the limitations it places on them, as these limitations were seen as not conducive to what they considered necessary to fostering creativity in the classroom.

Motivation

The general motivation to attend this workshop was a recognition that they had existing challenges teaching creative confidence and that there was an overall shift in the student body's information intake and that a new approach was needed to present content to students because the general system was outdated. The participants were interested to discover a possible new approach they could try out in their classrooms. For example, participant 8 mentioned that with some subjects, students are exposed to overlapping content over the years and aren't always meeting new information. "So, they feel like "oh we're doing this again." An interest in finding more creative ways to deliver the content was this teacher's motivation to attend the workshop.

Pressure

The teachers feel immense pressure to meet the requirements set out for them by Caribbean Examination Council (CXC) the governing body of educational development in the Caribbean. They feel strongly that there are too many subjects which make the students become stressed and there are also too many deadlines. Additionally, with a heavy workload it becomes hard to balance content delivery with the timing of syllabus requirements because of the nature of high- stakes-exam culture. Participant 5 said, "What I do not understand about CXC is that they come up with all these objectives that are supposed to help us, even though they aren't the ones doing it. Yet they have all these SBAs (School Bases Assessments) … children are bogged down … if you're doing 7 or 8 or 9 subjects they're stressed out!" This teacher further expressed, "We've voiced that as teachers and of course they ignore us. So, they're saying they want this. . .but we don't have the resources and we don't have the time. The children are stressed with all of this work and marks. And we've got deadlines. . .this, this, this and this! So, you're not only teaching skills, you're teaching to a deadline."

The SBA (School Based Assessment) is a set of asks/assignments/projects conducted in the school; carried out by the student following guidelines provided by CXC and assessed by the teacher using criteria provided by CXC. The SBA score contributes to the candidate's overall examination grade.

Perception

There was a belief that a relaxed environment was needed for creativity to thrive and the culture of education in Barbados was so heavily marks driven that it didn't help nurture this creativity. Participant 1 said "What is it we really want from the students? Because my experience is when you want creativity to flow you want people to be relaxed. I am most creative when I'm not pressured. But it's hard to remove that pressure when they need marks for the curriculum." The teachers felt that the current teaching model does not work for creativity and that the Caribbean has a very traditional mindset, and this presents a major challenge to changing the current system. Participant 4 expressed, "I actually think that you cannot teach the same way and try to be creative. It has to be a whole change! And I think once you are comfortable within that new shape then things can be implemented more smoothly. Within this new shape it will happen seamlessly... but it's because our mindset is still so traditional, we will have a challenge."

Time

Teachers are constrained by a lack of resources, and they do not feel seen or heard by the authorities whose objectives are too demanding. They find that they are constantly working to deadlines and there's lack of flexibility in the requirements CXC sets for them to meet in the syllabus. Trying new things takes away from the limited time they have to hit the markers to prepare students for their exams. Participant 5 shared, "I have to teach a program that is driven by 'you have to do this...you have to do that'... and it does not allow me to teach it in a slightly different way because then I cannot fulfill the requirements of the syllabus because I've got this deadline and that deadline. I've tried one or two things, but it has taken away from time." And participant 8 echoed, "it takes me half the class or even the entire class to get them involved and help them to understand and find examples and connect them to that [topic] before we even get into what the rest of the content looks like, before we can even begin to annotate, before we can even deconstruct text for them to be able to create something that they can write and take the information behind."

Evaluation

There are high expectations held by the government which continues to perpetuate the marks-driven culture that constrains the growth of students and flexibility of the teachers. Due to this marks-driven culture, even parents have high expectations, and this creates no middle ground for experimentation. Participant 1 noted that "in education it's still the authorities have designed something and then you're given it and you need to execute it properly because those marks are very important. We're still very much afraid to experiment." Participant 8 shared "I do think we are heavily marks driven and I do think that parents and teachers and children...all of us need to question the mental model about that. How much scaffolding do we do? How much of it that is behind the scenes is going to make the child successful from simple of executive function skills." Participant 6 said, "the whole education system we have is it's either right or wrong. There's no middle of the road."

After Activities

The participants shifted their focus to the activities and how they could implement the methodologies they learned. Empathy building was the tool they connected with the most, and this prompted them to explore alternatives for evaluation as this was an area in need of change in order to nurture a more creative environment. Additionally, the need for collaboration amongst the participants is an area for future growth.

Empathy

Participants found that the empathy-building exercise allowed for a mindset shift to occur. They liked that it encouraged engaging in your environment and exploring scenarios to problem solve. Additionally, it was positive that the exercise required you to embody another person or situation, express your point of view and encouraged asking questions to switch your thinking. Participant 8 mentioned, “I think that process of empathy helps a lot. . .even if you don’t have all the specialty knowledge, it helps to create a shift.”

Evaluation

Self-evaluation or peer review is an alternative to the marks-driven culture. Encouraging work where there is no set right or wrong answer reduces expectations and allows building imagination and creates more options for students to explore work where they can express themselves more. For example, participant 4 explained, “I liked the part about no wrong answers because I find with my Form 1’s. . .after all this common entrance preparation, it’s really hard for them to believe that two different answers can both be right, because that’s not what they’ve been prepped for. . . so, something like this that teaches them that there are many right answers, it’s a really good way to start shifting that.” Participant 3 remarked positively in the option to “encourage students to think of new ideas to bring to a task or topic. . .so encourage students to be freer in [their] expression. . .to understand there are many solutions, and that no answer is wrong. . .it may just be more or less applicable.”

Objective

A change in approach to the classroom objective is possible where teachers can flip the script and think from the perspective of the learner and build content materials from that angle. Speaking for the second group of teachers, participant 8 explained, “we were thinking about was to kind of flip the script a little bit and have the teacher think about what would it be like to be the learner . . .and so to see the objective from not what I have to deliver but what I have to learn. . .and from that perspective to then reflect a bit about the students perspective on what they might be getting. . .so we were thinking about the level they’re at to so we begin to create something that is visible to them.”

Support

Collaboration and community are needed to succeed. Teaching can be an isolating job when you are alone in the classroom all day, and in some departments, you may be the only teacher of your subject. Opportunity to share ideas and get feedback is critical. As explained by participant 6, “One of the problems is we don’t have enough people in the departments to brainstorm with. If you’re having to teach a class, you’re brainstorming with yourself. And that doesn’t help!”

Key Insights

There are a few key things that came out of the discussion and themes in this workshop which I think should be noted.

1. ***Work Within Constraints*** – the most noticeable shift pre- and post-workshop was the focus on external pressures. Prior to engaging the activities, there was a lot of dialogue and concern about the constraints placed on them. After the activities,

the teachers were less focused on the external pressures placed on them and began to explore ways, they could fit existing requirements within this model. This is to say, the confidence seemed to come from working within constraints, not by removing constraints entirely.

2. ***Establish Connection*** – The most impactful activity which the teachers also found easiest to implement into their class sessions was empathy building. Their remarks revealed that empathy building brought about a sense of connection, both with characters and the environment as well as with their own students. It also was the catalyst to connecting to the other steps of framework. It prompted the teachers to consider their approach from another perspective – the students.
3. ***Reframe Expectations*** – It resonated with the teachers the reframing of evaluation metrics in teaching creative thinking. Specifically, the notion of there being no wrong answer, and exploring different ways of assessing outcomes seemed much more possible with this framework and these activities than in the traditional curriculum. Prior to workshop activities, the dialogue allowed no alternative for grades, but afterwards, they were considering possibilities.

The significance of working within constraints is in considering the factors of decolonization and working in a postcolonial society. It is incredibly difficult to completely dismantle existing global socio-political structures that are so deeply engrained in us, but it is possible to be critically aware of those structures and work consistently to push against their borders and move them further outwards until a new paradigm has been created. Connection is multifaceted, as it also presented itself in the need for support and collaboration amongst the teachers and cannot be ignored as a catalyst to developing empathy and strengthening skillsets amongst students in a classroom setting. Where this makes a mark is the benefit of decolonial work to be grounded in solidarity. Strengthening the power base of a society can increase resiliency and cultural identity. Reframing expectations extends beyond evaluation or grades. This allows certain freedoms rarely experienced in colonized communities. The freedom to be in control, to explore, and to initiate ideas develops a different attitude among people.

These key insights and most impactful activities from the workshop informed a model for teaching creative thinking in the classroom.

Design Decisions

The design solutions were informed by the feedback to the workshop and the model illustrating how to teach creative thinking in classrooms (Fig. 1). Together, these informed the next iteration of the workshop design and the teacher's toolkit. Overall, the workshop needs to be extended to allow more time for discussion and the flexibility to go in-depth in the activities. The workshop should be a minimum of 4 hours in order to facilitate this approach. Additionally, there needs to be an opportunity to debrief (or quickly discuss) after each activity to capture more specific and isolated feedback to each stage of the workshop. Given the feedback captured in the questionnaires, the participants need an opportunity to take away the materials and

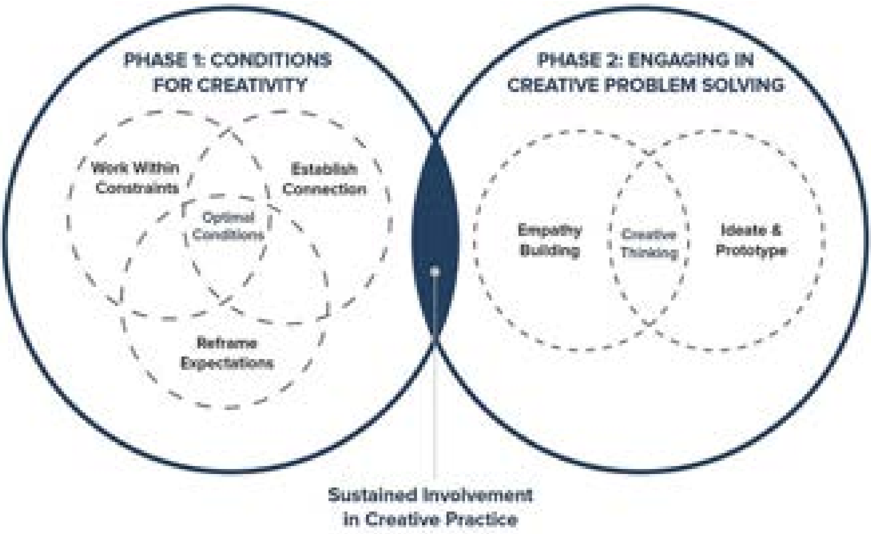

Fig. 1 Model showing how to teach creative thinking

practice these activities in their classroom to get more familiar with the material. Therefore, the prototype designed is intended to be multi-functional and allow the toolkit to be used in the workshop as well as independently by teachers (Figs. 2 and 3).

Prototype Design

The design solution for the teacher's toolkit has two components:

1. A manual for teaching creative thinking
2. Activity cards for classroom implementation

Manual for Teaching Creative Thinking

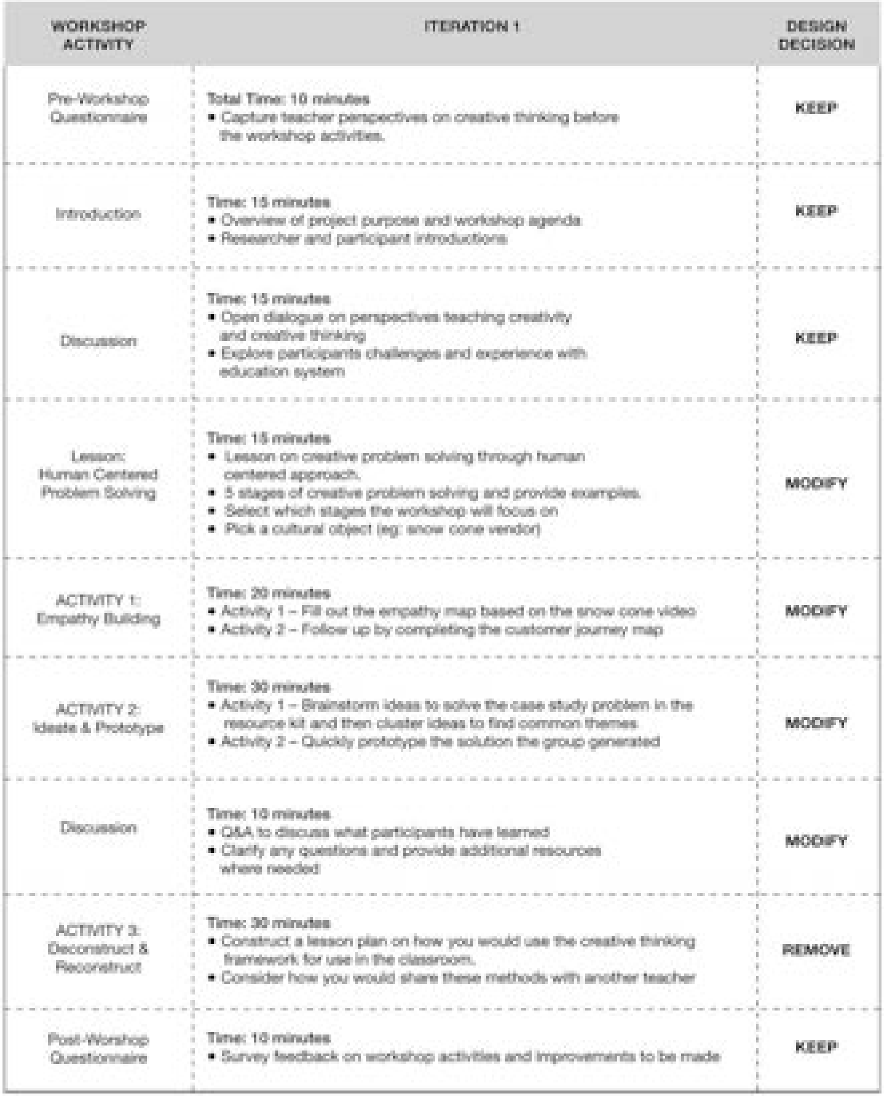
The purpose of the manual is to facilitate further workshops with more narrowed focus on activities and content that is most impactful to the teachers (Fig. 4).

What's Inside the Manual

- Overview of creative thinking and human-centered approach to problem-solving
- Three-step framework for creating the conditions for creativity
- How to activate and engage in creative thinking

Activity Cards for Teaching Creative Thinking

The purpose of the activity cards is to integrate the workshop methods into classroom settings and engage problem solving with students. The aim is to cultivate imagination building in students.

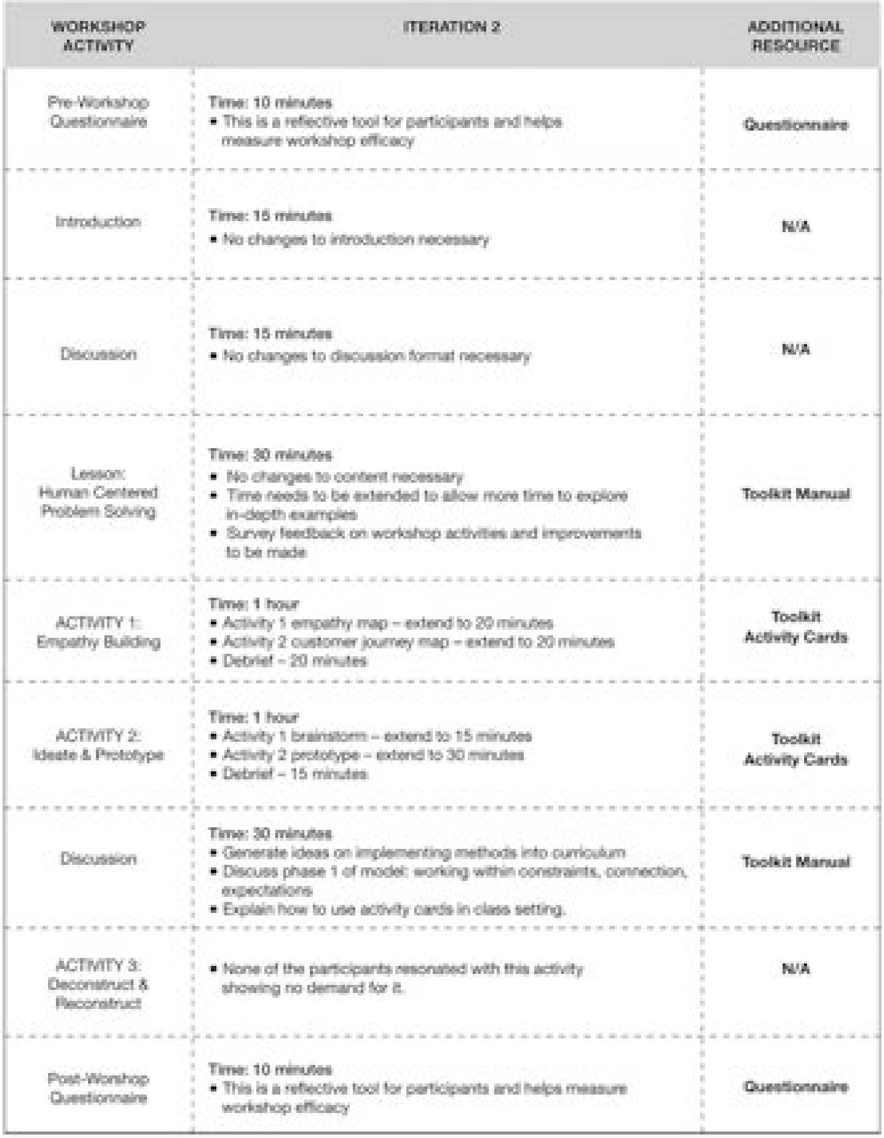


WORKSHOP ACTIVITY	ITERATION 1	DESIGN DECISION
Pre-Workshop Questionnaire	Total Time: 10 minutes ▪ Capture teacher perspectives on creative thinking before the workshop activities.	KEEP
Introduction	Time: 15 minutes ▪ Overview of project purpose and workshop agenda ▪ Researcher and participant introductions	KEEP
Discussion	Time: 15 minutes ▪ Open dialogue on perspectives teaching creativity and creative thinking ▪ Explore participants challenges and experience with education system	KEEP
Lesson: Human Centered Problem Solving	Time: 15 minutes ▪ Lesson on creative problem solving through human centered approach. ▪ 5 stages of creative problem solving and provide examples. ▪ Select which stages the workshop will focus on ▪ Pick a cultural object (eg: snow cone vendor)	MODIFY
ACTIVITY 1: Empathy Building	Time: 20 minutes ▪ Activity 1 – Fill out the empathy map based on the snow cone video ▪ Activity 2 – Follow up by completing the customer journey map	MODIFY
ACTIVITY 2: Ideate & Prototype	Time: 30 minutes ▪ Activity 1 – Brainstorm ideas to solve the case study problem in the resource kit and then cluster ideas to find common themes ▪ Activity 2 – Quickly prototype the solution the group generated	MODIFY
Discussion	Time: 10 minutes ▪ Q&A to discuss what participants have learned ▪ Clarify any questions and provide additional resources where needed	MODIFY
ACTIVITY 3: Deconstruct & Reconstruct	Time: 30 minutes ▪ Construct a lesson plan on how you would use the creative thinking framework for use in the classroom. ▪ Consider how you would share these methods with another teacher	REMOVE
Post-Worshop Questionnaire	Time: 10 minutes ▪ Survey feedback on workshop activities and improvements to be made	KEEP

Fig. 2 Design decisions of workshop iteration 1

How the Cards Work

- Step 1: Pick one of each type of card to create a narrative
  - Pick an archetype (vendor, bus driver, nurse, etc.)
  - Pick an activity (selling snow cones, treating a patient, making a delivery)
  - Pick an empathy card (says/thinks/does/feels)
  - Pick a problem card (various human problems: back pain, anxiety, no money)



WORKSHOP ACTIVITY	ITERATION 2	ADDITIONAL RESOURCE
Pre-Workshop Questionnaire	**Time: 10 minutes** ▪ This is a reflective tool for participants and helps measure workshop efficacy	**Questionnaire**
Introduction	**Time: 15 minutes** ▪ No changes to introduction necessary	**N/A**
Discussion	**Time: 15 minutes** ▪ No changes to discussion format necessary	**N/A**
Lesson: Human Centered Problem Solving	**Time: 30 minutes** ▪ No changes to content necessary ▪ Time needs to be extended to allow more time to explore in-depth examples ▪ Survey feedback on workshop activities and improvements to be made	**Toolkit Manual**
ACTIVITY 1: Empathy Building	**Time: 1 hour** ▪ Activity 1 empathy map – extend to 20 minutes ▪ Activity 2 customer journey map – extend to 20 minutes ▪ Debrief – 20 minutes	**Toolkit Activity Cards**
ACTIVITY 2: Ideate & Prototype	**Time: 1 hour** ▪ Activity 1 brainstorm – extend to 15 minutes ▪ Activity 2 prototype – extend to 30 minutes ▪ Debrief – 15 minutes	**Toolkit Activity Cards**
Discussion	**Time: 30 minutes** ▪ Generate ideas on implementing methods into curriculum ▪ Discuss phase 1 of model: working within constraints, connection, expectations ▪ Explain how to use activity cards in class setting.	**Toolkit Manual**
ACTIVITY 3: Deconstruct & Reconstruct	▪ None of the participants resonated with this activity showing no demand for it.	**N/A**
Post-Worshop Questionnaire	**Time: 10 minutes** ▪ This is a reflective tool for participants and helps measure workshop efficacy	**Questionnaire**

Fig. 3 Design decisions of workshop iteration 2

- STEP 2: Generate the case study/narrative based on the cards (make it seamless)
- STEP 3: Ideation – allow students to engage in a group brainstorm and discussion
- STEP 4: Prototyping – group or individual project that is student-driven; teacher-guided (Figs. 5 and 6).

The prototype of the toolkit manual and activity cards is available for download and user testing at: www.thisiscontexture.com

Creativity is an attitude towards life.
To teach creative thinking requires fostering
the right mindset and environment.

THE CONDITIONS
FOR TEACHING
CREATIVE THINKING

There are 3 simple things we can do to start creating the conditions for creativity in the classroom.

Work within constraints
Establish connection
Reframe expectations

1

Fig. 4 Sample page of the toolkit manual

Future Work

The following are some next steps to consider in further design development of the prototype:

Smaller Focus Groups

It was extremely advantageous to have a high number of participants in this study, but in order to continue fine-tuning the workshop to maximum impact, more time needs to be allowed for each activity. This can be achieved by working in smaller groups and pairing participants together during the activities.

Teacher–Student Co-Design

The activity cards need to be tested in a class setting with a teacher and students. One teacher to three students should be sufficient to try out the activity cards by subject to continue the iterative design process.

Subject Specific Workshop

This workshop can be explored across more subjects in the educational curriculum. For example, a workshop of creative thinking for science teachers, history teachers, or math teachers will yield further data to help develop different versions of the prototype.

Fig. 5 Archetype card and activity card

Limitations

This study was conducted at a private school where resources are more accessible than public schools. It would be beneficial to test the workshop prototype with public school teachers to understand further challenges that they may have, which may not have been considered or realized within a private school setting.

Furthermore, the scope of this research is limited to Barbados, which serves as an accessible model for other English-speaking Caribbean nations. It is without doubt, however, that the French, Spanish, and Dutch islands will require significant adaptations to this study to respect their individual histories and existing school systems.

Conclusion

The goal of this study was to introduce a practical tool to assist teachers in implementing creative thinking methods into classroom sessions. The intention was not to dictate specifically how to use this tool in their curriculum, but instead to give teachers a framework that empowers them to make changes where they feel most capable. And in doing this, begin to shift the perception and attitude towards creativity and visual arts as an optional component of Caribbean education.

EMPATHY CARD

SAYS

THINKS

DOES

FEELS

CHALLENGE CARD

Financial

Construction

Health & Wellness

Family

Fig. 6 Empathy card and challenge card

The Sternberg study introduced the elements that make up a creative attitude, and upon reflection and analysis, it's clear that these elements align with the key insights found in this study. Specifically, redefine problems, allowing time, allowing mistakes, and selling ideas. There is no fundamental difference in teaching creative thinking in the Caribbean compared to other regions. It is simply a matter of cultivating a learning environment and integrating methods that allow for creativity to flourish. Thus, this research study afforded a pedagogical toolkit to facilitate further workshop studies, as well as a model that illustrates the requirements for nurturing creative thinking in the classroom.

The use of the questionnaire both pre- and post-workshop allowed for the effectiveness of this research to be measured by mapping the confidence level the teachers had before and after their introduction to the creative problem-solving methods. The themes that arose from this research workshop perfectly grounded the toolkit components; empathy, ideation, and prototyping. Future studies should expand the scope to public schools to understand the unique challenges that arise in different school settings to allow for further adaptive workshops. The biggest insight from this study is the importance of teachers to challenge the imagination and encourage innovation amongst students. Thus, there is a need to design for more pedagogical flexibility in instead of the rigid structures that currently inhibit the Caribbean.

Interdisciplinary Center on Open and Accessible Educational Resources: 10 Years Building Inclusive Education in Uruguay and Latin America

50

Virginia Rodés and Regina Motz

Contents

Abstract

The year 2020 undoubtedly marks a turning point in the integration of digital technologies in education. The physical distancing necessary to contain the Covid-19 pandemic has highlighted the need to approach digital education from a holistic and critical perspective on its capacity for inclusion and exclusion. The Interdisciplinary Center for Open and Accessible Educational Resources (CIEDA) intends to consolidate and expand the approach to the subject of inclusive, open, and accessible digital education, in Uruguay and Latin America, implementing teaching, research, and third mission activities that provide scientific and technical knowledge for innovation, professional and academic practice, integrating diverse disciplines, producing a comprehensive approach, and giving rise to interdisciplinary and transdisciplinary collaboration. The interdisciplinary and intersectoral development in the university together with other social actors

contribute to the informed development of the action of civil society and the government, in the creation of public policies, in permanent dialogue with reference centers of the region and the world. The center is an effort to consolidate the work that has been carried out since 2015 by the Interdisciplinary Group of Open and Accessible Educational Resources together with works of different stakeholders from society. Currently, the center is expanding its scope to three cross-cutting areas for the generation of open knowledge and human development: digital media and educational technologies, education and open science, ethics, and digital rights. On these transversal areas, interdisciplinary and intersectoral lines of work articulate efforts in teaching, research, and third mission, with social appropriation and transferability (products and services): skills for digital citizenship; data and artificial intelligence for education; diversity, equity, and inclusion in education; and critical digital pedagogies. The chapter presents the main developments made during a decade of work aimed at educational inclusion in Uruguay and in Latin America.

Keywords

Open education · Inclusive education · Interdisciplinary

Introduction

Nowadays it is inevitable to consider education in the context of the digital transformation of our society; the imperative of open education in its broadest inclusive sense is highlighted. This includes, mainly, open access to educational opportunities, without economic, gender, race, accessibility, or territorial barriers; open access to educational resources for their use, reuse, adaptation, retention, and redistribution; open learning, with the flexibility of time, place, and pace of learning; and open access to education from diversity and equity as guiding principles of value.

Inclusive education means giving all students a fair chance to learn with the same high-quality education and develop the skills they need to have an autonomous life. In this sense, the possibility that open education offers to facilitate personalized adaptations makes it possible to address diversity and inclusion.

The year 2020 undoubtedly marks a turning point in the integration of digital technologies in education and the revitalization of open education. The physical distancing necessary to contain the Covid-19 pandemic has highlighted the need to approach digital education from a holistic and critical perspective on its capacity for inclusion and exclusion. Digitization brings with it many new opportunities, but it also poses significant challenges that cut across education.

Digital technologies can promote flexibility and creativity and help improve efficiency and learning outcomes. But at the same time, phenomena such as false news, misinformation, excess of information, cyberbullying, rights violation in digital spaces, violation of data privacy, unethical uses of artificial intelligence, deviations in the algorithms that classify student profiles and teachers, and uncritical integration of technology are some of the threats that attempt to further marginalize vulnerable groups from quality education.

Interdisciplinary Center for Open and Accessible Educational Resources

Addressing the complexity of the challenges posed by open and accessible education requires multiple perspectives to be taken into consideration. The Interdisciplinary Center for Open and Accessible Educational Resources (in Spanish NúcleoREAA) integrates academics from the Universidad de la República (Udelar), the main public university of Uruguay, who contribute from different perspectives to the subject. The existence of NúcleoREAA makes it possible to capitalize the efforts of these groups, allowing the interdisciplinary approach that is expressed also in the heterogeneity of the more than 30 researchers, both from their training and their academic professional career, in disciplinary fields like Education, Technologies, Information, Communication, Sociology, Anthropology, and Law, among others. Joined by academics from the country and foreign universities, together with the Education Training Council, National Public Education Administration, and civil society organizations – like Uruguayan Association of Librarians, Creative Commons, and National Union of Blinders of Uruguay – they frame their experiences and developments together, based on numerous projects and initiatives carried out.

These projects and initiatives allow researchers to "learn with," "learn from," and "learn about," developing interpersonal skills for teaching, research, and third mission, within interdisciplinary teams and intersectoral dialogue. The commitment to collaboration, added to the technical, pedagogical, and research contributions, results in the quality of the task to be carried out and has a direct impact on the conception, design, and development of the construction of knowledge in this interdisciplinary field. Interdiscipline is the result of disciplinary elements (ideas, methods, theories, and practices), which are interactive, not additive, and subject to negotiation and creative adaptations based on the needs of the particular context (Graff, 2015). This form of interdisciplinary work was learned and apprehended by most of the members, through their direct participation in the projects and actions carried out. An overview of its main achievements can be seen in Fig. 1.

The NúcleoREAA then becomes the workspace where the various disciplines that compose it are dedicated to the problem of open and accessible education in an interdisciplinary way, articulating their different epistemological, methodological, and practical views, in order to exceed their borders in achievement of the objectives.

Interdisciplinary Areas of Development

The NúcleoREAA is organized in interdisciplinary areas. These development areas are mainstreaming interdisciplinary and intersectoral approaches, building a conceptual and methodological basement on which teaching, research, and third mission

Fig. 1 Overview of main achievements of NúcleoREAA

initiatives are built. This approach allows to enhance the process of collective construction of the subject, as well as the research results and participation in its social appropriation.

Areas

The transversal areas are A1) digital media and educational technologies; A2) open education and open science; and A3) ethics and digital rights:

A1) Digital media and educational technologies. Today, digital media are part of the culture and govern behaviors, trends, and languages that emerge from the digital environment and go through in an invisible way. Education must be studied in a contextualized way, and today the context includes digital media, because citizens are on social media. Van Dijck (2016) argues how the increase in various technological platforms generates a plot and outcome that encourages people to transfer aspects of their lives, both social and professional, as well as cultural, to these spaces, which is why it is imposed as a need. The implementation of a solid media education is urgent.

The new media have been permanently integrated into the learning and teaching processes. However, this simple statement has many important implications. Transformation refers mainly to opportunities related to the democratization of education, social inclusion, and sovereignty over the data they record and produce. Undoubtedly, the use of technologies allows crossing many borders. It is not just a question of geographical restrictions, but of accessibility in a general sense, also those derived from disability or belonging to disadvantaged groups. Educational technologies converge services for the creation of educational resources, repositories of educational resources, Learning Management Systems, Content Management Systems, Recommender Systems, Educational Data Mining services, Learning Analytics, and platforms such as Blockchain that allow distributed and secure transactions between these services. Within NúcleoREAA, we shape this area as a space of synergy between social sciences and technology, from a sociotechnical approach (Bijker et al., 2012).

A2) Open Education and Science. Open Education and Open Science constitute two key elements for the transformation of the models of creation and access to knowledge and culture. Open education encompasses the entire cycle of teaching and learning processes, open designs, open pedagogies, and open educational resources as part of the curriculum and integrated into the so-called new literacies. In higher education, there is no open education without open science. Making open science the dominant paradigm of scientific practice means promoting that publications, data, practices, methodologies, and processes derived from research are accessible to the scientific community and society. It also involves citizens in research environments and socially responsible innovation initiatives. The open science and education movement breaks down barriers to equity by expanding participation. It also reduces the historical effects of educational colonization: language problems, contextual gaps, lack of cultural diversity, and educational privilege. It is not a panacea for solving all problems in a global society or in the higher education sector, but it does become an advocate for sociocultural dialogue.

Work has been done on the articulation of education and open science through educational action-research projects developed within academic professional learning communities (APLC) in the context of public education in Uruguay (Czerwonogora & Rodés, 2019a, 2019b) as fundamental frameworks to face the challenges of critical educational action research, as well as collaborative and participatory technologies for the transformation of teaching and educational research practices. The approach combines the community dimension of the APLC and the openness toward research, favoring the construction of Open Educational Practices and the development of Open Science competencies.

In the context of this area, NúcleoREAA aims to identify, analyze, understand, and propose actions that help to adopt a truly open access approach, and inform and reinforce existing and prospective open education and science initiatives in Uruguay and Latin America, through the development of common strategies with principles that promote diversity, equity, inclusion, and activities for social participation in education and science.

A3) Ethics and digital rights. NúcleoREAA's members share the vision that both creation and access to knowledge occur in a social context and exercise of power that is not free from conflicts and inequalities. That is why we incorporate this area, which studies and analyzes, from an interdisciplinary perspective, the impact of digital technologies in education according to ethical aspects and digital rights. This contextual and critical look is supported using models and processes that we understand to be fair and sustainable, developing the concepts of accessible and inclusive open education, open science, and open data. People with disabilities or minority groups face complex challenges in leveraging media and contents for education and social participation. In a context of neither access nor universal design, technology in fact creates new challenges for literacy, equity, and autonomy.

According to (González & Grzona, 2016), the right to education has an even more relevant weight, when thinking of this period as that of the knowledge society. Work has been done on proposals aimed at the digital rights of people with disabilities within the project "Digital and accessible library (Bidya): Digitization of Libraries within the framework of compliance with the Marrakesh Treaty" (Díaz-Charquero et al., 2017; Díaz et al., 2019; Patrón et al., 2019; Rodés & Motz, 2020). Work has also been done on the protection of personal data in learning analytics projects (Díaz et al., 2015; Macarini et al., 2019; Macarini et al., 2020; Cervantes et al., 2018) applying the principles of "Privacy-by-Design" in the development of educational information systems from the integration of computer science with law, education, and communication, also developing new literacies in copyright and data use.

In response to the continuous transformations of digital technologies, this area ensures compliance with ethical principles and digital rights in all educational experiences that take place in new contexts and communities.

Lines

On the three abovementioned base areas (A1, A2, and A3), NúcleoREAA is organized into 4 interdisciplinary lines, promoting the interactions and intersections between the different disciplines in the development and implementation of teaching, research, and third mission actions, from their design, methodology, and transferability.

These 4 interdisciplinary lines are: L1) skills for digital citizenship; L2) use of data and artificial intelligence; L3) diversity, equity, and inclusion; and L4) critical digital pedagogies:

L1) Skills for Digital Citizenship. The technological immersion that we live in the various areas of daily life, including education, generates the need for skills and abilities not only to face the demands that this entails, but also to achieve a better exercise of rights. In this line, it is proposed to continue with the work from a comprehensive approach to various competencies related to digital citizenship: digital competences. In this line, it is proposed to continue with the work from a comprehensive approach to various competencies related to digital citizenship: digital competencies (Gewerc et al., 2017), information competencies (Díaz Costoff, 2015; Cabrera Castiglioni, 2015; Ceretta & Gascue, 2015), OER and OEP (Núcleo REAA, 2018; Núcleo REAA, 2019), data (Atenas & Podetti, 2019), and copyright (Díaz et al., 2017; Secker, 2018).

It is essential that teachers acquire digital skills that allow them to develop and transmit their knowledge in the digital age. Uruguay, to date, is working on the development of a digital citizenship framework. The Agency for Digital Government, Information Society and Knowledge (AGESIC) launched a public consultation in June 2020 to contribute to the digital citizenship strategy that includes among its lines of action the development of capacities in three dimensions: "Responsible and safe use," "Critical and reflective use," and "Creative and participatory use."

In addition to the need to assess digital skills, there is also an urgent need for a teaching digital skills framework that involves teachers, not only as users but also in the leading role of builders of our digital society and agents of curricular change. Likewise, the digital competence of university students is scarcely studied in Uruguay, and along these lines, work will be done to better understand the impact of public policies on educational, digital, and social policy aimed at developing digital skills to which the country has made numerous efforts in the last decade.

L2) Use of data and artificial intelligence. As technology evolves, the application of advanced techniques of data use and artificial intelligence such as ontologies, machine learning, sentiment analysis, semantic analysis of social networks, the application of techniques for natural language processing, human-computer interaction models, and natural interface design, among others, help to better understand human behavior. With the recommendations provided by intelligent systems, teachers can timely detect students with problems and carry out a significant intervention, to ensure their inclusion and stimulate the improvement of their performance considering their possibilities, limitations, and preferences, thus reducing school dropout. According to Long et al. (2011), learning analytics are the measurement, collection, analysis, and reporting of data on learners and their contexts, with the purpose of understanding and optimizing learning and the environment in which it takes place. In this sense, they facilitate the processes of monitoring and analysis, prediction and intervention, tutoring, evaluation and feedback, adaptation, personalization, recommendation, and reflection (Chatti et al., 2012).

There are no indications of a systematic adoption within the educational system, of applications based on artificial intelligence for teaching and learning, despite the existence of these applications for years. NúcleoREAA’s members have developed relevant contributions from R & D & I projects (Cervantes et al., 2018; Macarini et al., 2019; Macarini et al., 2020).

An important challenge is to prepare decision makers and teachers for artificial intelligence integrated into education, and at the same time prepare artificial intelligence to understand education, as mentioned by UNESCO in its working document (UNESCO, 2019), contributing to respond to pedagogical problems, and not to deepen them. On the other hand, it is necessary to create new educational possibilities.

Developers of applications of artificial intelligence must participate in an active dialogue with educators, sociologists, educational technologists, pedagogues, communicators, and experts in data privacy, to understand how their solutions benefit educational practices from a human rights and ethical framework perspective.

Developing skills and attitudes to create, connect, and solve problems collaboratively is a process where research plays a highly relevant role. In this context, it is also necessary to promote national policies to explore how the use of big data, open data, federated OER repositories, linked data, and knowledge graphs and the application of artificial intelligence in education can contribute to more effective, better informed, ethical, and inclusive development.

L3) Diversity, equity, and inclusion. Diversity includes considering the different characteristics that make one individual or group different from another, from an equity and inclusion perspective. The concept of equity refers to justice in access, opportunities, and advancement of all people, while seeking to identify and eliminate the barriers that have prevented the full participation of some groups. Inclusion is the act of creating environments in which any individual or group can be and feel welcome, respected, supported, and valued to fully participate. Inclusion in education allows students to learn together respecting different learning processes and valuing diversity.

Ensuring inclusive and equitable quality education is the fourth Sustainable Development Goal (SDG) defined by the United Nations as part of its 2030 Agenda for Sustainable Development (UNESCO, 2019). It is essential to recognize the need for a Diversity, Equity and Inclusion (DEI) approach in the field of open and digital education.

Some of the areas in which the DEI issue has been addressed in open digital education reach areas such as social justice, feminist educational technology, and transversality of neocoloniality and postcoloniality in action frameworks, as well as the development of critical perspectives on openness. Inclusive education, design, and inclusive technologies are areas in which the NúcleoREAA's members have been developing work (Temesio & Motz, 2016; Motz et al., 2019; Oyelere et al., 2020; Rodés & Motz, 2020; Deambrosi et al., 2021).

L4) Critical digital pedagogies. In response to the interruption of face-to-face education due to the pandemic, NúcleoREAA's members participated in many global studies, as Bozkurt et al. (2020). The synthesis of this research suggests how social injustice, inequity, and the digital divide have been exacerbated during the pandemic; the relevance that a pedagogy of care, affection, and empathy acquires in this context, highlighting the importance of open education perspectives, concerns about ethics, surveillance practices, and data privacy. The potential impacts of this transformation, operated by the so-called "great onlining" (Brown et al., 2020), generate concern regarding the way that these remote teaching experiences in the emergency lead to uncritical and dubious quality models that affect in a negative way the current and prospective scenario of education, and particularly in the influence on the digital transformation of universities, addressing digital literacy and the transformation of the curriculum, as key dimensions of the digital university committed to social justice (Johnston et al., 2018). In this framework, teaching teams and decision makers need institutional support and teacher professional development strategies to face this enormous challenge, in order to mitigate the potential effects on the quality of teaching and favor that this massive and emergency experience allows to lay the foundations of sustainable models, instead of a massive digital colonization by the big platforms.

Critical digital pedagogy (Stommel et al., 2020) constitutes a central emancipatory approach, supporting the redesign of technological spaces and environments for teaching and learning from a radical understanding of digital, pedagogical, and social relationships, expanding the possibilities of democratization of digital education as a public good.

Addressing these highly complex issues involves significant challenges. Integrate the ethical perspective of care (Barnes et al., 2015) as a fundamental dimension of teaching practice (Noddings, 2012; Adams & Rose, 2014) and the consideration of the teaching function as an experience of care, analyzing dimensions of diversity (power, class, ethnicity, gender, culture, and access), in order to minimize inequity and maximize the degree to which relationships are reciprocal and oriented toward social justice (Rolón-Dow, 2005).

The context described makes it necessary to generate new research to examine, in detail, the effects and consequences of the expansion and incorporation of digital technologies and media in educational systems, institutions, and practices. Although these are not new problems generated exclusively by the pandemic, they are being experienced mainly by educators and students at all educational levels (Williamson et al., 2020). In this sense, this line aims to advance toward critical and innovative teaching practices, giving continuity to the research developed by NúcleoREAA's members on pedagogical teaching strategies in digital environments, pedagogical models and architectures, symbolic and practical appropriation of digital technologies by teachers and students, creation of open educational resources, and design and redesign of teaching in distance education settings (Pérez et al., 2017; Rodés et al., 2018; Czerwonogora & Rodés, 2019a, 2019b). Of particular interest are the professional development processes of university teachers, whose academic profile associated with their disciplinary specialty does not usually include pedagogical-didactic training.

Milestones in Building Inclusive Education

Regarding the trajectory of the NúcleoREAA in building inclusive education, integrating networks, and provoking synergies between academic and nonacademic spaces, nationally and internationally was the first milestone. The first Technical Report (2017) highlights the area of Repositories and Open and Accessible Educational Resources as eminently interdisciplinary and refers to the comprehensive and innovative approach that this convergence made possible. It also points out the potential to contribute to the theoretical-methodological construction of a field of theories and practices developed around the transdisciplinary articulation of still emerging and disruptive fields, in their disciplines of origin.

The context described a second milestone of its subsequent development was deepening and adding disciplinary fields and facilitating spaces for innovation and development that have been able to integrate a variety of actors. It is worth highlighting in this panoramic vision to the work of the Nucleus: Open Educational Resources as a topic, object of study, and scope of performance; Accessibility of OER, as a concept with multiple implications: its construction, availability, use, and institutional context; collaborative processes, both from the theoretical depth of the concept, and from the perspective of social and community action, as well as from a way of conceiving collaborative work in digital environments; learning analytics, data collection, and analysis process on individual student interaction with online learning activities and their contributions to pedagogy and didactics; and finally, the legal framework to address the implications of information management and its ethical challenges regarding security, people's rights, individual and institutional freedoms, and responsibilities.

The continuity and profusion in the production of the NúcleoREAA in research, teaching (in continuous education, undergraduate, postgraduate, and open courses), and third mission has strengthened its presence and recognition at the national and international level, linked to the relevance and timeliness of its topics and its condition of convening space between academic, civil society, and governmental sectors. On the other hand, NúcleoREAA participated, internationally, in various conferences in the area (LACLO, SIIE, CACIC, OEGlobal, and OER). Also noteworthy is the joint activity with the UNESCO Chair in OER, Brazil, the UNESCO/ICDE Chair in OER, Cánada, and the UNESCO Chair in Open Educational Movement for Latin America, México. During the last decade, NúcleoREAA expanded its national and international networks, by developing many research projects that are the core of its actions. The most important projects in terms of impacts are presented below, in Table 1.

Milestones of the last period were the approval and start of the implementation of the International Interinstitutional PhD Program in Informatics in Education, in collaboration between Universidade Federal de Rio Grande do Sul (UFRGS), Brasil,

Table 1 Major research projects

Project	Description	Founder	Year
ESVIAL	Virtual Inclusive Higher Education for Latin America	Alfa III Program of the European Union	2011–2015
LATIN	Latin American Initiative of Open Textbook	Alfa III Program of the European Union	2011–2015
REMAR	Network for the accessibility and collaborative generation of open educational resources	PASEM-MERCOSUR	2013–2015
RIURE	Ibero-american Network for the usability of educational repositories	CYTED	2013–2016
BIDYA	Digital and Accessible Library	FRIDA-IDRC	2016–2017
AREA	Use of the Ceibal Repository of Open Educational Resources by the Teacher Network	National Research and Innovation Agency (ANII)	2016–2017
DIIA	Discovery of Interactions that Impact in Learning	National Research and Innovation Agency (ANII)	2017–2018
PREDICTIVE MODELS	Predictive models for the determination of academic risk in education	National Research and Innovation Agency (ANII)	2017–2018
PRAXIS (I&II)	Pedagogical-didactic training in technologies and teaching practice	National Research and Innovation Agency (ANII)	2017–2020
SELI	Smart Ecosystem for Learning and Inclusion	ERANET-LAC National Research and Innovation Agency (ANII)	2018–2021

and Universidad de la República (UDELAR) and the approval of the Unesco Chair on Open Education within the framework of the NúcleoREAA.

Finally, we highlight two inclusive innovation projects that were developed during the last period that are milestones in the consolidation of our work in inclusive education. At the national level, it is the second phase of the BIDYA project funded by the National Research and Innovation Agency (ANII), in its Inclusive Innovation line. At the international level, the Smart Ecosystems for Learning and Inclusion (SELI) project stands out, funded through an ERANet-LAC call.

Following, we describe the most important developments made within these two projects, and their relevance as a summary of our comprehensive approach to educational and digital inclusion.

Accessible Digital Library: Digitization of Libraries Within the Framework of Compliance with the Marrakesh Treaty

The project aimed to intervene on some of the factors involved in the educational trajectories of people with visual disabilities, in order to offer tools that favor their integration and permanence in the formal educational system, guaranteeing equal opportunities.

In 2016, the Digital and Accessible Library project (BIDYA), presented by the NúcleoREAA and the National Union of the Blinders of Uruguay (UNCU) to the FRIDA-IDRC Program, was one of the ten innovative projects in Latin America and the Caribbean financed that year. This innovative project, which ended in July 2017, set out to generate a repository of educational materials accessible to people who are blind or have low vision, the Accessible Digital Library (BIDYA), at Universidad de la República.

During the implementation, more than 500 textbooks and study materials for the K12 curriculum in Uruguay were selected, digitized, adapted, and delivered in a repository. These documents can be read by screen readers suitable for the target audience. The results of this project were tested, improved, and approved by a group of people who are blind or with low vision. As a result, the launch of the Accessible Digital Library was completed by generating an accessible web portal (http://www.bibliotecaaccesible.ei.udelar.edu.uy/) and the publication of the resources in a special collection within COLIBRÍ – Institutional Repository of the UdelaR (https://www.colibri.udelar.edu.uy/jspui/handle/20.500.12008/9313). Another result of the project was the development of training and awareness-raising activities aimed at students, teachers, librarians, educational authorities, and the general population.

The project "Accessible Digital Library: Digitization of libraries within the framework of the compliance with the Marrakesh Treaty" is the continuity and expansion of the Digital and Accessible Library (BIDYA) project. It is aimed at the expansion and consolidation of one of the first successful experiences of implementation of the Marrakesh Treaty worldwide and the first in Latin America.

The project expanded the impact and scope of this digital library from digitization, availability in accessible format, and publication in the Digital Accessible

Library of corresponding educational resources at the university level at UdelaR, in which blind or low-vision people are studying.

Among the results achieved, the following stand out: 1) the expansion of the impact and scope of the Accessible Digital Library to the entire National Education System; 2) the generation of methodological guides for accessible digitization, web accessibility of repositories and digital libraries, information literacy for blind or low vision users, and strategies for the adoption of accessible digital libraries; 4) the promotion of its sustainability and replication in all libraries and national educational institutions covered by the Marrakesh Treaty, through the implementation of various training courses and activities for undergraduate, graduate, and graduate students; 5) the creation of the BIDYA Network, composed by organizations of civil society, activists for inclusive education, librarians, and other relevant stakeholders; 6) promoting the implementation of the Marrakesh Treaty in Uruguay by establishing joint lines of work with the National Library, the Copyright Council of the Ministry of Education, and the Monitoring Commission of the Marrakesh Treaty in Uruguay; and 7) the promotion of international collaboration for the promotion of accessible digital libraries at national and foreign educational institutions through participation in the creation and promotion of the Observatory of the Marrakesh Treaty in Latin America.

Smart Ecosystems for Learning and Inclusion (SELI)

The project is funded through the call, ERANet-LAC, which aims to strengthen international cooperation in research and innovation between agents of the European Union (EU) and those of Latin America and the Caribbean (LAC). Financing in Uruguay is in charge of the National Research and Innovation Agency (ANII).

The project addresses the issue of digital inclusion and accessibility of education for disadvantaged groups, improving the digital skills of teachers in the regions involved. The three focus areas are: 1) new pedagogies and methods; 2) new learning environments; and 3) digital training for educators. The project provides activities for teachers and students from participating countries with little access to educational technologies, collaborating with training and inclusion.

Many causes are responsible for the global lack of inclusion of people with disabilities: inadequate legislation, policies, and strategies; the lack of service provision; negative attitudes and discrimination; the lack of accessibility; inadequate funding; and many others. Considering this worldwide challenge, SELI project is designed to answer needs in regions and countries based on current conditions of unemployment, homelessness, street children, low education level of the disabled population, migrants, etc.

The SELI project has implemented workshops and focus group sessions with stakeholders and target groups (on the educational side with schools, social centers, and HEIs, on the technological side with ICT experts, and in the business part with entrepreneurs, companies, and SMEs); to discover needs and requirements for emerging pedagogies, methods, and technologies (such as blockchain, global sharing pedagogy, e-inclusion, e-accessibility, digital storytelling, flipped learning, and educational games).

The target groups are educators (higher education teachers, preservice teachers, and trainers in the social service sectors), entrepreneurs, and innovators in both the public and private sectors. Students, young people, the unemployed, the disabled, the elderly, migrants, and people living in remote areas in Europe and the LAC are its final beneficiaries.

In addressing the lack of accessibility to education, inclusive practices, and ICT technologies, the project fosters knowledge transfer and adapts pedagogical, scientific, and technical solutions for the specific problems of each country of the consortium. The collaborative approach means that the project addresses the wide scope of actors involved in the issue of improved education, inclusion, and accessibility through ICT.

Main achievements of the project include 1) learning environments, content, and services within the same architecture; 2) the development of methodologies and strategies (Porta et al., 2020).

Regarding technologies, contents, and services, SELI learning platform provides the opportunity to create courses for various types of disabilities, taking into consideration accessibility standards, interaction between students, and stimulating the creativity of tutors and students. The infrastructure provided by the SELI project is based on a Blockchain architecture and on having a set of microservices that can be incrementally coupled to offer different functionalities, one of which is learning analytics. Among the contents, courses are designed for students, young people, the unemployed, the disabled, elderly, migrants, and people living in remote areas in Europe and Latin America.

SELI project involved several piloting initiatives, and communities of practice. For example, workshops were held with teachers in Brazil, the Dominican Republic, Uruguay, Poland, and Turkey. This allowed the project team to explore the views of participants on inclusion related to their profession. Pilot tests were carried out in all partner countries, allowing the project team to observe the teachers' perception of the usability of the SELI platform, more specifically using authoring and digital storytelling tools. These observations led to an improved second version of the SELI learning platform that involved the development of a new authoring tool based on the ADDIE model (Analysis, Design, Development, Implementation, and Evaluation) and a new digital storytelling. Both the new authoring tool and the two versions of the digital storytelling tools provided more inclusive solutions targeting more diverse users. For example, two digital storytelling tools are available to facilitate users who require more guidance in visual or auditory communication. In this way, the digital stories on the SELI learning platform have the possibility of empowering users by giving a voice to the most diverse, so that they can be heard in the community.

The authorship tool based on the ADDIE model allows teachers to identify inclusion goals such as cognitive disabilities, diversity of abilities, and hearing and visual impairments when creating courses. This identification allows them to use more specific tools depending on the needs of the target group.

SELI is one of the many solutions that are part of the activities aimed at positive change, resulting from the diagnosis of individual and systemic resources, conceptual work, cooperation of representatives of the education sector with the technical sector (IT), and the testing and implementation of an innovative digital learning environment. Despite the diversity of partners, the objective is coherent and prioritized.

The transformation of education with digital support is currently not an idealistic assumption, but a goal of concrete and coherent actions. Undoubtedly, the solutions applied in the project aimed to contribute to increasing the effectiveness of learning and teaching and the attractiveness of group activities. Today's students and teachers are a completely different generation than their peers of decades ago. They are a generation that recognizes and appreciates the potential of diversity and digital media.

The nonstandard cooperation of professionals, scientists, engineers, and programmers shows that just going beyond typical schemes allows quality and creativeness. Regardless of technical achievements, the SELI project has created an opportunity to engage a large community of researchers and developers in an interdisciplinary process. This has been an opportunity to learn the languages and perspectives of others on inclusive technology and education.

The Way Forward

The work carried out in the last decade has allowed us to build a comprehensive, intersectoral, and interdisciplinary perspective, critical and propositional, which has contributed to the development of inclusive education in Uruguay and in Latin America. This theoretical-methodological construction, which puts people at the center, has the vocation of deepening, calling for more actors to join, in order to expand the concentric circles of influence in educational transformation.

The way forward is one of considerable complexity. The national and global economic crisis, and the conjuncture of educational continuity in the Covid-19 crisis has deepened educational gaps, going back decades in the educational inclusion work carried out by countries and organizations.

The influence of the large platforms and the digital colonization of the educational and social sphere leads us toward the challenge of building with others a decolonial agenda that allows maintaining and deepening digital citizenship, technological sovereignty, and educational inclusion. We invite those who want to join the challenge.

Contents

Abstract

Since March 2020, the COVID-19 pandemic impacted education worldwide, bringing new perspectives as well as many challenges in daily and professional practices. The education system as well as the students, with and without disabilities, were and are still affected by the "new normal" of the pandemic era. Schools and teachers had to change their strategies in order to adapt their curriculum and approaches to the need for remote education. Remote courses, online practices,

and virtual classes brought new opportunities but equally challenges for inclusive education.

For students with disabilities and special learning needs, moving to distance learning has posed opportunities, especially for those that benefitted from remote teaching. However, additional obstacles emerged for others, including barriers to technology engagement, limited access to instructional resources and individualized learning interventions, and the lack of social interactions.

In reaction to these challenges, many teachers have quickly adapted their practice and developed creative approaches to delivering comprehensive education to all students. However, gaps exist, resulting in obstacles for students with disabilities, while equally offering opportunities for further training and empowerment of inclusive educational practices.

In this chapter, a clear overview of the impact of the pandemic on inclusive education is raised, how the online teaching practice offers solutions but equally faces challenges, while this research also looks at recommendations to enrich the teacher's competencies on how to address these challenges.

Keywords

Inclusive pedagogy · Inclusive education · Inclusive education during Covid-19 · Inclusive education in the crisis period

Abbreviations

ADHD	Attention Deficit Hyperactivity Disorder
IPAA	Inclusive Pedagogical Approach in Action
MOOC	Massive Open Online Courses
OER	Open Educational Resources
PC/TV	Personal Computer/Television
UN	United Nations
VET	Vocational Education and Training

Introduction

The COVID-19 pandemic has caused the biggest threat ever to school systems, worldwide, affecting nearly 1,6 billion students in over 190 countries across all continents. School and other learning premises closures have affected 94% of the world's student population, rising to 99,9% in low- and lower-middle-income countries (UN, 2020).

Political, social, sociological, and financial infrastructures have always been difficult to navigate when it comes to inclusive education trips. As this chapter shows, the Covid-19 period merely enhanced the constraints and obstacles associated with inclusive education mandates. This has mostly been the case in terms of access to technology, inaccessible content, a lack of proper teacher training, rules that ignore the demands of various student needs that have risen as a result of the "new normal" of the COVID-19 era, etc.

This interruption has impacted students and instructors globally, from elementary through secondary schools, technical and vocational education and training colleges, universities, adult learning, and skill acquisition institutions (UN, 2020). Due to enforced seclusion and parents being overburdened with additional obligations that would have been carried by the educational institutions instead, it has also frequently had a severe influence on family life.

Because of the flexibility of e-learning in terms of delivering education and gaining access to materials, which involves teaching remotely and on digital platforms (Bakia et al., 2012), schools, instructors, families, and students were forced to adopt new methods to learning. The epidemic has forcefully enhanced the e-learning uptake in 2020, and it is projected to remain at a high level in the years to come. In the previous 20 years, e-learning only slowly took off and encountered several obstacles (Removing Barriers to Online Learning Through a Teaching and Learning Lens, ABLE Research Consultants, 2020).

COVID-19 Impact

At the beginning of the outbreak, no country had a universal digital curriculum for teaching and learning in place. This merely proves the efforts that governments and schools had to take to rapidly move toward distance learning, thus ensuring continuity of learning, but equally resulting in several problems for disadvantaged children (mainly children with disabilities and socially disadvantaged children).

First of all, remote education requires students with disabilities to have all needed technical equipment available at home. This ranges from assistive technologies to fast Internet access, the availability of a PC/TV/laptop/smartphone depending on the channel used by their educational institute to offer teaching, etc. This requires an investment by families, whereby the impact poverty has on (special education) students, which has been thoroughly described in various studies, should not be ignored (Enwefa et al., 2006). Some countries (Belgium) have identified this negative impact and have gathered many 1000s of laptops to ensure everyone can follow lessons. In other countries like Bulgaria, the focus has been on trying to teach also using smartphones, etc. to overcome financial barriers.

Online courses with a digital component rely on students' navigational and digital skills. However, learning management systems typically provide difficulties for students who have print disabilities or other physical, cognitive, or other limitations. Prior to COVID-19, schools already lacked completely accessible online teaching strategies as well as precise instructions on what accessibility actually meant. Here is a little illustration to help: When schools do invest in online learning resources that vendors claim to be accessible, they frequently discover that they fall short of even the most basic requirements for kids with visual impairments. Not all e-texts, for instance, are keyboard friendly or accessible, and others may have a proprietary format that makes it difficult for people to use or access if they have visual, motor, physical, or sensory impairments. For people who have other visual issues, dynamic e-learning content, such as additions to e-texts like movies and images that change when a user scrolls over or clicks on different portions, might be difficult.

Online education cannot replace the value of body language or account for all variations in educational approaches. Hence, teachers should modify their lectures for the online setting rather than merely transferring what was typically delivered in the old manner online (Sun et al., 2020).

Huang et al. (2020) identified seven important aspects that stand at the basis of online education and that have an essential role in optimizing learning in special circumstances like the ones created by the Corona virus pandemic (Huang et al., 2020). These aspects involve the following:

- Maintaining and expanding Internet infrastructure to prevent disruptions, particularly during video conferences.
- Using user-friendly technologies to assist students in assimilation and comprehension of knowledge.
- Providing dependable, engaging, and diversified electronic resources.
- Using social media to create online groups for kids to decrease feelings of loneliness.
- Using many successful strategies such as discussions or discovery and experience-based learning.
- Offering services that assist students and instructors in learning about the most recent policies implemented by educational institutions and the government, as well as fostering collaboration among these institutions.

These concerns, however, overlook the impact on kids with impairments who may require special assistance. While chat settings may technically allow (a)synchronous communication, chat styles might differ, appear discordant and scary, and hence risk alienating or marginalizing students. Children on the autistic spectrum who rely heavily on established daily rhythms and specialized interaction models may face crises and meltdowns when these patterns are disrupted by distant instruction. According to research, one of the most important factors influencing e-learning system adoption is self-efficacy (Almaiah et al., 2020). And developing self-efficacy is not always easy for students with impairments.

Teachers and students continue to face challenges in the field of inclusive education. Additionally, the pandemic process brought up new challenges that emerged throughout the epidemic terms, as well as increased the intensity of these issues. Teachers and youth workers who want to maintain inclusive education must be aware about and taught in accordance with these recently developed conditions. Along with updating their methods and course materials, they should also refresh their knowledge. The implications of COVID-19 on inclusive education will be discussed in the next section, along with potential challenges and solutions.

Inclusive Education

Inclusive education systems value the unique contributions that students from all backgrounds make in the classroom and allow different groups to thrive alongside one another, benefiting everyone (Inclusive Education, UNICEF). Children with disabilities are given opportunities for meaningful learning.

Inclusive education seeks to guarantee that all students have an equal chance to attend school, learn, and develop the skills necessary for success. In order to achieve inclusive education, all students must be placed in the same classes and educational institutions (primary and secondary education, higher education, and adult and VET education). It entails providing meaningful learning resources to persons who have historically been marginalized: pupils with impairments.

An inclusive curriculum promotes students from diverse backgrounds to learn and thrive alongside one another, which benefits everyone (Unicef). It implies that kids with disabilities are as entitled to and capable of obtaining a foundational education as any other student. Students may work in a more free setting without feeling rushed or restricted thanks to this.

The United Nations mentioned inclusive education in their UN Convention on the Rights of Persons with Disabilities. According to Article 24, “States Parties recognise the right of persons with disabilities to education... States Parties shall ensure an inclusive education system at all levels and lifelong learning...” (UN Convention on the Rights of Persons with Disabilities).

Students from different backgrounds and ability levels might learn a lot when they work together on an inclusive curriculum. They would be able to develop better problem-solving skills and understand the value of collaboration and teamwork. Academically, socially, and in terms of their ability to communicate and interact with others, students with impairments would benefit. They would feel like a common person in society and be treated accordingly. Peers of the pupils who do not have impairments would foster a positive and sympathetic attitude toward these individuals. By supporting their classmates, students would extend their perspectives, embrace differences, develop their skills, and acquire particular fundamental human qualities (Fostering Inclusive Education in Times Covid-19). Participating in a peer group should strengthen social interactions, foster peer solidarity and peer learning, and psychologically excite students with and without impairments, reflecting this in their academic results. Furthermore, during pandemics, all pupils with and without impairments are expected to be able to study and enroll in age-appropriate regular classes. They should have access to educational programs and teaching that are adapted to their individual need (UN, 2020). Children should participate in cocurricular and extracurricular activities, and they should profit from collaboration and participation at home, in school, and in the community. For example, most students are expected to attend various shifts of online and in-person classes. They had to plan their timetable around COVID-19 measurements. They were supposed to develop their IT abilities during the online learning process, so they could participate in classes, turn in assignments, and even take tests online.

However, as will be shown in the next section, these objectives do not always match up with reality.

Inclusive Education in Pandemic Crisis with Lockdowns

Schools had to modify their practices and timetables during the Covid-19 era in order to keep pupils safe as they continued their education. All schoolchildren must now complete digital education due to the global pandemic problem, whether they are ready or not. There are still numerous difficulties to be solved.

New Normal of the Pandemic Era

The pandemic has added little to new curriculums and education in general; instead, it has accelerated what may be called the technologization of previously existing trends. The pandemic ushers in a "new" normal in which digitization imposes new ways of working and studying while pushing education much further toward technologization, a process that had already started as parts of the teaching of the twenty-first century (15 Characteristics of a 21st-Century Teacher), whereby today's tools and technology enter the classroom.

The curriculum for COVID-19 has been relocated online, physically separating the students from one another, from their professors, and especially from the dialogical experiences that might take place in classrooms. While online learning is the likely solution to school closures, other writers believe that education channels are increasingly expanding and that learning awareness is being reduced to data to be transmitted (Pacheco, 2020).

There is a significant risk that children with disabilities who were enrolled in school before the crisis may not return. They may feel less included in the class setting and isolated during online schooling. On the other hand, because online schooling does not take much physical work, kids may be reluctant to leave their newly found comfort zone after the COVID-19 time. As a result, the crisis may intensify the alienation and isolation that existed before the crisis. Parents of children with disabilities can worry about the health hazards associated with their children's return to school.

It is uncertain if online learning would continue after the epidemic and how such a shift will effect global education given the quick shift away from the classroom in many areas of the world.

Numerous preexisting patterns and trends have been highlighted by COVID-19. On the one hand, this research has revealed a number of flaws and vulnerabilities, such as the accentuation of inequality, general erosion of consistency and quality of informational education, and how ill-prepared the educational system was for a significant transition from traditional classroom instruction to digital and distance learning. However, certain beneficial aspects of the society have also started to stand out more and more. The numerous educators, families, and children who are collaborating to provide extraordinary learning opportunities exhibit cooperation, a firm, resilient response to challenges, as well as resourcefulness, passion, and creativity (UNESCO, 2020).

(Not) Challenging for Pupils/Students with Disabilities

Remote education is not a new term in education. It became an indispensable practice during the pandemic time as part of the imposed lockdowns worldwide. Remote education opened a new page in inclusive education not only with its advantages, but also its disadvantages. These will be addressed in the next sections.

Advantages of Remote Education

The fundamental benefit of remote learning is that it promotes the health and safety of others while helping to keep students and teachers on the job.

Students with limited mobility can escape the everyday difficulties of travel and navigating a classroom with the help of remote education. Instead, individuals can gain from a personalized study place that is optimized for them and allows for their range of motion.

Students may now actively participate in class discussions and follow their courses online thanks to technological advancements. Most of what students accomplish in the classroom can now be done virtually thanks to virtual classrooms. Additionally, the potential accessibility of education is increased by the digitalization of education. When they choose, students can download course materials and replay recorded lectures. Communicating through forums and social media relieves the strain of communicating with others, particularly for those who are shy about speaking in front of a group or who require time to gather their views. Remote education includes a range of tools, platforms, and software that teachers may use with their courses to boost their students' attention.

Students who are unable to use their hands and feet due to cerebral palsy, muscular dystrophy, or other disabilities are frequently habituated to dictating text or email using voice-activated applications or speech-recognition systems such as Dragon NaturallySpeaking. Many people also utilize eye-tracking technology such as Tobii (which uses the iris to issue commands to a computer that then speaks for the user). Students with mental or psychological problems, post-traumatic stress disorder, or cyclical mood disorders have the freedom to plan their study schedules around changes in receptivity.

Students with Asperger's syndrome and other autism spectrum disorders, as well as those who struggle socially in general, can work in more familiar, relaxed environments, such as at home, rather than in huge classroom settings. A side note must be noted, too – confinements also mess with a schedule that autistic youngsters were used to.

Students may be relieved of time constraints through online programs. Students who struggle with learning problems such as attention deficit hyperactivity disorder

(ADHD), dyslexia, visual processing disorder, or dysgraphia should pay close attention to this. The typical classroom's potential stressors, auditory or visual overstimuli, and diversions are also avoided. Students can examine materials as much as necessary while working at home at their own speed. They can even edit digital text to comprehend knowledge.

Students with hearing impairments have options thanks to digitized course materials, subtitled lectures (rare), and asynchronous communications.

Handheld digital audio recorders and note-taking programs like AudioNote can help students who have poor eyesight or no vision record lectures in class. Similarly, screen reader software, such as the open-source NVDA, outputs text-to-speech or feeds a Braille display, the fact that the source information was presented in an accessible style and fulfills, for example, WCAG 2.0 guidelines.

Disadvantages of Remote Education

Despite these benefits, there are a few drawbacks to remote learning that should be taken into account. The nonexhaustive analysis that follows tries to highlight the most glaring drawbacks of distance learning.

The effects of poverty on students are already addressed, and this is especially true for students with disabilities who frequently need to purchase expensive supporting technology and software (appropriate and necessary devices to connect and learn, such as assistive technologies, whether operated via laptops, tablets, smartphones, reliable yet affordable home Internet access). Then there are the many forms of educational resources, ranging from individualized lesson plans for teachers to fully scoped and sequenced student online textbooks, OERs, and MOOCs. Finally, it should not be overlooked that formal training and informal practice to acquire and master digital technologies will be necessary in many circumstances, both for students and instructors, as well as technical assistance (Examining 5 Key Costs of PreK-12 Distance Learning, 2020).

Implementing digital-based online programs assumes that students can browse the information. However, some learning management systems (LMS) create hurdles for students by failing to provide the necessary accessible interfaces or failing to adhere to an uniform layout. Even with a fully accessible LMS, an instructor or course developer can easily generate inaccessible pages within the course that lack correct heading structure or feature images without alt text. By submitting inaccessible PDFs or other digital documents, films without subtitles or audio explanations, and other inaccessible course materials, they can also violate accessibility. Equally, by selecting to utilize a plug-in that was not created with accessibility in mind, a teacher or course creator might make an otherwise accessible course less accessible (How do learning management systems differ on accessibility?).

Because of the aforementioned LMS restrictions, many schools do not have completely accessible online resources. In addition, it is possible that the people who designed the courses themselves did not have clear instructions on what accessibility meant and how to include it into their materials. There are several content suppliers who publish nonaccessible electronic editions of their textbooks for students with special needs. A way to remediate this issue is by annotation of these inaccessible documents. A good example is the ADIBib program. A PDF of educational material that was not created in an accessible format is being manually annotated in Belgium as part of Eureka's ADIBib program (Adiboeken En Voorlees-software Voor leerlingen met een lees- of schrijfbeperking), thus to make it accessible for screen reader software. Unfortunately, lockdowns that come out of nowhere cause clear bottleneck issues since the demand for such customized accessibility cannot be met in a timely manner.

Those with impaired vision or color blindness may struggle to see particular colors, typefaces, and formats. Dynamic e-learning information, such as e-text features, movies, and images that change as a user scrolls over or clicks on different portions, might be difficult for persons who have other visual issues.

Screen readers and voice transcribers, for example, may demand more bandwidth than students have at home. Punctuation varies from one screen reader to the next, and not all marks translate. Keeping up with advancements also necessitates regular software updates, which may be pricey with specialized screen readers. As a result, open source solutions such as NVDA are becoming more popular (JISC TechDis' free and open source software listing).

Challenges and Solutions

COVID-19 pushed Internet as the primary medium for education. To ensure the well-being of their pupils, teachers moved their lessons online. As previously noted, several difficulties emerged throughout the lengthy periods of distance instruction, ranging from infrastructural to psychological to educational in character (shown in Table 1).

In the context of the MyHub project (https://handbook.inclusion-hub.eu/handbook/10/10_1?lang=en. Accessed 05 Jan 2022), some indicative challenges and solutions have been identified regarding online education for students with disabilities, in a European context. They are listed in Table 2.

Table 1 Challenges faced

Challenge	Examples
Infrastructural	Lack of internet connection, lack of devices, and lack of online resources/systems
Psychological	Anxiety, depression, lack of adaptation, and isolation (Matthew et al., 2021)
Educational	Inadequate education, learning loss, lack of evaluation, and lack of inclusion/engagement in the class
Various fears	Risk to be contaminated, disorientating time of inactivity, and de-socialization

Table 2 Challenges and solutions related to online education

Challenge	Solution
Personal support in the classroom is missing	Remote assistance is being provided by the same persons that normally provided the support in the class (Example from Italy)
Training material and platforms not accessible	Zoom is an easy, affordable, and accessible virtual meeting tool (https://zoom.us/accessibility. Accessed 12 Apr 2021) for students with visual impairments, while homework assignments in the form of Microsoft Word documents and Google Docs can be read by screen-reading technology. It does however require that accessibility guidelines are applied when creating the learning materials, guidelines which are freely available online and provided by Microsoft, Open/Libre Office, etc. (https://www.microsoft.com/en-us/accessibility/resources, https://www.openoffice.org/ui/accessibility/, https://www.libreoffice.org/get-help/accessibility/. Accessed 12 Apr 2021)
Parents are in a panic about how their child will be able to follow the lessons	Teachers need to talk with the parents and children to identify what their specific needs are. Teachers need to look at it as an opportunity to think creatively and think outside the box to figure out what can be done for the particular student who is impacted
How do I as a teacher adjust my course for remote and accessible education?	Four main tips (https://svp.umd.edu/keepteaching, Accessed 12 Apr 2021): Keep it simple – do not try anything new or complex if you do not have to Do not try to be perfect – this is a significant challenge for everyone. Things will not go as planned. The technology may falter. Students may have access challenges Be honest, transparent, and respectful – communicate with your students about the challenges. Let them know what you are trying to do and ask for help, from them, from your colleagues Review and be sensitive to the required privacy and security settings
Staff is not aware of accessibility guidelines for their teaching material	Resources should be made available to teachers, children, and parents that lower the barriers toward participating in online courses. An extensive guide on accessibility, especially how to accommodate students online, is needed Free online resources (https://www.microsoft.com/en-us/accessibility/resources, https://www.openoffice.org/ui/accessibility/, https://www.libreoffice.org/get-help/accessibility/. Accessed 12 Apr 2021) can be very helpful

Post-COVID-19: How the Educational System May Adapt Toward an Inclusive Pedagogical Approach

The digital tools that are common to the teaching profession are the ones that are the focus of teacher education (e.g., the Digital Competence Framework for Educators – DigCompEdu framework (https://ec.europa.eu/jrc/en/digcompedu, https://ec.europa.eu/jrc/en/publication/eur-scientific-and-technical-research-reports/european-framework-digital-competence-educators-digcompedu, Accessed 12 Apr 2021)). The need for teacher education to be responsive to the more distinctive disciplinary practices and traits that characterize each given school topic, particularly those practices that may address the issues encountered in a COVID-19-racked educational system throughout Europe, is equally important. This is especially important when considering those most impacted by the pandemic's impact on education: children with special needs who become disoriented in the new teaching reality (support teachers who are not present in person, different daily structure, etc.) as well as those who do not have the financial means to participate in online learning (lack of hardware, software). So yet, limited steps have been taken across Europe, and they are not harmonized.

There is an evident need for educators to have digital and inclusive pedagogical abilities where inclusive learning activities are addressed, where scientific disciplines, professional disciplines (pedagogy and subject didactics), and inclusive practices all contribute to a cohesive whole. Inclusive learning environments and learning pathways are also included in this. Generic, inclusive, and subject-specific features of the technologies combine and are operationalized in the design to provide a truly inclusive educational practice.

The teacher's abilities to translate traditional lesson delivery into digital content – including what pedagogic strategies to utilize, what exercises would be appropriate, and what are the (more accessible, open-source) solutions they may use – are equally crucial.

As a result, a model for integrating digital and accessible resources into teachers' pedagogical practice can take place with two dimensions: one dealing with the kinds of factors that influence teachers' adoption of digital content, and the other with the traits of different stakeholders and the nature of digital curriculum resources (the content) and supporting technology (the tools).

As a result, inclusive pedagogy was developed. It is a pedagogical approach that strives to improve learning chances for all students in order to decrease educational disparities. Its purpose is to improve traditional education by removing practical uncertainty. It was developed as a consequence of research aimed at recognizing the qualities of teachers who are willing to connect with a wide range of pupils in order to ensure outstanding academic achievement for all students, particularly those who require more help (Florian, 2015).

The Inclusive Pedagogical Approach in Action (IPAA) framework (Spratt & Florian, 2015) can thus serve as a support mechanism for teachers to develop responses to individual differences in ways that do not marginalize any learner (Spratt & Florian, 2015), while also taking into account the challenges that have arisen as a result of forced lockdowns in educational settings and their effects on students with special needs. The IPAA philosophy replaces deterministic ideas about children's abilities and cognitive growth with the idea of transformability. This idea helps inclusive professionals behave, feel, and think like inclusive instructors while also demonstrating inclusive teaching. It has been proposed that a deeper comprehension of IPAA can assist instructors in moving away from dividing kids into groups based on their impairments and toward seeing them as capable learners (Spratt & Florian, 2014).

Children with special educational needs can convert learning and developmental risks into positive outcomes by properly using the IPAA framework. This is

Table 3 Summary of IPAA. (Adapted from Spratt & Florian, 2014, 2015)

Principles/underlying assumptions	Associated concepts/actions	Key challenges
Difference must be accounted for as an essential aspect of human development in any conceptualization of learning	Replacing deterministic views of ability with a concept of transformability	"Bell-curve thinking" and notions of fixed ability still underpin the structure of schooling
Teachers must believe (can be convinced) they are qualified/capable of teaching all children	Demonstrating how the difficulties students experience in learning can be considered dilemmas for teaching rather than problems within the student	The identification of difficulties in learning and the associated focus on what the learner cannot do often put a ceiling on learning and achievement. Teachers must change their beliefs that some children are not their responsibility
The profession must continually develop creative new ways of working with others	Modeling (creative new) ways of working with and through others	Changing the way of thinking about inclusion (from "most" and "some" to everybody)

especially relevant since inclusive pedagogy maintains that every child's learning capacity is malleable: What instructors do (or do not do) now can impact a child's learning capacity in the future (Florian & Black-Hawkins, 2011). The IPAA framework is summarized in Table 3.

The IPAA framework views every child as a "active meaning-maker, who uses her/his personal and social resources to make sense of the world as she/he experiences" while learning from inclusive teachers (Nind et al., 2014). It demonstrates a deliberate effort to enhance the learning environment for all children, as opposed to focusing on the shortcomings or needs of certain kids (Boettcher, 2007).

Engaging educators in conscious reflection on their own practice may significantly advance their knowledge, and being, and improve the way they instruct all students to get the most out of their educational opportunities (Dall'Alba, 2004; Florian, 2009).

Participants can move away from deterministic views of ability with the help of the IPAA framework (Brennan et al., 2019). Additionally, it could result in the much-needed paradigm change in inclusive educational strategies. Furthermore, IPAA can assist instructors and practitioners in increasing their potential and performance when teaching online. New obstacles and possibilities that arose throughout the distant education process should be addressed, and solutions to assist instructors should be developed, combining this with the IPAA approach as applied to online learning practices.

Conclusion

The COVID-19 epidemic has forced the emergence of online learning in a way that has never before been placed onto the educational community. But in order to guarantee that the requirements of children with special education needs are also satisfied, assistance for teachers and schools in implementing digital inclusive education preparation, encompassing also inclusive pedagogy methods, will be required.

By accomplishing this, the post-COVID-19 period will be successfully organized, and an inclusive school year will be realized. The importance of this is increased by the likelihood that many kids' everyday school experiences will increasingly involve remote teaching and learning. From the numerous examples, it became evident that the issues are not only digital in nature, but also related to the participation of instructors and children with special education needs in educational settings that have significantly transformed, essentially overnight.

It is therefore necessary not only to rely on existing practices, such as various accessibility guidelines for online/offline teaching material, but also to improve current pedagogical approaches and embrace and update, for example, the IAAP framework, thereby empowering teachers to face this new reality, in conjunction with a much needed digital inclusive education readiness.

Abstract

This study investigates the importance and affordances of implementing pre-braille activities in a kindergarten classroom, regardless of whether students have sight or have sight loss. We question what tools and/or support are needed to conduct greater, inclusive-based lessons in the classroom, and how awareness about the braille writing system could be introduced.

Semi-structured interviews and co-creation sessions were the methods used to gather information, in addition to the traditional literature review. Sessions were conducted with 13 participants. Through listening and learning from a community of experts, teachers, and parents, noted areas of support and needs were incorporated into the design process and discovery of design opportunities. The designed objects foster inclusive teachings, collaboration, and communication between students with all abilities.

Our analysis shows a strong correlation between pre-braille activities and kindergarten classroom teaching. Pre-braille activities work to build two-handed coordination, finger sensitivity, light touch, dexterity, and mobility, all important for reading braille, a tactile writing system.

We propose that integrating multiple modes of tactile engagement in the kindergarten classroom will increase interest in pre-braille and the braille writing system. This is especially important for those who later need to learn formal braille. The designed objects, a pouch fostering multiple modes of tactile engagement and an activity prompt system, act as inspiration pieces, allowing students and teachers to co-create activities in the classroom.

Keywords

Curriculum · Early education · Multisensory · Pedagogy · Pre-braille

Introduction

In early education, a period when development is at its highest and most significant, building foundational literacy skills is important for success, whether personal or academic (Dereli Iman et al., 2019). During the early grades in school, children will develop literacy skills by reading and writing. Students with sight loss develop these skills in the form of braille. Braille is a writing system for blind and partially sighted individuals (BPSI). It gained its first recognition in 1852 after Louis Braille's death (Tobin & Hill, 2015, p. 240). Obtaining a strong understanding of what braille is and how to use it can help an individual excel in school, work, and their personal life, overall, increasing confidence and independence. With technological advancements, students are using audiobooks and assistive technology to learn and complete assignments. Unfortunately, this does not assist the retention of braille writing and reading. Given the importance of braille writing skills for BPSI, and the connection of pre-braille to kindergarten classroom learning, this research aims to introduce braille concepts and emphasize pre-braille learning in kindergarten classrooms, regardless of whether students have sight loss or not.

My interest in the braille writing system stemmed from a project in my graduate studies focused on creating feasible braille signage in a university setting. Our team consisted of three researchers/designers, and two individuals who are blind. Working directly with the two BPSI, we were provided with the insights of support and needs people in the vision community require when navigating indoors. This fruitful experience, in combination with the creation of a children's story and activity book during my undergraduate studies, led to three topic areas: braille, pre-braille, and early education.

Pre-braille, or more recently referred to as early tactile strategies and exploration, works to develop fine motor skills and concept development. Motor skills, such as two-handed coordination, finger mobility, dexterity, and sensitivity, are explored naturally while discussing concepts such as physical weight, i.e., heavy and light. We see examples of pre-braille-like teachings in Montessori and Waldorf schools. The Casa program in Montessori education includes practical life and sensorial exercises to help train the hand (OMS Montessori, n.d.).

CASA, JK, and SK in Montessori (ages 2.5 years to 6 years) cost more than an undergraduate university degree for Canadian students in Ontario (Montessori The Place to Grow). Because Montessori and Waldorf education include sensory teachings but are not accessible to all (cost), I am researching the kindergarten classroom. Unlike Montessori or Waldorf education, the kindergarten classroom at public preschools is free to attend (paid for by taxes) (People for Education, 2021). Kindergarten holds an array of opportunities. It is a time when children first leave their home to learn, work, and play with kids of all abilities. The Ontario Kindergarten Program uses a play-based structure, incorporating processes of inquiry. Students will explore and question using an array of materials found in the classroom and outdoors (The Kindergarten Program, 2016, p. 23).

I am not teaching braille. Braille education requires qualifications of which I do not possess. My purpose is to work directly with kindergarten teachers and teachers of the visually impaired and respond to the following research questions:

By questioning sensory practices currently in place in the school environment,

- What tools and/or support might teachers need to conduct greater inclusive-based lessons in the classroom?
- How can we increase engagement in pre-braille and awareness about the braille writing system?

Through co-creation with teacher participants, we found design opportunities that led to the creation of an object (pouch) with multiple modes of tactile engagement and an activity prompt system. Both outputs can be used on their own or together by kindergarten students in collaboration with teachers in the classroom. The outputs foster inclusive teachings, engage early tactile strategies, and allow for collaboration and further communication between students with sight and students with sight loss.

Literature Review

Braille: A Tactile Writing System

In order to understand pre-braille, we must first discuss braille. Braille is a tactile writing system used for individuals who are blind or partially sighted (BPSI). Braille is made up of the cell, constructed of two columns and three rows, a total of six raised dots. Each number and letter share similarities as they are all created using the same cell format. Michael J Tobin, a professor of Special Education at the University of Birmingham, says braille is successful due to its consistent formation, even with slight alterations such as the addition of contractions and a sign to indicate a capital letter (2015, p. 240). There are two grades within the braille writing system, grade one and grade two. Grade one is typically used by those who are new to the writing system, and grade two is more advanced (Tennessee Council of the Blind, 2010). “Braille permits the exploration of a whole page of text, scanning of a sentence backwards and forwards, up and down the page” (Tobin & Hill, 2015, p. 246) (Fig. 1).

Developing braille literacy skills requires repetitive reading and writing practice, as well as linguistic and haptic skills (Oshima et al., 2014). The repetition further enhances muscle memory and information retention. Because braille requires different skills than reading visually, it is crucial for individuals with sight loss to learn braille as early as possible. This tactile writing system can be both read and written by people with sight (Tobin & Hill, 2015, p. 246). This allows opportunities for teachers, classmates, and parents to become familiar with braille to teach or assist those who are new to the writing system.

Pre-braille: Strategies and Exploration of the Hands

Pre-braille, as it sounds, occurs before learning the formal braille writing system. Lynn Rollings and Darlene Urban, teachers at the W. Ross Macdonald School in Brantford Ontario, describe braille as read with the sense of touch (Rollings & Urban, n.d.). Therefore, one must first develop finger sensitivity, mobility, dexterity, two-handed coordination, and other strategies helpful to becoming attuned to tactile perception. Well-known in the deafblind community, Lilli Nielsen, a former preschool teacher, psychologist, and teacher of the blind, outlines examples of pre-braille activities: sorting and stacking, distinguishing between a variety of textures, completing tracking worksheets, stringing buttons or beads, crumpling pieces of paper, manipulating clay, and winding up toys or timers (Nielsen, 1994).

Both “Paths To Literacy,” a resource site for students with sight loss, and an interview with a manager of a Blind-Low Vision Interventionist Program discussed the importance of concept development in pre-braille (Gwyn52, 2015). Working on tactual awareness and fine motor skills are more easily understood through concept teaching. Without sight, concepts must be taught deliberately (Knight, 2014). Example activities to teach concept development are as follows: creating a nature basket, a story box, and stacking or nesting. A story box includes a number of objects in a bag or box that are used during the appropriate time when telling a story (Drissel, n.d.). This creates a more exciting and interactive story time experience (Knight, 2014).

Storytelling is also a valuable method for learning, especially when learning literacy skills. Storybooks allow for periods of creativity and imagination, collaborative reading between the teacher and student, and encourage exploration (Beginning Literacy Development at Home). Stories can help articulate concepts and are therefore a reason we see the creation of the story box. Unfortunately, this powerful learning tool is not always available to families of BPSI, and braille books are much larger and longer than those without braille. Given the importance of concept building and storytelling, I brought the explorative and sensory features of story boxes to the proposed design outcomes (Fig. 2).

Montessori Education: Tactile Activities in Use

Montessori and Waldorf-style education models emphasize hands-on learning and collaborative play. Maria Montessori, an Italian physician in the early 1900s, worked to create a new approach to education, one that would allow children to reach their full potential. The Casa program in Montessori, referring to the age bracket of 2.5 to 6 years old, develops practical life skills, contains sensorial and cultural activities, and incorporates movement and art into every subject (Lillard, 2018).

The following are examples of practical, sensorial, and cultural activities, as outlined in a Montessori school, located in Chatham Ontario (Montessori The Place to Grow, n.d.).

Fig. 2 Story box example (Image by the Author 2021). Alt Text: Picnic objects to be used when telling a story related to a picnic. A basket on its side. A blanket with a plate on top. A fork, spoon, and cup sit on the plate

- Practical: Pouring liquids, polishing, sweeping, dusting, and washing tables, all introduce independence and self-confidence to students.
- Sensorial: Taking things apart and putting them back together helps develop curiosity and discovery.
- Cultural: Exercises in geography, history, and sciences help students understand the world they inhabit.

The artistic expression and display in Montessori and Waldorf schools are typically visually focused. Children without sight are not able to learn incidentally like their classmates with sight. Incidental learning, or learning through observation and repetition, is a large part of how we learn, especially at a young age. Langley, a teacher of students with profound visual and multiple handicaps, states, “Visually impaired children rarely used objects that deviated from day-to-day experiences” (1985, p. 103). The first time a child with sight loss is presented an object, it is the first time they are experiencing it. This was especially helpful to remember during the design process as the outcome benefits both students with sight and with sight loss. The objects used in the designed outcome have a sense of familiarity to students with sight loss.

Ontario’s Kindergarten Classroom: Play-Based and Student-Led Learning

The kindergarten classroom takes a play-based learning approach. It is found that this type of education has “lasting benefits for children’s reading, writing, numeracy, self-regulation and social skills" (Building Better Schools, 2019). Several centers in the classroom allow for small groups, large groups, and one-on-one learning time. The classroom centers include materials for all types of collaboration, such as whiteboards and markers, sand, and playdough. The Ontario Kindergarten model benefits from two types of educators in one classroom at a time. One, a certified teacher has knowledge of the elementary curriculum outlined by the Ministry of Education, and two, a designated early childhood educator (DECE) brings knowledge of learning needs for children ages birth to 5 years old (Building Better Schools, 2019). Two educators allow for more time getting to know each student and their unique way of learning.

The Ontario Kindergarten Program 2016 describes the child and teacher as co-learners. A child will engage in inquiry when supported by the teacher. Example acts of inquiry are: "exploring objects and events, making observations using all five senses and generating questions, gathering, comparing, sorting, and notice patterns" (The Kindergarten Program, 2016, p. 23). This is supported through the educator posing open-ended questions, providing a variety of materials, modeling how to plan, and asking questions which expand upon the child's thinking. Already, I have noted a strong correlation between kindergarten's acts of inquiry (exploring objects using all five senses) and pre-braille activities (sorting, stacking, manipulating clay, etc.). The connection between pre-braille and kindergarten learning was only made possible through literature review and discussions with kindergarten teachers. Literacy learning in kindergarten is, in fact, very similar to pre-braille. Many teachers noted in interviews that pre-braille could be referred to as pre-reading for children with sight.

Young students are growing up in a very digital time and therefore develop digital literacy at a young age. With the rise of technology, BPSI are beginning to read acoustically, i.e., listening to audio textbooks instead of writing and/or reading braille. Some students in higher education say there is limited time to complete homework, so reading acoustically has become a staple practice, says Vassilios Argyropoulous, a member of the Department of Special Education at the University of Thessaly, and Aineias Martos, who works at the Center of Education and Rehabilitation for the Blind (2006, p. 3). This poses an issue because without frequent literacy practice such as reading and writing braille, braille retention may be lost. This is especially unfortunate, because it is known that developing braille literacy skills can assist with employment, schooling, independence, and overall happiness (Argypopoul & Martos, 2006). It is therefore crucial that we integrate pre-braille activities into early education, hoping students without sight, or those who lose sight later, will be more apt to continue reading braille moving into higher education.

Toys as Learning Tools

A team in India, including individuals with design and vision rehabilitation knowledge, describes the impact of play-based learning as "promoting social skills, emotional development, sensory awareness, and communication, along with helping children develop fine and gross motor skills" (Jain et al., 2018, p. 902). There are many types of toys promoting learning and play simultaneously; examples can be seen in Montessori classrooms. There are wooden and plastic toys made to practice stacking and sorting, matching like-shapes, counting, and connecting. These types of toys are durable and effective teaching methods.

Concepts in mathematics can be more clearly described through 3D objects, which help visualize concepts related to counting and space. The second semester of kindergarten introduces 3D shapes to explore relationships and properties (Kinzer et al., 2016). Fittle, a 3D-printed puzzle created in India, recognizes that blocks are accessible thinking tools and effective modes for reasoning, modeling, and constructing. The Fittle puzzles contain several blocks, each embossed with English Braille. Once adjoined, the pieces create an object with the object name included on top. A child with sight loss is then able to read, for example, fish in English Braille, while feeling the shape of a fish.

Review and Next Steps

The following bullet points started out as a quick reminder to myself when reflecting on what the literature review taught me and how it informs the design. I have left the bullet points allowing for a cursory overview and reflection period.

- Braille is a tactile writing system, typically used for those who are blind or partially sighted (BPSI). This writing system helps empower individuals, as they are often more successful in work and school with knowledge of braille.
- Pre-braille, more recently referred to as early tactile strategies and exploration, is typically learned before formal braille, grade one and two. It allows individuals to build strength in their fingers and hands (the tools they will be reading and writing with).
- Both Montessori or Waldorf education (private sector) and Ontario's kindergartens (public sector) implement tactile activities in their teachings, Montessori and Waldorf maybe more so. But these alternative education models are not accessible (cost wise) to all.
- From observation and research of toys present in kindergarten classrooms, I have noted they are often one-dimension, meaning, one toy will allow for stacking, but not other activities like stringing, crumpling, zipping, and further manipulating.
- Play-based learning and toys promote social skills, emotional development, communication, etc., important for future learning and growth.

Methodology and Methods

I conducted qualitative and participatory research methodologies. Qualitative research involves collecting and analyzing nonnumerical data to gather in-depth insights (Bhandari, 2020). Participatory research emphasizes the perspectives and priorities of participants. It can be defined as "systematic inquiry in direct collaboration with those affected by the issue being studied" (Vaughn & Jacquez, 2020). Both methodologies were chosen as they align well with inclusive design practices. Inclusive design assesses and evaluates the needs and barriers of participants often not acknowledged in current systems. The methods used included semi-structured interviews, co-design, and feedback sessions with teacher participants.

Participants and Recruitment

Because I would be working directly with individuals, research ethics (REB) needed to be completed. I gained REB approval (#101812) on June 26, 2020. This meant I was able to prepare for interviews early. Just 3 months before REB approval, our world entered a global COVID-19 pandemic resulting in lockdowns and isolation practices. Participant recruiting was deemed more difficult than initially expected. Teachers were finding creative solutions to conduct their lessons digitally, and parents, in many cases, became their child's primary teacher. As to not burden early educators with further stress, I looked to retired kindergarten teachers and those on maternity leave. These participants held immense knowledge and practice teaching. As of October 2020, some teachers who were teaching kindergarten during the COVID-19 pandemic and learning how to adjust to teaching online indicated their availability to participate in research. I was then able to interview not only retired kindergarten teachers but also current practicing teachers. Conversations with teachers of the visually impaired (TVIs) and mobility and orientation (O&M) specialists occurred later in the research process, March and April 2021.

In the following sections, I will describe the chosen methods and what was learned from each.

Semi-structured Interviews and Understanding Data

A semi-structured interview allows for more discussion-based conversation than a fully structured interview. In general, semi-structured interviews are commonly practiced in qualitative research, allowing the researcher to listen and reflect on participant's real-life scenarios, stories, and expertise, a depth of knowledge not gained by a literature review alone. Interviewees expanded on what I had studied and revealed new points of view, which further enriched my research and, ultimately, the designed outcomes. I was able to interview a pre-braille specialist, two Principles of Montessori-based schools, a parent of a child with sight loss, six kindergarten teachers, and three teachers of the visually impaired (TVI), each bringing detailed knowledge of early education, ranging from daily structure, activity types, and communication between the teacher, student, and parent. The participants interviewed are in the Greater Toronto Area (GTA) and Niagara Region in Ontario, Canada. With permission granted, interviews were recorded for the purpose of transcription and deleted once notes were complete. The list of questions was provided one day prior to the interview phone call.

I was used to coding as a natural next step following interviews, but in processing this information, I discovered that trying to codify majority needs and findings meant I was excluding individuals that did not "fit" the majority. This realization came only after conducting initial coding into categories, i.e., government and curriculum, age group and type of teaching, teacher-parent-student relationships, etc. Instead of showing you the coded findings, I present some similarities found, but also the needs and barriers of participants.

Some areas of recurring practices and needs mentioned are as follows:

Practices

- Incorporating sensory activities.
  - Activities are sometimes conducted outside to engage the senses in ways the classroom cannot.
  - Tactile engagement is integrated in the kindergarten curriculum and must continue to be integrated and developed upon.
- Technology integration is different from school to school but implemented in all to a certain degree.

Needs

- Support: for teachers, parents, and students with disabilities
  - Greater teacher support within the classroom
  - Stronger communication between parents and teachers
- A need for more open discussions related to sight loss and other abilities

I have broken down the following findings into areas within kindergarten education that displayed barriers, needs, and successes, reflecting of the bullet points above.

The Value of Incorporating Sensory Activities

This section assesses the types of tactile engagement integrated in the kindergarten curriculum as well as the types of activities conducted outside. It was confirmed during conversations with participants that pre-braille activities, such as hand and finger strength, mobility, and dexterity, are examples of literacy learning. By practicing tactile activities such as collecting materials outside that have the same size or texture, students are learning important skills for reading and writing.

When we discussed types of sensory and tactile activities, the mention of outdoors appeared repeatedly. "Forest schools" was a new term to me. This idea has been incorporated into many schools. It is an allotted time per week that students are taken outside to learn. If there is a forest or park nearby, the "forest school" will take place there. Learning outdoors offers opportunities to touch, smell, and hear differently than indoors. Science is also a subject that allows for more sensory learning and learning that can be done outside. For example, exploring the concept of growth, freezing, or thawing by observing a plant grow and seasons change.

In an interview with teacher participant G, a teacher of the visually impaired (TVI), they discussed that in the event of a class trip outdoors, to say a nature conservatory, a pre-made kit will be delivered (during the COVID-19 pandemic) to the student with sight loss. The parents will then assist the child while the TVI explores the kit with the student virtually. This kit might include a branch asking to be smelt, handled and manipulated, and seeds, able to be cracked in the students' teeth. Exploring the kit in advance allows the child the attention, knowledge, and sensory experiences before attending the trip with their peers.

Everything using fine motor, i.e., manipulating smaller objects, connects to pre-braille learning. Understanding the importance of these tactile experiences and its connection to literacy and braille learning affected the tactile pouch outcome co-designed by myself and teacher participants. Reflecting on the benefits of the pre-made kit in the example above, the co-designed pouch uses a variety of textures including rough Velcro, soft denim, hard plastic zippers, and smooth laces. Exposure to different textures will improve sense of touch and ultimately reading.

Technology

This section looks at the type and degree in which technology is used in the classroom. I am defining technology as assistive tools requiring internet connection, i.e., iPads or computers to use websites and applications. Because students are growing up in an increasingly digital age, technology is becoming less foreign to children. All teacher participants mentioned some amount and type of technology used in the classroom, each at slightly different levels. In this case, some classrooms introduced math manipulatives, hands-on tools to solve math problems. Other classrooms are using sites like gfletchy.com, where math problems are presented in the form of short commercials. These example tools and/or technology offer auditory and tactile strategies, differing from the previously taught math problems conducted on worksheets. These have proved to be more effective, fun, and not limiting to sight dependency. It is important to note that the type of technology available in the classroom is dependent on financial conditions and funding available.

For BPSI, technology can be impactful and lead to increased independence and confidence. Some of the technology present in an elementary classroom for BPSI are a Mountbatten Brailler and a Victor Stratus Reader (audiobook player). Other technologies introduced are audio devices, electronic books, and screen readers, all of which are described as assistive technologies.

Support: For Teachers, Parents, and Students with Disabilities

This section is reflective of the need for greater teacher support within the classroom as well as a need for stronger communication between parents and teachers. While teachers do their best, there is never enough time to support all students, especially in classes with 20+ children (typical in Toronto public schools). Teacher participant B said, "teachers need the same support a child needs." This being the case, they feel as though parental support, to reinforce learning being done in the classroom at home, would be helpful, as well as extra and specialized support professionals in the classroom. Strategies to support students with sight loss and/or other learning disabilities from the point of view of kindergarten teachers looked like: chunking work into manageable pieces, enlarging content, using assistive technology (dictation applications), creating unique tasks and visual schedules, having the student sit closer to the teacher, and helping kids understand what they are feeling. TVIs noted the importance of students with sight loss to be at the same pace as their classmates. A suggestion was support over the summer months, a time when pre-braille practice can be lost and/or delayed.

Support over the summer for BPSI shows promise for future opportunity and development of this research project.

Parents are the first teachers of their children, and they have a lot to share with classroom teachers if given the opportunity. This research focused on teacher insights. Further research would benefit from conversations with parents. Reading exercises and at-home literacy practices were briefly discussed with teacher participants who are also parents of young children. Primary discussions about parents were in conversation with teachers and how teachers interact and bring parents into the child's learning. Some teacher participants suggested ways for parents to continue classroom learning in the home. One of these suggestions was going on a walk with your child and asking simple and effective questions, enforcing curiosity and inquiry.

Unexpected Findings

While there were some similarities shared across teacher participants related to types of activities taught on a day-to-day basis, there were also unexpected findings. Firstly, the importance of technology was particularly crucial to the one parent participant interviewed. Again, this would be interesting to explore with more parent participants in future studies. This parent has a child with sight loss and noted a lack of support for their child in the school setting, particularly in older elementary grades. They also made clear they wished their child would have more practice and exposure to technology in the classroom. "I want my child to be able to participate in the 21st Century." Although important to note, the initial design in this research does not include technology, as producing something feasible to many was a priority; something that can be constructed by teachers and guardians if they are unable to purchase tools. Activity prompts are able to be shared physically or digitally and printed at a low-to-no cost.

Teacher participant C discussed the use of technology in their classroom. Since the beginning of the COVID-19 pandemic, this participant has looked to platforms like Twitter to help engage parents with the student's classroom work and learnings. Other classroom teachers are making use of Google Classroom and conversations with parents and/or guardians via Zoom. The types of technology and platforms used were dependent on the teacher and parent interest. A TVI noted that their student caseload is approximately 70 students. This is not typical. It had increased when learning no longer took place in-person. Here, an opportunity emerged to develop a community platform or forum for teachers of the visually impaired to share experiences and expertise. Teacher J said “This job can be lonely. There aren’t many of us.” As a result, internal motivation is crucial to succeed in a job of a TVI.

With unexpected findings, I was able to incorporate unique barriers and needs that arose in the designed outcomes. The created activity prompt system (as seen in the section “Working Practices”) may be a starting point for a community sharing project. Because the prompts are modular, they offer customization. It is my hope that teachers will add to and refine the activity prompts to then be shared within the community. This is a first step to addressing the need for a community where TVIs can share experiences, concerns, and material. Other unique needs that arose in this section “Unexpected Findings” have created a space for new inclusive projects.

Co-design

I have learned to adapt both the language and design used throughout this project process. When introducing the idea of co-design sessions to participants, there was hesitation. Many people hear the word design and if they do not have a design background, they feel fearful. Adjusting the name to co-creation or workshop allowed for a greater ease and welcoming nature to the process. Going forward, I will be toggling back and forth between the terms co-design and co-creation.

As I learned in the Inclusive Design Master program, co-design means recognizing that your participants are the experts – experts in a field of study and in real-life experiences. I considered how co-design could be used as part of this project. By co-designing, we can learn from participant’s unique experiences and begin to design systems, products, etc., that address the needs and barriers of people who are not considered the majority. I co-designed with kindergarten teachers and teachers of the visually impaired. Whether currently teaching, retired, or specialized, i.e., an orientation and mobility specialist (O&M), all teachers have rich experience and unique styles of teaching to learn from. Co-design is an important part of inclusive design. It is one of the three dimensions outlined by Jutta Treviranus, director of the Inclusive Design Research Centre at OCAD University. “Use inclusive, open and transparent processes, and co-design with people who have a diversity of perspectives, including people that can’t use or have difficulty using the current designs” (Inclusive Design Research Centre, n.d.). The purpose of the co-design sessions was to have teacher participants design a multisensory kit including objects and activities that could be used in the classroom, whether the students have sight loss or not. It is important to reinforce that during a co-design session, I, as a facilitator, am meant to actively listen and guide when needed. The designed outcome is to be created by the participants without influence or bias.

Co-design sessions are an appropriate and effective method when conducting participatory research. They allow for learning and feedback from individuals constantly working with the intended age group. We arrived at co-designing a multisensory kit from literature and interview findings. Co-designing the proposed design outcomes allowed for most needs to be met. The importance of play for learning and retention of information, tactile activities in place in the kindergarten classroom, and an opportunity for more inclusive conversations, naturally developed to a kit (object and activities). A need arose for objects with multiple modes of tactile engagement, one that allows for manipulation of large objects and small, each requiring different finger and hand manipulations. I am naming the designed object a tactile pouch as it offers multiple modes of tactile and pre-braille practice, i.e., collecting and sorting as well as more fine motor development (wrapping a string around a button). Design decisions for the tactile pouch are discussed in greater detail in ▶ Chap. 34, "Monstrous Intersectionalities." Beneficial to the design was knowledge of materials that are safe for the kindergarten classroom, what a child would be most engaged with whether having sight loss or not, and how classroom activities could integrate the tactile object.

Co-design Session Reflection

A number of co-design sessions were set up in order to learn from participant's creations. The created outcomes highlighted types of materials, what participants would like incorporated into the classroom and what they could do without. The first session did not go as planned, which had its benefits: unique learning opportunities! It compelled me to reflect on different setups for future sessions. The first co-design in practice was more conversational. I posed a few questions at the start, i.e., Is the kit used outside or inside? Does it only contain activities specific to one subject area? Conversations deviated from the posed questions and included the sharing of techniques and current experiences in the classroom. I predict both participants were curious about one another's background and not enough time was allotted for them to get to know each other outside the conducted co-design. The opportunity to converse during breaks, for example, would have been more natural in an in-person setting. Due to the COVID-19 pandemic, the co-design session took place via a three-way phone call. This posed its own challenges, as we had no indicator of who was to speak next. Understanding it can be uncomfortable speaking to multiple strangers on the phone or in a video chat, I decided asynchronous activities would be more valuable for both participants and myself.

Asynchronous Activity Co-creation

As a result of busy schedules and excessive time spent in front of screens, an asynchronous activity (not in real time) was proposed. The asynchronous activity allowed participants the time to test without the stresses of scheduling and planning with other participants. Each participant was given an introduction to the research project, a warm-up activity to help them feel more relaxed with the idea of designing, and a formal activity. After about a week, a follow-up call was scheduled to discuss thoughts and findings.

1. The formal activity is as follows: Inspired by action words used in pre-braille, i.e., sorting, stacking, stringing, twisting, matching, grouping, comparing, and tracking. Make something that incorporates the act of stacking; or
2. Stack your collected materials (a suggested list was provided beforehand)

The activity then asked participants to consider the materials they used. Posing questions like: Is the material safe for a kindergarten classroom? Is it a found material? Can you see this material transferring to other pre-braille activities?

Review and Response to the Asynchronous Activity

Although it appears the asynchronous activity was only conducted by two individuals (looking at the figure above), multiple teachers participated. I believe some felt more comfortable speaking to their design without photos of what they had created. In the future, it may be beneficial to ask participants to record not the outcome but the materials used. This on its own is extremely beneficial to the design process. As seen in Table 1, many of the materials used can be found in the home and a kindergarten classroom. Conversations were had about sizing of beads, the kitchen-friendly ingredients of playdough, and repurposing materials post-use. Most interesting to note is that kindergarten includes a large age range of approximately 3–6 year olds. Older students in kindergarten may have no trouble using their pincer grasp when

Table 1 Asynchronous activity findings

Creations by participants	Materials	Observations
	Marker lids Sort by color and size As marker wears out, collect lids Buttons A staple in the classroom Playdough Moldable, holds its shape and takes on various forms Often used recycled materials in classroom when discussing shapes	The smaller the material, the more agile and precise one has to be Playdough allows for different hand strength and muscles to be used Material like wood does not allow for same sort of manipulation
	Playdough Can be made at home or in the classroom Stamp letters in playdough Beads Reusable Different colors used for matching and sorting activities Pipe cleaners Reusable Used to form letters All materials safe for kindergarten classroom	Conducting activity required: Hand-eye coordination Depth perception Pincer grasp to pick up individual objects, i.e., bead Activity would have been easier with larger materials Beads with larger hole Cut-up rings of paper towel roll

Alt Text: Three columns and two rows. From left to right: creations by participants, materials, and observations. There are two creations, the first uses playdough, marker lids, and buttons. The second uses playdough, pipe cleaners, and beads manipulating beads; younger students, on the other hand, may need larger objects to start with. This made it clear that the materials used with the tactile pouch should be inspired from assessing where the child is at in terms of their fine motor skills, hand-eye coordination, and depth perception. A solution may be to have beads (and other materials) of different sizes in the classroom so students can choose and use what they feel comfortable with and/or are able to manipulate. It is also important to use found and recycled materials, as mentioned by multiple participants. As to be inclusive to both students with sight loss and students with sight, materials might be limited to those BPSI are familiar with, although materials will likely be customized by the classroom teacher and students.

Feedback Sessions

I showed teacher participants early sketches following the asynchronous activity for further design feedback. When looking at early sketches of the tactile pouch, teacher participant G suggested the pouch fit on the child's lap, as kindergartners like to work on the floor where there is more room and less confined space. In terms of activity prompts for teachers, participant G thought there might be a way to allow teachers to create activities based on observing how their students interact with it. "Place the pouch on the math table and see how kids interact. Are they stacking? Sorting? Stringing?" depending on their range of skill and manipulation ability, especially with smaller objects.

Another conversation led to insights about a kindergartner's work ethic. "Kids are able to build at this age. They are also result and goal-driven." This highlights the importance of keeping activities challenging. This could be addressed through levels or layers within the pouch, or modifications to activities, i.e., a prompt that is relatively easy (to manipulate) and one that requires more fine motor challenges. The tactile pouch could include Velcro and buttons in the first layer, and string in the second. The levels and/or layers would allow the child to work through different tasks and manipulate their fingers in different ways in isolation.

Working Practices

This section takes knowledge learned from research, interviews, and co-creation with kindergarten teachers and teachers of the visually impaired (TVI), to describe how the design came to be. Sections within the chapter explore materials and prototypes for both the pouch and activity prompt system.

Co-creating with teacher participants meant designing and reviewing the tactile pouch and activity system's benefits, safety, and mutability. It is my goal that with the design outcomes in hand, teachers and kindergartners will work together to explore textures in a safe space, while simultaneously conversing about what it means to read tactually.

Inspiring the Design

As stated in Ontario’s Kindergarten Program 2016 (first mentioned in the section “Literature Review”), children are engaged in inquiry when they “gather, compare, sort, classify, order, interpret, describe observable characteristics and properties, notice patterns, and draw conclusions, using a variety of simple tools and materials” (The Kindergarten Program, 2016, p. 23). These acts connect well with pre-braille activities, i.e., sorting, left and right, tracking, matching, stringing, and lacing (Rollings & Urban, n.d.). The activity prompt system was inspired by a need for ideas and/or suggestions on how one might use the pouch for classroom activities. When constructing activities with teacher participants, we noted distinctions between learning outcomes, settings (outdoor versus indoor), and the pre-braille actions themselves. The prompts then evolved to become a modular system, allowing mixing and matching between options related to the three distinctions. More detail about the modularity can be read in the section “Activity Prompt System.”

Material Exploration

As my research focuses on the sense of touch, it became increasingly crucial to test materials that could be used in the kindergarten classroom, as well as receive feedback from teachers to confirm whether the materials were appropriate. Materials with unique textures allow us to develop finger sensitivity, but also an understanding of usability and safety. Therefore, materials chosen based on appropriateness, effectiveness, and multiple purposes, i.e., safe for the students and classroom, resulting in thoughtful teachings, and able to be used by both BPSI and students with sight.

A resource from the Inclusive Design Research Centre’s SNOW project, titled “One is Fun, Guidelines for Better Braille Literacy” by Marjorie Troughton, reinforced the materials and actions that should be used when beginning to learn braille as a child. “Interesting books for preschool readers include cloth, zippers, buttons, magnets, Velcro, action figures, pockets, etc. as well as books of different shapes” (Troughton, 1992, p. 33) (Table 2).

Table 2 represents the review and testing of materials found in my apartment, outlining the advantages, disadvantages, and relationships to pre-braille activities. Materials were chosen based on what I already had and/or what I could access during the COVID-19 pandemic. The benefit to using found and familiar materials during testing was that many of these materials would also be accessible to teachers and parents. A creatively inclined parent might use these materials to make their own tactile pouch. The items tested were inspired by a pre-braille document shared with me by a manager in the Blind Low-Vision Early Intervention Program at Surrey Place, as well as being mindful about what children use and how they play. As you can see in the above figure, wood is a sturdy material with structural

Table 2 Sample material exploration chart

Photograph	Material	Advantages	Disadvantages	Activity (Pre-braille)
	Wood	Sturdy Structural integrity	Can be heavy Difficult to transport Requires additional tools for manipulation Splinters	Blocks used for stacking and sorting Noticing patterns
	Rope	Available Used to teach tying shoes	Dangerous if too long Requires advanced fine motor development	Stringing (fine motor) Two-handed coordination Pincer and grasp
	Fabric	Variety of textures Beneficial to develop finger sensitivity	Some available Subconsciously teaches material waste	Differentiating textures (rough and smooth) Matching Comparing
	Magnet	Variety of objects used with magnets Move and manipulate attached objects Portable	Magnets work with water?	Sort Group Track and trace fingers over objects

Alt Text: Five columns and four rows. The columns from left to right read: photograph, material, advantages, disadvantages, and activity (pre-braille). The four materials photographed are: wood, rope, fabric, and magnet

integrity but can be heavy, difficult to transport, and may need additional tools for manipulation. Magnets include a variety of benefits for exploration. They can be moved to different locations, allow for manipulation of objects, and are small enough for transport.

Design Ideation

Before beginning to prototype objects and activities, I revisited my research questions in more detail. This allowed me to clearly outline the specific needs that arose from discussions with participants, needs that would be addressed in the final design outcomes.

Research Questions Revisited

What tools and/or support might teachers need to conduct greater inclusive-based lessons in the classroom?

As gathered from interviews, teachers are looking for further support, whether that is in the classroom or at home. There is an opportunity to continue learning in the home environment, but it requires strong communication of expectations between parents and teachers. Teachers are interested in more manipulatives and tools to use in their teaching; however, these tools can often be expensive. As a result, students share and work with them in small groups. Here, an opportunity for an educational tool at a low-to-no-cost emerged.

How can we increase engagement in pre-braille and awareness about the braille writing system?

Ways of engaging in new material might include: play-based inquiry, the outdoors, manipulatives, and engagement in multisensory activities, all tactics used in kindergarten teaching. These types of learning are found to be most important at this stage of development. I use the example of egg cartons simulating the braille cell in the activity prompt systems, seen in the section "Designed Outcomes." This idea was inspired by a teacher participant who had experience and success using this specific material when discussing braille. Objects like egg cartons, cut in half, offer an introduction to the braille cell formation. Both the halved egg carton and braille cell consist of two columns and three rows. When stones or marbles (objects found outside and inside the classroom) are placed in the carton divots, the braille writing system is simulated. There are many activities that can spark discussion about the braille writing system. The activity prompt system will help with initial pre-braille activity ideas and construction.

Tactile Pouch

Early design ideas for the tactile object used a wooden board as a starting point. The board was to have carved out circle depressions which would then be filled with materials like marbles, allowing children to track and trace their hand over the objects (see Fig. 3). In discussion with participants, it became apparent that a wooden board may not be the best material for kindergartners. Although sturdy and long-lasting, wood is heavy, especially if the students are meant to carry this board to and from school. Wood also poses challenges when it comes to cleaning and disinfecting (something that should be considered during the global COVID-19 pandemic).

A magnetic sheet became a unique solution to a wooden board base. The magnetic sheet rolled up easily, making transportation simple. Magnets allow for the exploration of materials on a variety of planes, i.e., upside down and on an angle.

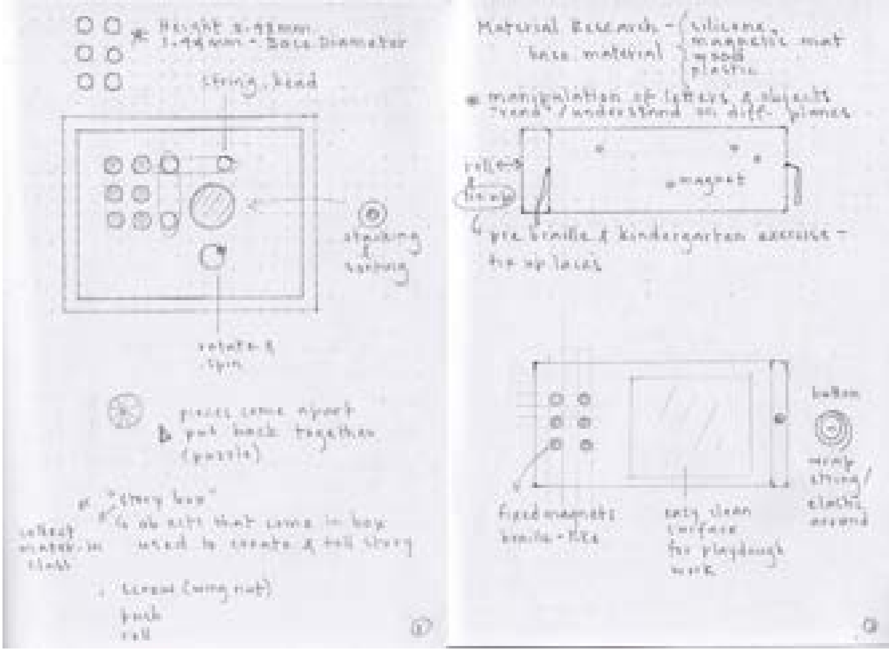

Fig. 3 Object design sketches (Drawings by the Author 2021). Alt Text *Design Sketch A*: A pencil drawing of a wooden board with circle depressions. Alt Text *Design Sketch* B: A pencil drawing of a magnetic sheet rolled out flat. Small circle magnets rest on top. String is drawn at the end of the sheet to show it rolls up and ties closed

For the magnetic sheet to hold or contain opportunities for other activities, it was decided to wrap it in fabric. The fabric would allow for sewn-on pockets, zippers, Velcro, and buttons, each requiring unique hand position, movement, and other considerations (Fig. 4).

The figures above show a prototype for a tactile pouch. Using paper and fabric to prototype made for quick and multiple iterations. Three contrasting colors were chosen, a light gray, red, and black, with the knowledge that people with partial sight can see some color. The pouch itself will be 16 in by 12 in. This size will fit within a child's lap so that they can use it in any location and/or position. The front, in a washable fabric, will contain: two pockets and additional magnets. Each attachment, i.e., pocket, has its own unique purpose and function. The pockets are meant for collecting, sorting, and matching pre-braille activities. The magnets supplied with the pouch can be used in conjunction with objects throughout the classroom. The magnet can attach to the object (with a sticker backing) allowing for manipulation and comprehension on different planes. The backside of the pouch will primarily be used with a Velcro patch and Velcro stickers. Attached is one pocket at 6.25 in, able to hold collected materials such as fabric scraps. The fabric scraps, when attached to

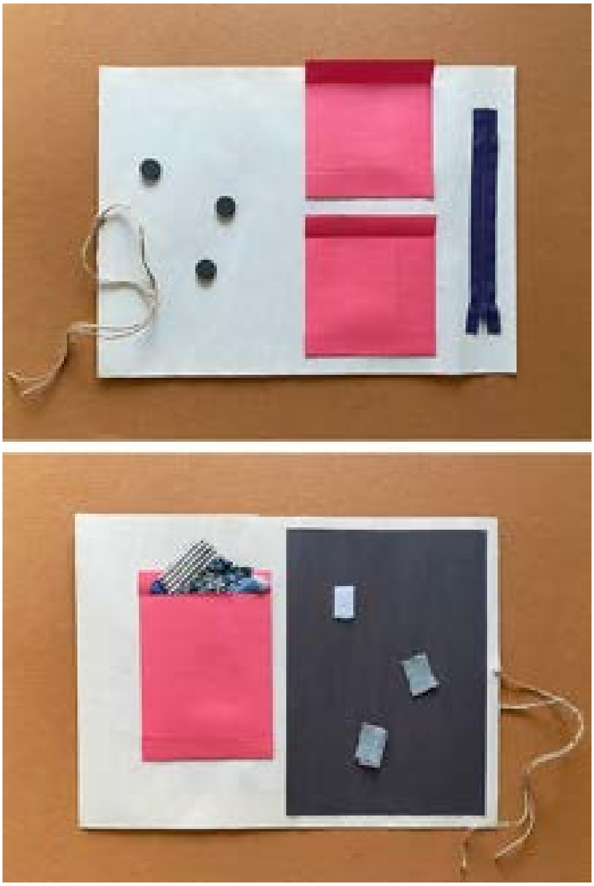

Fig. 4 Paper prototype. (Prototypes by the Author 2021). Alt Text *Prototype* A: A paper prototype to size, 12 by 16 inches. A light gray paper rectangle represents a fabric pouch. On one side of the rectangle are two red pockets. To the left are three small magnets and a string. To the right of the pockets is a zipper. Alt Text *Prototype* B: The same light gray paper rectangle flipped over to show the backside. Left of the center is one red paper pocket with fabric coming out. Right of the center is a large black paper rectangle representing a Velcro patch. Pieces of fabric are stuck to the Velcro patch

the pouch with Velcro, permit tracing and tracking, noticing different and like-textures (Table 3).

Activity Prompt System

The activity prompt system includes suggestions and prompts related to materials, settings, context, pre-braille activities, etc., helping kindergarten teachers create classroom activities that foster pre-braille practice and introduce the braille writing system. The system includes ten settings, ten pre-braille actions, and ten learning outcomes. These 30 prompts can be mixed and matched to create 1000 unique activities. In addition to the prompts, the system, titled “Introduction to Sensory Learning,” includes eight grouping suggestions for initial activity ideation, two

Table 3 Pocket and clasp exploration

Section	Type	Image	Pros	Cons
Pocket	Button		A pre-braille activity Requires more fine motor movement	Needs a large flap to prevent materials from falling out
	Velcro		Easy to use Effective for younger kindergarten students	Could wear over time; lose traction
	Clasp		Uses many pre-braille activities, i.e., finger strength, fine motor movement, and two-handed coordination	Could be difficult to manipulate for younger ages Requires fine motor and finger strength

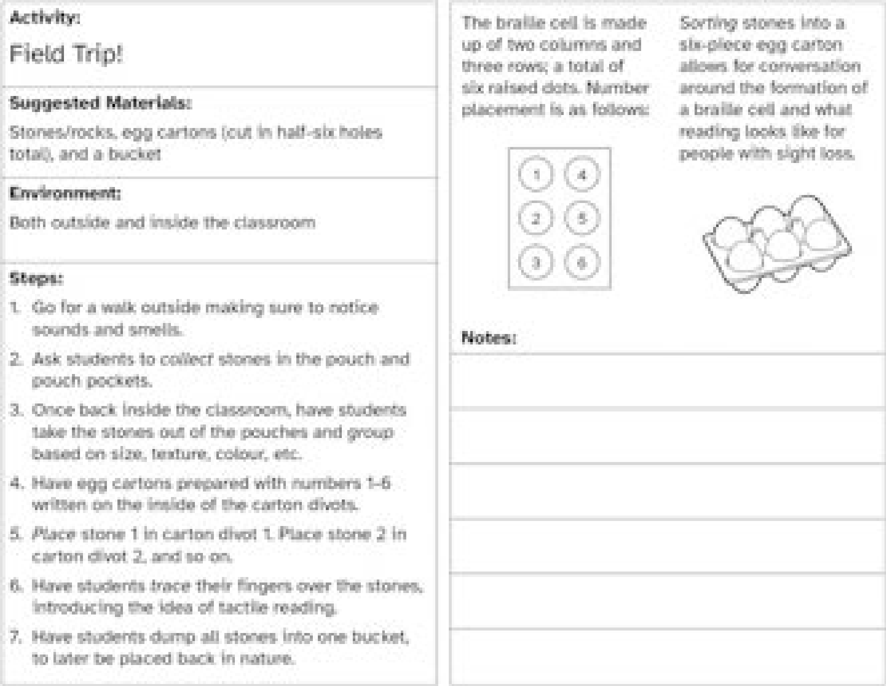
detailed examples, and blank activity cards for personalized groupings and recording of activity creations.

The activity prompt system became modular after an initial version was completed (see Fig. 5).

The proposed activity "Field Trip," could be done either inside, outside, or both, splitting the time between the two. There was also a chance to use stones, marbles, etc., depending on the activity setting. An opportunity for mixing and matching materials and locations (environment) became clear.

The next version, as seen in Fig. 6, introduced a modular system. Modularity allowed the system to be accessible to any teacher, no matter what materials and objects they have in their classroom. They can use the system in consultation with the Ontario Kindergarten Program 2016, specifically, the learning outcomes in the document, as well as the space and materials available to them. While speaking with teacher participants early in the design process, it became clear that the messaging was not detailed enough. It was only after explaining via phone calls that they understood completely what the cards were meant to do. To clarify the modularity, three shapes were used to distinguish the prompts setting, pre-braille action, and learning outcome. The shapes as well as the colors dedicated to each shape improved the clarity and recognition of the system.



Activity:

Field Trip!

Suggested Materials:

Stones/rocks, egg cartons (cut in half-six holes total), and a bucket

Environment:

Both outside and inside the classroom

Steps:

1. Go for a walk outside making sure to notice sounds and smells.
2. Ask students to collect stones in the pouch and pouch pockets.
3. Once back inside the classroom, have students take the stones out of the pouches and group based on size, texture, colour, etc.
4. Have egg cartons prepared with numbers 1-6 written on the inside of the carton divots.
5. Place stone 1 in carton divot 1. Place stone 2 in carton divot 2, and so on.
6. Have students trace their fingers over the stones, introducing the idea of tactile reading.
7. Have students dump all stones into one bucket, to later be placed back in nature.

The braille cell is made up of two columns and three rows; a total of six raised dots. Number placement is as follows:

Sorting stones into a six-piece egg carton allows for conversation around the formation of a braille cell and what reading looks like for people with sight loss.

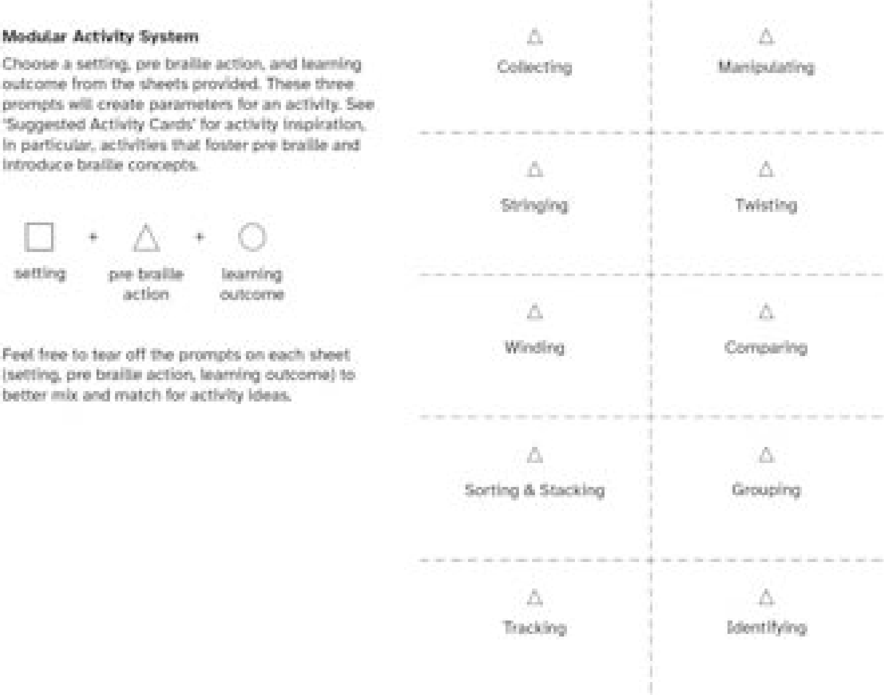
Notes:

Below the activity name is: suggested materials, the environment in which the activity should be done, and a list of seven steps. The steps outline how the activity should be completed. Alt Text *Card B*: The activity card continued (the backside). Two columns of text, the left describing the braille cell formation with an illustrated image. The right column describes the benefits of using an egg carton for braille cell comprehension. Below the text is an illustration of a six-piece egg carton. The bottom half of the card leaves space for teachers to take notes

Inclusive Considerations

It is important when designing for a marginalized group to ask: Is the product available? Does it function with ease? Is it feasible? Is it reliable? And are needs recognized and understood? Participants and I co-designed with kindergarten teachers in mind as the primary users. These users may or may not have students with sight loss in their classroom. Some of the families attending the school may be of low income; others may have children who are blind or are developing sight impairments. Designing for people outside of the majority demands different questioning and holistic thinking (Fig. 7).

The swatches above illustrate the color decision. High contrasting colors make the pouch accessible to students with various sight abilities (low vision, color blind, and sighted). The contrast allows for distinction between different sections and



Modular Activity System

Choose a setting, pre braille action, and learning outcome from the sheets provided. These three prompts will create parameters for an activity. See 'Suggested Activity Cards' for activity inspiration. In particular, activities that foster pre braille and introduce braille concepts.

Feel free to tear off the prompts on each sheet (setting, pre braille action, learning outcome) to better mix and match for activity ideas.

△ Collecting	△ Manipulating
△ Stringing	△ Twisting
△ Winding	△ Comparing
△ Sorting & Stacking	△ Grouping
△ Tracking	△ Identifying

Fig. 6 Second version prompt cards (Graphics by the Author 2021). Alt Text *Card* A: A card introducing the activity prompt system. This card includes a description of the system followed by three shapes, a square, triangle, and circle. Each shape corresponds to a prompt: setting, action, and learning outcome. Alt Text *Card B*: Two columns and five rows. Each section includes a small triangle followed by a pre-braille action, i.e., collecting

functionalities, although not crucial to comprehension, therefore, the pouch can be used by those who are blind.

The activity prompt system required similar color considerations. Three colors were chosen to distinguish between the setting, pre-braille activities, and learning outcomes. A colorblind-friendly color palette was chosen. The three colors are: a light blue, purple, and deep blue. Even when printed in black and white, this color palette is distinguishable due to high contrast between the three tones (Fig. 8).

Designed Outcomes

Proposed Tactile Pouch

From the co-designs, in particular with teachers of the visually impaired (TVI), we reached a slightly different pouch design layout. Early ideas and concepts arose throughout the interview process. Coming into co-design sessions, participants did not have any reference to early sketches and/or mockups I had done. It was only after they participated in an asynchronous activity and shared their thoughts and suggestions, that they saw the early mockups. The mockups then evolved, incorporating the specific needs described by participants, for example, a space to carry braille books. Early iterations only made room for a magnetic sheet. A new design allowed the same size pouch, 12 in by 16 in, to carry braille books of which are 11 in squared in size (Fig. 9).

So many tactile activities coincide with learning math concepts, such as counting, sorting, and grouping. In fact, the kindergarten classroom holds an array of centers, one being specific to sorting. In discussion with teacher participant H, a teacher of the visually impaired, the pouch encourages manipulation, having to look for objects in a pocket, then opening the pocket to play. Each pocket benefits from a different type of opening, i.e., button with string and magnetic clasp. With unique openings, the child will have to move their hands in different ways. Before the student has retrieved the objects from the pouch pockets, they will use problem-solving skills, determining how to access the objects, and then what to do with them once access is gained.

Understanding how to use zippers can be liberating for students with sight loss. The zipper is a difficult but necessary device to operate as it is something we encounter every day on clothing and accessories. Zippers will help students practice their finger and pincer strength. In addition to having a zipper on the tactile pouch,

Fig. 9 Proposed tactile pouch (Images by the Author 2021). Alt Text *Pouch A*: A dark blue cloth bag with two yellow pockets. Between the pockets is a zipper. The pocket on the left side of the bag is closed shut with a red button. Alt Text *Pouch B*: The backside of the dark blue cloth bag. Halfway down the bag is a rectangle lined with Velcro strips. A hand places one piece of fabric on the Velcro with Velcro sticker fastenings. Alt Text *Pouch C*: The blue fabric bag in full. On top of the yellow pockets are materials one might use to create tactile activities. The materials are: pipe cleaners, playdough, popsicle sticks, beads, and buttons

the activity prompt system suggests activities that help develop fine motor skills such as zipping and stringing.

The proposed tactile pouch holds a structured form allowing the depth for multiple books and objects to be stored. The opening of the pouch includes a toggle to pull and keep objects inside secure. The toggle is a tool that requires fine motor manipulation and finger strength. The front, in a dark denim fabric, has two yellow pockets, each with unique clasps. A zipper is placed between the pockets. Its function is solely to practice fine motor manipulation. Inside the pouch is a mesh pocket. The pocket holds a magnetic sheet that works in combination with magnetic stickers. A portion of the backside is lined with Velcro strips. The Velcro is effective in combination with Velcro stickers. The whole pouch is washable. This was important in considering the COVID-19 pandemic and the mess that comes with play.

Proposed Activity Prompt System

The proposed activity prompt system includes introductory cards of 4 in by 6 in, outlining what the system is, what is included, and how to get started. Cards of this size do not require a lot of space. They can be stored in a drawer, on a desk, or in one of the tactile pouch pockets. Following the introduction, are three 8.5 in by 11 in sheets (letter-sized paper), each listing ten prompts; ten settings, ten actions, and ten outcomes. These three sheets are intended to be cut out by teachers, stacking the prompts together with a staple, bulldog clip, or other fastening device. I suggest using a clip or ring, allowing ample flexibility, exploring all opportunities when mixing and matching the prompts. In addition to the three sheets, there is a card (4 in by 6 in) dedicated to demonstrating activity possibilities, matching eight settings, pre-braille actions, and learning outcomes. This can be referred to by teachers when planning class activities. The system takes these eight pairings one step further, with two detailed examples. The examples specify where the activity should take place, the types of materials the teacher might use, why the activity is important, and a list of steps to plan and construct. These specific examples highlight introductions to the braille writing system that might be discussed in class (Fig. 10).

The Ontario Kindergarten Program 2016 was especially helpful when constructing the prompt system, especially the pre-braille actions and learning outcomes. The Appendix located on pages 306–318 breaks down the overall expectations of kindergartners in relation to: belonging and contributing (BC), self-

Fig. 10 Proposed activity prompt system (Images by the Author 2021). Alt Text *System A*: Two hands hold and flip through the activity prompt system. The page shown illustrates example groupings, five settings, five actions, and five outcomes. Alt Text *System B*: The activity prompt system held together with a ring, lays flat on a blue background. Beside the system is six-piece egg cartons. Two of the divots hold stones. Alt Text *System C*: All parts of the activity prompt system lay flat on a blue backdrop. The grouping held together with the ring is beside the larger sheet of paper with learning outcome prompts ready to be cut out and clipped together. The ten action prompts have been cut out and grouped together with a clip

regulation and well-being (SRWB), demonstrating literacy and mathematics behaviors (DLMB), and problem-solving and innovating (PSI). The previous section was particularly interesting in regard to the action prompts. This section outlines multiple outcomes that relate well to pre-braille activities, i.e., "demonstrates control of small muscles, e.g., use a functional grip when writing, while working in a variety of learning areas, e.g., sand table, water table, visual arts area, and when using a variety of materials or equipment, e.g., using salt trays, stringing beads, painting with paintbrushes, etc." (Ontario Ministry of Education, 2016, p. 309). I urge teachers to reference the document, in particular the Appendix starting on page 306, when looking for additional outcomes for activity creations. The additional activities can be recorded on the blank cards provided in the activity prompt system.

Conclusion

Practicing tactile skills such as finger and hand strength, two-handed coordination, and fine motor development is especially important in an ever-evolving digital world. Literacy learning requires continuous reading and writing practice, but with technological advancements, students are using devices to assist their work at an earlier age.

I worked directly with kindergarten teachers and teachers of the visually impaired, listening and learning from their experiences, understanding what types of support and/or needs they require while teaching. Together, we used our knowledge on the importance of literacy learning and created a system that would assist kindergarten teachers engage students in pre-braille activities and introduce the idea of reading tactually. "Every child should feel that he or she belongs, is a valuable contributor to his or her surroundings, and deserves the opportunity to succeed" (Ontario Ministry of Education, 2016, p. 125). By introducing reading tactually, also known as braille, students become aware of other abilities, making the classroom a safe and inclusive space to learn and explore.

The project was only possible through multiple design iterations and co-design sessions required in participatory research methodology. Co-design, or co-creation, means listening to and learning from participants' experience. From there, assessing the needs and barriers that prevent something from being truly inclusive. This project built upon a need for a tool that is feasible, available, and fosters multiple modes of tactile engagement. Design iterations explored a variety of textures, vision-friendly color palettes, and flexibility in materials, spaces, and outcomes. I argue that with continuous tactile practice, in the form of pre-braille activities, students who need to later learn braille will benefit from this early exposure. It will also assist those new to the braille writing system and reduce stereotypes in the classroom.

Based on work with teachers, future research will look at the benefit of tactile and play-based learning in grade schooling, after kindergarten. Some teacher participants explained grade schooling, grades one and two, do not engage play and inquiry-based learning like kindergarten does. Students must make big changes in learning styles between the summer of kindergarten and grade one. This is especially concerning for students who learn kinesthetically. There is a possibility to reinforce the benefits and introduce pre-braille learning beyond the kindergarten classroom.

Limitations

As previously mentioned, the global COVID-19 pandemic of 2019–2021 made the Major Research Project process quite challenging. Going into schools and speaking with teachers was no longer an option, interviews and co-creation sessions were done remotely, and design feedback relied on visual and audio descriptions of what was being created. Gaining trust with people in person can be difficult, let alone in the digital space. The co-creation process of this project was altered to fit the teachers time and schedule, only appropriate for the mental and physical exhaustion that came with work and school moving to a fully online experience.

The proposed design outcomes are yet to be tested by participants. Teacher participants co-designed the initial system and offered feedback via emails and phone calls but did not have the time to test the tactile pouch and activity prompt system in the classroom. Only two pouches were made, and completed later in the process, therefore, could not be sent to all participants and in time. The activity prompt system could have been emailed to participants for them to print and test during class time; however, classes were conducted online at this time. Introducing a new and tactile system would benefit from in-person testing, especially when first introduced.

Recommendations for Further Research

This research demonstrated many opportunities and directions, some of which include: a sharing platform, opportunities to continue pre-braille learning and development outside of school months (summer), and conducting similar research with kindergarten students and their parents.

Teachers need to be intrinsically motivated to do their job, but support can always be increased. Support may look like extra assistance within the classroom, cooperation, and stronger communication between parents and teachers, a platform to speak with other teachers and share experiences, or more manipulatives and tools available in the classroom. I especially see an opportunity for further work on a digital platform or forum for teachers of the visually impaired (TVI) and orientation and mobility specialists (O&M) to share and assist one another.

Another area of interest and possibility is support for students with sight loss over the summer months, when formal school is not in place. A space and time to continue practicing their pre-braille activities in the months off school would be most beneficial. This could be in the form of a camp, summer classes, multisensory kits that could be used at home with parental assistance, etc. Instead of developing something new, there may be possibilities of working with or integrating this teaching into existing schools and galleries that host summer classes.

The tactile pouch is an inspiring piece. It provides an idea of the format, materials, and types of activities that can be used to foster pre-braille exercises and introduce the braille writing system. Using found materials throughout the co-creation and design process inspires a do-it-yourself (DIY) project, as readers reflect on found materials in their home or classroom to produce a pouch. With limited sewing knowledge, I was able to design something that could be recreated fairly easily. I enlisted some sewing help, but for those who have sewing knowledge, I imagine creating their own pouch would not be very challenging. Workshops encouraging the making process could be hosted by parents and teachers with sewing practice. Tactile pouches could be made for people with limited resources and/or experience. The tactile pouch workshop idea is borrowed from face mask DIY and workshops emerging out of the COVID-19 pandemic.

Parents are the first teachers of their children, and they have a lot to share with teachers, as I understand from my interviews. It would be interesting to conduct a similar research and co-creation process with parents of children in kindergarten. There is an opportunity to discover and address the parent's needs, in addition to improving communication between parents and teachers of students at the kindergarten level.

Abstract

Co-design is used to provide a wide range of stakeholder perspectives before and during the design process, but geography and transportation difficulties often prevent important stakeholders from participating as co-designers. This chapter explores a spectrum of co-designs from group to individual and describes techniques that have been successful when working with co-designers remotely. Techniques for working with individuals with mental or sensory impairments, in particular visually impaired participants, are also given. Four examples of co-designs led by the authors are given with a discussion and tools used in each session. Incorporating remote techniques into the co-design process enables stakeholders from around the globe and those with mental or sensory impairments to provide feedback and input throughout the development process.

Keywords

Co-design, Inclusion, Remote, Virtual, Non-visual

Introduction

In 2008, Sanders and Stappers published “Co-creation and the new landscapes of design” which defined the term “co-design” as “the creativity of designers and people not trained in design working together in the design development process” (Sanders & Stappers, 2008). Sanders and Stappers describe how co-design contrasts with traditional design, in that co-design is designing for a purpose instead of designing a product. To achieve this paradigm, end users need to be brought in during the ideation phase, before money and time have been invested in a solution, and treated as equal to the main designers. “Professional” designers shift their role to be a facilitator and bring knowledge of what’s possible and how to get there to the process.

There are many techniques to facilitate co-design, both group based and individual, and Hendriks et al. (2015) recommend customizing the co-design methods to the participants. Lavender et al. (2020) conducted 27 in-person group co-design sessions with small groups, and each group utilized a toolkit to quickly prototype a solution. Santin et al. (2019) and Mäkelä et al. (2019) began with in-person group workshops, where stakeholders met and discussed aspects of the system as it was developed. They then did virtual one-to-one sessions with users to evaluate and get feedback on their prototype. Lee (2018) and Siu et al. (2019) performed individual co-design sessions with users where problems were identified, a prototype was developed, and then an existing prototype was shown to the user, followed by a debrief. During 2020, several design firms published guides on how to run virtual co-designs, but examples and guides are lacking in the academic literature (Castán, 2020; Ringrose, 2020). These are useful resources for running co-designs with an audience without physical or mental impairments and who are able to use a digital whiteboard. In the academic literature, Dorta et al. (2016) describe a promising virtual reality application they developed to facilitate co-design of physical objects, but no mention was made if the participants had any kind of mental or sensory impairments.

Hendriks et al. (2015) point out that many of the traditional ideas of ideation include verbal conversations, groups, drawing, writing on paper, crafting or moving objects, or viewing pictures. Virtual co-design sessions also may include virtual reality (Dorta et al., 2016). These methods are often not accessible for individuals with mental or sensory impairments. They recommend, rather than trying to develop a one-size-fits-all methodology to co-design, facilitators should structure activities and outcomes around participants with an initial co-design session to create techniques for future sessions.

One of the most impacted groups with traditional ideation and design techniques are non-visual participants. Metatla et al. (2015) described how the visual nature of many tools used conventionally for prototyping, such as storyboards, collaborative whiteboards, virtual reality drawing tools, and paper prototypes, makes them inaccessible to people living with visual impairments. Additionally, while using visual means to express ideas for designing graphical interfaces is appropriate, it is harder to use them to articulate the design of non-visual displays. The approach from Metatla et al. (2015) combined an initial stage involving focused discussions, application-independent technology demonstrations, and non-visual design activities, with a second stage comprising iterative participatory prototyping sessions that relied on highly malleable non-visual prototypes and audio diaries. They concluded that non-visual technology demonstrations allowed them to establish a baseline of shared understanding and to build a shared vocabulary for expressing non-visual design ideas, while low-fi physical audio-haptic mock-ups did not encourage co-design as anticipated and instead hindered communication. Participants switched to verbal descriptions to generate and capture design ideas instead. The use of highly malleable non-visual digital prototypes in the second stage provided an effective medium for shared design activities, while audio diaries expanded the users' reflection space to reach beyond design sessions and provided designers with a further resource of feedback. One of the challenges this chapter explores is how to develop prototypes and effectively present them in a way that can be facilitated remotely to non-visual users.

Many of the co-design practices revolve around in-person activities. With the increased globalization and acknowledgement for the need of greater diversity among co-design participants, in-person co-design is becoming too expensive and difficult for many situations. Remote co-design enables access to a greater number of participants who are often spread out geographically and difficult to physically reach. It also lowers the cost for both the facilitator and the participant, allowing more sessions to be held with the same budget of an in-person session. This chapter presents detailed examples of remote co-design sessions and discusses what works and what could be improved in each example.

Performing Co-design

Four co-designs are presented below showing a spectrum of approaches that worked and didn't work. After each description, there is a discussion that explores the effectiveness of the different aspects within that session. At the end, there is a final discussion that presents conclusions looking at all four examples and gives ideas for future sessions. Most of these studies were done during the last year, so are still pending publication. The first co-design uses a technical prototype in a group co-design session with six participants. The second example is a longitudinal multi-phase study that employs a mixture of surveys and individual sessions. The third example uses a set of tactile objects and sound files that were given to the participants before the group co-design session. The fourth example is a co-design session that was performed individually with participants.

Study 1: Group Co-design with a Technical Prototype over Zoom

Study Summary

In March 2021, our team held a co-design with six participants over Zoom where traditional group co-design methodology was utilized. The co-design was to investigate attitudes around traveling during the COVID-19 pandemic as a blind individual and to investigate some solutions to help increase confidence. There were six blind individuals from around the USA: three males and three females. The participants ranged from 19 to 82 years old with two participants between 18 and 30, one participant between 31 and 60, and three participants above the age of 61. One participant had low vision, one participant could see shapes, and the other four participants have no light perception or were totally blind. The co-design was approved by the institutional review board at the Smith-Kettlewell Eye Research Institute. Participants were compensated $90 for their participation. Rewards Genius ("Rewards genius," 2021) was used to pay participants, and consent forms were collected using Microsoft forms. To coordinate a time that worked for everyone, Doodle ("Doodle," 2021) was used. This study is pending publication.

Materials and Methods

The co-design was detailed in a facilitation guide that outlined each task, had links to all the relevant applications to install and use, and described the time set aside for each task. The six tasks on the facilitation guide were outlined as follows and were scheduled to take 1 h, but participants were told to expect 3 h to plan for technical difficulties. Participants received both individual email support before the session and three emails in the week leading up to the session, reminding participants to test an example application link that was given, fill out the consent form, install Zoom, get a note-taking device, and obtain headphones and a device with a keyboard and updated browser (needed for the prototype). Participants were also sent the facilitation guide the day of the session with links to the prototypes and Zoom session. Individual support was offered to help participants test their setup, although no one did more than ask for clarification over email.

- Warmup – 10 min: "Participants will be split into groups of 2 and put into a breakout session. Messages will be sent to each breakout room when the activity should switch. There will be a countdown when the activity is almost finished. There was a template to fill out: My partner's name is... They live in... List 3 of their favorite hobbies...."
- Reflect on relevant experiences traveling during COVID – 10 min: "Participants will be split into pairs and put into a breakout room, with a facilitation leader in each room. The facilitation leader will write down experiences in the google sheet. Reflect on a relevant experience. Using two items from the experience list below for inspiration and the relevant experience template, reflect on an experience relevant to the workshop's objectives: what worked and what didn't work about that experience? If you did not feel safe or independent during that experience, say why." There was then a list of experiences, such as shopping, doing outdoor cardio exercise, etc.
- Concept review and prototype – 40 min: "In this activity, participants will review two concepts and experience the prototypes. For each concept, participants will have time to review the concept material and capture any feedback in the space provided. After each concept review, participants will discuss their feedback. Facilitators will capture this feedback in the Google Sheet." There was then a detailed description of the two prototypes that were used, along with links to access the prototypes. Both prototypes were accessed through the web browser. Participants then had a list of questions, such as "Please write a list of features you like, and a list of features you dislike about the application." and "For the features you like, what did you like about them and why?". Participants answered questions for each prototype.
- Prototype generation – 25 min: "As a group, fill in the prototype build out template using the material from the previous two activities as ideation stimulus." Participants were then given a prototype template they needed to fill out that included problem, feature rankings, and final description of a product.
- Fill out prototype presentation template – 5 min: "As a group, fill in the presentation template. This resource will help focus your presentation to the key details of your work. Select one person to read out loud the presentation template."
- Group prototype presentations – 6 min (3 min for each group): "Each group will take 3 min to present, taking a few questions afterwards."

What Happened

The co-design session was completed with valuable insight being obtained, but the technical problems of groups and complex web-based prototypes on the computer meant that many of the activities needed to be modified.

- Warmup: The first technical problem came when Zoom groups did not each contain a facilitator after the Zoom Host split everyone into groups, and the interface was too complicated for the Zoom host to easily move participants, especially participants who had joined with a computer and phone, around the groups. This led to the warmup activity taking 35 min instead of 10 min and not everyone completing the task. Breakout rooms were not used for the remainder of the session.
- Reflect on relevant experiences traveling during COVID – 10 min: Originally, this was supposed to be done in small groups, but was modified to be done in a large group. Participants really enjoyed the diversity of perspectives in the large group, and the facilitator ensured everyone was part of the conversation. Despite being six individuals rather than two, the group was able to go through a number of experiences and talk about some experiences not in the list, such as the fear of racial violence while traveling as a blind person during COVID. This section generated extremely useful insights and flowed much easier than the icebreaker. The session took 45 min, instead of 10 min.
- Concept review and prototype – 40 min: This section began with everyone pulling up the email with the links to the online prototype. One participant's audio of the prototypes was streamed through Zoom and was too difficult to troubleshoot, so that participant muted him-/herself while exploring the prototypes. When participants opened the prototype, they needed to do three key commands to get the prototype working on their machine, and two of the participants experienced technical difficulties that needed to be resolved. One participant took 25 min to find the link to the first prototype, but when they were in the prototype, their cat unplugged their computer, and they had to get back into the prototype, which took them a total of 50 min. It took around 15 min for everyone but the participant with the cat to get the prototype working. Several of the participants had the prototype working in minute 1 and were just waiting for the other participants to get things working. There was no correlation between age or vision and getting the prototypes working. During this entire time, participants were all asking questions at once, and the facilitator had to keep track of where each user was in the experience while responding to their questions. The facilitator was able to ask several questions about the experience that were answered by the group, such as their thoughts on particular sounds. The facilitator also asked the participants to fill out the feedback form individually for the prototypes. At the 45-min mark, the participants switched to the second prototype. Everyone but the participant with the cat successfully switched from the first prototype to the second prototype within 3 min, and at 15 min, the facilitator moved to the next activity. In total, the prototype review session took 1 h and 5 min.
- Prototype generation – 25 min: At this point, the session was at 2 h and 15 min, and participants were getting tired. To modify this activity for a group, the facilitator asked what problem was the most important from the list from activity 2. Participants started with one idea, social distancing, then moved to other topics fairly quickly, and described solutions or ideas for how they would want to access information for several of the problems listed in activity 2. Many of the

discussions centered around the ideas in the prototypes, but the group was quick to move beyond the capability of the prototypes and outlined ideas that they would find useful. All participants contributed to this conversation. This section took 25 min, and at that point, the facilitator thanked everyone for their time and ended the session.

Discussion

This co-design produced some extremely useful insights, but took longer than expected and had several major technical difficulties that could have been mitigated with a different design. The sessions with participants sharing their experiences and discussing the prototypes were the most successful. This required little technical knowledge and is similar to other Zoom sessions for participants. The breakout rooms may have been useful, but for everything but the icebreaker, they were not really needed or worth the technical difficulties they caused. For larger groups though, the breakout rooms are a must. The prototype viewing session was the largest source of stress for everyone. The diverse technical support needs, even among technologically sophisticated users, made the group-based prototype experience extremely chaotic for everyone. A better design would include individual sessions with each of the participants to walk through the prototypes with them before the prototype discussion and prototype generation. This could either mean doing relevant experiences, and concept review and prototype individually with each participant, or having a short group session with relevant experiences, then an individual prototype review with each participant, followed by the prototype review and group prototype generation. Despite significant planning, technical problems are better mitigated completely, rather than attempting to lower the risk. Individual sessions would have allowed participants to get focused technical support and a more in-depth experience with the prototypes.

Study 2: Longitudinal Remote Methods for Needs Assessment and Formative Evaluation

Study Summary

We describe a longitudinal study to co-design auditory route overviews for previewing travel routes by blind people. The project was developed over four phases, from an initial needs assessment through several iterations of design and ending with a formative evaluation (Aziz et al. 2022). Zoom was used as the remote conferencing software for all virtual meetings.

Phase 1 was a remote survey, phase 2 comprised a series of in-person group co-designs combined with remote feedback on those designs, phase 3 was an in-person usability study, and phase 4 was a remote one-to-one co-design session. Consent was obtained by email in phases 1 and 2, while in phases 3 and 4, consent was obtained via an accessible form included in the software platforms specifically built for those studies. Participants took part voluntarily in the first two phases, while participation was paid through cash or direct deposit in phases 3 and 4 as those phases were much longer.

The target population (participants) were heavily involved in each phase. Most of the work was done with participants contributing online, with one phase taking place in-person. Some participants were chosen to contribute across multiple phases to add longitudinality and depth to the data. These participants experienced how the research evolved, providing input at multiple stages, having had time to think about the system and its issues in between the studies. Other participants were deliberately chosen because they hadn't been involved in previous phases and were able to bring a fresh viewpoint not influenced by the development process. In what follows, we describe the research methods employed and reflect on their efficacy.

Materials and Methods

We decided to administer the needs survey online in order to reach a more diverse range of potential users. It was important to make participation from people's homes or places of work as straightforward as possible and avoid unnecessary travel. The early part of the online survey focused on "what" and "why" questions, namely, "what is an auditory route overview?" and "why would a system to present such overviews be useful?". The second part of the survey focused on specific requirements for content: "How long should an auditory overview of a route be?" and "What different types of audio should it contain?". Fifteen blind participants from different geographical locations from Asia, North America, and Europe participated. The participants were aged between 17 and 72 ($M = 41.86$, $SD = 16.19$) years. The survey was designed on SurveyMonkey ("Survey monkey," 2021) and tested for accessibility using the JAWS screen reader. Participants were provided the link to the survey, which they accessed and completed in their own time.

Based on the outcomes of the survey, a design study was conducted, comprising two separate sessions: in-person designer workshops with design experts and remote formative feedback sessions with potential users.

The design workshops took place in person. The experts in the workshops designed example auditory route overviews and discussed them in semi-structured interviews. Three out of the eight designs from the designer workshops were chosen for the user feedback session on the basis of the variety in their techniques and content. These sample designs were distributed to blind participants in the formative feedback sessions which were conducted online through email. The sessions involved participants listening to the designs and responding to survey questions. The content of the questions was informed by the discussions in the earlier studies and focused mostly on the content and quality of the auditory designs. The majority of questions were open-ended to encourage discussion of ideas and preferences. Eight blind individuals, aged between 25 and 57 years ($M = 42.14$, $SD = 12.63$), participated in the study. Participants were encouraged to give detailed feedback. The findings from the design study led to the design guidelines on which a prototype system was developed.

The prototype system that was developed in the previous phase was then evaluated for usability using Lego blocks in an in-person laboratory study. A major reason for conducting this in-person was the experimental equipment. The disadvantage, however, was the limited number of participants. One way of doing this remotely would be to transfer it online. While this would require the development of bespoke software to emulate the experimental setup, it would have the advantages of increased participation, participant's ease due to being at home and performing the study on their own machines, and reduced stress from commuting to the lab. While some Lego simulation software exists ("Lego digital designer @ONLINE," 2019, @leocad), these would not fulfil the requirements for the experimental study. For example, the bespoke software would have to be accessible and would require the integration of Lego simulation and the auditory route overview system.

Six blind individuals, aged between 24 and 58 (M = 47.67, SD = 13.75) years, participated in the usability study. All participants were comfortable with independent travel and had at least 5 years' experience with computers. The study comprised two parts: (1) presenting participants with the auditory route overviews generated by the prototype system, requiring them to reconstruct the route using Lego blocks, and (2) user feedback through an end-of-study survey consisting of both ratings and open-ended questions. The data from the first part of the study and the rating questions were analyzed using statistical methods, such as ANOVA, while the qualitative responses were analyzed using thematic analysis (Braun & Clarke, 2006).

The usability study was designed on simple, purpose-built software that included the details of the study, a training module that allowed the participants to train on the design specifications at their own pace and provided the auditory route overviews for the reconstruction tasks in three separate trials. The study details and the initial briefing were provided through a video, embedded into the platform, to communicate the experiment instructions effectively and uniformly to all the participants. The routes presented in each trial were chosen randomly from a predefined pool to ensure that no bias was added to the experiment and a clean comparison within trials and between participants could be made.

In the final phase, an application-based usefulness study was conducted to investigate how the blind users utilized an interactive and customizable auditory route overview system to preview routes and make decisions regarding them. The study was conducted online using an accessible, custom-built, interactive web application. The design of the interaction on this platform, in terms of navigation and placement of buttons, was informed by the training platform of the previous usability study and was basically a second iteration of an accessible experimental portal. The application included the information regarding the study, a method to acquire consent, a training platform, the auditory route overview system, as well as the survey questions. The study was designed in a survey style to gather open-ended but focused responses related to the research questions. Further details were discussed in end-of-study interviews. There were four parts of the study. The first two required the participants to choose a route for a given task from a set of route options, while the remaining two investigated the retention and recall of route features. The data of the first two scenarios and the end-of-study interview was analyzed using thematic analysis, while that of scenarios 3 and 4 was analyzed using statistical techniques.

Eleven blind individuals participated in the study. They were recruited through social media groups, re-recruitment from the design and usability studies, and snowball sampling. The participants were aged between 38 and 66 (M = 53.45, SD = 8) years, were comfortable with independent travel, and had between 12 and 45 (M = 34.2, SD = 8.9) years of experience with computers and assistive technology. The study was conducted individually, on a one-to-one basis. All participants, except PWS2 and PWS11, performed the study synchronously, while these two performed it in their own time, due to logistic reasons.

All participants apart from these two did the study on their own, while the researcher stayed connected with them via Zoom to ensure smooth running and provide any support if needed. All participants took part in the end-of-study interviews which were conducted individually over Zoom.

Piloting of the purpose-built software platforms was critical to all design phases. This was to ensure that the software was accessible to blind users and to minimize the effort needed to navigate the study platforms. Both the usability and the usefulness studies had custom-built software, with the usability study having a physical Lego-based setup as well. The usability study was piloted twice with a sighted person and once with a blind person to ensure smooth and uniform functioning of the experiment. With the sighted person, the pilot was repeated to remove ambiguities and incompleteness of instructions and to confirm that the different routes were realistic (Cairns & Cox, 2008), while with the blind person, it helped ensure that the entire experimental setup was accessible and easy to use. The usefulness study was piloted twice with a blind user to ensure that all the interactions were understandable, that flow between the different web pages was smooth, and that the screen reader could access the entire website without any issues. Even after repeated piloting, some issues of accessibility still arose during the study, such as not being able to read the labels of radio buttons. This was anticipated, and so the study sessions were performed synchronously where possible, to provide support during the session.

What Happened

The decision to conduct all but one of these studies remotely turned out to be a good one. No issues were encountered with communications or with participants preemptively accessing and auditioning the auditory route overviews sent to them as email attachments. It was clear from the results of the initial survey that auditory overviews of routes were considered useful and important by the participants and that their design and duration should vary depending on the content being represented.

Some interesting and valuable results arose from the design study. The designers predominantly thought that the overviews should be abstract. They believed that overviews were supposed to be more metaphorical than literal. Furthermore, they thought an abstract auditory display might give quicker representation, while a literal description using only speech would require more time and cognitive load to process. These ideas were in direct contrast with the blind participants who considered functional information to be more important. This discrepancy is representative of the gap that can exist between expert designers and user requirements and is, in and of itself, a compelling argument for co-design.

An extreme example of this arose when some designers designed their auditory route overviews using only sounds. Blind participants felt that the sounds of landscape and points of interest (PoI) alone were useless for guiding travel and must be augmented with more concrete speech-based direction information.

During the process of consolidating the results of this study into a prototype design, the researcher had to take a position on this discrepancy. She decided substantially to take the viewpoint of the blind participants, as they represented potential users of the system and had substantial experience being consumers of auditory displays.

The comments from the participants and the trends in the collected data indicated that they learned the system design over multiple trials. The data showed a reduction in both the number of replays required to learn the route and the time required to reconstruct it as experience with the system increased. Moreover, participants reported increased confidence in recognizing and placing PoIs over trials. User input from this study led to major design changes to the developing prototype.

A key decision concerning the usefulness web study was to run it as a one-to-one session between the researcher and individual users. We believe this made a significant difference in terms of being able to provide individual, tailored support to users and helped maximize the useful information derived from individual sessions. In general, users were successful in performing the tasks using the web application and responded effectively to the survey questions.

Discussion

Throughout this research project, a user-led design approach was employed to determine design requirements. It was based on an iterative process involving cycles of requirement gathering, rapid prototyping, and user-based evaluations, aiming to determine design guidelines generated by the participants and hence suited to the target user population (Barrass & Vickers, n.d.). Throughout this work, the findings of one phase fed into the research criteria of the next to create a longitudinal design process, with user involvement at every stage. Various instruments including questionnaires, interviews, and focus groups were used at different phases of the research to collect auditory/video and text-based user data, which was then analyzed quantitatively and qualitatively to develop design specifications. All of these research mechanisms proved to be robust in the context of online user participation. It is only in the case of the usability study that specific challenges exist, documented in the "Materials and Methods" section, that make it difficult to deploy in an online setting. Even there, the development of accessible Lego simulation software, integrated with the research tools deployed, such as surveys or interaction logging software, could enable that part of the study to be conducted online. It is likely in such a scenario that gamification might be usefully employed to promote user engagement.

Study 3: Group Co-design with Digital and Physical Prototypes

Study Summary

Two co-design workshops were organized with the purpose of exploring the design space of data sonification narratives. Based on prior formative work, the research team wished to explore the combination of narratives and audio graphics as a means of creating a more engaging and usable representation for data on the web. All workshops were conducted online through the Zoom video conferencing platform and lasted approximately 90 to 120 min. Participants were compensated with an Amazon gift card (Siu et al. 2022). Six participants were recruited from around the USA, and the same participants participated recurrently in both workshops. All participant co-designers identified as blind and/or visually impaired and used screen readers as their primary AT. The median age was 26.5, SD = 17.9, and range = 40. Workshop #2 had five participants instead of six since one participant from the previous workshop was not able to attend.

Materials and Methods

Before the workshops, the research team met with each participant individually to explain the goal of the co-design workshops and answer any questions. Additionally, both physical and digital materials that were used to support different workshop activities were shared with all participants. Physical materials were mailed to participants; these included tactile graphics, tactile prototyping materials (e.g., Wikki Stix and pipe cleaners). Digital materials included the agenda for each workshop, background information, and sample datasets in both audio sonification and tabular format.

Workshop #1 focused on the brainstorming and ideation stages of the design process. The goals of the activities for this workshop were to encourage conversation around different available data representations (tactile, speech, and audio), discuss preferences and tradeoffs, and start to formulate a list of guidelines for when each representation was useful or preferred. Next, we briefly summarize the activities in the agenda of Workshop #1:

- Introductions and Ice Breaker: To facilitate sharing and conversation among participants, we began the workshop with introductions from each participant and invited participants to share any personal data-driven story or interesting dataset they had explored.
- Background: To start with a common ground for discussions, we briefly reviewed different data representations and concluded with a problem statement to frame the workshops.
- Brainstorming and Ideation: Participants individually explored different datasets through different modalities (physical or digital) and shared what they liked or wished from each in a group discussion. For the individual exploration time, participants were encouraged to think about the story behind the data and how they might share it with others. After individual time to engage with the data, the research team started the group discussion with guiding questions. This was repeated for three different datasets. Participants were encouraged to discuss what worked for each dataset probe and what could be improved by proposing alternative data representation prototypes and combinations of prototypes. Throughout the discussions between participants, the facilitator took notes and, after each discussion, summarized some of the insights for generating prototypes, and these were further discussed by participants.
- Break: One 5-min break was provided between discussions.
- Reflection: The workshop concluded with a summary of the main insights learned, open questions, and next steps for the next workshop. Participants were also encouraged to provide any feedback on the workshop activities itself.

Between Workshop #1 and Workshop#2, the research team generated prototype alternatives that were discussed in Workshop #1. Facilitators provided a summary of what was learned from Workshop #1 and answers to any questions that couldn't be answered during the workshop.

Workshop #2 focused on the prototype stage of the design process. Activities focused on critiquing the different prototype probes that were generated from Workshop #1 and proposing new changes. Next, we briefly summarize the activities in the agenda of Workshop #2:

- Introduction: We began the workshop by reflecting on what we had learned from Workshop #1 and what the remaining questions we had identified were.
- Prototype Critique: Facilitators shared the prototypes that were generated based on the design guidelines generated in Workshop #1. After listening as a group, discussion followed.
- Prototype Generation: Participants were asked to share prototype ideas for how they would use the design guidelines to create their own data narratives. Participants shared with the group and discussed.
- Reflection: The workshop concluded with a summary of the main insights learned and remaining questions. Participants were also encouraged to provide any feedback on the workshop activities itself.

What Happened

Most of the activities were followed by a group discussion which took longer than expected. At the same time, these reflection periods discussing the prototypes and suggesting new designs were the most successful in meeting the intended workshop goals. Thus, during Workshop #1, facilitators opted for entirely skipping one activity in order to allow more discussion time. Based on the learnings from Workshop #1, facilitators planned the timing of activities for Workshop #2 accordingly. Another tension during group discussions was making sure all participants were engaged and felt they could contribute. During different discussion periods, specific participants dominated the discussion, and with limited time, this behavior could easily leave out some thoughts from the quieter participants. It was helpful to start by doing a quick roundtable discussion where each participant shared one thought and then opened the floor to more open discussion.

Providing participants with all materials beforehand so they could familiarize and have them ready helped save time during the workshop and ensure all participants were ready to engage during the workshops. Additionally, providing participants with multimodal ways of accessing the same information helped accommodate for participants different needs and preferences. Participants could access the datasets used to guide discussions tactually, auditorily through sonification, textually, or through raw tabular representations.

Discussion

The research team was able to summarize design guidelines for sonification data narratives based on the prototypes and discussion during the two workshops. These were incorporated in an algorithmic solution for sonifying data interleaved with narration. An aspect that was very helpful throughout the workshops was providing participants with supporting materials beforehand in a variety of modalities so each participant could familiarize with the materials and access them in their own way.

The prototype activities were planned to last 35–40 min, but between sharing ideas as a group and allowing sufficient individual time, we found that having an additional 30 min of discussion time would have been a more comfortable pace. Unlike in-person workshops where participants can be discussing in small groups without interrupting others, online discussions demand engagement from all participants in the call. Breakout rooms could be one solution toward encouraging more informal discussions, but these add some complexity and reduce group collaboration. Despite using both physical and digital materials to support the session, the goal of the prototypes was for them to be entirely digital delivered through audio-based methods. For projects where the primary goals are investigating physical prototypes, further work will be needed to investigate how such prototypes can be shared and experienced by participants in multimodal ways through a remote format.

Study 4: Individual Co-design and Evaluation with a Technical Prototype

Study Summary

This was a virtual one-to-one co-design and evaluation session to create a method to represent geographical map data completely in audio. The co-design session was meant to determine past experiences, thoughts, and future designs around digital non-visual mapping tools. The result of this session was used as the foundation for future designs and funding for the project. The evaluation was reported in Biggs et al. (2019). All workshops were held over the Skype video conferencing platform, were recorded, and lasted between 1 and 2 h. There were ten participants who ranged in age between 16 and 43 years old, and participants were located in India, South Africa, Romania, Canada, the USA, and Iran. Participants completed consent forms using Google Forms. All participants had used a screen reader for at least 5 years and were congenitally blind. Participants were not compensated for their participation, and the study was approved through the institutional review board from OCAD University.

Materials and Methods

The study consisted of four sections: (1) an unstructured interview about the user's past experiences around navigation, maps, and technology usage, (2) a design session, (3) an evaluation of a prototype, and (4) a debrief and revisit of the design in section "Performing Co-design." Skype was chosen for its ability to easily share system sound which was critical for the monitoring in step 3, the evaluation. The prototype was built to run in the browser and required headphones, a modern web browser (Firefox, Chrome, or Safari), and a keyboard to use. Participants had the option to use a built-in text-to-speech engine or their own screen reader, and everyone chose to use their own screen reader. The sections were laid out to minimize bias with the researcher's preconceptions of the subject area. The interview consisted of open-ended and Likert scale questions, probing to discover if the participant had any issues with the subject area. If the participant had no issues, they would skip section "Performing Co-design" and move to sections "Study 1: Group Co-design with a Technical Prototype over Zoom" and "Study 2: Longitudinal Remote Methods for Needs Assessment and Formative Evaluation." A detailed description of the four sections is as follows:

1. Interview: The interview section began with demographic and health information and then moved into the participant's past experience. Initially, they were broadly asked about their experiences, desires, and feelings around maps and navigation. They were then broadly asked about their technology experience and usage. Finally, participants were asked their thoughts, experiences, desires, and feelings around "digital maps." Some examples are as follows: "What comes into your

mind when you hear 'digital map'?", "What kind of information do you wish you had from a digital map?", and "How would you like to interact with a digital map?". These questions were used to guide the user in thinking about their needs and desires around mapping and to get them warmed up to the topic.

2. The co-design began with the prompt: "Without worrying about feasibility or possibility, please describe what your ideal digital map experience would be." This prompt could have been overwhelming and a nonstarter, but since participants had already begun thinking about their needs and desires in section "Introduction," this prompt was not very overwhelming, although it still required some additional prompts to take shape. Participants were asked to first describe the system they wanted to have, and then they were asked to describe an experience using the system.
3. Evaluation: This section began with the researcher asking the participant to share their system sound. Since all the participants were screen reader users, this enabled the researcher to follow along with what the screen reader was saying to the participant and easily troubleshoot any issues. The participants were given a link over Skype to the webpage with the map viewer on it. First, participants were trained on the system by the researcher and explored the interface until they felt comfortable using the controls. Participants were then ask to complete a list of tasks, such as locate an object on the map, or describe the route between two objects. These tasks were evaluated by reviewing the recording after the session. Both participant responses and hearing the participant's actions over Skype were used to quantitatively score the tasks.
4. Debrief: Participants were asked about their experience with the prototype, how their thoughts on their ideal system in section "Performing Co-design" were influenced by the prototype, and what they liked, thought needed improved, and didn't like about the prototype and finally an open-ended "What other comments would you like to say about your experience?".

What Happened?

This co-design had very few technical difficulties and any issues were resolved during the session or the interview was canceled due to the inability to resolve an issue. One of the major problems was that Apple computers at the time were unable to share their system sound, so no participants with an Apple computer were able to complete the session. The prototype was also only available and working on a computer, so a number of older participants were unable to participate due to them not having a computer. Five possible participants were excluded due to not having a Windows computer.

1. Interview: This section gave the participant time to openly express their thoughts and feelings. Surprisingly, there was one participant who had no experience with maps, had no desire to experience a map, and didn't think maps would ever be useful. Other participants were able to express their feelings and experiences

around viewing geographical information for navigation and information analysis.

2. Co-design: One fear of the researcher was that participants would describe something that was too unrealistic and the results of this co-design would not be useful. But in reality, participants were often stuck picturing a system that was implemented into their past experiences, such as text descriptions. Participants also expressed worries that their ideal system would not run on the existing technology. The researcher reassured participants they could imagine anything without limitation and it just needed to be detailed and thought out. Four users wanted a full VR experience where they could hear their environment in 3D audio, feel objects and textures, and use their cane. Three participants described a refreshable tactile hologram that could expand to about an 11-inch square that would have a miniature of the location with them in the center. Two participants wanted an implant in their brain that would be super accurate and up to date that would allow them to just know where to go. One user found the idea of a digital map too alien to contemplate. Although these responses are pushing the edge of technical possibility, they provide a clear direction for future research.
3. Evaluation: None of the participants had major issues with viewing the prototype, although there were a few sound card problems, and some participants had to switch browsers. The researcher was able to troubleshoot in real time as the participant navigated the system. Some of the participants had problems finding the link on the Skype interface, so the researcher had to give them step-by-step instructions on how to find the link.
4. Debrief: Participants really appreciated being able to give their feedback after viewing the prototype. They collectively gave over 40 unique feature requests and described how this platform would impact their life if they had it for more locations. The final question that asked participants what else they wanted to share often presented some of the most useful insights to how the users would be impacted by a system (either the system they co-designed or the prototype itself). Participants felt open to share personal stories about times when they got lost or when their GPS led them astray.

Discussion

This co-design produced a significant amount of qualitative and quantitative data. The co-design produced around 15 h of interview recordings. One of the main cons of this study was that participants were unable to discuss and share their thoughts and ideal systems with other participants. The upside of this is that the systems that participants did describe in their co-designs were extremely detailed. The lack of technical difficulties meant that the entire session was completely focused on the subject area. It was critical that the researcher could hear the participant's screen reader, as this meant they could easily and quickly solve issues. The global nature of the participant pool also meant an extremely diverse number of perspectives were obtained across a number of cultures. One thing to note is that 15 h of interviews can be intensive to qualitatively code, so the coding technique should be chosen to account for this fact. Overall, the co-design and evaluation produced a significant amount of data with little stress. This co-design was completed with a $0 budget, but participants should be compensated when possible.

Discussion and Reflection

A number of observations can be made from the above studies that may be useful when designing future co-design sessions. One thing to note is that all the prototype outcomes of the above co-designs were digital experiences, so co-designs with a physical deliverable may need to adjust their techniques.

- Online needs more time: Studies 1 and 2 show that the online modality took much longer than expected due to several factors, including increased difficulty of splitting individuals into pairs and lack of control around prototypes. Study 4 required a significant amount of time from the researcher in both interviewing and analyzing the data. In general, it took around twice as long to accomplish the co-designs than expected.
- Online requires more coordination: All the co-design sessions required detailed planning and materials to be created, tested, and sent out before the session. The group co-designs each had a detailed agenda and had tested and insured technology and prototypes were in the hands of participants before the session began. All the studies had participants from multiple time zones, and coordinating across time zones is very challenging.
- Group co-designs need prototypes to be low tech, like tactile objects or audio files: The group session in study 1 had a complex technical prototype that was tested as a group. This was a disaster. Study 3 was much more successful when utilizing audio files and physical, uncomplicated objects. Study 2 mitigated the problem of showing technical prototypes in a group by showing the prototypes individually. The level of complication is probably relative to the population and maturity of the prototype, but it seems as if audio files are probably the most complex digital prototype that can be experienced as a group. This is because there are no questions about buggy computers or not understanding the interface that need to be troubleshooted in a group setting when using technology that is ubiquitous and familiar like a sound player. It also probably helped that study 3 met individually before the session to ensure the prototypes were ready and functional.
- Individual co-design sessions yield more data: Due to the more focused format, individual co-design sessions, such as those in study 2 and study 4, produce significantly more data than a group co-design. This is something to consider when planning how long a study analysis will take.
- It’s easier to do demos individually, but discussions are better done in groups: Studies 1 and 3 both found significant value in groups collaborating and talking among themselves, but the technical prototype was not good for a group setting.

Designing multiple sessions, similar to study 2, would allow for both group discussion and group collaboration while minimizing technical problems.
- Providing materials in multiple modalities was helpful: Participants desired to experience the prototypes and materials in the modality they were most comfortable with. Study 3 is the only study from this group that attempted providing multimodal materials, but it seemed to work well.
- Piloting and testing with users before the study can mitigate technological disaster. Both studies 2 and 3 performed significant testing with participants before performing the evaluation. This helped reduce possible errors and ensured the platform was accessible and understandable.
- Synchronous vs asynchronous: Study 2 found it was possible to run a prototype session asynchronously, and they also explored utilizing surveys as part of the co-design process. The problem with this method is that participants are unable to interact with each other. Responses to questions and follow-up questions also become more difficult when the researcher is not present. The advantage is the wider number of participants who can participate in the co-design.
- Payment across multiple currencies can be complicated: *Note:* The below are not recommendations by the authors, but have been used by the authors in the past. Also, functionality may have changed when this is being read. When designing a global study, being able to pay participants in their local currency is critical. There are several options: Rewards Genius ("Rewards genius," 2021) allows batch payment in multiple currencies with a nominal fee and allows participants to redeem their reward at over 80 popular locations, such as Amazon and Uber. Rewards Genius also allows the accounting department of an institution to provide a requested amount of money, and if that money is not spent, they will refund it to the institution. PayPal ("PayPal payouts," 2021) also allows for batch uploads of payments, although recipients need a PayPal account. Amazon ("Buy gift cards in bulk for your business – amazon incentives," 2021) is another popular option that allows for batch uploads of rewards cards in multiple currencies. The cons are if Amazon is not in the user's location and if the user does not have an Amazon account.

Co-designing is critical to achieve the paradigm of designing for a purpose, rather than designing a product. Having access to participants from around the globe and with diverse perspectives requires the use of remote technology and techniques. The studies outlined in this chapter present a set of resources, methods, and experiences that can be utilized in future remote co-design sessions as part of an inclusive design process.

Cocreating Inclusive Interviews: VR Technologies for Job Interview Training of Individuals on the Autism Spectrum and Strategies for Employers

54

Mirjana Jevremovic

Contents

Abstract

This is a report on the research of how to use Virtual Reality (VR) technologies and Video Self-Modeling (VSM) techniques to structure job interviews so that individuals on the autism spectrum could more easily provide the information that employers seek. The report also addresses the use of the same technologies for job interview training by informing the affordances of a different structure of behavioral interview questions. The participatory research comprised two phases, Phase 1:

M. Jevremovic (✉)
MDes Inclusive Design, OCAD University, Toronto, Canada
e-mail: mina@design-kaleidoscope.ca

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_48

codesign development and deployment, and Phase 2: codesign evaluation and revision. It was rooted in an iterative and inclusive process that generated an app with a scaffolding sequence of behavioral interview questions to address different verbal abilities of individuals with Autism Spectrum Disorder (ASD). It resulted in the creation of strategies for employers such as the Inclusive Interview Guide for Employers and specific question inputs. This cocreative method generated technologies and procedures that could be used by individuals on the autism spectrum, as well as by employers, employment agencies, and ASD support programs. It demonstrated a process by which to communicate better with individuals on the autism spectrum.

Autism · Codesign · Inclusive interviews · Scaffolding questions · Virtual reality · Video Self-modeling

Introduction

A critically important part of our current hiring system is the job interview. Unfortunately, this step is often inaccessible to individuals with disabilities especially those on the autism spectrum. Individuals on the autism spectrum are often disadvantaged in job interview scenarios where social skills and verbal expression may be prioritized over areas where individuals with autism have greater strength such as focus and tenacity. Additionally, job interviews generally consist of behavioral, situational, and job-specific segments (Structured Interviewing, n.d.). As individuals on the autism spectrum struggle with generalization, the behavioral component of the job interview is considered the hardest.

This participatory research tried to discover, with individuals on the autism spectrum as cocreators, the best way to help address challenges of behavioral interview component. The result was a nonimmersive Virtual Reality (VR) app that provides opportunity for job interview practice while scaffolding structure of behavioral questions makes them more specific and easier to answer. It allows individuals with different verbal and cognitive abilities to use an app successfully and provide more information about themselves. The research gave insights into ways to conduct job interviews more inclusively and opened pathways for more inclusive employment structure where employers, employment agencies, and support organizations can all benefit from the results. We gained some answers on how to adjust job interviews that in its current form represent the major systemic barrier to employment of individuals on the autism spectrum.

ASD and Employment Rate

The National Autism Spectrum Disorder Surveillance System (NASS) was Canada's first national-level surveillance-system to register all the individuals affected with

ASD. NASS' findings revealed that 1 in 66 children and youth were identified as being on the autism spectrum (Autism Ontario, 2018).

ASD can be defined as a lifelong neurological difference that affects a person's behavior, communication, and social interaction. It influences how a person perceives and interacts with the world around them (Autism Ontario, 2018).

Furthermore, many individuals on the autism spectrum have additional co-occurring disabilities (87%), with a learning disability being the most common. These concomitant issues may be contributing factors to 67% unemployment rate reported by Canadian Survey of Disability of 2017 (Government of Canada, 2020).

As per Huffcuff (2011), the analysis of the employment interview construct literature shows that "the twin interpersonal constructs social skills and verbal expression appear to have some of the strongest correlation with interview ratings" (Huffcuff 2011, 74). Individuals on the autism spectrum struggle with interpersonal and communication skills, which would result in a low interview rating despite their educational achievements and qualifications for the position. For a person on the autism spectrum, job interviews are very challenging.

Therefore, addressing the challenges associated with job interview became the focus of the research, with an emphasis on the use of behavioral questions. This research aimed to explore the following: VR app as a means for job interview training; the structure of behavioral interview questions; and ways to apply these two approaches more inclusively. The cocreation process of development, deployment, evaluation, and revision was done by all parties involved, participants and researchers alike.

Employment Initiatives

There were many successful vocational training programs implemented during secondary education for individuals with ASD (Wehman et al., 2014) but not many for adults on the autism spectrum. Due to a high unemployment rate, the Canadian government launched the Blueprint for National Autism Spectrum Disorder Strategy (the Blueprint) along with a substantial fund release (the Fund). The Fund dedicated 9.1 million dollars over 5 years to support innovative community-based projects designed to help individuals with ASD (ages 15–29). It included five action areas, one of which was employment. The program that resulted from these initiatives was Worktopia, a program offered by the EmploymentWorks Canada Centre. Worktopia is part of the employment action area, providing preemployment training for young adults on the autism spectrum. Through this program, individuals with ASD learn to define their goals, deal with workplace challenges, and practice the communication and social skills necessary for future employment (Chowdhury, 2017).

The Spectrum Works Autism Job Fair in 2019 proved that there has been an increase in employers' awareness of the abilities of people on the autism spectrum (Simmons, 2019). In a similar vein, there is Specialisterne Canada, an employment agency that focuses on employment strategies for individuals with ASD who have completed higher education within the IT industry (Specialisterne, 2013). However, despite the rise in initiatives and programs such as the one run by the Dan Marino Foundation – and many new employers open to hiring individuals with ASD – the unemployment rate for individuals with ASD is still extremely high.

Virtual Reality (VR) Benefits

There were not many studies exploring VR in the context of challenges related to job interview performance of individuals on the autism spectrum. The wider scope of literature review was conducted to better understand how individuals on the autism spectrum embrace nonimmersive VR technology and learn using these tools.

Most studies of VR as an educational tool were done with children on the autism spectrum. VR technology helps children with ASD improve their contextual processing and cognitive flexibility (Wang & Reid, 2013). Therefore, if a VR environment is carefully designed, it can provide students with more accessible contextual learning (Lan et al., 2018). The customizable aspect of VR environments allows for creating various domains where parameters could be adjusted as per each individual's needs. Garland et al. (2012, 511) emphasize the importance of this individual adjustment, referring to it as "instruction delivered with high fidelity implementation." The flexibility of VR, where steps could be repeated as many times as needed, allows for the degree of autonomy required by each learner since children, who are the same as adults with ASD in this regard, "follow their own agenda when learning" (Hentschel & Lange-küttner, 2019, 191).

Like children, adults with ASD benefit from the flexible options inherent in VR to accommodate their individual needs and unique learning styles. White et al. (2019) suggested that this customizable aspect of VR interventions benefits students in higher education. Articles published in the *Journal of Autism and Developmental Disorders* explore using VR to treat fears and phobias in individuals with ASD by way of cognitive and behavioral interventions (Maskey et al., 2014). Some articles point to VR as social imitation learning (Simões et al., 2014) and social cognition training (Yang et al., 2017). VR's adjustable features allow simulation of environments in which complexity is reduced, thereby enabling ASD individuals to learn social skills, social cognition, and social functioning (Kandalaft et al., 2013). Individuals with ASD experience VR environments as "safe to explore social risk-taking" (Gallup & Gallup, 2019, 226).

VR Job Interview Training and Video Modeling (VM)/Video Self-Modeling (VSM)

Although many studies show the benefits of VR for individuals on the autism spectrum, only a few have dealt with VR job interview training (Strickland et al., 2013, Smith et al., 2014, Burke et al., 2017.)

Strickland et al.'s (2013) study comprised a number of components including online training; role-play interview sessions for a hypothetical position; one VR job-training session including feedback; and repeated role-play interviews to measure performance improvement. The VR session consisted of two avatars: an interviewer and an interviewee. However, the avatar interviewer was led remotely by a clinician, and the participants had only one VR session and no opportunity to rehearse. The VR session where the avatar interviewer is led remotely by a person represents the main difference between Strickland et al.'s (2013) study and the studies by Smith et al. (2014) and Burke et al. (2017), namely, that Smith et al. (2014) and Burke et al. (2017) used humanoid avatar interviewers. Smith et al. (2014) also had role-play interviews as a baseline and an e-learning module with resume building. The VR program in Smith et al. (2014) study randomized 1000 questions and selected them based on participants' resumes. The VR feature also included a *coach* function to help participants with responses. There were 2000 ready answers that the coach would offer participants if they needed help. The Burke et al. (2017) study included one baseline VR session, four practice VR sessions, and role-play interviews. Although all the studies reported improvements in participants' performances, Strickland et al. (2013) and Smith et al. (2014) used role-play interviews for hypothetical positions, and participants in Burke et al.'s (2017) study had 14-week training with embedded curriculum for a particular job position and interview process.

Although these studies offered participants help with answers either in the form of a coach avatar (Smith et al., 2014) or educational training (Burke et al., 2017), they did not explore alternatives for interview questions as this research intended to do. Additionally, none of the studies included participants in the development process or in conducting the data analysis. Along with VR, video modeling (VM) and video self-modeling (VSM) were also explored as additional techniques to be included in the research to help participants with challenges of job interview training. Video modeling (VM), which is when individuals watch a video recording of someone performing a skill in order to learn that skill, is considered an effective way to facilitate learning in individuals on the autism spectrum (Fitzgerald et al., 2018). Video self-modeling (VSM) is when individuals watch a video recording of themselves and learn how to change something in their performance. The use of video recordings (i.e., VSM) is regarded as a supplementary tool to VR to provide feedback and allow users to take self-correcting measures pertaining to supplemental aspects of the interview process such as posture, eye contact, etc. (Burke et al., 2017).

Interview Questions

Job interviews usually consist of behavioral, situational, and specific job components (Structured Interviewing, n.d.). The behavioral element seems to be the most difficult for individuals on the autism spectrum because of the broad nature of behavioral interview questions. Some of the research literature suggests considering volunteering and school experience as transferable skills, since individuals on the autism spectrum usually do not have a lot of work experience (Autism Speaks, 2013; Fraser, 2016). Fraser (2016) also suggests rewording questions to be more experiential.

Additionally, each interview should consist of questions regarding fundamental skills, personal management skills, and teamwork skills (Employability Skills, n.d.).

Nowack (n.d.) confirmed the importance of these components in his *Personality View 360: Structured Behavioural Interview Guide.*

Purpose of the Study

The unemployment rate of 67% for persons with ASD demonstrates that traditional hiring approaches are not favorable to individuals on the autism spectrum. The ongoing communication challenges affect their prospects of employment. The main factor in getting a job is a powerful job interview performance. It is difficult for an individual on the autism spectrum to realize a successful job interview performance despite their talents and qualifications for the position.

The recent employment initiatives demonstrate the new direction that is being taken to support individuals on the autism spectrum to be successful in gaining employment. However, very few of these initiatives prepare individuals on the autism spectrum for a rigorous interview process. VR environments are beneficial to individuals with ASD because of their customizable nature, the possibility of realistic simulations, and the opportunity for repetition of the trials until the task is mastered. There are not many VR simulations of job interview training, thereby leaving a significant gap in the literature and a need for further research. Contrary to the existing VR job interview studies, I wanted to explore with this research *behavioral interviews* and *broad interview questions* using a nonimmersive VR app. In consultation with others interested in these issues, I tried to answer the following research questions:

1. How can VR/VSM technology be used for job interview training of adolescents and adults with ASD?
2. How can the same technology be used to structure job interviews so that individuals with ASD can more easily and better provide the information employers seek?
3. What are the affordances of the different structures of behavioral interview questions?

In conducting this research, my highest priority was that it be participatory research, where participants were included in all the cocreation process phases: development, deployment, evaluation, and revision.

Research Design: Cocreating Inclusive Interviews

Methodology

The *quality* or well-done, meaningful, and useful research involving individuals on the autism spectrum is based on person-oriented ethics, including individualization, acknowledgment of the lived world, empowerment in decision-making, respect for holistic personhood, and a researcher-participant relationship (Cascio et al., 2020). As an individualization segment, this research included an assent form with simplified language; an option for text on the screen during semi-structured interviews; visuals for all the prototyping; and optional support (one participant had a support worker). This research acknowledged the lived world of participants by inviting parents and significant others who play an important role in their lives/world to view video recordings and provide feedback. The participants' session schedules and changes were respected and accommodated. Additionally, I, as a researcher, shared with participants my lived experience, disclosing that my interest in the topic came from having a son on the autism spectrum. As participatory research, participants were involved in the codesign process of development, deployment, iterations, and testing the prototype, rooted in an iterative and inclusive process shown in Fig. 1 (participants were involved in all iterations except cycles 8, 14, and 15).

The biggest challenge in conducting quality participatory research is power-sharing (Nind & Vinha, 2014; Hagen et al., 2012; Reason et al., 2012). Additionally, there needs to be trust and openness to address the power imbalance. Therefore, participants were invited to share their interests and participate in discussions other than a research topic to facilitate trust-building. They talked about the love of singing, and online games, and shared their Anime work. They were shown respect

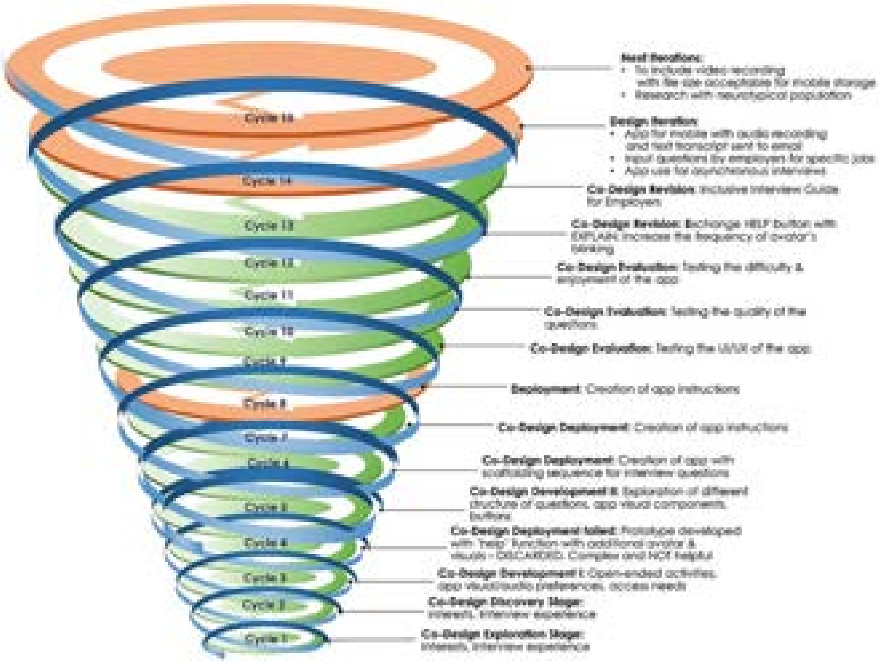

Fig. 1 Virtuous Tornado: design iterations of the inclusive process of the research

as individuals, not only as research subjects. The honorarium was mailed to each participant with a personalized message to express gratitude for their participation, and follow-up confirmation of their receipt of it was done via email.

All the participants, stakeholders, and stakeholder organizations will continue to be included in the dissemination of the results. The accessible format will also be provided to all the parties (see Appendix A). It represents the final segment of the person-oriented ethics that this study strived to achieve.

Method

Ethical approval for the research was received from the Research Ethics Board at the OCAD University, Toronto, Ontario (Ethics Approval Number 2020–2052). The research consisted of Phase 1: Codesign development and deployment; and Phase 2: Codesign evaluation and revision. The purpose of Phase 1 was to allow participants to share experiences and to explore visual and audio preferences and accessibility features that would inform the following prototype. Phase 2 was the process of analysis, during which the app went through an iterative process.

Participants

There were two participants in Phase 1 of the study (P1, P2) and three participants in Phase 2 (P2, P3, P4). One individual who participated in Phase 1 (P2) expressed an interest in being part of Phase 2, for which she signed a separate consent form. During Phase 1, assent and parental consent were obtained as participant P2 was a minor at that time. At the time of Phase 2, the same participant reached adulthood and signed a consent form. Therefore, P1 and P2 were the participants in Phase 1, while P2, P3, and P4 were participants in Phase 2.

Participants in Phase 1 were recruited through community organizations. P1 came from a special-care facility for adults with complex needs. P2 was recruited through a local community-based center delivering a social development program for young adults with intellectual disabilities, including ASD. Participants P3 and P4, who were part of Phase 2, were recruited through a consulting-service organization that provides solution-based assistance to individuals with ASD. The recruitment poster was included in the quarterly newsletter of the consulting-service organization.

All the participants were identified as on the autism spectrum and were older than 16, which constituted inclusion criteria. Additionally, participants had to satisfy technology requirements to be part of the study, which had to be conducted online due to the pandemic. Participants had to have a laptop or computer with a camera and Internet access. One participant (P3) was acquiring a new laptop, so she used her mobile phone instead for all the sessions.

Participants asked that their first names be used, so, going forward in this chapter, I will refer to them by their names (Table 1).

Table 1 Participant identifier-name description

Identifier	P1	P2	P3	P4
Name	Shemar	Christina	Olivia	Nicholas

Phase 1: Codesign Development and Deployment

Phase 1: Process

Phase 1 of the research consisted of four sessions. Each session was 30 minutes long. For each session, an email was sent containing the link for a Microsoft Teams meeting (video conferencing tool). Sessions were conducted using screen sharing function in Microsoft Teams. The researcher shared content with participants, and they provided verbal responses. All sessions were recorded with participants' permission. The prolonged recruitment process, timing, and scheduling conflicts resulted in separate codesign sessions. One individual attended all four sessions; the other participant could do two merged sessions at once (duration – 1 h). This combined session could not be recorded due to technical difficulties, so it was treated as an observation and data extracted from extensive notes taken during the session. After the last session, participants were thanked and offered an honorarium of a $20 gift card. Shemar had a support worker present during the session.

Session 1 and 2 with the first participant were part of exploration stage. They were conducted as semistructured interviews, supported with text displayed on PowerPoint slides. The purpose of these first two sessions was to provide insight into participant's interests, online activities, volunteering or job experience, and volunteering or job-interview experience.

Session 3 was part of discovery stage where participant was invited to draw upon their experiences that were enjoyable or considered successful in an effort to discover a way to clarify interview questions for the app development. Questions for this session were formulated based on participant's answers from the first two sessions. Session 3 was conducted as semistructured interviews supported with text displayed on PowerPoint slides.

Session 4 included prototyping with open-ended activities where the participant explored the app's visual and audio aspects, such as avatar, setting, and voice (i.e., computer-generated vs. human). For participant 1, the app included an accessibility feature: closed captioning as well as a help option with or without a robot avatar. The help option provided more specific questions that were supported with visuals to clarify the broad interview questions (shown in Fig. 2). However, the help robot avatar feature was added to the complexity and was not effective in the provision of help. It was reconsidered, and a new approach was explored with the second participant.

The second participant of Phase 1 explored the different help feature that had subquestions to help explain the main behavioral interview questions. He also rated the difficulty of the questions, as shown in Fig. 3. The session's result demonstrated that if the participant needed help, they would select the "help" button, which would lead to a more specific question, requiring a short "yes" or "no" as an answer. After having selected either "yes" or "no," the participant would be prompted to answer an

What are you passionate about?

Do you have things that you do for fun?

What are the things that you like to do for fun?

How do you spend your time at home?

Fig. 3 Exploring the different structure of the behavioral questions

additional question. The improved help function provided the scaffolding sequence for each interview question. It was more efficient as the questions were more explicit, and easier to answer, and encouraged the participant to provide more information.

Phase 2: Codesign Evaluation and Revision

Phase 2: Process

Phase two was comprised of four individual sessions, and each session was 40 min long. Three participants were codesigners in Phase 2 of the research (one from phase 1 and two new participants). At the end of each session, participants were invited to draw from their life experiences not related to the research as topics for discussion. The discussion was on a voluntary basis, intended to demonstrate that participants were valued as individuals, not only as research subjects (Cascio et al., 2020). The discussion prolonged most of the sessions, with a maximum session duration of 2 h. In the end, participants were thanked for their participation and offered a stipend of a $50 gift card.

Findings from Phase 1 informed nonimmersive VR app creation using Unity game engine with total of ten main behavioral questions. There were three questions per session for Sessions 1, 2, and 3, and one question for Session 4. The end of Session 4 was left open for final comments and closing remarks.

This general session-plan was modified and depended on participants' dispositions at the time of the session. All sessions were conducted through screen sharing in Microsoft Teams. At the beginning of Session 1, participants watched a short instructional video on using an app. As shown in Fig. 4, the instructional video consisted of slides. Since participants did not have direct access to the app, they had to declare which button they would like to select, and the facilitator would carry out the task. For each question, a closed caption was displayed. It remained on the screen until the individual was ready to move to another question, allowing participants to reread the question and process the information at their own pace.

All sessions in Phase 2 consisted of three main activities:

1. Answering the questions
2. Responding to the survey
3. Analyzing the quality of the questions

Fig. 4 Instructional video slides

Answering the Questions

During the first activity, participants engaged with an app and committed themselves to providing answers to behavioral interview questions. If they knew the answer to the question, they would ask for the “finished” button to be selected, and the app would randomly choose another of ten main questions. If the participant did not know the answer to the question, they would ask for the “help” button. It would lead them to the more specific formulation of the same question, to which they could reply with “yes” or “no” as shown in Figs. 5 and 6. Each of these replies would lead to an additional explicit question (see Appendix B).

Responding to the Survey

After participants finished the first activity, they would respond to the Evaluation Survey shown in Fig. 7. In this survey, participants were asked to rate the session’s

Tell me about the time you worked in a team.

Did you ever work in a team at school, volunteering job, or a real job?

How did you like working in a team?

Do you like to work with people?

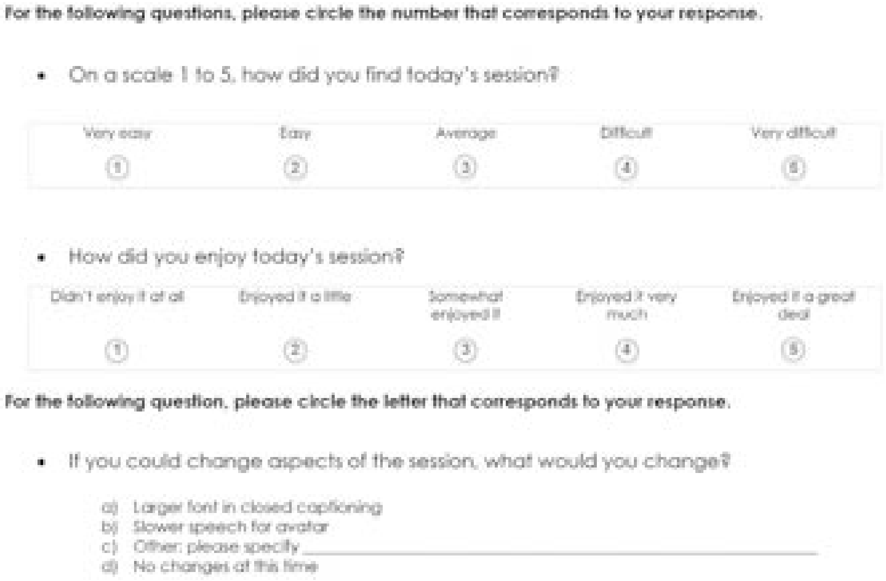
Fig. 5 App question no. 2 interface: scaffolding sequence

Fig. 6 Representation of scaffolding sequence for question no.2

difficulty from 1 to 5 using the Likert-type scale (Joshi et al., 2015, 398). Similarly, they were asked to assess their enjoyment of the session on a scale of 1–5. Next, participants were asked to note their assessment of the app and propose any adjustments to it (such as visual, audio, or any other of its features) or choose an option which indicated no proposed modifications to the prototype.

Analyzing the Quality of the Questions

For the last activity, the facilitator would use screen sharing and PowerPoint slides to display the text questions. Questions were shown one by one in the order the participant had been presented with them during the first activity. Each question was presented in its entirety of scaffolding stages (sample question 6 shown in Fig. 8). There were "main," "help," "yes," and "no" questions, representing four stages in the scaffolding sequence. Participants engaged in the analysis of the quality of each of the questions. They were asked to provide suggestions on improving each



For the following questions, please circle the number that corresponds to your response.

- On a scale 1 to 5, how did you find today's session?

Very easy	Easy	Average	Difficult	Very difficult
①	②	③	④	⑤

- How did you enjoy today's session?

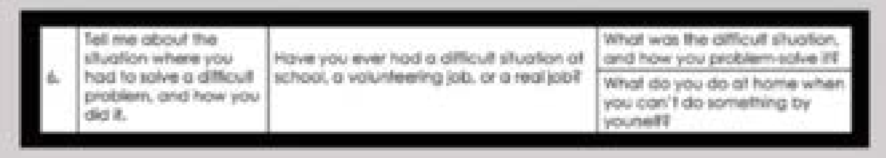
Didn't enjoy it at all	Enjoyed it a little	Somewhat enjoyed it	Enjoyed it very much	Enjoyed it a great deal
①	②	③	④	⑤

For the following question, please circle the letter that corresponds to your response.

- If you could change aspects of the session, what would you change?

  a) Larger font in closed captioning
  b) Slower speech for avatar
  c) Other: please specify ____________________
  d) No changes at this time

Fig. 7 Evaluation Survey Components



6.	Tell me about the situation where you had to solve a difficult problem, and how you did it.	Have you ever had a difficult situation at school, a volunteering job, or a real job?	What was the difficult situation, and how you problem-solve it?
			What do you do at home when you can't do something by yourself?

Fig. 8 Sample question 6

question's structure, to define if questions were easy or hard to answer, and to propose alternatives to make the questions more explicit.

Data Analysis

All sessions were video-recorded using a web camera, a part of the Microsoft Teams videoconference tool platform. The exception was Shemar, who did two merged sessions that could not be recorded due to technical difficulties. All the information collected from this participant was recorded in the notes, and this data was treated as observation. Video recordings were transcribed using Dragon Professional speech recognition software operating from the PC, ensuring the confidentiality and security of the data. The researcher manually adjusted transcripts to match verbatim the video-recordings' content. The text segments of the transcripts were treated as codes. Data coding was conducted using NVivo for Windows Qualitative Data Analysis software. Data were analyzed using an iterative and inductive approach, identifying patterns of meaning that came up frequently to inform themes. The themes that emerged were reorganized with further iterations. The final result was the identification of the following themes:

1. Interview Quality
    1a) Technology- app
    1b) Video Performance Feedback
2. Questions- Scaffolding Affordances
    2a) Question Creation
3. Communication

The first theme that appeared was the Interview Quality theme. Technology- app and the Video Performance Feedback were closely linked to it. All three themes correlated with the first research question. Theme 1 indicated how VR/VSM technology could be used to structure job interviews so that individuals with ASD can more easily and better provide the information that employers seek. Themes 1a) and 1b) related to the ways VR/VSM technology could be used for job interview training of individuals on the autism spectrum.

The themes of Questions- Scaffolding Affordance and Question Creation were associated with the second research question that explored affordances of the different structure of behavioral interview questions.

Theme 3 was a part of a broader category of secondary themes, out of which communication provided the wider social context for this research. It is an overarching theme, connective fibers that bind segments of this research to society as a whole. It demonstrates the need for and possibility of this inclusive matrix.

Each theme is schematically represented by a theme concept map shown in Figs. 9, 10, 11, 12, and 13. The theme concept maps demonstrate the process of qualitative analysis. They reveal data that were assigned specific codes, which, in turn, were grouped into nodes with similar properties. Nodes with similar attributes

Fig. 9 The concept map for Theme 1. Interview quality

Fig. 10 The theme concept map for Theme 1: a) Technology-app

Fig. 11 The theme concept map for Theme 1: b. Video performance feedback

Fig. 12 The concept map for Theme 2. Questions- Scaffolding Affordances

were further classified into subthemes. A few subthemes constituted each theme. The legend for the schematic representation of the categories is shown below each illustration (categories: theme, subtheme, node, and code).

Interview Quality

The first central theme that emerged from the data analysis related to the interview quality. The data collected in this theme correlated both with the quality of the answers participants provided and participants' interview experience or preparation.

Fig. 13 The concept map for Theme 2: a) Question Creation

Out of three participants who were part of Phase 2, one had both college preparation for job interviews and job interview experience. Another participant was interviewed once for a volunteer position, while the third participant did not have any interview experience. This information was categorized into three subthemes: *No Interview Preparation, Interview Employment Preparation, and Interview Experience.* The data grouped into these subthemes did not correlate with the number of times a participant needed clarification on questions and used the "explain" function.

However, there was a correlation between data about the interview experience and the nature of answers participants provided, which informed the subtheme *Quality of Answers.* Most of the answers participants provided were grouped into the node *Adequate Answers.* Other nodes, such as *Long Answers, Answers Related to Different Topic,* represented the groupings of either too-long or off-topic responses. The responses that were too personal or described negative traits and negative people were regarded as outside the adequate interview response scope.

Closely connected to off-topic answers was a subtheme of *ASD-Related Influences.* The participant who previously had job coaching provided concise and on-topic replies with some explanation. The other two participants struggled with the length, points that should be included, and whether the answer should be related to professional or personal experience.

> Because one of difficulties I have is when I start opening up and start talking about something, one of my difficulties and part of its from being on the spectrum, a big part of it I have trouble stopping or knowing what information is pertinent and important and what is unnecessary. That's something I am doing my best work on. (Nicholas, Phase 2, Session 3).

Therefore, if participants could watch an instructional video before engaging with the app, the quality of the answers could improve. The instructions could provide a brief overview of the STAR Interview Technique (Doyle, 2020) and a few suggestions on the length and the topic of interview answers as per the following example:

RULES FOR EACH ANSWER:

Situation- provide the background of your story
Task- explain what was supposed to be done
Action- describe what you did
Result- report how it ended

GENERAL RULES:

Is the answer about the job?

Interview answers should always be related to work, volunteering, or school experience UNLESS you are specifically asked about personal things (i.e., things you do for fun, etc.).

What type of information to include in my answer?

Interview answers should always be related to people and situations you consider pleasant UNLESS you are specifically asked about an unpleasant situation such as a conflict with someone (i.e., to describe a situation when you did not get along with someone).

How long should be my answer?

The answers' duration is different, but the answer should have more than one sentence and not be longer than 5 minutes as a general rule.

Technology: App

Another theme that emerged from the data analysis consisted of a few subthemes that were related to accessibility, usability (UI), and user experience (UX). The subthemes related to the UI revolved around UI design principles such as easy-to-follow navigation, making call-to-action (CTA) buttons clear, and user-centered design (Ye, 2017).

At the beginning of the first session of Phase 2, the participants watched an instructional video on using an app. The instructions were reported to be clear, and they needed to watch them only one time. This confirmed the easy-to-follow navigation UI principle.

The other UI design principle that was seen in the subthemes was making CTA buttons clear. During the Codesign Development and Deployment – Phase 1, it was discovered that the bright color was more visible to participants and that there should be a color differentiation between the two buttons that were shown on the screen. Therefore, the buttons “finished” (formerly “next”) and “explain” (formerly “help”) became orange and yellow. For consistency, “yes” and “no” also became orange and yellow, respectively.

The user-centered design principles were reflected in the participants’ choice to have closed captions with the interview-questions’ audio (Phase 1). They also decided to have closed captions displayed for the duration of question-answering until they made another selection.

The Evaluation Survey that participants did after each use of the app in Phase 2 of the research consisted of questions about the font size in the closed captions, the avatar’s speech speed, and any other suggestions participants had. It influenced the iterations of the prototype, with changes in the frequency of the avatar’s blinking. It also resulted in replacing the button “help” with “explain.”

The “help” button’s erasure echoed the participants’ satisfaction. As Olivia shared:

> I hate the word “help.” I hate asking for help. It's so weird. We just don't push “help” button [referring to individuals on the autism spectrum]. Even if we want to push the “help” button—we don't!...because so many people on the spectrum will not click the button if it says “help!” (Olivia, Phase 2, Session 2)

The *UI UX Satisfaction* subtheme represented a UX design component. Additionally, subthemes *UX Session Difficulty, UX-App Enjoyment,* and *UX Value* also described aspects of UX design. The Evaluation Survey that participants completed as activity 2 of Phase 2 had a component related to the session’s ease. On a scale of 1 to 5 (with 1 being *Very Easy* and 5 *Very Difficult*) and across the four sessions, the participants rated the session “easy” (i.e., rated as 2 on the Likert-type scale) 11 times, and one participant assessed it as “average” (i.e., rated as 3 on the scale).

The same Evaluation Survey also had a part related to the pleasure participants experienced while interacting with the app. Participants had to assign a numeric value of their enjoyment on a scale of 1 to 5, with 1 being *Didn’t enjoy at all*, and 5 – *Enjoyed it a great deal*. Participants appraised sessions and stated one time that they “somewhat enjoyed it” (rated as 3 on the scale), stated eight times that they “enjoyed it very much” (rated as 4 on the scale), and stated three times that they “enjoyed it a great deal” (rated as 5 on the scale).

Therefore, participants considered the app easy to use and enjoyable. They also stated about the app that:

> It was fun! (Olivia, Phase 2, Session 2).

In the subtheme UX Value, participants reflected on the value they perceived in the app. They thought that the app was helpful to people on the autism spectrum. They saw it as a way to improve communication with individuals on the spectrum. As Nicholas declared:

> That’s why I’m really glad you’re doing this! (Nicholas, Phase 2, Session 2).

Video Performance Feedback

All the Codesign Evaluation and Revision Sessions – Phase 2 were recorded, and the link to the video content was emailed to participants. Only one participant, out of three in this phase of the research, watched the video and corrected her posture for future sessions:

> For example, after watching my first video, I stopped leaning on my hands and holding my chin because this might tell the person interviewing me that I'm bored. (Christina, Phase 2, Session 2)

Participants expressed interest in showing the video to parents and getting feedback from them. As Nicholas reported, he and his mom never had a chance to do that. However, Christina did show all the videos to her mom. It was reported that the video recordings were a great way to both see the strengths and point to the weaknesses in her daughter's job interview performance. Christina's mom described the value of the video recordings as extremely useful for feedback and job interview preparation. In conclusion, Christina's mom reported that she considered the app to be interactive and friendly.

Therefore, the video recordings seemed to help participants both as a self-correcting measure and, more importantly, as a way to obtain helpful feedback from parents or other persons constituting participants' support networks.

Questions: Scaffolding Affordances

One of the subthemes that composed Questions- Scaffolding Affordances was *Explanation Needed at "Real" Interviews.* During the Codesign Development and Deployment Phase (Phase 1), Christina talked about her interview-process experience for a volunteer position. The semistructured interviews with the participant revealed the importance of explanations of interview questions. Interview questions were not considered hard if the clarification was provided, as Christina noted:

> No, the boss was explaining to me… (Christina, Phase 1, Session 2).

The option with question clarification was considered an improved alternative:

> Yes, it was better (Christina, Phase 1, Session 2).

During Phase 1, it was discovered that the "help" function in the form of another avatar with visuals was too complex and ineffective. A different approach was taken, and the new iteration started with focus on the different structure of behavioral interview questions. The "help" function was revised. It now provided the same question in the explicit form to which the participant could answer with a short "yes" or "no." This would further lead to the related question that would ask for some examples or clarification. This sequence of questions would consist of the "main," "help," "yes," and "no" questions. In codesign sessions with participants, it was discovered that the "main" type of question was considered difficult to answer, but explicit options of the same question ("help," "yes," and "no") were deemed to be easy. The data about the questions' difficulty and the confirmation of the scaffolding method used were grouped in subtheme *Scaffolding Sequence.*

In the Codesign Evaluation and Revision Phase (Phase 2), during the first activity (Answering the Questions), the participants tested the new iteration of the prototype/app. Each participant had ten questions to answer in the course of four sessions. For the most part, participants were able to answer "main" questions. Two participants needed the "help" function three times, and one participant needed it only once. These answers informed the sub-theme *Questions-Scaffolding Answers.*

As a part of the third activity in Phase 2- Analyzing the Quality of Questions, participants were asked to assess the quality of questions they had been given earlier in the session. They were looking at all the questions in the scaffolding sequence and providing feedback. Some of the answers participants provided were grouped under the subtheme *Generic Answers- Question Quality,* and they consisted of routine "yes" replies. More specific responses were grouped into a subtheme *Specific Answers- Question Quality.* These responses were rich and vivid, and as Olivia enthusiastically affirmed:

> That's exactly the way they are going to ask it. So, that's perfect! (*Olivia, Phase 2, Session 1*).
>
> Also, another really likely question you are going to be asked. About 100 times... (*Olivia, Phase 2, Session 1*).

Participants confirmed that the scaffolding method worked well to clarify the broad behavioral questions. Additionally, if adopted by employers, the scaffolding method could provide insight into an individual's needs and demonstrate if the individual can articulate those needs. Ultimately, it could help employers better understand and learn how to communicate with individuals on the autism spectrum. As pointed out by Nicholas:

> It could help show the employer as well as... I am trying to think of how to clarify this. Part of the communication difficulties. Like, on one hand it can help the employer to see what the person's difficulties and needs are, and on the other hand it can also help show them if the person has any knowledge on how to deal with their own difficulties and needs as well. Does that make sense? (Nicholas, Phase 2, Session 1)

The data grouped in subtheme *Inadequate Teaching Practices* refers to current teaching practices for training individuals on the autism spectrum. Having attended job interview preparation courses, Olivia's experience was that if an individual on the autism spectrum did not know how to answer a question at the job interview, they were advised to ask an interviewer to:

> Just skip it! (laughing) (Olivia, Phase 2, Session 2).

The educational advice to skip the interview question demonstrates the current lack of understanding by employment trainers of individuals with ASD. It illustrates the need to improve our awareness and learn how to better communicate with individuals on the autism spectrum.

The data gathered in the Questions- Scaffolding Affordances theme has a profound impact, as it revealed that with added clarification an individual on the autism spectrum could do a job interview without skipping any questions (Olivia, Personal Communication, November 24, 2020).

Question Creation

The Question Creation theme came as a surprise as part of secondary findings. The theme development unveiled some compelling information about participants and their preferences. The highly captivating nature of the data and participants' intense feelings about these topics led to the design of the Inclusive Interview Guideline for Employers, as shown in Fig. 14.

Because the structure of our education system is designed mainly to attend to the neurotypical population, individuals on the autism spectrum often need accommodation for their differences. They are in constant need of some support that routinely attracts negative attention, and to which is attached a stigma.

This results in the internalization of a negative bias about requesting help and thus not asking for assistance even when it is needed. As Olivia illustrated:

> Even if when we want to push the "help" button—we don't! (Olivia, Phase 2, Session 2)

Additionally, the participants did not have issues with answering questions about the resolving of conflicts or the solving of complex problems. They disliked being asked to disclose moments of helplessness, panic, or mental collapse that evoked strong negative feelings about themselves, such as:

> Tell me a time about when you went blank. (Olivia, Phase 2, Session 2)

As already stated, they do not like questions that:

> . . .make me speak negatively. I don't like being negative. We just don't like talking bad about ourselves [referring to individuals on the autism spectrum]. It's taking down your own ego. (Olivia, Phase 2, Session 2)

Therefore, the Question Creation theme findings revealed that participants had hesitancy to ask for help and disliked talking negatively about themselves. These two findings, along with the previously described finding that individuals with ASD struggle with broad interview questions, constituted the few items on the Inclusive Interview Guide for Employers that employers would do well to consider when interviewing individuals on the autism spectrum. As a result of this discovery, a few options were listed in the guide that employers could implement to make the

ASD Community:
67% Unemployment Rate
Canadian Survey of Disability of 2017

Inclusive Interview Guide for Employers

When interviewing individuals on the autism spectrum, these are some of the things to consider:

- The hesitancy to ask for help
- The struggle with broad questions
- The dislike of talking negatively about themselves

If you understand this, there are some things you may do to make the interview process easier for the person on the autism spectrum:

- Offer explanations
- Offer clarification with examples
- Avoid discussing negative experiences
- Provide written form of interview questions
- Provide opportunity for asynchronous interview option

For additional readings consistent with my findings please refer to:
Autism Speaks. (2013). *Family Services Employment Tool Kit 66.*

Fig. 14 Infographics: Inclusive Interview Guide for Employers

interview process easier for persons on the autism spectrum. When conducting interviews, employees could offer explanations, and clarification with examples, avoid discussing negative experiences, provide the written form of interview questions, or provide an opportunity for the person with ASD to choose an asynchronous interview option.

Communication

Some of the topics in the secondary themes related to participants' passion for art, gaming, music, and how well they were doing in these particular fields. They also included unique family influence in advocating; choosing future professions; and some personal struggles related to comorbid issues. But the topic that was discussed most of all was the prevalence of lack of understanding and communication difficulties in the social domain. As participants mostly had school experience to relate to when discussing social functioning, their examples demonstrated how these difficulties occurred or were exacerbated in the school social sphere.

The lack of understanding at school was rooted in the absence of knowledge and training. A participant described feeling not having control over school life, as the structure of school life was imposed and enforced by staff who did not know how to communicate with individuals on the autism spectrum. All the issues that come later in life derive from this lack of understanding and communication. The damage individuals on the autism spectrum experience due to lack of understanding and communication during school years have far-reaching consequences, affecting their ability to get employment, as the following comments eloquently attest:

> I didn't really have much of any control over my situation throughout school (Nicholas, Phase 2, Session 4).
>
> A lot of the issues in dealing with now, as adults on the spectrum that can affect my ability to get a job. A lot of that stemmed from how things were run in school. The fact that barely anyone on staff actually understood how people like me function. (Nicholas, Phase 2, Session 4)

> Like a lot of the issues people on the spectrum like me can have in adult life stem from everything in how things were handled in school as we were growing up. That if it's not sufficient there, it's toxic even with lasting scars and inadequacies in our ability to perform an adult life. (Nicholas, Phase 2, Session 4)

It is evident that to help improve the social quality-of-life for individuals on the autism spectrum, the most critical aspect in need of being addressed is communication. The employment status quo can only shift if we make a collective effort to increase communication with individuals on the autism spectrum.

Individuals on the autism spectrum could perform job interviews successfully if there were increased understanding and improved communication. This app can serve individuals on the autism spectrum to practice job interview questions. But, equally important, it also provides an effective method and strategies for employers to conduct inclusive interviews.

Discussion

In this participatory research, participants were involved in the codesign process of development, deployment, iterations, and testing of the prototype that generated an app with a scaffolding sequence of behavioral interview questions.

The app can provide adults with ASD the opportunity to practice the interview process in the safety of VR. Training using the app may help individuals on the autism spectrum to build confidence in the social skills necessary for successful job-interview performance. The video recordings could help users assess their performance and gain feedback. They can use the VSM aspect and apply it as a self-correcting measure for additional elements of the interview process such as posture, eye contact, etc. The design intention, supported by the research findings, is represented with the tetrahedron artifact 1, shown in Fig. 15.

The unique method of the scaffolding sequence is designed with human uniqueness and variability in mind. The scaffolding provides an opportunity for individuals with diverse verbal and cognitive abilities to use an app successfully. It delivers a specific version of the broad behavioral questions and prompts users to provide more information about themselves, as shown in Fig. 16.

The study revealed additional ways to better communicate with individuals on the autism spectrum. The findings resulted in the development of the Inclusive Interview Guide for Employers.

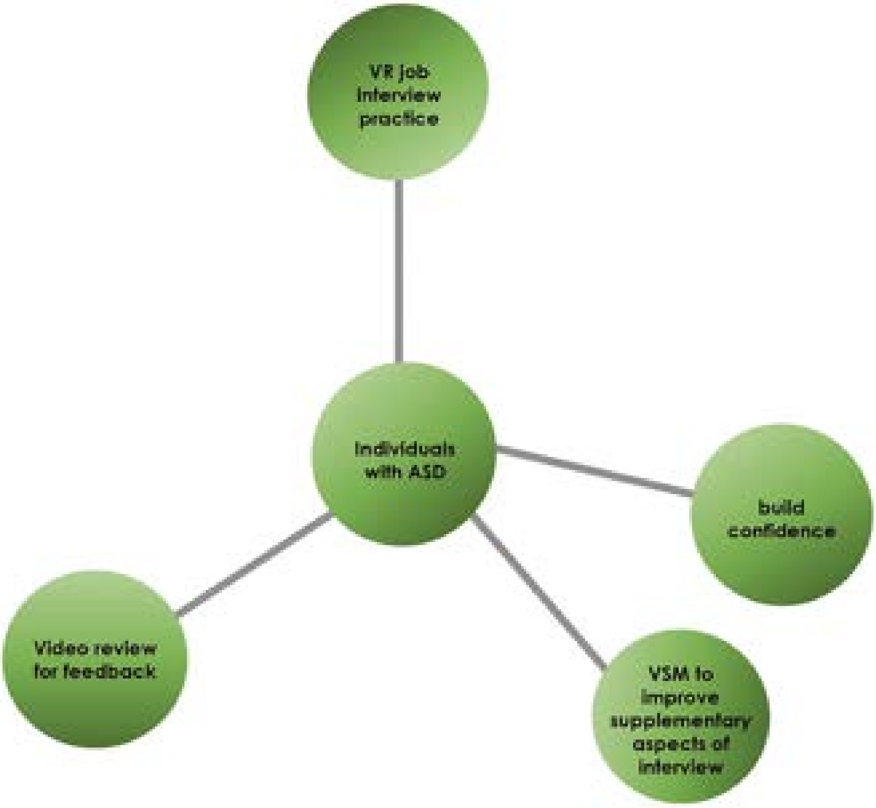

Fig. 15 Tetrahedron Artifact 1: VR/VSM for individuals on the autism spectrum

Fig. 16 Scaffolding sequence of behavioral interview questions

Additionally, the app allows employers to input their questions, customize the interview process, and use it as an asynchronous interview alternative. It can also enable employment agencies to prepare clients for future jobs. The provision of another way to do job interviews can contribute to a more inclusive interview process. The customizing option ensures flexibility that other VR studies do not demonstrate. This alternative enables the use of the app to create interview questions for specific jobs as well. Nicholas expressed an interest in such a possibility:

> And if it [referring to an app] also includes examples of kinds of questions that someone might be asked while pursuing a particular position, I think that would also be helpful. (Nicholas, Phase 2, Session 1)

The video recordings proved effective not only as VSM but also as feedback. The new iteration allows for the provision of text transcripts sent to the user's email. These features can help employment-support agencies to provide feedback to their clients on the autism spectrum. Currently, employment-support agencies and programs provide training on creating resumes and a general overview of interview questions. The employment-support programs could use an app to help their clients get ready for job interviews and to assess their performances.

A previous study has revealed that VR job-interview training is beneficial for neurotypical individuals who have been unemployed for more than 1 year (Aysina et al., 2016). The anecdotal survey findings from the Inclusive Spectrum Exhibition confirm the interest of neurotypical individuals in using an app (Inclusive Spectrums: VR/VM Job Interview Training for Individuals with ASD, 2020*)*.

The findings of this research and the app can affect all of the parties involved in the employment system, as represented with the tetrahedron artifact 2, shown in Fig. 17. It can result in a more inclusive employment structure.

The further iteration of the app could include video recording with file size acceptable for mobile storage. It may also involve an instructional video at the beginning of the app to ensure concise and on-topic answers. Future studies could test the feasibility of the instructional video and include neurotypical participants.

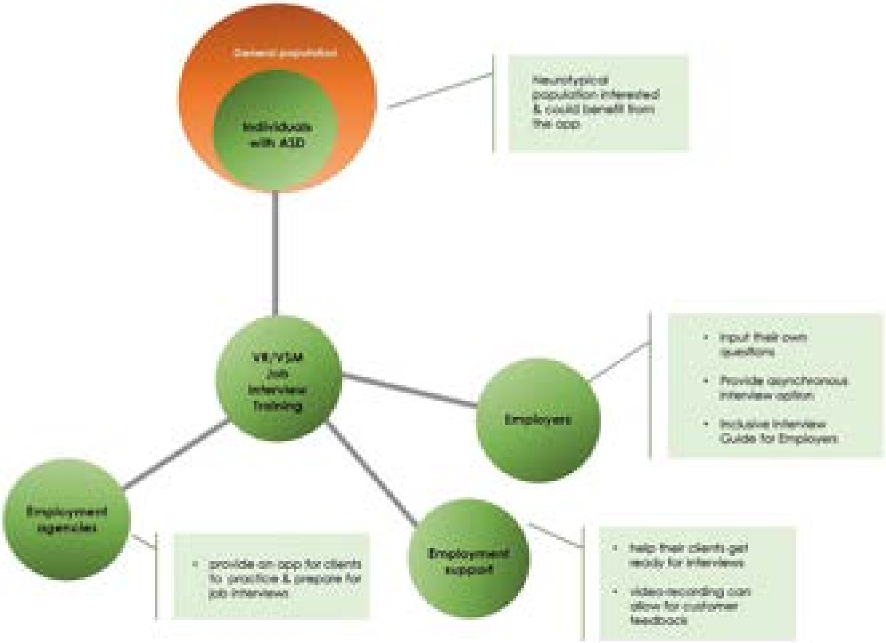

Fig. 17 Tetrahedron artifact 2: inclusive employment structure

Conclusion

This research represents a fulfillment of a longing to contribute to the inclusion of individuals on the autism spectrum. The world of autism is a realm where a constant chase of “normalcy” starts from the first signs of autism a toddler shows and never ends.

Individuals on the autism spectrum are expected to perform self-erasure daily to be part of our neurotypical world. If we made an effort to learn how to communicate with these atypical individuals, we would discover a dimension of unprecedented honesty, dependability, commitment, focus, precision, and diligence.

The possibility of inclusive interviews would be a benefit to all of us. We could realize a wholesome society where everyone, including individuals on the autism spectrum, would have an equal employment opportunity regardless of their unique expression.

Appendix B: Scaffolding Sequence of Questions

Question 1: **Tell me about yourself**.

- If a participant selects “help”: **Have you worked or volunteered anywhere before?**
  - If a participant selects “yes”: **Did you use a computer to send emails?**
  - If a participant selects “no”: **Did you use a computer at school to send emails?**

Question 2: **Tell me about the time you worked in a team**.

- If a participant selects “help”: **Did you ever work in a team at school, volunteering job, or a real job?**
  - If a participant selects “yes”: **How did you like working in a team?**
  - If a participant selects “no”: **Do you like to work with people?**

Question 3: **What are your greatest strengths?**

- If a participant selects “help”: **Are there personal qualities that make you good at school, a volunteering job, or a real job?**
  - If a participant selects “yes”: **What are those qualities?**
  - If a participant selects “no”: **What are the things you want to become better at?**

Question 4: **What is your greatest accomplishment?**

- If a participant selects “help”: **Have you ever won an award, or did someone praise you?**
  - If a participant selects “yes”: **What were you awarded or praised for?**
  - If a participant selects “no”: **What are some of the things that you do really well?**

Question 5: **What are you passionate about?**

- If a participant selects “help”: **Do you have things that you do for fun?**
  - If a participant selects “yes”: **What are the things that you like to do for fun?**
  - If a participant selects “no”: **Do you do things at home for fun?**

Question 6: **Tell me about the situation where you had to solve a difficult problem and how you did it**.

- If a participant selects "help": **Have you ever had a difficult situation at school, a volunteering job, or a real job?**
  - If a participant selects "yes": **What was the difficult situation, and how did you problem-solve it?**
  - If a participant selects "no": **What do you do at home when you can't do something by yourself?**

Question 7: **Tell me about the time you went "above and beyond."**

- If a participant selects "help": **Did you do something extra for your school project, a volunteering job, or a real job that wasn't asked of you?**
  - If a participant selects "yes": **What was it that you did extra that wasn't asked of you?**
  - If a participant selects "no": **Do you help at home with chores without being asked?**

Question 8: **Describe a time you went out of your way to help somebody.**

- If a participant selects "help": **Did you ever help someone at school, a volunteering job, or a real job?**
  - If a participant selects "yes": **Who was it that you helped, and how did you help?**
  - If a participant selects "no": **Do you help others at your home?**

Question 9: **Tell me about the time you had to adapt to change over which you had no control**.

- If a participant selects "help": **Was there ever a change of routines at your school, volunteering job, or a real job?**
  - If a participant selects "yes": **What was a change, and what did you do about it?**
  - If a participant selects "no": **Have you ever had any sudden changes in your routines at home?**

Question 10: **Describe a situation where you didn't get along with someone**.

- If a participant selects "help": **Was there ever a person at your school, a volunteering job, or a real job that you didn't get along with?**
  - If a participant selects "yes": **How did you handle it when you didn't get along with the person?**
  - If a participant selects "no": **Do you always get along with others in your house?**

Inclusion of Persons with Disabilities by Design: From Product Centered to Justice and Person Centered Inclusive Co-design

55

James Rwampigi Aniyamuzaala

Contents

Abstract

Persons with disabilities and their needs were excluded by design according to the article 2 of the Convention on the Rights of Persons with Disabilities. The review of the literature and secondary data revealed the three inclusive design school of thoughts and practices, and these included the following: The Canadian, the United Kingdom (UK), and the Technology Industry's Inclusive Design school of thoughts and practices. The qualitative critical analysis of the three inclusive design school of thoughts resulted into the Justice and Person Centered Inclusive

Co-Design (JPCICD) as the fourth inclusive deign school of thought and practice. The JPCICD expands on the Canadian inclusive design school of thought and practice to comprehensively cover justice, equity, and human diversity dimensions of design. The JPCICD shifted the focus of inclusive design from product and market system to person's social, political, economic, cultural, and technological justice or total justice. It also considers the equity principle in its definition. The JPCICD was developed based on the foundation of the human rights and justice principles such as equity and equality human diversity, freedom of choice, and others. JPCICD focuses on equitable distribution of resources and power to the diverse excluded persons with disabilities by design.

Keywords

Inclusive design · Human diversity · Persons with disabilities · Justice

Introduction

The chapter examined the secondary data related to inclusive design practices and school of thoughts and the challenge of exclusion of persons with disabilities and their needs by design. The qualitative research study analyzed how the different inclusive design school of thoughts facilitated equity, justice, and freedom of choice of the diverse persons with disabilities in the design processes and practices. The chapter was based on the review of the research work of Prof. Jutta Treviranus and Clarkson, Coleman, Hosking, Waller, and colleagues on Inclusive design methods and practices. The chapter complimented and expanded on the inclusive design research work developed by Inclusive Design Research Center, Canada. The review of the research work on inclusive design methods, processes, and practices resulted into the development of the Justice and Person-Centered Inclusive Co-Design (JPCICD) school of thought and practice. The JPCICD centers the person at the center of design and considers justice, equity, human diversity, and freedom of choice in the design processes and practices that address the exclusion of the diverse persons including persons with disabilities. The development of the JPCICD Inclusive Design school of thought and its comparison with other design practices were examined in detail as follows.

The Exclusion of Persons with Disabilities by Design

Approximately One billion people globally were diverse persons with mild to moderate to severe disabilities (World Health Organisation and World Bank, 2011). Persons with disabilities were composed of the different groups of persons such as persons with deafblindness, persons with intellectual disabilities, persons with psychosocial disabilities, persons with hearing, visual, and communication disabilities, and persons with physical disabilities and others (World Health Organisation and World Bank, 2011). Research studies (Olkin et al., 2019) revealed that a significant number of persons have invisible disabilities, and their needs cannot be predicted without personalized assessment. The United Nations Convention on Rights of Persons with Disabilities noted that designs excluded persons with disabilities and their needs. The CRPD prohibited exclusion of assistive technology (AT) needs of the specific persons with disabilities such as persons with deafblindness by Universal design (The United Nations, 2006).

The Ireland’s 2005 Disability Act confirmed that Universal design does not consider the AT needs of some of the diverse persons with disabilities. It stated that, “Universal design (a) means the design and composition of an environment so that it may be accessed, understood and used; (i) to greatest practicable extent, (ii) in the most independent and natural manner possible, (iii) in the widest possible range of situations, and (iv) without the need for adaptation, modification, assistive devices or specialised solutions by persons of any age or size or having any particular physical, sensory, mental health or intellectual ability or disability,” (Republic of Ireland, 2005). The universal design implied that persons with disabilities such as persons with deafblindness in need of adaptations, modifications, and assistive technology products were excluded by design because the one-size-fits-all approach and does not address their specific personal needs. Based on the above background, this chapter examines how the inclusive design processes and practices addressed the exclusion of persons with disabilities by design.

Methodology

The methodology was composed of the review of the secondary data on inclusive design methods, processes, and practices developed by Prof. Jutta Treviranus and Inclusive Design Research Center, Canada (IDRC). The Inclusive design methods and practices in the UK were also examined in this chapter. The data was analyzed based on the research proposition that stated that all the design methods, processes, and practices considered justice, equity, freedom of choice, and human diversity, and address the needs of each of the diverse persons with disabilities (Yin, 2018). The main source of the secondary data reviewed in this chapter was the research study by Prof. Jutta Treviranus of 2018 on the three dimensions of inclusive design: A design framework for a digitally transformed and complexly connected society, PhD thesis, University College Dublin, http://openresearch.ocadu.ca/id/eprint/2745/ (Treviranus, 2018). The other sources of data were: the 2007 Inclusive Design Toolkit, Cambridge University, http://www.inclusivedesigntoolkit.com/ by Clarkson, Coleman, Hosking, Waller, and colleagues (2007). The secondary data was examined in detail as follows.

Inclusive Design and Persons with Disabilities

Some of the design methods and practices excludes some of persons with disabilities and their needs, as confirmed by the Convention on Rights of Persons with Disabilities and the 2005 Ireland´s Disability Act (The United Nations, 2006; Republic of Ireland, 2005). Inclusive design emerged as a design method and practice to address the exclusion of diverse persons including diverse persons with disabilities. It recognises persons with disabilities as one the human diversity dimensions. Inclusive design, through the one size fits one and expand to many approach and practices, centers each of the diverse person with disabilities at the center of the design processes. This implied that inclusive design recognises the human diversity within the different categories of persons with disabilities (Treviranus, 2018).

The Inclusive Design School of Thoughts and Practices

Jutta Treviranus (2018; p79) acknowledged the development of the UK and Canadian inclusive design school of thoughts and practices. The UK inclusive design school of thought emerged from engineering, higher education, industrial design, and business groups to address the product design. The UK inclusive design centered product inclusivity and market expansion to persons with money at the margins of society as a result of the design. The Canadian inclusive design school of thought and practice emerged from a community tackling computer access and digital inclusion through co-design and co-development processes and practices. The Canadian inclusive design was established by a community of practice led by IT developers and professionals with the support of community users of products, services, environments, and facilities. The two inclusive design schools of thoughts and practices were analyzed in detail as follows.

The UK Inclusive Design School of Thought and Practices

Jutta Treviranus (2018; 79) noted that the UK inclusive design school of thought and practices focused on physical product design and not justice, equity and equality, freedom of choice, and other human rights principles. The inclusive design toolkit was developed by Clarkson, Coleman, Hosking, Waller, and colleagues (2007) at the Engineering Design Centre of the University of Cambridge. Prof. Jutta Treviranus noted that the UK inclusive design school of thought was developed as a business compromise to the perceived unrealistic aspirations of universal design. The UK inclusive design school of thoughts and practices focused on the development of the commercial solutions and not addressing social, economic, political, cultural, and technological justice demands of persons with disabilities and other diverse persons excluded in the design practices and processes (Treviranus, 2018).

The Inclusive Design Toolkit site of the University of Cambridge differentiated universal design and inclusive design as follows: “In contrast, inclusive design originated with product design, and focuses on choosing an appropriate target market for a particular design and making informed decisions to maximise the ‘Product performance indicators’ for that target market. While Inclusive design intends to extend the reach of mainstream products, it acknowledges the commercial constraints associated with satisfying the needs of the target market” (Clarkson et al., 2007). The UK inclusive design school of thought and practice focused on the expansion of the market of the products by designing the family of the same products that meets the different targeted markets including persons with disabilities’ markets.

Inclusive design practices in UK was referred to as the product-centered inclusive design because it prioritized products at the center of design and not persons, including persons with disabilities (Treviranus, 2018).

The British Standards Institute's Inclusive Design

Clarkson, Coleman, Hosking, Waller, and colleagues (2007) noted that the British Standards Institute defined inclusive design as follows: "The design of mainstream products and/or services that are accessible to, and usable by, as many people as reasonably possible ... without the need for special adaptation or specialised design." This definition of inclusive design promoted the narrative that universal design was the same as inclusive design since both considered accessible mainstream products and environments usable by many to the greatest extent possible without the need for adaptation. It also promotes the narrative that for All or universal design and accessibility (Cremers et al., 2013).

However, the Inclusive Design toolkit clarified that inclusive design was not the same as universal design or Design for All through the acknowledgment that one size does not fit all. The Inclusive Design toolkit noted that inclusive design does not suggest that it was always possible or appropriate to design one product to address the needs of the entire diverse population. The inclusive design toolkit confirmed that inclusive design was a valid and appropriate design response to human diversity within the population of people excluded through the following: Developing a family of products and derivatives to provide the best possible coverage of the population. Ensuring that each individual product has clear and distinct target users. Reducing the level of ability required to use each product, in order to improve the user experience for a broad range of customers, in a variety of situations. The British Standards Institute's inclusive design practices considered persons with disabilities to have the same needs that were addressed through a one-size-fits-all approach and design. Design focused on product development and not social, economic, cultural, and political justice aspects related to consumer rights and exclusion of diverse persons from use or benefiting from products, services, systems, environments, and others (Clarkson et al., 2007).

The UK User-Sensitive Inclusive Design

Jutta Treviranus (2018; p83) noted the development of User Sensitive Inclusive Design by Newell and colleagues at University of Dundee computer science department. Newell and Gregor (2011) used user-centered and user-sensitive inclusive design as a response to difficulties related to Universal design and user-centered design. The specific needs of older persons and persons with disabilities were not addressed by a universal user-centered design for all. The attempts to address their needs within the framework of universal design for all resulted in add-on accessible alternative solutions that were not equivalent or interoperable with solutions designed for all. User sensitive inclusive Design was developed based on the notion that all persons were users.

Jutta Treviranus (2018; p83) further noted that the use of sensitive by Newell and colleagues encompassed a more empathic relationship with the users. It was a response to designs that treated persons with disabilities and older persons as test subjects for usability experiments. This further proves that the user-sensitive inclusive design did not share power and resources with persons with disabilities and older persons often excluded because of both less power and resources. It considered them as objects of experiments, and this advanced the Charles Darwin narrative of survival of the strongest and the individual liberal capitalism that treats all people as market commodities. It did not recognize persons with disabilities as rights holders with freedom of choice.

Jutta Treviranus (2018) revealed that the use of the UK inclusive design principles to design digital systems, networks, software, and services came later in the UK and was influenced by researchers in computer science at the University of Dundee and the Helen Hamlyn Centre for Design at the Royal College of Art in London co-founded by Roger Coleman and Jeremy Myerson. The UK inclusive design practices and methods aimed at expanding the beneficial impact of products and built information and communication environments to persons with disabilities and older persons at the margins with similar needs. Inclusive Design practices and methods used in UK do not consider justice, equity, and freedom of choice dimensions of design. The product was at the center of design and not persons with disabilities.

The Canadian Inclusive Design School of Thought

The Inclusive Design Research Center (IDRC) at the Ontario College of Art and Design (IDRC-OCAD) University, Canada (Inclusive Design Research Center, 2018), defined inclusive design as "design that considers the full range of human diversity with respect to ability, language, culture, gender, age and other forms of human difference." The three dimensions of the Canadian inclusive design school of thought and practice included the following: recognition of diversity and exclusion; inclusive processes and tools; and broader beneficial impact. Jutta Treviranus (2018; p79) noted that the Canadian inclusive design school of thought emerged from the global community of practice that tackled computer access and digital inclusion, and focused on personal computers, digital documents, software applications, interfaces, Web systems, and all things computer-mediated and networked.

The Canadian Inclusive design was rooted in the digital systems and networks that provided flexible personalized design and opportunities for a wide range of users. It differed from the UK Inclusive design school of thought that focused on addressing the business challenges related to Universal design. Jutta Treviranus (2018; p84–p85) confirmed that the Canadian Inclusive design shared the social justice values for the disability movements. The social justice values for the Disability Rights Movement were promoted and protected by the Convention on Rights of Persons with Disabilities (CRPD) as an international human rights law ratified by member states.

The CRPD article 3 principles included the following principles: the full and effective participation and inclusion in society, equality and equity, non-discrimination, respect of human diversity, respect of freedom of choice and others as captured by article 3 of the UN Convention on Rights of Persons with Disabilities (United Nations, 2006). The development and practice of Inclusive design within the social justice and human rights contexts resulted into the Social Justice Inclusive design or Justice and Person Centered Inclusive Design.

The Technology Industry’s Inclusive Design School of Thought and Practices

The Microsoft developed Inclusive design guide to ensure that their software products and human resource environments were inclusive and accessible to all diverse persons including persons with disabilities. The Microsoft Inclusive design practice was considered as the implementation of the Canadian inclusive design in the tech industry context with the aim of expanding the market for tech products and services. The IDRC Canada contributed to the development of the Microsoft Inclusive design practices and guide as a means of building inclusive and socially responsible businesses and industries. Inclusive design was used as a tool to widen the accessibility of digital products to be usable by as many people as possible, thus expanding the market. The other tech companies that used inclusive design were Apple (2021) and Adobe methods and practices to ensure that their products, such as computers and software, were accessible and usable by as many people as possible at the edges of the society. This section of the research paper critically analyzes the Canadian inclusive design school of thought and practices within the justice, social justice, and human rights contexts (Microsoft, 2018).

The Justice or Person-Centered Inclusive Co-design School of Thought

The UK Inclusive Design School of thoughts and technology industry applied and practiced inclusive design within the market system. The two schools of thoughts focused on the expansion of the market for their products by reaching out to new customers who could not use their existing products and services. The Canadian Inclusive design school of thought and practice was developed by academicians, open-source software developers, and ICT developers to reduce the exclusion of the diverse persons including persons with disabilities. The Canadian inclusive design school of thought did not prioritize equity, justice, freedom of choice, and human rights by design. This section examines the Canadian inclusive design school of thought based on justice and human rights principles and practices. The outcome was the justice or person-centered inclusive co-design (JPCICD) school of thought. The JPCICD transforms the inclusive design into a justice and human rights tool and process for achieving full and effective participation and inclusion in political, economic, social, cultural, and technological activities of society and adequate well-being of the person. The JPCICD does not only center the diverse persons with disabilities at the center of design, but it also prioritizes justice, equity, and freedom of choice of the person at the center of the design (United Nations, 2006; Treviranus, 2018).

The Justification for the Justice or Person-Centered Inclusive Co-design

The section of the research paper defines justice or person-centered inclusive co-design (JPCICD) as a design that considers justice, equity, human diversity, freedom of choice, and other human rights principles in the design of environments, products and services, facilities, and others to realize full participation in all life environments and well-being of each of the diverse persons. The JPCICD expands the Canadian definition of inclusive design by IDRC OCAD University to include justice and equity and freedom of choice. It applied the human rights and justice lens on the Canadian inclusive design school of thought and practice. The justification of JPCICD was based on several factors that have been examined as follows.

The Exclusion of Assistive Technology (AT) Needs of Persons with Disabilities

The Convention on Rights of Persons with Disabilities through article 2 stated that "Universal design shall not exclude the use of the Assistive technologies (AT) used by persons with specific disabilities" (The United Nations, 2006). The definition of universal design in Ireland´s 2005 Disability Act excludes AT devices and prohibits adaptations of environments and products to meet the specific needs of persons with disabilities whose needs are not addressed by one-size-fits-all products and services (Republic of Ireland, 2005). The diverse persons with deafblindness have specific needs that require a person-centered inclusive co-design with persons with deafblindness and their caretakers to find the appropriate accessibility accommodations including AT products and services. Research studies revealed that persons with deafblindness were among the most affected group of persons with disabilities by environmental barriers, poverty, and other inequalities. Research studies also show data desert for persons with deafblindness, and they were invisible in the data collected based on the set of questions of the Washington Group on Disability Statistics (World Federation of the Deafblind, 2018; Washington Group on Disability Statistics, 2022).

The Nordic research center for rehabilitation technology (2007; p4–p16) further confirmed that universal design could not be applied to design of AT solutions for the diverse persons with different AT needs and personal characteristics. This confirmed that the JPCIC was the appropriate design practice that adapts the AT solutions to the AT needs of diverse persons with disabilities and expands to many with less difficulties. Speech to Text for persons with hearing loss and ear assistive technology (HEAT) solutions such as captions were used by both persons with and without hearing loss. The AT solutions were based on freedom of choice and rights of the person in need in Norway. The state shared the resources and power with the person at the center of design of AT solutions and service delivery systems.

The JPCICD as a Social Justice Tool for Distribution of Power and Resource

The one-size-fits-all design implied that designed products were supposed to be used by all without the need for adaption and inclusive co-design with diverse persons including persons with disabilities. Persons with disabilities were considered among the most affected population by poverty. They have low purchasing power for market goods and services. The attitudinal barriers facilitate an environment that considers persons with disabilities as objects without power to influence decision-marking and markets. Sometimes persons with disabilities were consulted in design as passive participants without power to influence the design processes and practices. The JPCICD and interactive practices means a process that shares the decision-making power and resources with the diverse person at the center of the design to facilitate the full participation, inclusion, and well-being of that person, especially a person with disabilities (Olkin et al., 2019; Treviranus, 2018).

The freedom of choice and influence of the person at the center of the design in the decision-making of the design processes was a parameter used for measuring the equal power sharing between the person and design team or designer. The design tools and processes should be inclusive and accessible to allow the inclusive participation of the person in the design processes. The achievement of the full participation in the different life environments and adequate well-being of the person was considered as a measure of the share of the resources between the person at the center of the design and the design teams. The outcome of the inclusive design should be based on the freedom of choice of the person at the center of the design and be inclusive, accessible, and usable by a person at the center of the design without economic, political, cultural, social, and technological barriers and others (United Nations, 2006; Treviranus, 2018).

The Dynamic Personal Features and Environment and Human Diversity

Newell and Gregor (2011) confirmed that the personal features and environment were dynamic and the design for users especially for older persons required consideration of dynamic human diversity and environment. Jutta Treviranus (2018; p13–p64) argued that the human interactions within the changing environment were complex and these were part of the complex adaptative system. Jutta confirmed that the closed classification and categorization systems exclude persons without similar characteristics based on to form classes and categories. Jutta advocates for open education resources and open software, and these represented the open classification and categorization systems that adapt to human diversity, dynamic personal features, and environment. Education was an outcome of the categorization system, and software were outcome of the product classification system. The JPCICD was developed based on the human diversity, personal features, and environment to respond to the unique needs such as needs of persons with varying degrees of functional difficulties, environmental barriers, participation restrictions, and new needs that emerge from the society's complex adaptative system interactions. It is the iterative path of expanding the beneficial impact to diverse persons.

From the Product to the Justice or Person-Centered Inclusive Co-design (JPCICD)

This discourse shifts the focus from products and services centered inclusive design to person-centered inclusive design. This research paper thesis integrated the inclusive design with the human rights-based approach and human rights principles under article 3 of the UN Convention on Rights of Persons with Disabilities to establish the social justice inclusive design or person-centered inclusive design. The CRPD through article 9 on accessibility confirmed that the design of inaccessible information, communication, technology, and built environments that excluded persons with disabilities from usability of services, goods, facilities, environments, and others. The CRPD article 9 also confirmed that design for accessible services and goods, environments, and others for all diverse persons was a social justice and human rights issue (United Nations, 2006).

The Design for All and JPCICD

Jutta Treviranus (2018) noted that the Design for All philosophy emerged from Europe was formalized in the European Institute for Design as a standard and the 2004 Disability Stockholm Declaration (European Standard Agency, 2019). Jutta argued that the Design for All was applied across all areas of design and recognized three approaches to providing access to information and communication technology (ICT). ICT that can be accessed by nearly all users without modification. ICT that can be modified to provide access to different needs and standard technologies that interoperate with assistive technology. Jutta argued that the Stockholm declaration aligned Design for All to Inclusive design by stating that, “The practice of Design For All makes conscious use of the analysis of Human needs and aspirations and requires the involvement of end users at every stage in the design process.” The involvement of users in every stage of design was the first step towards sharing power and resources with the users to influence a design system that develops person-centered inclusively designed environments, services, products, and facilities.

In addition, both Design for All and Inclusive design recognized user diversity and provided for user diversity through one size fits each user diversity. Design for All considered design for ICT used by many without the need for adaptation. It also recognized design of ICTs that were modified and adapted to meet the different needs of diverse persons. Design for All considered design for standard ICTs that interoperate with assistive technologies used by diverse users. The assistive technology solutions were a personal solution outcome of a person-centered inclusive design practice as confirmed by the UNCRPD that stated that “Universal design shall not exclude Assistive Technology” (The United Nations, 2006). The Design for All did not recognize resources and power as part of the design processes that exclude persons.

The Universal Design for Learning and JPCICD

Jutta Treviranus (2018) noted that David Rose and Ann Meyers as founders of CAST in Boston published Teaching Every Student in the Digital Age: Universal Design for Learning (Rose and Meyer, 2002). The publication noted that UDL has the following three principles below: provide multiple means of engagement, provide multiple means of representation, and provide multiple means of action and expression. Jutta Treviranus argued that the User-centered design shifted to put the user at the center of the design and shifts the learner to the center of education. The principles were aligned with inclusive design approach of one-size-fits-one approach to user diversity or different needs of the diverse persons. The universal design for learning principles also reflected an effort to shift power to the user through multiple means of engagement, the provision of multiple means of representation, and multiple means of action and expression. However, these cannot be achieved without the adaptations, modifications of the environments, and the use of AT to support participation and representation of the diverse persons with disabilities such as persons with deafblindness. Universal design for learning was also silent on justice and the shifting of resources to the user, which are key factors in determining an equitable distribution of power and resources.

Jutta Treviranus (2018) revealed the collaboration of CAST since 1990s on education learning projects. The divergence in approaches used by the Inclusive Design Research Center (IDRC), Canada, and CAST were as follows: the IDRC focused on open education resources and the application of educational technology to enable the personalization of learning. This was done through projects such as the inclusive learning exchange, flexible learning for open education, ATutor, and other projects that promoted personalized one-size-fits-one delivery of learning experiences through the inclusive system. This reflected share of resources to facilitate participation and inclusion of learners in education programs. However, the power shift to learners with disabilities to make decision on education programs of their choice was not clearly defined and measured. The JPCICD shifts the power and resources to the person at the center of the design through equitable sharing of resources and power and based on the freedom of choice of the person at the center of the design.

The CAST worked extensively with educational textbook publishers and served learner diversity through curriculum approaches that provided students with diverse curriculum options for a given learning goal. Jutta argued that the CAST approach was linked to the universal design of a built environment that anticipated the range of visitor needs in advance. The students' needs were anticipated in advance rather than adjusting the curriculum when the students arrive. Jutta further noted that the two approaches were complimentary in the joint project between CAST and IDRC Canada called Center on Inclusive Software for Learning (CISL) that focused on open education resources. The CAST approach was also not clear on the distribution of power and resource between the learners and the hierarchical education system administrators. It did not define the freedom of choice of the learner that is key in democratization of the education system and building inclusive education systems (CAST, 2018).

Jutta Treviranus (2018, p84) noted the development of differentiated learning by Morgan (2014) as a teaching philosophy and approach that was based on the design of the curriculum on iterative assessments that guided the modifications of the instructional material and teaching approach to diverse students. Jutta argued that inclusive system enables adaptation of curriculum and personalization of learning to address the different learning needs of the diverse learners. Inclusive systems were grounded on the computer digital system, open software, and user-centered design. The inclusive system also shares the resources and power with the learners and persons with less power and resources. This shows that adaptations, modifications, and use of AT were necessities for facilitating inclusive education systems. This was referred to as inclusive learning by design (ILD) or inclusive design for learning. These were part of inclusive education by design (IED).

The Universal Design and JPCICD

The universal design was defined as design of products, services, environments, and others to be used by as many people as possible without the need for adaption. The universal design promoted a practice of one size fits all the needs of the diverse persons. The IDRC Canada (2018) noted that universal design and inclusive design both facilitated inclusion and accessibility of services, products, environments, and others by all diverse persons. However, the two design methods differed in how they addressed the user diversity needs and how they originated from the different fields of studies. The universal design emerged from the engineering or from group of people advocating for accessible built environment in the USA. These were concerned with the inaccessible built environment for persons with disabilities. It was developed to address the built environment inaccessibility later expanded to other life environments like ICT and learning. The inclusive design emerged from the computer science, Web, and open software communities, and it worked with flexible and personalized digital systems. The person-centered inclusive design was driven by the social justice movement that call for equitable distribution of resources, power, inclusive participation, and accessibility of services, products, environments, and facilities (Treviranus, 2018; Inclusive Design Research Center, 2018).

The Universal design was based on a one-size-fits-all approach, as there was no need to adapt the environments, services, products, and others to the needs of the person. Universal design focused on addressing the needs of persons with disabilities as a priority. Inclusive design was based on an inclusive system that addressed the diverse needs through a one-size-fits-one approach and expand to many. It adapted the environments, products, facilities, and others to the needs of the diverse users. Inclusive design does not only focus on the diverse persons with disabilities but also prioritizes all other diverse groups such as older persons, children, women, and others. The universal design did not recognize equitable distribution of resources and power between the person and designers. The JPCICD considers the distribution of power and resources (The United Nations, 2006; Inclusive Design Research Center, 2018).

The JPCID Wider Beneficial Impact

Persons without difficulties or disabilities find it much easier to use the products, services, and environments designed to be used by persons with varying difficulties or disabilities. The captions or speech-to-text services were designed to be used persons with hearing difficulties but they also benefited persons with language difficulties and learning difficulties. The telephone was initially designed as a solution for a person with hearing loss and now it is used by most of persons as a communication solution. The easy to read and understand texts benefits persons with intellectual difficulties and persons with low levels of education. The late Olof Palme, former prime minister of Sweden, once said that, “The quality of life of society can also be measured by how such society treats it’s most vulnerable citizens. If the most vulnerable are well off, then those who do not have vulnerabilities are far better off’ (Treviranus, 2018).

JPCIC-Related Practices, Processes, and Tools

This section of the research paper examined the JPCICD processes, tools, and related practices. The inclusive design processes and tools, individual rehabilitation and vocational rehabilitation plans, individual education plan, and international legal framework for JPCICD were examined in detail below.

The Inclusive Processes, Tools, and Practices

The second dimension of the Canadian inclusive design was inclusive processes, tools, and practices, according to Jutta Treviranus (2018). The sharing of resources and power requires inclusive processes, tools, and practices that makes the usability of the design systems, environments, services, products, facilities, and others adapted to the personal needs. The inclusive processes, tools, and practices are part of the reparation interventions and practices to distribute power and resources equitably and responsibly. The inclusive processes, tools, and practices address discrimination, apartheid, racism, violence, and other forms of exclusion in the design of economic, political, technological, cultural, and social systems of power and resources. JPCICD centers persons with disabilities at the center of the design through the inclusive processes, tools, and practices.

The JPCICD Normative and International Legal Framework

The CRPD article 2 (The United Nations, 2006) stated that, “Universal Design shall not exclude the use of assistive technology.” This statement in the UNCRPD forms the international legal framework for the inclusive design or person-centered inclusive design. Assistive technology is an outcome of a person-centered inclusive design. The design process adapts the services, environments, facilities, and products, including assistive technology products and services, to the person's needs or characteristics and environmental requirements. The UNCRPD's reference to assistive technology is not to be excluded by universal design. Treviranus (2018) defined universal design as a design that responds to as many people as possible without adaptation and confirmed the PCICD in international human rights law as a design that responds to the needs of diverse persons, including persons with disabilities.

The JPCICD-Related Practices

This section of the research paper examined the different practices that relate to the JPCICD. Individual rehabilitation and vocation rehabilitation plan and individual education plan practices in Finland and the USA, respectively, were identified as the practices that relate to the JPCICD. These were examined in detail below.

The Individual Rehabilitation and Vocational Rehabilitation Plans

The individual rehabilitation and vocational rehabilitation plans in Finland were based on assessment of the person's rehabilitation needs and selection of the rehabilitation and vocational rehabilitation solutions based on freedom of choice of the person. The state shared the resources and power in the design of the personal vocational rehabilitation plan and the implementation of the vocational rehabilitation plan according to the Nordic center for rehabilitation technology (Nordic Center for Rehabilitation Technology, 2007).

The Individual Education Plan

The development of the individual education plan was a fulfillment of the 2004 Individuals with Disabilities Education Improvement Act. The development of the plan centers the learner's needs and participation at the center of the design of the individual education plan. The needs and the solutions or responses to the needs were based on freedom of choice of the learner. The state covers some of the costs of the interventions of the individual education plan. However, the IEP does not define the freedom of choice and equitable distribution of resources and power between the learner and school administration (US, 2004).

Conclusion

The Justice or person-centered inclusive co design practice emerges from the Canadian inclusive design school of thought and social justice movement. It does not only center the person's needs but also centers their participation in the design of services, products, environments, facilities, and system to respond to the personal needs. However, it also shared the power and resources with persons at the margin of society to facilitate full and effective participation and inclusion of diverse persons in all life environments. It was based on social justice values of an equitable share of resources and power, Non Discrimination, freedom of choice, gender equality, and full and effective participation and inclusion in society. The JPCICD was developed based on the open classification and categorization system that expand the beneficial impact to persons with unique different needs at the margins of the society. Persons without disabilities or difficulties find it much easier to use the public services, products, and environments designed with and by persons with varying degrees of difficulties or disabilities. The ramp benefits wheelchair users with permanent, temporary, and situational mobility needs, pregnant women, mothers with baby strollers, older persons, the emergency evacuation response team, and others.

Mariana Campos Gutiérrez

Contents

Abstract

This research project (RP) presents a communication tool designed through an experience-based co-design (EBCD) method that aims to increase empathy and establish an emotional connection between pediatric oncology patients and the nurses that care for them. We ask: What value can the personal experiences

of participants bring to the design process of a tool that is intended for their use? We explore this question by first conducting a series of interviews with four pediatric oncology patients and nine nurses of the pediatric oncology ward, focused on identifying and understanding the emotions they experience during the different procedures that take place during the patients' stay in the hospital. The data collected during these interviews were used to create emotional maps that directly informed the design of a mobile application, which allows users to collaborate by recording customized audio stating their feelings and agreements between both parties, which they can later listen to during painful and emotionally tolling procedures. Participants then tested the prototype in a series of workshops where their feedback was collected and integrated into a second and final prototype. Our results show that (1) pediatric oncology patients and the nurses that care for them are open to and enthusiastic about using a tool to work together and empathize with one another, (2) an EBCD method is helpful to understand abstract emotional conditions, and (3) tools designed through participatory co-creation are better suited to address the unique user needs of pediatric patients.

Introduction

Medical practitioners of all types face both professional and personal challenges in their day-to-day practice. Because medicine deals with human ailments, there is an emotional component that healthcare workers must take into consideration. Moral support is considered central to the practice of caregiving and care receiving (Kleinman, 2016). Children who suffer from cancer may experience significantly high-state anxiety or depression scores (Patenaude & Kupst, 2005). On the other hand, pediatric oncology nurses suffer from high burnout rates and are extremely vulnerable to its repercussions (Waddill-Goad, 2016), including heightened stress, loss of sleep, and physical and emotional exhaustion. In the clinical encounter, the understanding and practice of empathy has the possibility to protect both the health professional and the patient from personal distress (Ekman & Krasner, 2017).

The overarching goal of our research was to build a tool for the use of nurses and pediatric oncology patients of the pediatric oncology ward of a hospital in Mexico City, Mexico. Nine nurses and four pediatric oncology patients participated in the design of the tool's prototype. The children were all between the ages of 10 and 12 years old. The intention of the tool is to improve communication between pediatric oncology patients and nurses prior, during, and after uncomfortable but necessary medical procedures, such as catheterization, taking medication, and blood drawing. The communication tool is intended to meet the needs of both nurses and pediatric patients along the spectrum of their care journeys by taking into account their emotions during these procedures.

The tool was designed through an experience-based co-design methodology, a scheme supported by ethnographic-based methods (Bate & Robert, 2007), which will be referred to as EBCD (Donetto et al., 2015) throughout this chapter. The research process allowed us to gain access to the users' experiences in order to address the perceived lack of trust and empathy between nurses and the pediatric oncology patients they care for. The final result of this EBCD method was a mobile application that allows users to record and listen to customized audio tapes through a playful and warm visual interface.

Through a series of in-depth interviews based on EBCD with the participants, we determined that the tool would function as a platform for recording and listening to audio material which focused on establishing a narrative to favor the psychological and emotional balance of the patient and nurse (Iyendo, 2017). The tool would thus function as a communication channel that the patient and nurse can relate through and express and process the experiences they share during treatment in a more fluid and playful way (Gilljam et al., 2016) than existing nurse-child patient clinical encounters.

An emotional map was created based on an initial workshop where participants identified the emotions that they feel during different scenarios of their interactions with one another. Based on this data, a low-fidelity prototype (PT1) was designed and evaluated by participants during a second workshop. Finally, this evaluation led to the design and implementation of a high-fidelity final prototype (PT2) (Sanders & Stappers, 2014).

In order to further understand the valuable role users can play in design, this chapter contributes by designing a communication tool that is strongly based on the stated needs and desires of its final users. To the best of our knowledge, this is the first EBCD study focused on healthcare to be carried out in Mexico. The remaining chapter describes our materials and methods, results, conclusions, and discussion.

Literature Review

Illness Narratives

In addition to strictly professional responsibilities, healthcare workers face moral burdens. Acknowledging the personhood of sufferers is a basic moral act in human relationships of all types, including those between patient and physician or caregiver (Kleinman, 2012). The concept of "presence" – moral support given even when nothing practical can be done – is considered central to the practice of caregiving and care receiving, because the interpersonal relationship formed resonates with both parties' understanding of life, self, and dignity (Kleinman, 2012). Children with cancer may experience poor psychosocial adjustment following their diagnosis or during the different stages of treatment, including a significantly high-state anxiety or depression score (Patenaude & Kupst, 2005). Children who lack emotion regulation abilities are more vulnerable to facing psychosocial difficulties during and after treatment, and behavioral interventions targeting emotion regulation skills are believed to reduce the internalizing of symptoms in this population (Katz et al., 2015).

On the other hand, a study carried out in the USA shows alarming results of burnout levels among physicians. As such, 45.8% of physicians reported at least one symptom of burnout (Shanafelt et al., 2012). Burnout refers to overwhelming emotional exhaustion, depersonalization, and feelings of professional insufficiency. Secondary traumatic stress (STS) is a condition characterized by fatigue that can arise from witnessing or listening to accounts of disturbing experiences or traumatic events (Wagaman et al., 2015). Emotionally charged and intense demanding relations are the cause of this grave emotional crisis. Physician burnout and mental distress not only affects the sufferer; it also affects the quality of care that they provide, since it leads to more medical errors (Shanafelt et al., 2010). Nursing is an inherently stressful profession because nurses are overly committed and deal with death and disease on an everyday basis, and they often play the role of peacemaker in an ambiguous hospital environment where uncertainty can cause chaos. Nurses suffer from high burnout and are extremely vulnerable to all of its repercussions (Waddill-Goad, 2016).

Going deeper into demanding and intense relations, physicians, nurses, and patients create one during a health crisis in a rapidly changing environment that includes constant suffering. Emotions run high, the work is intense and overwhelming, and the results can be stressful. This chain reaction has created an increase in burnout, emotional exhaustion, and secondary traumatic stress in caregivers (Yuguero et al., 2017). This relationship between nurses, doctors, and patients creates a complex system which can be easily harmed (Orlando, 2018). Ida Jean Orlando, a renowned psychiatric nurse, theorist, consultant, and researcher, explained that this relationship is a dynamic "whole" and very important ground for professional behavior that needs to be used to help the patient. Nurses who work in pediatric oncology become most distressed when they are unable to provide the high-quality compassionate care that they believe the child and family require (Newman et al., 2018).

Compassion Training

Humans are emotional beings as well as thinking ones. According to Paul Ekman, "emotions are a process, a particular kind of automatic appraisal influenced by our evolutionary and personal past, in which we sense that something important to our welfare is occurring, and a set of psychological changes and emotional behaviors begins to deal with the situation" (Universal Emotions|What Are Emotions?|Paul Ekman Group, 2020). Emotions are a central part of the human experience. They determine how we understand the world and how we interpret the actions of others (The Nature of Emotion et al., 2020).

Dr. James Doty, director of the Center for Compassion and Altruism Research and Education, Stanford University (CCARE), assures that compassion, a multi-textured response to pain, sorrow, and anguish including kindness, empathy, generosity, acceptance, and the capacity to open to the reality of suffering and to aspire to its healing (Strauss et al., 2016), is what will save our species and that this positive emotion is the core of our humanity. Humans are social, sentient beings – through language, we express and transmit information to each other. Some information is easy to express and deliver, and other information is more complex, such as emotions. It is not polemical to say that emotions are sometimes hard to identify in ourselves and in others and even more when we share them. Jean Decety defines empathy as "an inter-subjective induction process by which positive and negative emotions are shared, without losing sight of whose feelings belong to whom," adding that "empathy can lead to personal distress or to empathic concern" (Decety & Meyer, 2008). In other words, in the process of sharing emotions, the intensity of another's negative emotions may lead us to experience pain ourselves.

Empathy in the clinical encounter has the possibility to examine how to enrich a therapeutic relation, benefit the health professional and patient, and protect both from personal distress (Ekman & Krasner, 2017). Neuroscientist Tania Singer states that there is a difference between empathy and compassion: "In contrast to empathy, compassion does not mean sharing the suffering of the other; rather, it is characterized by feelings of warmth, concern and care for the other, as well as a strong motivation to improve the other's wellbeing. Compassion is feeling for and not feeling with the other" (Singer & Klimecki, 2014). Understanding the nature of this important social emotion is crucial to identifying its positive impact on our human behavior (Yongey Mingyur et al., 2007).

Neuroscientists and psychologists have recently shown interest in the study of compassion in an academic way, understanding it as the contemplative science that refers to interdisciplinary scientific approaches to the mind and mental training based on traditional Eastern contemplative methods and philosophy (Kemeny et al., 2012). In the classic contemplative tradition of Buddhism, the study of mind, compassion, and meditation in compassion has been observed for centuries. Dharma, the teachings of Buddha, believes that the basic nature of all sentient beings is goodness. Compassion takes this capacity to look at another sentient being as equal to oneself and further. Since one of the current theories of modern physics holds that all matter was connected as a single point at the start of the Big Bang, it is theoretically possible – though as yet unproven – that whatever affects one particle in our universe also affects every other one (Yongey Mingyur et al., 2007). This entanglement creates connections we observe between individuals when sharing deep emotions.

The idea of being able to help others and share their emotions can become difficult when it comes to the sharing of suffering. When exposed to constant distress, the distinction between self and other becomes blurred, and managing this emotion becomes challenging, especially for professionals in healthcare institutions (Singer & Klimecki, 2014). Compassion is a convenient tool when handling a crisis (Wagaman et al., 2015).

Studies show that, applied correctly, compassion can be used to prevent negative emotions that emerge during a crisis and the constant exposure to the suffering of others (Davidson & Harrington, 2002). Many benefits have been found upon cultivating compassion in the clinical encounter, chiefly that communication through empathy can improve patient outcomes (Neumann et al., 2009). Compassion can be taught; our brain can form new connections to produce new cells as well as sculpt existing connections. This is called neuroplasticity. When our brain faces a new challenge, it reorganizes and restructures to respond to that situation. In addition, our brain learns more established pathways and successful emotional regulation and creates a healthy habit (Davidson & Lutz, 2008). There is evidence that shows a change in neural responses to suffering in individuals who were taught compassion training and a new coping strategy that fosters positive affect even when confronted with the distress of others (Klimecki et al., 2013). Furthermore, increased altruistic behavior after compassion training was associated with altered activation in brain regions implicated in social cognition and emotion regulation. These results suggest that compassion can be cultivated with training and that greater altruistic behavior may emerge by understanding the suffering of other people (Weng et al., 2013).

In his research, neuroscientist Ezequiel Gleichgerrcht posits that for medical practitioners, it is important to understand where the pain comes from in order to develop strategies that prevent them from having emotional burnout. Gleichgerrcht concludes that professional experience seems to desensitize physicians to the pain of others without necessarily helping them down-regulate their own personal distress. Minimum levels of empathy appear necessary to benefit from the positive aspects of professional quality of life in medicine (Gleichgerrcht & Decety, 2014).

EBCD

Though children's right to participate in their own healthcare is an issue which has gained traction in research in recent years, their participation is unsatisfactorily applied in praxis (Gilljam et al., 2016). Gaining a better understanding of children's own perspective on how their participation can be promoted in healthcare can lead to a more qualitative and appropriate care for pediatric patients (Gilljam et al., 2016). By basing their design approach on constructivist grounded theory, a researcher can attempt to understand experience and its meaning in the same way as participants (Charmaz, 2014), particularly in the multiplicity of experiences.

The concept of experience-based co-design (EBCD) refers to the gathering of multiple and varied experiences from participants to identify key "touch points" – emotionally significant points – and assign positive or negative feelings to them it has its origins in both the design and social sciences. It's a commitment to allow participants to become designers of their own experience (Bate & Robert, 2007). In addition to a focus on experience, EBCD aims to engage users in the design process through their active participation as co-designers (Donetto et al., 2015). Although the results of EBCD are mostly small-scale changes within one service area, they have been found to be immensely valuable to patients (Robertson et al., 2012). From the perspective of adhering to inclusive design principles (Rioux, 1996), we have conducted research and design on a hard-to-reach and often excluded grouping in healthcare and services research (Treviranus, 2019) – children who are in various points along their healthcare journeys, from initial diagnosis to treatment, remission, and relapse.

An example of the implementation of EBCD is the case of the UK-based User-Centered Healthcare Design (UCHD), a team of design and healthcare researchers and practitioners who develop methodologies for healthcare service design. Their approach has a focus on people's lived experiences and a commitment to participation in the process of design, as a means of ensuring that what is designed is relevant to the practices, needs, and values of participants. Through EBCD, the UCHD works together with patients, caregivers, and staff. Rather than being a single prescriptive method, EBCD provides a range of techniques and tools within a four-phase structure where participants work together to capture and then understand their lived experiences of healthcare in its multiplicity, improve a service based on this understanding, and measure the effects of these changes (Bowen et al., 2013).

Materials and Methods

Having understood that empathy and compassion can be useful in addressing the particular distress experienced by patients and healthcare professionals, our study aimed to create a communication tool that would improve the relationship between pediatric oncology patients and nurses working in the pediatric oncology ward of a hospital in Mexico City, Mexico. We decided to approach the design through a participation-based method (Fig. 1).

Interviews with Field Experts

The first step in our methodology was to conduct a series of interviews with field experts, where we were able to discuss topics such as emotions, the role and importance of compassion in the treatment of pediatric oncology patients, and all topics of interest in this chapter (Sexton, 1980).

The interviewed field experts were Mariana Campos, the psychologist working at the pediatric oncology ward of the hospital where this research was conducted, and Emiliana Rodríguez Morales, who holds a Master's in Mind, Brain, and Education from Harvard University and a Bachelor's in Physics from the National Autonomous University of Mexico. Mariana Campos participated in four sessions, in which she provided insights to the researcher on patient journeys in the hospital and the complex and varied relationship between pediatric oncology patients, their medical team, and their families. Emiliana Rodríguez Morales participated in two sessions, in which she provided insights on working with children and their emotions, evaluated the research design that had been created in collaboration with Mariana Campos, and

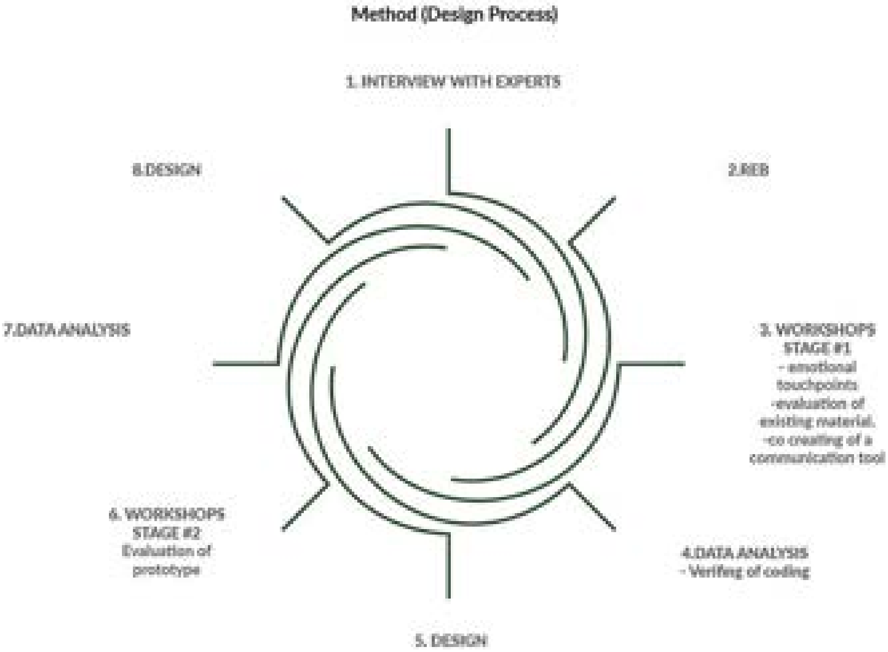

Fig. 1 The EBCD methodology employed in our research, in chronological order: (1) interviews with experts, (2) REB, (3) workshops stage #1, (4) data analysis – verifying of coding, (5) design, (6) workshops stage #2, (7) data analysis, and (8) design

suggested that the employed emotional vocabulary be widened to capture the range of children's experiences.

REB Approval

The second step was obtaining written approval from the Research Ethics Board (REB). The application process was meticulous and relatively long because children and nurses – the key subjects of our research – are emotionally vulnerable. In seeking REB approval, our main concern was to avoid becoming a source of stress for the children or nurses, as working with emotions can sometimes result in an emotional state or crisis. Psychologist Mariana Campos, who had previously treated all pediatric patients involved in this research, was present during our work sessions with all parties and was fully prepared to lead any necessary intervention. These ethical concerns led us to create multiple workshop sessions for our research, in order to separate nurses and children, allowing children who felt indisposed to postpone the session and nurses to be divided into groups to avoid heavily affecting their workload.

It was also decided that the researcher would not interact directly with the patients or nurses. The researcher acted as an observer, and psychologist Mariana Campos directed all sessions. To avoid overwhelming the participants, the duration of each work session was 60 min or less, as determined by the psychologist. Nurses participated voluntarily and were informed of the research protocol through an informed consent form. The pediatric oncology patients who participated were selected by the psychologist, and a consent form was signed by their parents. When working with the pediatric oncology patients, all questions and comments were made through play and words appropriate for their age, which they understood, and which did not generate confusion or stress. The children were informed that they could stop the session at any moment. The workshops took place in an area of the hospital already familiar to the participants*. Only audio was recorded during the sessions; no video or photographs were taken. This REB approval was obtained on November 11, 2019.

* Note: Due to the unexpected situation relating to the COVID-19 pandemic, some workshops were conducted virtually.

Workshops

The psychologist conducted the workshops while the researcher took field notes, recorded the sessions, and collected the materials created by the children and nurses. As observed in Dewar's (2010) research on the use of emotional touch points as a method of tapping into the experience of receiving compassionate care in a hospital setting, this method helps people to get in touch with their own experience. It also enables the development of relationships with patients, families, and staff (Dewar et al., 2010). Participants were therefore invited to engage with emotional touch points, pairing emotions with touch points or experiences during hospitalization, such as surgeries, chemotherapies, consumption of medication, and canalization, among others (Dewar et al., 2010), as well as activities that involved evaluating the existing didactic material tools and designing, drawing, or otherwise explaining their ideal toy or tool (Sanders et al., 2010). The analysis of the workshop led to exploring more profound issues during the following session (Charmaz, 2014) (Fig. 2).

The first workshop was conducted with the aim of identifying and understanding the needs and emotions of all participants. This was the first stage of co-designing the communication tool. The workshop consisted of three activities:

Activity 1

The participants were presented with three different types of materials that have been used in the past to discuss the following: What didactic tools have been presented in the past that have been useful and which ones haven't and why? What characteristics do they believe are key to creating a successful communication tool? These were discussed using age-appropriate language.

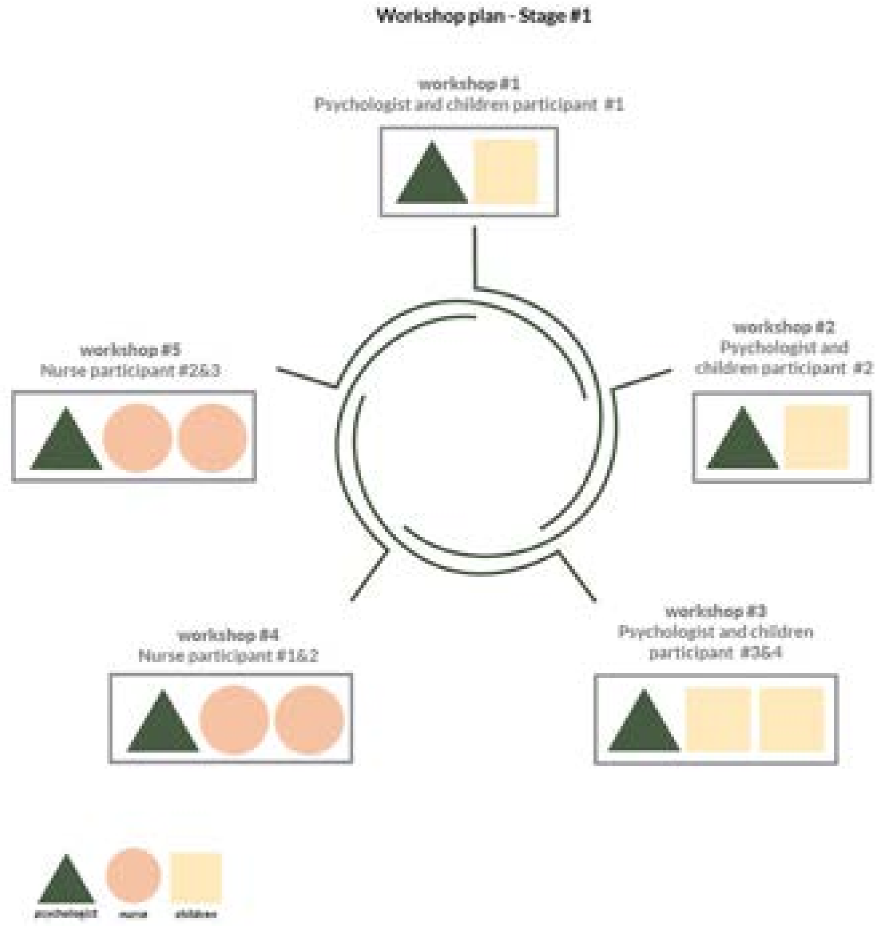

Fig. 2 The structure of the first round of workshops

Activity 2
The participants were presented with a timeline of their hospitalization process and for the nurses of their journey with their patients with an emotional vocabulary to pair with crucial moments.

Activity 3
The objective of this activity was to gather characteristics for the new communication tool. The nurses were asked to write words or sentences describing what the communication tool must solve, be like, and communicate. What affordances the communication tool must have and adjectives describing what it must not be according to the pediatric oncology patients.

Overall, the three activities were designed to take into account psychologist Mariana Campos, Emiliana Rodríguez Morales, and the researcher’s observations that it is not wise to overstimulate the children's senses, and to avoid incorporating the sense of smell into any activities designed. In addition, visual stimulation should be very subtle and abstract, and concentrating on graphic stimulation should be avoided. The nurses were concerned with the isolation kids experienced and said that, in their experience, video games disconnect them further, causing them to neglect their everyday routines during hospitalization.

Participants

Four nurses and four children were invited to participate in our Participatory Designing Workshop (Robertson et al., 2012) in the oncology ward of the hospital, located in the Observatorio neighborhood of Mexico City. The nurses are all employed in the pediatric oncology ward. All four nurses are females between the ages of 25 and 65.

The pediatric oncology patient participants were three females, two of 10 and one of 12 years of age, and one male of 10 years of age. They have all been diagnosed with cancer or are in need of a bone marrow transplant. The age range of the children was chosen for two reasons. First, it was considered by the hospital staff to be an age range within which children will be most responsive to this play-workshop environment and able to communicate their thoughts and express their preferences for communication tools. Second, because in this particular hospital the majority of the pediatric oncology patients are within this range, it is believed that new communication tools will have a positive impact on the children and meet their varied needs.

Originally, four workshops were planned, but due to the health situation the children were facing and the tight schedule the nurses work under, the workshops were divided. Three workshops were done with the children, one where two participants took part in an individual workshop, and another where two participants engaged in the workshop together. With the nurses, we divided the workshops into two, where one was held with transplant pediatric oncology nurses and the other with pediatric oncology nurses.

Psychologist Mariana Campos invited nurses and pediatric oncology patients to participate by playing an active role in the creative process (*Making Emotional Connections Through Participatory Design – Boxes and Arrows*, 2002), through workshops aimed at developing a new communication tool intended to improve the nurse-patient interactions during painful oncology procedures. These workshops were held at the hospital. Psychologist Mariana Campos selected patients, considering that they were suitable to participate in the sessions based on her professional knowledge of the patients' states and fitting the strategies to the particular specific research participants (Charmaz, 2014).

Analysis

Our analysis involved different steps. First, a read-through of collected field notes and open discussion sessions with psychologist Mariana Campos. Second, a session of coding systematic code through content analysis took place. There were two coders; we used the software NVivo12 to carry out the coding digitately. The session involved a categorization of themes that led to the first findings of the nature of the prototype. The material created by children and nurses (see Fig. 3) was analyzed, grouped by themes, and categorized to identify the relationship between the emotions presented by the children and the nurses during the same experience or touch point. After coding was finalized for the purpose of triangulation and verification of the coding, a session with Emiliana Rodríguez took place to analyze the focus of the research and the nature of the prototype. We report on these findings below.

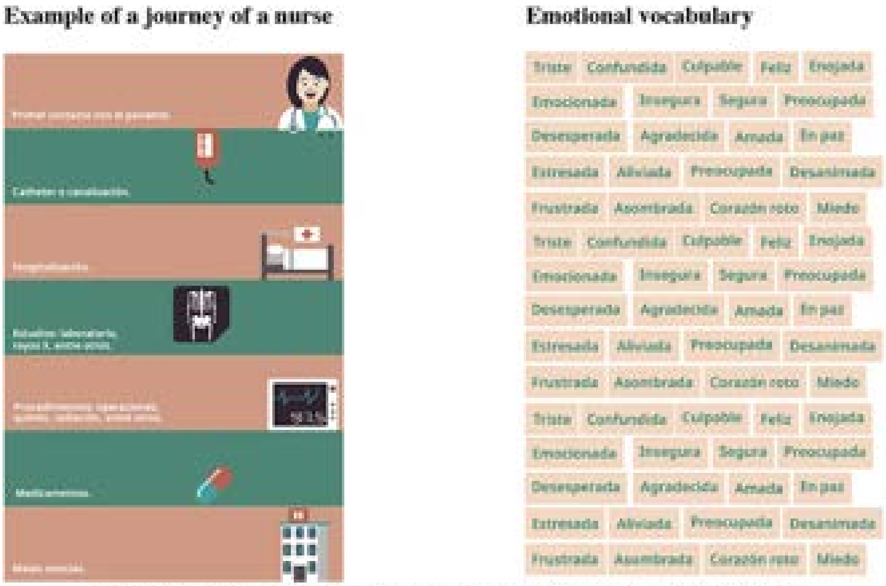
Findings

In their work, Simon Bowen, Kerry McSeveny, Eleanor Lockley, Daniel Wolstenholme, Mark Cobb, and Andy Dearden (2013) reported initial concerns about activities being "daunting" to participants in their study. After their workshop, participants agreed that sharing their experiences "helped to build empathy and cohesion in the project group." Also, as in their research implementing patient-centered cancer care: "using experience-based co-design to improve patient experience in breast and lung cancer services, the majority of our participants nurses and children felt vulnerable at certain points in the pathway" (Tsianakas et al., 2012). In our workshops we found that participating children also experienced points in their care journeys when they were vulnerable by virtue of feeling isolated and lonely. We found that the children and the nurses trust that the hospital, health professionals, and the treatment prescribed are adequate and helpful and that their stays in the hospital are necessary. However, the children don't feel an emotional connection with the nurses. They don't feel they are a team. Among the many emotions mentioned by the children, isolation and loneliness are deep emotions that indicate their need and longing for human contact (Fox et al., n.d.). We observe that emotions come from both physical pain and emotional pain (Weissbourd, 2009).

Below, we have divided our findings into two categories. First, we present the children's responses to the activities. Second, we present the conclusions of the nurses after participating in the activities, using the most representative examples of their responses.

Children

The aim of the first activity was to identify and understand the prevailing emotions displayed by children during their hospitalizations (*Toolkit*, n.d.). This emotional mapping exercise was used to invite the patients to reflect on the emotional impact of the touch points along the pathway (Bate & Robert, 2007; Dewar et al., 2010). The most common emotions shown by children during hospitalization processes are fear and worry: 50% of pediatric oncology patient participants feel worried and sad when they receive the news that they will be hospitalized, and mostly all emotions they feel they say are negative. When they are canalized or in a catheter process, three out of four children feel fear. One participant expressed that she feels secure because she feels safe, but the rest of the emotions are negative, like worry and desperation. During hospitalization, three out of four children feel sadness. Other feelings expressed are anger, discouragement, and confusion. One participant says she feels safe in the hospital but, at the same time, stressed and with fear. While taking labs,



Example of a journey of a nurse

Emotional vocabulary

Example of an emotional map created by a pediatric oncology patient:

Fig. 3 An example of an emotional map and the tools that were used by the participants

three out of four children feel fear and two out of four feel nervousness. During surgeries, chemotherapy, and radiation, two out of four participants feel fear and confusion. The emotions that the children feel while taking medication were different for each one. Three out of four of the children associated taking medicine with strong negative emotions such as anger, desperation, and discouragement. Two out of four children said they feel at peace, especially when they finish taking them all. One participant expressed only positive emotions, like a sense of security and peacefulness. When given bad news, all four children felt strong negative emotions such as sadness, fear, concern, frustration, and desperation. Two out of four children felt sadness.

The aim of the second activity was to analyze the preexisting didactic material available to the children within the hospital (Sanders et al., 2010). Reflecting on this, the four children who participated in this study stated that they enjoy playing with toys during hospitalization. All four had brought some of their favorite toys from their homes to the hospital. Some mentioned that they faced problems bringing them into the hospital due to safety concerns. They stated that this personal object serves as relief. The participants did not show deep interest in reading or looking at illustrated books during hospitalization. They do not talk much about technology, though participant #2 mentioned that what is most enjoyable for her is playing online games with her friends.

The aim of the third activity was to co-design the new communication tool (Sanders et al., 2010). All four pediatric oncology patient participants said that what helped the most during painful and complicated procedures was being close to their mother, with some mentioning their father as well. They also mentioned that the saddest moment is being separated from their parents and their siblings, friends, and grandparents. One participant also mentioned her pet. They all drew toys and security objects such as stuffed animals and blankets they had during their hospitalization. All these objects were brought from home by the pediatric oncology patients. One girl drew a pizza because "it was the only dish that never changed flavor," so we associate this with comfort of something she knew or relied on. When one participant drew her family, she drew hugs and holding her mother's hand while in pain. Participant #2 stated: "in fact, every time I'm punctured, I lean on mom, I hug her and close my eyes."

Nurses

The aim of the first activity was to identify and understand the emotions presented by nurses during the children's hospitalizations (Bate & Robert, 2007; Dewar et al., 2010) and to involve them in a collaborative identification of areas of opportunities and possible solutions (Iedema et al., 2010). When the nurses have their first contact with a new patient, three out of four nurses report feeling positive emotions such as happiness and excitement. Three out of four feel excited by the idea of meeting a new patient and look forward to it. One nurse experiences only negative emotions since she does not like working in the pediatric ward and prefers working with adults.

Below are some testimonies which are representative of the general responses we obtained from nurses.

Nurse #2: *And well, the hospitalization part is sometimes sad because they stay for many days. They feel, I don't know, like locked up. It sometimes is very difficult for them to have contact with me because they do not see me due to my mask and medical gear. It is very difficult to show your emotions through your eyes. Well, that part has caught my attention a lot. Because they don't know that I am smiling at them or that you are doing something even though they don't look at you. I don't know. I feel that communication is broken and the relationship with the patient is cut. Because you don't see each other well. You only see the other person's eyes.*

Nurse #4: *I have mixed feelings about medication. One, I'm grateful if parents cooperate. If they help us. It is easier, less traumatic, and less complicated for the child. But also, angry because children are the reflection of adults. If the child has tantrums and does not cooperate, we still have to make them take the medicine. That's when the nurse becomes rude and ugly, when she doesn't speak nicely, when she doesn't know, when she can't.... And that leads us to many medical errors too.*

The aim of the third activity was to co-design the new communication tool. Nurses stated the following in response to the question: What should this communication tool solve and communicate?

1. Resolve attitude
2. Security
3. Interpretations
4. Availability
5. Resolve doubts
6. Communicate education and information among staff
7. Effective communication
8. Resolve honesty
9. Resolve conflict between us

Nurses stated the following in response to the question: What affordances should it have?

1. Attitude
2. Companionship
3. Emotional help
4. Teamwork
5. Flexibility; not so many limits
6. Empathy
7. Consistency and communication between interdisciplinary team
8. Knowledge and education

Nurses stated the following in response to the question: What should the tool avoid?

1. Representation of angry or stressed nurses
2. Representation of needles

3. Representation of nurses who don't know
4. Crying children
5. Closed rooms

Design of Prototype

The design process for this prototype involved the four stages described by Sanders and Stappers in their work. These include probes, toolkits, prototypes, and four approaches: pre-design, generative, evaluative, and post-design. Within this process, nurses and pediatric oncology patients are active participants in the generative and evaluative stages through a series of interviews and trials of the prototype (Bate & Robert, 2007).

Additionally, the strengths and limitations of the available didactic materials were determined in the workshops. Materials such as books and toys worked well as complements to psychological therapy; however, the nurses don't have access to these materials. The objective was to design a tool that facilitates an emotional connection being formed between the nurses and pediatric oncology patients. Books and toys do not engage both parties and, therefore, they do not serve that purpose. Additionally, the accessibility of these materials is limited, as they are prohibited from certain areas of the oncology ward for hygiene purposes.

On the other hand, the nurses stated that their main task is to ensure their patients cooperate with them and abide by their routines and that this becomes difficult to accomplish when pediatric oncology patients do not trust or feel an emotional connection to them. However, the nurses have little free time to devote to devising activities that enable them to bond with their patients.

In response to the above-mentioned findings, we determined that the prototype would be an application, accessible from smartphones, and based on sounds rather than images (Iyendo, 2017). Research has been conducted on the subject of the use of music and sound therapy to alleviate stress and improve immune system function. It has been widely documented that stress can be suppressive of various aspects of the immune response (Brennan & Charnetski, 2000). In modern times, music is used in many facilities such as hospitals, nursing homes, schools, and clinics to help combat a variety of problems, including anxiety. Relaxing music helps slow down heart rates, breathing, and thinking and enables a person to reach a deeper level of rest and tranquility. It therefore can become a key tool to help relieve stress and calm the mind (Clements-Cortés, 2013). However, we recognize that deploying a sound-based approach provides a limitation in terms of inclusivity, and future research and design will take into account the needs of hearing-impaired children in order to support them in their pediatric oncology care journeys.

The nature of the initial app is based on establishing emotional connections between the participants (nurses and their pediatric oncology patients), allowing them to discover the touch points in which they often feel the same emotions. Smartphones were found to be possessed by the parents of even the most underprivileged pediatric oncology patients, as well as by all of the nurses of the oncology ward. All parents and nurses interviewed were familiar with smartphone applications and were able to operate them. Therefore, they were determined to be an accessible tool that does not require additional time spent on specialized training for these participants. During interviews, pediatric oncology patients stated that they feel good when they seek contact with the people they love or when they are in contact with positive objects, they are familiar with. It was therefore determined that the application would be used prior, during, and after painful and stressful procedures that the nurses administered to the children, such as vaccines or the taking of blood samples. The application would allow the nurse and the pediatric oncology patient to connect on an emotional level before these procedures, establishing touch points of compassion and empathy between them. It is through design that we can add spirit and aesthetic to the equation of good engineering (*Programmers, Designers, and the Brooklyn Bridge|Scott Berkun*, n.d.).

Mobile applications for meditation or music listening, such as Headspace or Spotify, are widely available. This prototype is instead focused on establishing and nurturing a personal relationship of trust and an emotional connection between the nurses and the pediatric patients of the hospital's oncology ward, through customizable voice messages that can be recorded by both parties. The shapes and colors displayed in the user interface were muted to avoid overstimulating the users (Fig. 4).

Results and Discussion

Prototype #1 (P1)

The application features a Welcome page that displays two options: Instructions (which can be skipped) and Start. By clicking Start, the user is taken to the Home page, which is divided into three sections: Create, Listen, and Reflect. Instructions are available for all three sections, and there is an option to skip the instructions. The instructions can be read or heard in order to ensure accessibility.

The first section, Create, is divided into two sections: one that enables the user to record with or without background sounds and another that records agreements, where the pediatric oncology patient and nurse can record themselves stating mutually beneficial agreements. Once the user has recorded something, they are automatically taken to the Listen section. The Listen section allows the user to play the different recordings they have saved, organize their order, and create playlists. The final section, Reflect, allows the user to evaluate the recordings and reflect on where and when the application was used and whether they found it useful.

Evaluation of P1

A workshop subdivided into six sessions was conducted to test the first prototype (P1). The children interacted with the prototype and after this psychologist Mariana Campos engaged with some questions. The questions we asked the pediatric oncology patient and nurse that were invited to engage virtually with P1 were based on the

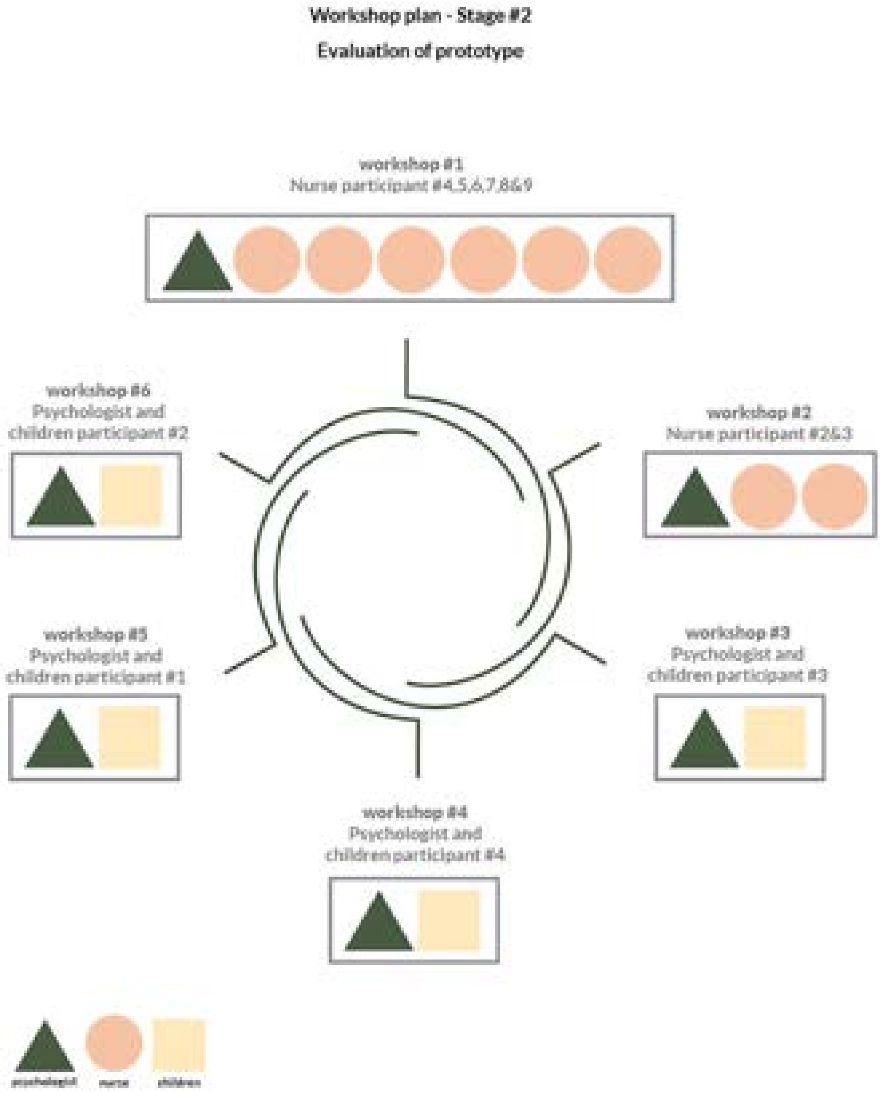


Fig. 4 The structure of the second round of workshops

three elements of good design by essays on design engineering and project management (*Programmers, Designers, and the Brooklyn Bridge|Scott Berkun*, n.d.). The following are the examples of the questions:

1. Is this mobile app easy to navigate?
2. Did you understand the instructions?
3. Do you like it, and would you use it?
4. What would you change?

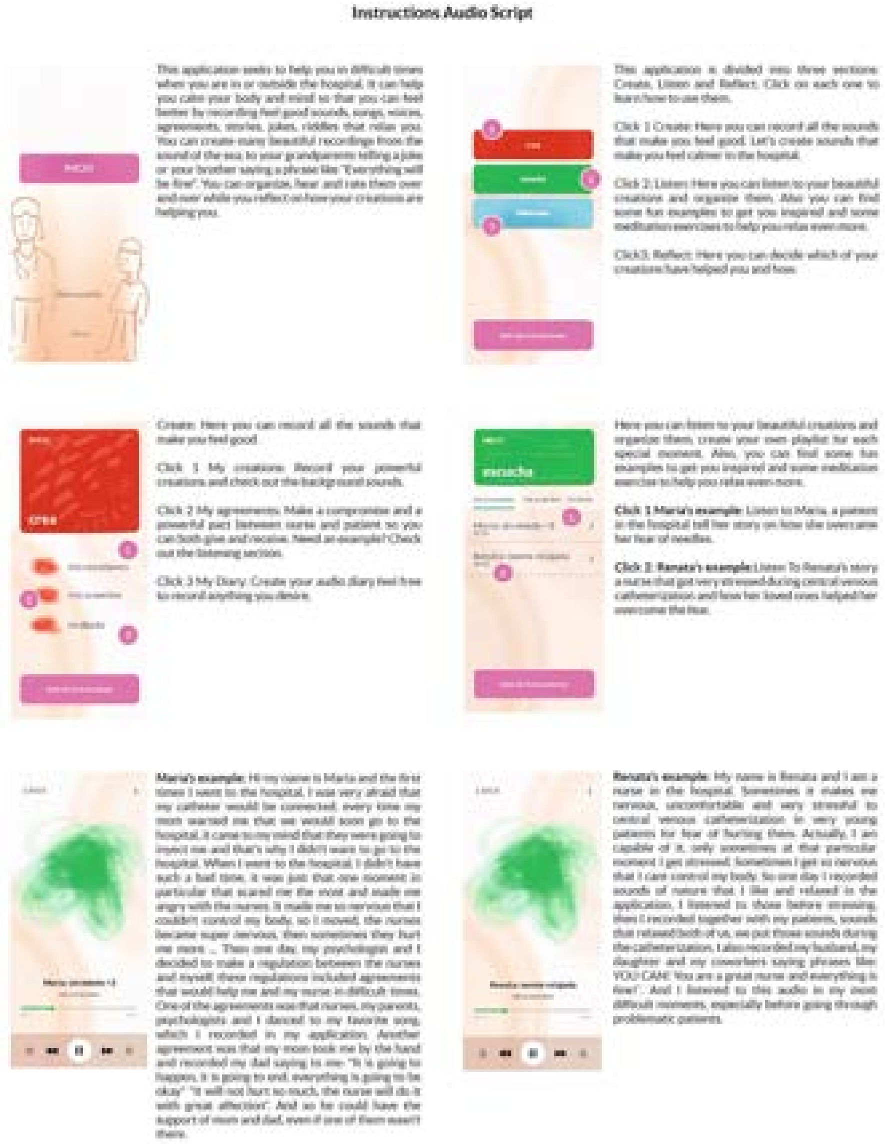

Fig. 5 Description the instructions audio script

The following are the most relevant takeaways from the interviews (Fig. 5).

Workshops #1 and #2

For the first workshop, six nurses were invited to engage with P1 and later interviewed on their opinion (*EBCD: Experience-Based Co-design Toolkit|Point of*

Care Foundation, n.d.). The second workshop repeated this dynamic, with two nurse participants. The questions were asked openly, and the participants were invited to answer freely as a discussion.

As a group, all six nurses interviewed agreed they liked the idea of an application using personalized sound recordings to help them connect with their patients, though some concerns were raised about presenting themselves as vulnerable to the children, as well as about time constraints in their tight schedules. The group agreed that P1's user interface was legible and easy to navigate. Regarding the P1 graphic design, all six nurses agreed that they would like the colors to be brighter and for the design to be more child-friendly by integrating illustrations or animations. Regarding the integration of pre-recorded meditations and breathing exercises to the prototype, the majority of the nurses interviewed agreed that they are interested in using an application to relax and be in touch with their emotions.

Through this interview, it was determined that an introduction on the topic of compassion should be added to the application. This could take the form of an animation to motivate the pediatric oncology patient and to establish a connection between them and with their own emotions. It was also determined that following interviews should focus on collecting more personal stories from the nurses to analyze.

The feedback from the second workshop, with two nurse participants, was similar to the answers recorded in the first workshop. Both nurses agreed that the tool would be useful to them and that establishing an emotional connection with their patients would help them carry out their work. They agreed that the prototype was simple to navigate and suggested the word "Reflect" be changed to something more child-friendly. Both nurses suggested more colorful shapes for the design.

Workshops #3, #4, #5, and #6

For workshops #3, #4, #5, and #6, four pediatric oncology patients were invited to engage with the prototype and later interviewed on their opinion, individually. Each workshop interviewed a different pediatric oncology patient. The interview questions were the same as those asked in workshops #1 and #2.

All four pediatric oncology patients agreed that they liked the idea of the application. The two pediatric oncology patients in remission stage liked the initial design's muted color scheme: the other two stated they would prefer livelier colors and shapes. All participants agreed that they found the application easy to use; one pediatric oncology patient stated there were words they did not understand, but that they would ask their parent or guardian to explain.

Prototype #2 (P2)

The evaluations of P1 served to create a second prototype, with the following improvements.

Color Palette

The first color palette was chosen in a low-intensity hue based on psychologist Mariana Campos' expertise and experience with didactic material to induce a calm mental state and to invite the participant to partake in the action of interiorizing. Taking into account the evaluation of the first prototype, we made the colors less mild and more attractive based on the pediatric oncology patients' and nurses' descriptions of what color palette they would like (De et al., 2018).

Script

Considering the results of the evaluation of the prototype and the suggestions given, we made changes to the script. We summarized the instructions based on the understanding that both pediatric oncology patients and nurses found the app intuitive while interacting with it, and the excess of instructions was not needed.

Illustrations

In response to the suggestions to make the prototype more user-friendly, we created some illustrations of a nurse and a child and added more texture to the background. The interaction and structure of the app stayed the same since they were able to interact and understand it easily (Figs. 6 and 7).

Discussion

Experience-based co-design (EBCD) engages users by gathering their experiences and taking them into account, thus making them active participants in the design process (Donetto et al., 2015). Our study aimed to create a communication tool that would improve the relationship between pediatric oncology patients and nurses working in the pediatric oncology ward of a hospital in Mexico City, Mexico.

We interviewed field experts who helped outline two workshops, where participants were able to provide key insights on their experiences and needs, from which we built an emotional map that elucidated the main concerns that the communication tool would address. The next stage involved analyzing the collected data and designing the initial prototype (P1). In this stage, it was determined that P1 would be a mobile application based on sounds, to avoid overstimulating the participants' visual senses, which psychologist Mariana Campos has found in her work in the hospital to trigger emotional responses more easily than other senses. Based on psychologist Mariana Campos' observation that children can enter a melancholic emotional state after a visually stimulating video call with their loved ones, we ensured that the interface of P1 maintained their awareness of their hospital surroundings. By only incorporating sounds into P1, we grant participants control over what to record, manipulate, or erase, enabling them to choose what relaxes them. Nurse participants mentioned that pediatric oncology patients appear isolated after they spend prolonged time interacting with screens and that this makes it difficult for

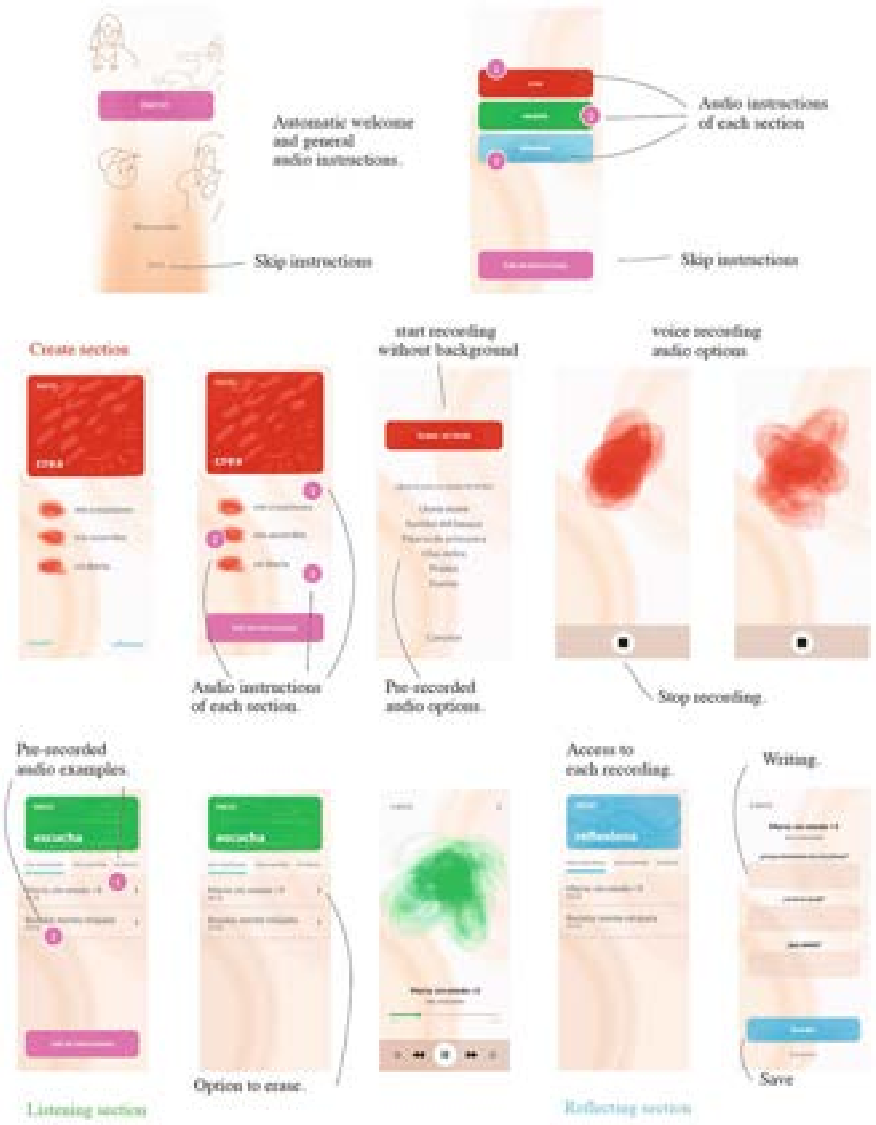

Fig. 6 The final prototype

the nurses to connect with them. For this reason, P1 is intended to be low interaction in front of the screen.

The nature of the P1 application is intended to help establish an emotional connection between pediatric oncology patients and nurses of the pediatric oncology ward, to generate an affective bridge of communication between patient and nurse by using technology – which is something that children currently value and are familiar

Fig. 7 A comparison between Prototypes #1 and #2.

with – and to support the nurses in the daily procedures they are tasked with by creating communication strategies. An example of these strategies is the possibility of recording verbal agreements through the application. In order to cooperate and form a healthy relationship, first both parties should avoid being in a state of alert or stress. Connection is very difficult to accomplish in a state of alertness, stress, worry, or anger (Fox et al., n.d.). By accessing relaxing sounds or the sound of a family member through this application, we hope to lower this state of anxiety in participants, so they can then begin making agreements and forming an interpersonal connection.

The second workshop consisted of allowing participants to test the prototype and then collecting their feedback. The data was analyzed and employed to create a second prototype (P2). From the participants' feedback, we concluded the following:

- P1 responded to the pediatric oncology patients' feelings of isolation and nostalgia by allowing them to record custom audios of their loved ones and reminders of joyous memories.
- It allowed pediatric oncology patients and nurses to have a moment in which, together, they established and recorded agreements through negotiations, to listen back to them during painful or difficult procedures. In this way, the nurse and patient had a space for connection that was mediated by a concrete tool which was used equally by both participants, because the interface is the same for children and nurses.
- The design is flexible so it can meet the changing needs of children depending upon where they are at in their care journeys.

To the best of our knowledge, there is no literature in Mexico that addresses emotional processes through an EBCD methodology. Our findings showed that all participants recognized the necessity for a communication tool, were eager to participate in the design process, and found the resulting prototype to be engaging and helpful. Moving forward we intend to continue to update the mobile app.

Part IX

Poverty and Economic Inclusion

Poverty and Economic Inclusion: Introduction

57

Stefan Tromel

Abstract

The statistics show that persons with disabilities have lower levels of lower market participation than the rest of the population and are also often not covered or at least not adequately covered by social protection. The five articles in this section of the handbook provide a complementary perspective on the barriers faced by persons with disabilities both in developed and in developing countries in the access to their rights to employment and social protection, rights enshrined in the CRPD. Recommendations are made for policy makers to reduce the gaps persons with disabilities face in the enjoyment of these rights.

It is a generally accepted fact that persons with disabilities are overrepresented among persons living in poverty and extreme poverty. Two of the main reasons for this are the lower levels of employment and insufficient access to social protection. It is therefore not surprising that the different contributions in the chapter on poverty focus on employment and social protection.

The statistics available in the International Labour Organization from almost 100 countries show that there is a gap of 30–40% in the labor market participation of persons with disabilities compared to persons without disabilities and this gap exists in all regions of the world. The gap between women with disabilities and women without disabilities is similar, but as the overall labor market participation of women is lower than that of men, the rates of women with disabilities are lower than those of men with disabilities.

When in employment, persons with disabilities are overrepresented in self-employment and in informal employment compared to persons without disabilities.

S. Tromel (✉)
Gender, Equality, Diversity and Inclusion Branch, Senior Disability Specialist, International Labour Organization, Geneva, Switzerland
e-mail: tromel@ilo.org

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_96

There is also a salary gap for persons with disabilities which in the case of women with disabilities is compounded by the gender wage gap. A particularly concerning statistic shows that youth with disabilities are twice as likely to be in neither employment, education, nor training (NEET) than youth without disabilities and this is so across all regions.

Enjoying the right to work and employment remains a persistent challenge for many persons with disabilities, and there are many factors that contribute to this. The UN Convention on the Rights of Persons with Disabilities (CRPD) reminds us that all rights covered by the Convention are interrelated and indivisible and Article 27 on work on employment is a good example of this. When persons with disabilities don't have equal access to education, when some persons with disabilities are denied their legal capacity, and when public transport, buildings, and information remain inaccessible for many persons with disabilities, all these rights violations have a significant impact on the opportunities for persons with disabilities to enter and stay in the labor market, but also in ensuring that they have equal opportunities in accessing decent work, the ILO terminology which is now also reflected in goal 8 of the Sustainable Development Goals.

A particularly important relationship exists between social protection and employment. Too often, social protection systems are designed based on the assumption that disability means inability to work. While social protection plays a key role to protect persons with disabilities, like many others, from poverty, the benefits provided should focus on the additional costs faced by persons with disabilities and should be compatible with income resulting from work or other support that addresses poverty, unemployment, etc.

When looking at legislation, policies, and programs that seek to promote the employment of persons with disabilities, it becomes clear, as shown by the different contributions in this section, that there are huge differences between those countries where the majority of the working-age population works in the formal economy and those countries where the majority, and often the vast majority, of the working-age population works in the informal economy. The usual catalogue of measures that we are familiar with (non-discrimination legislation, quota systems, and other affirmative action measures) are often not relevant in the context of the informal economy, and more efforts need to be made to design policies that are tailored to this situation. And let's not forget that 60% of the workers worldwide work in the informal economy.

As reflected in the UN CRPD and in line with other rights enshrined in the Convention, more efforts need to be made to ensure full inclusion and participation in the mainstream solutions that governments put in place to increase labor market participation. An example of this are measures to increase employment of youth in the digital and green economy which need to be inclusive and accessible to young women, men, transgender, and gender non-conforming people with disabilities. Still too often, the focus is on specialized and separate measures focusing on persons with disabilities which, even when well designed, can only make a small contribution to addressing the employment gaps faced by persons with disabilities.

On a more positive note, the last years have seen an increased interest of the private sector in the employment of persons with disabilities. A still small but rapidly growing number of global and national companies have realized the benefits of employing persons with disabilities. Supported also by the ILO, there are more than 35 national employer-led networks bringing together companies, both local and subsidiaries of global companies, committed to the employment of persons with disabilities. An area that deserves more attention is how governments and also these networks can provide more support to small- and medium-sized enterprises, including those that operate in the social economy.

The contribution from Gertrude Oforiwa Fefoame and Hannah Loryman focuses on the recently adopted General Comment No. 7 of the UN Committee on the Rights of Persons with Disabilities related to Article 27 of the CRPD. Nobody better placed to do this analysis, as Ms. Fefoame was the chair of the working group of the CRPD Committee which led the work on this General Comment. The chapter provides an overall description of the General Comment and focuses in particular on some of the less explored or more challenging elements of Article 27. Ensuring that the discrimination based on disability includes persons who are associated with a person with a disability and who might be discriminated because of this association is a very important and welcome clarification of the article. The challenges and opportunities of a rapidly changing labor market, the need to focus on persons with disabilities in the informal economy, and the impact of unpaid care especially on women with disabilities are other important elements of the new General Comment explained in this contribution. Finally, also addressed in this contribution is how to deal with sheltered and segregated employment, one of the most debated elements in the discussions that led to the adoption of the General Comment.

The contribution from OECD experts Silvia Garcia-Mandico and Christopher Prinz provides a very good analysis of the interaction between poverty and employment and makes very relevant recommendations on the way forward. The data from OECD confirm that the rate of poverty of persons with disabilities has been higher by ten percentage points that that of persons without disabilities (approximately 23% compared to 13%) with very little variation between 2005 and 2019. The employment rates of persons with disabilities are stubbornly low with a gap of 40 percentage points, and annual wage salaries are also lower than those of persons without disabilities, which is partly linked to a skills mismatch. Social protection plays a key role in the prevention of poverty but needs to be better designed to ensure early intervention. Very important also is the strong argument that the way forward requires a much more rigorous disability mainstreaming in all relevant labor market measures, including vocational training and public employment services.

The contribution from Dorothy Nakato Mubezi, supported by the International Disability Alliance (IDA), focuses on the access to gainful employment for women and youth with psychosocial disabilities, an excellent example of intersectionality in action. Based on discussions with key informants, the contribution assesses the barriers and enablers faced by youth and women with psychosocial disabilities in Africa. Addressing discrimination and harassment, the provision of reasonable accommodations, as well as affirmative action are looked at both in the initial recruitment and in terms of career advancement. The contribution also includes very relevant recommendations to State Parties, to the private sector, and to organizations of persons with disabilities (OPDs).

John Stapleton provides an interesting in-depth analysis of the “welfareization” of disability benefits in Ontario over the last 10 years in a moment where a new bill is being introduced which seeks to end “welfareization” of disability benefits and effectively reduce poverty among persons with disabilities. The contribution provides an interesting view on how disability-specific benefits and mainstream social assistance benefits interact with each other, the latter increasing in significance and take-up, when access to the former has been tightened.

Doug Waxman’s contribution is based on the analysis of 130 studies that have looked at employers’ perceptions of persons with disabilities, usually based on self-reporting by employers. The self-reported positive attitude to persons with disabilities is however usually not consistent with the actual behavior in terms of employment of persons with disabilities. Mr. Waxman highlights that there is a gap in this type of analysis in the global south and provides a suggested way forward to better understand and assess the actual behavior of employers.

Blanck, Hyseni and Goodman’s chapter on economic inclusion and empowerment of people with disabilities discusses extreme disparities in economic inclusion. These disparities are heightened by and interrelated with other inequalities that marginalized populations experience such as higher rates of poverty and lack of access to education, housing, transportation, medical care, banking, and food. The COVID-19 pandemic has amplified the employment disparities between people with and without disabilities and within the non-monolithic disability community. The expansion of the gig economy, the non-traditional routes to employment, disability owned businesses, apprenticeships, and paid leave benefits may help.

Triggered by the five contributions, I would like to finish by highlighting several areas that, while often already receiving some attention, would benefit from further research and analysis to inform future policies:

- The challenges and opportunities of the future of work for persons with disabilities, including, among others, remote work, the gig, and platform economy.
- How to improve working conditions of informal workers with disabilities and how to eliminate barriers to their move to the formal economy.
- How to provide the required assistance and support to small- and medium-sized enterprises, so that they can contribute more to the employment opportunities of persons with disabilities.
- The possible use of behavioral science to bridge the gap between attitudes and actual behaviors.

Towards a Rights-Based Policy Environment for the Employment of Persons with Disabilities

Contents

Abstract

Article 27 of the Convention on the Rights of Persons with Disabilities (CRPD) obligates States parties to recognize the right of persons with disabilities to work on an equal basis with others. The rights of persons with disabilities to work on an equal basis with others is also referenced in Articles 5, 8, 9 and 12, demonstrating the cross-cutting nature of employment as a policy issue. Effective

implementation of Article 27 will also ensure that States parties meet their commitments under Sustainable Development Goal 8.5 on achieving the full and productive employment and decent work for all women and men, including persons with disabilities, and equal pay for work of equal value. The recent adoption by the Convention on the Rights of Persons with Disabilities (CRPD) of the General Comment on Work and Employment is a major step forward in clarifying the obligations of States parties regarding the right to work and employment. This chapter examines some of the key challenges arising for states parties in meeting their obligations under Article 27 and, in the context of the new General Comment, discusses the key factors required to create an enabling policy environment for the employment of people with disabilities, as well as key outstanding questions and gaps which will need to be addressed for successful implementation of the CRPD.

Employment · Work · Convention · Disability · Policy

Introduction

Although data is lacking and comparisons across countries are challenging, it is widely recognized that persons with disabilities experience lower levels of employment than their peers without disabilities and that, when they do access employment, they are more likely to work part-time, for lower pay and in the informal sector (United Nations, 2018; Braithwaite & Mont, 2009; Mizunoya & Mitra, 2013). When in employment persons with disabilities are also more likely to face exploitation and discrimination (Galarneau & Radulescu, 2009, O'Hara, 2004). Women with disabilities are less likely than men to be in employment and face barriers as a result of discrimination based on gender, disability, and intersecting identities. Access to employment is also highly variable across impairment groups, with persons with intellectual disabilities consistently experiencing lower levels of employment and people with some impairments facing specific barriers – such as specific forms of discriminatory legislation against persons with psychosocial disabilities (Shaw et al., 2012).

Article 27 of the Convention on the Rights of Persons with Disabilities (OHCHR, 2006) obligates States parties to recognize the right of persons with disabilities to work on an equal basis with others. The cross-cutting nature of employment as a rights and policy issue is also demonstrated by the inclusion of references in Articles 5, 8, 9, and 12.

Effective implementation of Article 27 will also support States parties to meet their commitments under Agenda 2030, specifically Sustainable Development Goal 8.5, on achieving the full and productive employment and decent work for all women and men, including persons with disabilities, and equal pay for work of equal value but is also key to achievement of the Agenda more broadly (United Nations, 2015).

The recent adoption by the Committee on the Rights of Persons with Disabilities of the General Comment on the right of persons with disabilities to work and employment (OHCHR, 2022) is an important step forward in clarifying the obligations on States parties regarding the right to work and employment and, as such, marks an important point to reflect on some of the policy challenges that remain in realizing the Convention, and how the General Comment provides an important framework and direction of travel in overcoming these.

This chapter examines some of the key challenges arising for states parties in meeting their obligations under Article 27 and, in the context of the new General Comment, discusses the key factors required to create an enabling policy environment for the employment of persons with disabilities, as well as key outstanding questions and gaps which will need to be addressed for successful implementation of the CRPD. It does not intend to provide a comprehensive overview of the General Comment, but instead presents some key areas for discussion and reflection.

The CRPD and Employment of Persons with Disabilities

The right to work is a fundamental human right, and forms an inseparable and inherent part of human dignity, recognized and articulated across multiple human rights and legal instruments including The Universal Declaration of Human Rights (United Nations, 1948) and Articles 6, 7, and 8 of the International Covenant of Economic, Social and Cultural Rights (United Nations, 1966). The right to work and employment for persons with disabilities, as well as being enshrined in the CRPD, is also articulated in other key rights documents such as ILO Convention 159 (ILO, 1983).

Article 27 of the CRPD requires States parties to recognize the right of persons with disabilities to work on an equal basis with others, including their right to gain a living by work freely chosen or accepted in a labor market and work environment that is open, inclusive, and accessible. Article 27 sets out measures through which States parties can respect, protect, and promote the right of persons with disabilities to work and employment.

While the obligations of the CRPD sits with States parties as signatories, most rights require a multistakeholder approach if they are to be realized in practice. This is evident for the right to work, where a significant amount of employment will be within the private sector. Article 27 of the Convention requires states to place obligations on private sector employers, for example in the provision of accessibility and reasonable accommodation, whilst requiring States parties to adopt positive measures to promote the employment of persons with disabilities.

The equal employment of persons with disabilities cannot be achieved through measures that solely focus on employment. This is well recognized in the CRPD with references to work and employment also included across other Articles 8 on Awareness Raising, 9 on Accessibility, and 26 on Habilitation and Rehabilitation. The right to work can also an important enabler for the achievement of other rights, such as the Right to Health and Participation in Public and Political life.

It is important to be cognizant that while the engrained perception that many persons with disabilities cannot work does not hold true, it is also critical that discussions about the right to work for persons with disabilities do not cause the small minority of persons with disabilities that, even with the right accessibly environments and support, cannot work further violations of their rights. Comprehensive social protection floors (ILO, 2012) are an enabler to the right to work, but they also play a critical role in supporting those who either temporarily or permanently are unable to work (OHCHR, 2015).

Challenges in Implementing Article 27

The Committee's Concluding Observations[1] on Article 27 provide a useful entry point for understanding some of the policy challenges and areas of contestation that exist in securing the right to employment for persons with disabilities. Consistently the Committee highlights concerns about the low numbers of persons with disabilities in employment, particularly women and persons with intellectual or psychosocial disabilities and other contextually marginalized populations. As highlighted above, this holds across high-, middle-, and low-income countries in the employment data that exists.

Beyond this, the Committee's Conclusion Observations also make clear that there are similarities in challenges that States face in implementing the Convention.

The existence of a strong legal and policy framework for employment remains a significant challenge in many countries (United Nations High Commissioner for Human Rights 2021). The Committee has identified persistent gaps in policy and legal processes and frameworks as well as consistently raising the issue of non-implementation of laws and policies relating to employment. People with disabilities are also more likely to work in the informal sector, presenting additional and specific challenges for the development of an enabling legal and policy environment.

Reasonable accommodation is a foundational principle in the CRPD and is clearly linked to the equal realization of rights (Lawson, 2017). In relation to work and employment, the CRPD sets out that States parties should "ensure that reasonable accommodation[2] is provided to persons with disabilities in the workplace" (OHCHR, 2006). Reasonable accommodation, in tandem with accessible workplaces, plays a critical role in ensuring that persons with disabilities can realize their right to employment. Despite its importance, the Concluding Observations for the majority of States parties highlight issues and challenges with the provision of

---

[1] The 17 Concluding Observations between 2019 and 2022 accessed on 3/9/22.

[2] Defined in the CRPD as: "necessary and appropriate modification and adjustments not imposing a disproportionate or undue burden, where needed in a particular case, to ensure to persons with disabilities the enjoyment or exercise on an equal basis with others of all human rights and fundamental freedoms."

reasonable accommodation. The concept of reasonable accommodation will likely always contain some element of contestation, partly because the definition of "reasonable" will always be context-specific and require an element of judgment in delivery. However, clear definitions and robust guidance for implementation can and should eliminate some of this ambiguity. The Committee has identified a range of issues in providing reasonable accommodation; these include issues around the existence of sufficient legislation and policy, lack of implementation of legislation and policy, and lack of accountability and measurement.

Another consistent area raised by the Committee is the right of persons with disabilities to participate in the open labor market. Concerns expressed by the Committee demonstrate and emphasize the importance of the "right to work" not just being about the right to employment but the importance of the concept of "freely and openly chosen" for persons with disabilities (OHCHR, 2006). Legislation and policy which permits, and in some cases encourages, employment in "non-open" settings, is often seen as a legitimate part of a response to low employment levels by States parties. While this may seem like a pragmatic approach to address low numbers of people with disabilities in employment it is problematic on multiple counts. This includes concerns raised by the Committee that sheltered employment does not only violate people's right to work on an equal basis with others, but it can also lead to other rights violations, such as being paid below minimum wage.

General Comment on the Rights of Persons with Disabilities to Work and Employment

All treaties are written at a point in time and are a process of complex negotiations, discussions, and have to condense complex rights into short statements, which are therefore inevitably open to interpretation and reinterpretation. General Comments, therefore, provide an important and more practical interpretation of the rights, providing practical guidance to states to support implementation. They play a critical role in articulating the specific actions needed to realize the rights set out.

Human rights Committees, in developing General Comments, have to navigate a complicated path between protecting and promoting the rights of their constituency, expressing up-to-date expertise in an area, and keeping to the intent of their treaty, which has been ratified by States parties. The complexity of this can be partially understood by reading the submissions.

Although General Comments are not legally binding instruments, they provide "authoritative guidance" around implementation of the legally binding articles of a convention (OHCHR (n.d.). In September 2022, the Committee on the Rights of Persons with Disabilities published its eighth General Comment on Article 27. The development of the General Comment generated significant interest from States and those across the disability sector, with around 90 submissions made to the Committee in one round of input requested on the draft General Comment.

Key Aspects of the General Comment

Policy, Assumptions, and Value Systems

Policy decisions are rarely neutral and are a reflection of the values and assumptions that society and, by extension, policymakers hold. The CRPD is widely recognized as representing a paradigm shift from conceptualizing persons with disabilities as objects of charity to subjects with rights (Harpur, 2012). However, outdated modes of understanding disability still prevail in society and, as a result, in policy. This issue was brought to the forefront during the Covid-19 pandemic where government's responses to the pandemic demonstrated how entrenched discrimination often is Quinn (2000). In General Comment 8 the CRPD Committee explicitly names "ableism" as the underpinning values system, which drives medical and charity models of disability and, in turn, underpins much discrimination on the basis of disability.

While ableism is not a new concept and is widely used in academic literature, by activists and in some policy areas, it has not been used extensively in General Comments previously.[3] Making the concept of ableism explicit in relation to employment, and by extension other rights in the CRPD, is a helpful framing for unpacking the underlying drivers which have led to some of the policy decisions that are consistently raised by the Committee as undermining the rights of persons with disabilities in employment.

In particular, while ableism underpins many of the explicit forms of discrimination persons with disabilities experience in employment, the concept of ableism is particularly useful to understand some of the approaches and policies which are put in place by States in order to attempt to address the lack of inclusion of persons with disabilities in the labor market, but actually can be understood to be undermining the rights of persons with disabilities. This is notable around sheltered and segregated work, but can also be seen in the design of some affirmative action policies. Discrimination that is built into legislation, for example legislation that permits persons with disabilities being able to receive a lower than minimum wage, is also fundamentally built upon ableism.

This new emphasis on ableism is particularly pertinent as it gets to the core of the approach taken in the CRPD and its focus on not just addressing the outcomes of disability discrimination and rights violations, but also addressing the core reasons behind these.

Complexity of Policy and Legal Reform

It is increasingly common rhetoric within the disability sector that the policies and laws are in place around disability, but that they "just" need to be implemented.

---

[3] General comment No. 5 (2017) on living independently and being included in the community briefly mentions ableism but does not expand on it in the way that this General Comment does.

Putting aside the complexities of implementation, which apply to the issues discussed throughout this chapter, this also oversimplifies what is needed in terms of an enabling policy and legal framework if the rights of persons with disabilities are to be realized in employment.

While there has undoubtedly been an increase in the existence of laws and policies on disability there still remains significant gaps. A recent study of all 193 UN member states which found that only 62% of countries prohibit disability discrimination in employment but that added to this only 33%, prohibit indirect discrimination (Heymann et al., 2022). Further studies have also highlighted the lack of legal and policy protection of women with disabilities (Braunmiller & Dry, 2022) and persons with psychosocial disabilities (Ebuenyi et al. 2019).

Another challenge links to the persistence of certain assumptions and value systems, as set out above, and how they persist within policy and legislation. For example, recent research in South America found that although all countries in the study had enacted legislation on the employment of persons with disabilities, all but one seemed to take a medical model and therefore perpetuated the association between disability and incapacity to work (Pinilla-Roncancio & Rodríguez Caicedo, 2022).

This demonstrates the critical importance of taking a holistic view of what the policy framework for the inclusion of persons with disabilities in the labor market should look like. The CRPD already clearly sets out some legislative and policy requirements of States parties through its General Obligations, and these apply to the right to work and employment. The General Comment sets out that States should introduce a national employment strategy and plan for action and also brings to the forefront a range of legal and policy provisions that are required to create an enabling environment for the employment of persons with disabilities. This is important ensuring that a comprehensive policy framework is in place.

The General Comment also emphasizes the need for effective redress mechanisms, without this accountability the existence of policies and legislation cannot be effectively implemented.

Affirmative Action

Affirmative action is one of the most commonly used policy instruments implemented by states to promote the employment of persons with disabilities. Although much broader, affirmative action is often seen in the form of quotas, and despite being frequently used across contexts, the effectiveness of quotas remain extremely contested. Quota systems, which usually take some form of requiring employers to hire a certain percentage of persons with disabilities, have been adopted by around 100 countries (United Nations, 2018; ILO, 2018).

Quotas vary significantly in how they are established and have often not been well evaluated or their impact understood. Many of the submissions made to the Committee when the General Comment was being developed expressed concerns about quotas. These concerns identified that quotas can risk perpetuating long held assumptions about the ability of persons with disabilities to work on an equal basis with others. They can reinforce the charity model of disability that the CRPD has worked so hard to remove. They may lead to employers hiring persons with disabilities, but in low-paid, low-progression jobs which can further entrench discrimination and exclusion. In other cases, quotas are not implemented and not enforced. Inclusion International highlighted that quotas “do not work for persons with intellectual disabilities” (Inclusion International, 2022). Susan Scott Parker in her keynote speech to the Committee stated that quotas, and their failure to increase employment “reinforces those same negative assumptions regarding ‘disability’ which caused them to come into being” (Scott Parker, 2021).

While there are strong opponents to quotas, as seen above, most do not argue for a removal of quotas but for modifications that address some of the challenges identified and lead to more effective implementation. As the ILO has identified, more recently quotas are being introduced in tandem with anti-discrimination legislation (ILO, 2018). Critically, the General Comment makes clear that quotas and other affirmative actions will not work if they are introduced in isolation, that where they are put in place they should form “part of a holistic approach.” Part of this holistic approach must be the existence a strong legislative and policy framework around discrimination. Non-discrimination laws will not alone address exclusion, but they provide an important basis upon which other policy responses can be built (Heymann et al., 2022).

The General Comment is important in that it provides a set of measures that should underpin affirmative action measures, including quotas, if they are to be considered in line with the CRPD. For example, as highlighted above, there is concerns that quotas may not work for all persons with disabilities and so the Committee highlights the importance of “incorporating a disability, gender and age perspective” in the General Comment. This will have to be a critical line of inquiry for the Committee going forward.

The Committee also highlights the need for greater assessment and evaluation of affirmative action policies and their implementation this will be critical to establish how best affirmative action can support the meaningful employment of persons with disabilities and avoid many of the pitfalls and challenges that are consistently raised and identified. In elaborating further on what affirmative action that is in line with the Convention looks like the General Comment provides an important framework upon which existing and new affirmative action policies should be assessed and developed. The Committee in its concluding observations often recommends that existing quotas should be implemented. While implementation remains a challenge, the elaboration made in the General Comment could also form the basis of recommendations by the Committee and support a more nuanced, evidence-based, approach to continuing to strengthen affirmative action.

While affirmative action goes beyond quotas, the dominance of quotas as an affirmative action measure remains clear and this is reflected in the input that the Committee received when preparing the General Comment, as well as in the Committee’s Concluding Observation. This may be a useful inflection point for the Committee, academia, and civil society to reflect on how to broaden discussions around affirmative action and ensure that a full range of affirmative action policies are being considered and developed by States parties.

Segregated Employment

As set out above, issues around segregated employment and lack of promotion of employment in the open labor market are often raised by the Committee in Concluding Observations.

The idea that persons with disabilities should be able to access employment in the open labor market is not new (or limited to persons with disabilities). Even prior to the development of the CRPD the UN Standard Rules on the Equalization of Opportunities for Persons with Disabilities (1993) promoted access to the open labor market by persons with disabilities.

The CRPD itself emphasizes the employment of persons with disabilities in a labor market which is open but does not specifically mention segregated workplaces. The CRPD Committee has also previously articulated the link between quality inclusive education and employment in the open labor market through General Comment number four.

The General Comment therefore provides an important articulation of what it means for States parties to provide employment that is open. The General Comment clearly articulates that any form of segregated employment is not in line with the CRPD. The issue of segregated employment is identified by the Committee as one of the major and ongoing violations of the rights of persons with disabilities. States parties should now take steps to transition away from segregated employment. The issues around segregated employment are multiple. Segregation is both a practical problem, in that there is evidence that it restricts wages and career progression, for example, but the idea of setting up segregated employment as a response to the low employment of people with disabilities is fundamentally built on a charity model of disability which cannot understand that people with disabilities can work on an equal basis with others when the right conditions are in place.

The interpretation of the Convention on this issue is not without complexity. For example, Australia in its input to the General Comment makes the case that while persons with disabilities should not *only* be able to access employment in segregated settings the wording of the CRPD suggests that alternative forms of employment should not be prohibited, as long as they are not the only option (Government of Australia, 2022).

For some States parties segregated employment plays a significant part of their policy framework for attempting to increase the employment of persons with disabilities and therefore this transition will be complex. This is of course not to say that these States parties should not now transition away from segregated employment, but it is important to recognize that this transition may take some time. The General Comment recognizes this and so makes it clear that during this transition process segregated workplaces should be providing equal pay. In fact, ensuring that persons with disabilities received equal pay during this transition will be critical in starting to dismantle some of the pervasive norms and perceptions of the value of persons with disabilities' work that often underpin a model which favors segregated employment. The transition to a full open labor market must also ensure that it does not disadvantage those persons with disabilities who have always worked in segregated employment and therefore may not have had the opportunities to secure qualifications or skills which might be required in the open labor market.

The Role of Families and Discrimination by Association

As set out in the CRPD both persons with disabilities and their family members should receive protection and assistance to the extent to which "it enables families to contribute towards the full and equal employment of the rights of persons with disabilities" (OHCHR, 2006).

How the CRPD and its General Comments include families and caregivers of persons with disabilities remains an often-contested discussion for important reasons. The purpose of the CRPD is to protect and promote the rights of persons with disabilities themselves. Therefore, families and caregivers are not, and should not be, the priority of the CRPD. However, to ignore the important role that families and caregivers play in supporting some persons with disabilities to access their rights would be to ignore the reality for persons with disabilities.

Added to this, discrimination is often based on the negative stereotypes and attitudes that people hold about disability and, as such, families and caregivers can also experience discrimination because of their association with persons with disabilities, which can also have an impact on persons with disabilities. For example, a woman with a child with a disability might be assumed to be an unreliable employee and not given a position. This discrimination impacts on the woman herself, but it also impacts on her child. The discrimination in this case arises because of discrimination relating to the negative attitudes to disability, although it is directed at the person without a disability.

The General Comment therefore recognizes discrimination by association. This does not undermine the fact that persons with disabilities are the primary focus of the CRPD and does not deny the reality that discrimination and abuse of persons with disabilities often comes from those who are closest to them.

Informality

People with disabilities, and particularly women with disabilities, are disproportionately represented in the informal sector (Mizunoya & Mitra, 2013), where they will often have poorer job security, limited protections and limited access to accountability and redress mechanisms if they do experience discrimination.

Many of the issues discussed in relation to formal employment are also applicable to informal employment, but the responses required may be different and are often poorly understood.

The General Comment recognizes the need for states to respond to informality in employment in three ways: by protecting and supporting people in the informal economy, promoting and accelerating the transition to the formal economy, and preventing work in the formal economy from becoming informal. At the core of these responses is the need to reduce discrimination, through policy and legislation and behavior change among other mechanisms.

It is critical that protecting those in the informal economy is considered in the design, implementation, and accountability of policies around employment. The Committee has an important role in monitoring the implementation of the Convention in ensuring that in working towards the right to work and employment states are considering both formal and informal sectors.

Looking Forward: Emerging and Interconnected Issues and the Right to Employment

The Changing World of Work

In many places the nature of work is changing and will continue to change (World Bank, 2019). The General Comment recognizes that States must ensure that they respect, protect and promote the rights of persons with disabilities as these shifts occur and highlights specific areas such as the gig and platform economies and the transition to a green economy. Many of these changes will also interact with issues around informality.

The General Comment provides a framework for implementation of Article 27 across very different labor markets and contexts globally, and so it is also important to recognize that these shifting dynamics in work and employment will likely raise new concerns and issues for States parties. While these changes do not alter the rights that the CRPD provides, they may see new manifestations of existing discriminations and also present new opportunities for inclusion.

States, the Committee and civil society must continue to develop their understanding of how employment and labor markets are changing and the potential risks that this holds for persons with disabilities and their right to employment.[4] States parties and other relevant stakeholders should also be cognizant of the opportunities, changes in the labor market hold, and maximize the inclusion of persons with disabilities.

Unpaid Care

As highlighted, the Committee have repeatedly emphasized that women with disabilities face disproportionate barriers to realizing the right to work and employment.

The Covid-19 pandemic has brought to the forefront the recognition of the importance of, and lack of attention paid to, unpaid care as a rights and development

---

[4] Some research is beginning to emerge in these areas, see for example Harpur and Blanck (2020) but this is still limited and largely in high-income settings.

issue.[5] Unpaid care and employment are intrinsically linked, with policies around care impacting significantly on people's, particularly women's, employment (Charmes, 2019). The disproportionate impact of unpaid care is one barrier to equal access to employment for women, with social and gendered norms and assumptions that women should play the main caregiving role significantly contributing to this (Sepulveda, 2013).

The ILO has included unpaid work in its definition of work (ILO, 2006) and the Sustainable Development Goals reflect unpaid care and domestic work in Goal 5 on gender equality. Although it is also notable that the indicators for the target require states to disaggregate by sex, age, and location, but not disability. In their contribution to the preparations for the General Comment Women Enabled International highlight that where "caregivers or care recipients are persons with disabilities, the opportunity costs of care work are often exacerbated" (Women Enabled International 2022). There is often little attention paid to disability within the dialogue around the impact on the unequal impact of unpaid care on women with disabilities, and if there is attention paid to disability it is by recognizing persons with disabilities as recipients but not also caregiver themselves.

Addressing the unequal impact of unpaid care on women, including women with disabilities, is critical if states are to achieve substantive equality. The General Comment specifies "unpaid work" as an arena where states parties should address exploitation, and highlights the need for affordable, accessible, and appropriate childcare. The General Comment therefore begins to make the link between employment and unpaid care for women with disabilities and provides a useful step forward which should be built upon by the Committee in monitoring the Convention and in future General Comments.

Social Protection

A full discussion of the importance of comprehensive social protection systems for persons with disabilities sat outside of the scope of this General Comment, although it was highlighted by contributors as a key consideration in realizing the right to employment. Social protection for persons with disabilities has often been tied to their "inability" to work (Devandas-Aguilar, 2015). The provision of social protection for persons with disabilities who are unable to work, be that temporarily or permanently, is a critically important element of any system. However, the dominance of this type of social protection can be argued to be linked to the underlying assumption that persons with disabilities cannot work, driven by ableism, and therefore the role of social protection is purely to "replace" income from employment. However, social protection should also play an enabling role in supporting persons with disabilities to access employment as well as covering the additional costs that persons with disabilities experience when participating in society on an

---

[5] See, for example, the inclusion of care in the World Bank IDA's policy commitments.

equal basis with others. The General Comment makes an important statement in this regard by setting out that persons with disabilities should "not lose the benefit of disability allowances when they start work."

Conclusion

The General Comment on work and employment is a useful point for States parties, civil society, and other stakeholders to reflect on what is needed to ensure that the right to work and employment is achieved for persons with disabilities.

For States parties it provides critical guidance on areas of complexity surrounding the right to work and employment and it advances understanding on how to realize the right to employment.

The General Comment clearly articulates that the right to employment for persons with disabilities will not be achieved through one approach alone and States parties must adopt holistic and comprehensive approaches. This includes a comprehensive and cross-sectoral policy framework that not only supports people to be employed in the formal sector, but that also breaks down barriers to achieving the right to work in the informal sector.

Substantive rights under the CRPD continue to be explained and articulated through the General Comment, and it also brings to the forefront newer or more contested areas that it will be important for States to address and for the Committee to monitor and raise through its ongoing review process.

poverty. These policies, however, need to be carefully designed to promote sustainable employment for persons with disabilities and avoid creating poverty traps. This chapter argues that social protection and employment policies for persons with disabilities should be approached through systematic disability mainstreaming, meaning treating persons with disabilities within the mainstream systems and services provided to persons without disabilities, to avoid perpetuating difference and disadvantage, and holding mainstream institutions accountable for reaching persons with disabilities. Individualized, targeted approaches are key, but they are key for everyone who needs support, irrespective of where the need for support originates from.

This chapter consists of four parts: an introduction with selected key poverty and employment figures for persons with disabilities in OECD countries; a section on the poverty-preventing role of social protection; a section on employability, employment promotion, and poverty traps; and a policy conclusion with focus on the need for rigorous disability mainstreaming.

Keywords

Poverty · Social protection · Labor market · Skills · Mainstreaming

Introduction

People with disabilities face large poverty risks, making social protection critical in breaking the link between poverty and disability, by covering the additional costs of disability and promoting employment. However, a real change will require shaking up the existing system, and thinking about policy differently, through a rigorous mainstreaming of all policies.

- **The link between poverty, employment, and disability is inextricable, as disability is both a cause and consequence of higher poverty levels and lower employment rates**. The data are unequivocal: People with disability (PwD) face higher poverty risks than people without a disability (PwoD), in part because their employment rates remain stubbornly low.
- **Social protection is necessary to prevent PwD from falling into poverty**. Benefit adequacy considerations must take a holistic view of the benefits system, as many PwD depend on top-ups provided through social assistance or, more often, on social assistance payments altogether.
- **Policy efforts to promote the employment of PwD must be oriented toward preventing people from getting to a stage from which there is no sustainable return to work**. This can be supported by policies promoting the early identification of barriers to employment, giving a greater role to the stages preceding application to disability benefits, i.e., sickness insurance and unemployment insurance.

- **Closing the skills gap is a condition for closing the employment gap of PwD**, which starts with inclusive education. OECD countries need to make efforts in ensuring inclusive mainstream secondary schooling, including apprenticeships and vocational schools, and in promoting an inclusive transition to the labor market. Public Employment Services also have a great role to play in promoting the transition from school to the labor market and ensuring the continuous learning and upskilling of PwD.
- **Truly achieving a policy transformation that promotes the employment of PwD while ensuring their safety net requires a rigorous mainstreaming of all policies** – in education policy, labor market policy, and social protection policy. Mainstream systems should follow the principle of personalization and individualization of supports and be accountable for the inclusion of PwD, in line with the UN Convention on the Rights of Persons with Disabilities.

Poverty, Employment, and Disability

A Large Share of People with Disability Live in Poverty Across OECD Countries

On average across OECD countries, almost one in four PwD live in a household with an income level below the poverty line (60% of the median). Figure 1 shows that poverty of PwD has steadily increased, from 18% of households with PwD living in poverty in 2005 to 23% in 2019. When comparing the poverty rates of households with PwD to those without PwD, we note that both the level and trends are grimmer for PwD. In 2019, 13% of households without PwD lived in poverty, resulting in a disability poverty gap (calculated as the difference in poverty rates between PwD and PwoD) of 10 percentage points. This disability poverty gap has doubled since 2005 due to a deterioration in the relative income position of PwD. What are the reasons behind this strong and persistent link between poverty and disability? The following sections unravel some of the key elements of this discussion.

Intergenerational Transmission of Disadvantage Is Stronger for People with Disability

PwD are more often raised in vulnerable settings, and more likely to become (or remain) poor themselves, making the intergenerational transmission of disadvantage a real challenge for PwD. Table 1 below shows that PwD have a substantially higher probability than PwoD of having lived in households in a bad or very bad financial situation during their youth. Low parental income puts children and young people at a disadvantage by limiting the resources available to be invested in promoting their well-being and developing their human capital. The children of poor

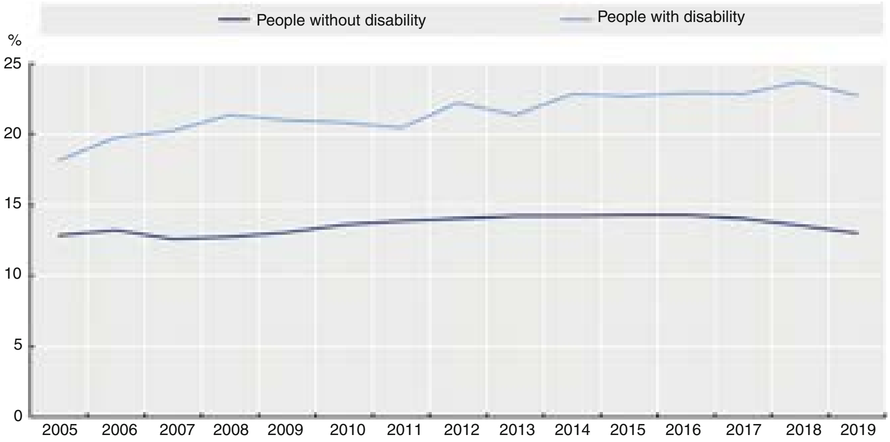

Fig. 1 The poverty rate of persons with and without disabilities across OECD countries.
Note: The data show relative income poverty, i.e., the share of people with and without disability living in a household with an income below 60% of the median income. Household income is equivalized for household composition by dividing by the square root of the size of the household. The data shows the unweighted average for a set of OECD countries, namely, Australia, Austria, Belgium, Canada, Chile, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Korea, Latvia, Lithuania, Luxembourg, Mexico, the Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, the United Kingdom, and the United States. (Source: OECD calculations based on the European Union Statistics on Income and Living Conditions (EU-SILC, 2008–2019) for European countries. The Household, Income and Labour Dynamics in Australia Survey (HILDA, 2008–2017); the Canadian Income Survey (CIS, 2013–2019) provided by Employment and Social Development Canada; Chile's: Encuesta de Caracterizacion Socioeconomica Nacional (CASEN, 2016–2017); Mexico's Encuesta Nacional de Ingresos y Gastos de los Hogares (ENIGH, 2016); the Korean Labour & Income Panel Study (KLIPS, 2008–2018) and the United States Current Population Survey (CPS, 2008–2018))

parents are more likely to be poor adults than children that did not grow up in poverty (Bird, 2010). The fact that PwD are more often exposed to poverty when growing up than PwoD puts them at a higher risk of being poor when adults than PwoD. An additional factor, however, is that the strength of the intergenerational transmission of poverty may be stronger for PwD, especially for children with disabilities growing up in poor households. Children with disability have more health care needs and require more support to pursue education, and more time and resources to promote their well-being. In a context of financial and time deprivation, these needs may be more difficult to meet, resulting in lower development and a stronger transmission of poverty for children with disabilities than for children without disabilities (van der Mark et al., 2017). Table 1 can also be interpreted from another angle, by which disability is a consequence of poverty. Income and resources appear to affect health in early developmental stages (Cutler et al., 2011), which could affect adult health and the development of a disability. The additional costs related to having a household member with disability (either in terms of foregone work income and additional expenditures) can also cause financial hardship. Either way, poverty and disability are interlinked, which is a solid

Table 1 Intergenerational transmission of disadvantages hits people with disability harder. Parental and financial situation of respondents when aged 14, 2019

	People without disability (PWOD) (%)	People with disability (PWD) (%)	Difference (PWOD−PWD)
Living in a household with bad or very bad financial situation	8.98	16.61	−7.63***
Living in a household with moderate financial situation	54.31	55.02	−0.71**
Living in a household with good or very good financial situation	36.70	28.36	8.34***

Parental and financial situation of the respondent when aged 14. Respondents are aged 15 to 59 in 2019. Significance stars correspond to significance of a t-test of equal means between PWoD and PWD. *** p-value <0.01, ** p-value <0.05. Observations are 130,706 for PWoD, and 24,943 for PWD. Data represent 25 European countries: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Latvia, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, and United Kingdom

argument for promoting disability-inclusive poverty reduction and (social) development strategies (World Bank, 2015).

Persons with Disabilities Face Stubbornly Low Employment Rates

PwD are not able to overcome the poverty-disability link by thriving in the labor market. PWD have stubbornly low employment rates, which is one of the key challenges of disability policy (OECD, 2010a, 2022b). Figure 2 below shows the employment rates of PwD and the gap in employment rates between PwD and PwoD on average across the OECD area. The crisis of 2008–2009 has affected employment rates of PwD and PwoD similarly (employment rates fell by 5.66% between 2008 and 2010, compared to 5.13% for PwoD). However, the recovery of PwoD has been faster, particularly in the past 3–4 years prior to the COVID-19 crisis. As a result, the disability employment gap has been widening over the past few years. More recent data suggests that the disability employment gap may have even further widened as a result of the COVID-19 crisis, at least for some countries (see the Office for National Statistics (2020) for the UK, and the Bureau of Labor Statistics (2022) for the USA). The postpandemic recovery for PwD, in the context of the current economic and inflationary shocks, are yet to be seen.

Limited improvements in employment rates of PwD and the unchanged disability employment gap are disappointing given the improvement over the past 15 years in the level of educational attainment of PwD (OECD, 2022b). This suggests that the necessary policy transformation that many countries have started over the past decade has not gone far enough, an aspect that will be discussed further below in this chapter.

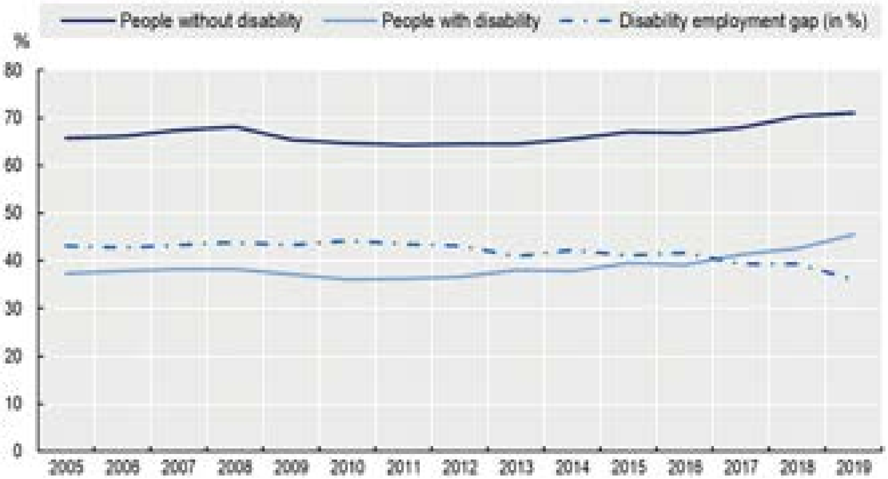

Fig. 2 Employment rate for people with disability and gap in the employment rate, calculated as the percentage point difference of rates of employment of people without disability and people with disability.
Note: data cover persons aged 15–69. The data shows the unweighted average for a set of OECD countries (see Fig. 1). (Source: OECD calculations based on European Union Statistics on Income and Living Conditions (EU-SILC, 2005–2019) for European countries; the Household, Income and Labour Dynamics in Australia Survey (HILDA, 2005–2017); Chile's Encuesta de Caracterizacion Socioeconomica Nacional (CASEN, 2006–2017); Mexico's Encuesta Nacional de Ingresos y Gastos de los Hogares (ENIGH, 2010–2016); the Korean Labour & Income Panel Study (KLIPS, 2008–2018) and the American Community Survey (ACS, 2008–2018). Data for Canada provided by Employment and Social Development Canada based on the Canadian Income Survey, 2013–2019)

A core reason behind the low employment rates of PwD is that it is harder for them to be hired and to stay in the labor market. Figure 3 below shows that, for European OECD countries, getting into the labor market is much more difficult for PwD than for PwoD (Panel A), and dropping out of the labor market is much more frequent for PwD than for PwoD (Panel B). Further disaggregation of these findings by demographic characteristics sheds further light on these labor market dynamics:

- Hiring rates drop sharply for older workers, which is true for PwoD as well. The disability gap in hiring rates is relatively small for both young workers (age 15–29) and older workers (age 50–69), with only a 2.5 percentage point difference on average (Panel A). However, the gap is very large for prime-age workers (age 30–49): In this age group, the annual hiring rate is only 10% for PwD but over 25% for PwoD. The disability gap in hiring rates increases with the level of educational attainment and is, on average, 1.5 times larger for men than for women.
- The labor market exit rate, i.e., transitions from employment to inactivity, is significantly larger for young and older workers, irrespective of their disability

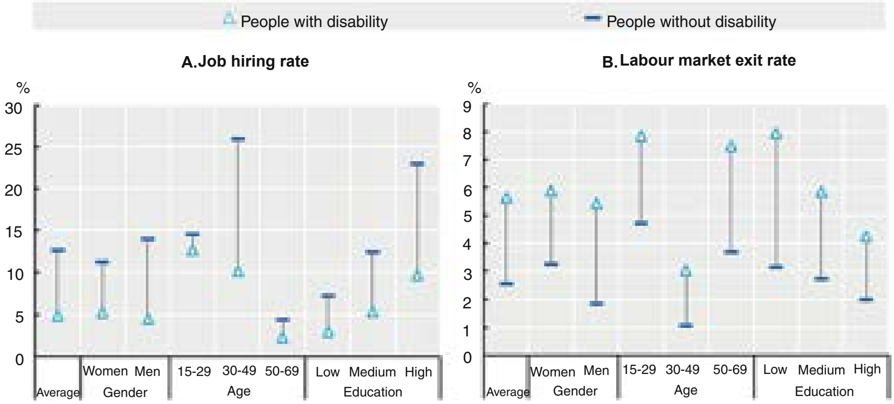

Fig. 3 Labor market transitions by disability status and demographic characteristics, average of 26 European OECD member countries, average over 2016–2019.
Note: Data show the unweighted average of the 25 European OECD countries as listed in Table 1. People with disabilities are defined as those who 1) declared to suffer from any chronic illness or condition and 2) with moderate to severe activity limitation due to health problems. Levels of education are defined according to the International Standard Classification of Education (ISCED), where low refers to below upper-secondary, medium to upper secondary, and high to tertiary education. Labor market transitions refer to individuals moving from one employment status to another in the year before the survey. Panel A: The job hiring rate is the share of those who are employed by the time of the survey but did not have a job the previous year, over the nonemployed. Panel B: The labor market exit rate is the share of those who were inactive at the time of the survey, but the previous year were employed, out of all the employed. (Source: OECD calculations based on European Union Statistics on Income and Living Conditions (EU-SILC, 2016–2019)

status. The likelihood of exiting the labor market is much higher for PwD in all sociodemographic groups, suggesting that many workers exit the labor market permanently due to health problems or disability (Panel A).

Persons with Disabilities Earn Lower Wages

PwD not only work less often than PwoD, but when they work, they tend to earn less. The average wage of PwD is about 85 to 87% of the average wage of PwoD (Fig. 4). There is substantial variation across countries. In some OECD countries, for instance, Korea, Mexico, the Baltic countries, Sweden, and Norway, the disability wage gap is (still) very large. In other countries, like Austria, Australia, and the Netherlands, PwD earn 90% or more of the wage of PwoD, and Greece and Italy appear not to have any disability wage gap. In the latter two countries, this is coupled with a very low employment rate among PwD; hence, selection effects seem to be at stake.

The disability wage gap can result from discrimination against PwD, due to stereotypes or preconceptions about PwD's productivity. Ameri et al. (2017) find that PwD face discrimination during the hiring process, as they are less likely to be called for an interview. This discrimination could also translate into lower pay.

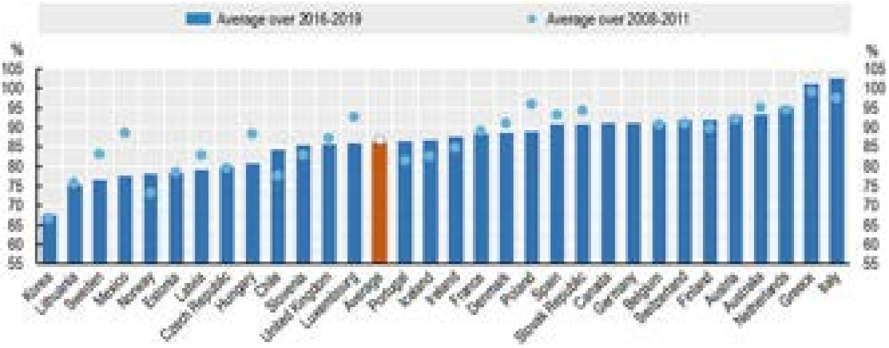

Fig. 4 Average annual full-time wage of people with disability over people without disability. Note: Data refer to annual employee wages employee cash or near cash income for employees and cash profits or losses from self-employment for persons self-employed (European countries); main labor income in cash (Chile); financial year gross wages and salary (Australia); average hourly wage excluding self-employed and the Canadian Armed Forces (Canada); total after-tax yearly earned income (Korea); main wage in main work, piece rates, commissions, payment for extra hours in main work, incentive pay, bonus, holiday pay and cash income second job (Mexico), and total wage and salary earnings (United States). The period 2016–2019 refers to 2012–2015 (Korea). The orange bar is the unweighted average of the countries shown excluding Canada and Germany which do not have data for the earlier period. (Source: OECD calculations based on European Union Statistics on Income and Living Conditions (EU-SILC, 2008–2019) for European countries. Exceptions: 2016–2018 (Belgium, Iceland, Ireland, Italy, and the United Kingdom). The Household, Income and Labour Dynamics in Australia Survey (HILDA, 2008–2017); the Canadian Income Survey (CIS, 2016–2019) provided by Employment and Social Development Canada; Chile's Encuesta de Caracterizacion Socioeconomica Nacional (CASEN, 2010–2017); Mexico's Encuesta Nacional de Ingresos y Gastos de los Hogares (ENIGH, 2016); the Korean Labour & Income Panel Study (KLIPS, 2008–2018), and the United States Current Population Survey (CPS, 2008–2018). Panel B: European Working Conditions Survey (EWCS)

Selection into different occupations and working arrangements can play a crucial role in explaining the disability wage gap. US Census Bureau research shows that PwD often work in certain low-paid occupations, and that among people working similar jobs and schedules, the median earnings for PwD are very close to the earnings for PwoD (Cheeseman Day & Taylor, 2019). Other research for the UK finds that the disability wage gap only halves when taking into account differences in characteristics, such as selection into low-paid occupations, part-time work, and a lack of high-level qualifications (Longhi, 2017). This indicates a substantial need for both policies to support the upskilling of PwD, and to address demand-side discrimination against PwD.

Adequate Social Protection: Breaking the Link Between Poverty and Disability

Social protection is essential in breaking the link between disability and poverty, particularly among those with severe disabilities who cannot work. By providing adequate social protection that prevents poverty, governments can support their citizens in making productive human capital and health investments, thus promoting their well-being and self-sufficiency (Hoynes et al., 2016; Brown et al., 2020). In the case of disability, social protection may also prevent the occurrence of extreme events: Deshpande, Gross, and Su (2021) show that receipt of disability allowances reduces the likelihood of bankruptcy, foreclosure, and home sale, which reflect reductions in financial distress. When well designed, social protection can be a powerful, and necessary, tool to support PwD.

Most countries provide disability-specific social protection programs for PwD that are granted after a certification of disability or long-lasting health issue. These are disability benefits and pensions, but also sickness benefits, especially when these can be granted for a long time. When evaluating the social protection coverage of PwD, however, focusing only on these *health-related* benefits is likely to give a partial picture of the true extent of social protection use. For instance, some PwD are excluded from health-related benefits if they do not have sufficient social security contributions, leaving them to rely on social assistance and means-tested programs as their sole source of income. Even when eligibility is ensured, health-related benefits may be too low and social assistance may play a key role in supplementing disability payments. This creates a strong nexus between the contributory, *health-related*, benefits and the noncontributory, *assistential*, system when it comes to supporting PwD. More generally, it also means that it is crucial to keep a holistic view of the social protection system when assessing how well PwD are covered and supported by social protection.

Vulnerable Persons with Disabilities Are Well Covered by Social Protection

The coverage of social protection programs is good in most OECD countries, as most PWD not working are supported through at least one type of income-replacement benefit. On average across the OECD, 87% of PwD with severe disability and not working receive any benefit, ten percentage points less for those with a moderate disability (Fig. 5, Panel A). Differences across countries are fairly small, with only a handful of countries having a coverage below 80% for those people with severe disabilities and not working. The differences in coverage between people with moderate and severe disabilities are also similar across countries, ranging between 5 to 10 percentage points, except for Iceland and Italy.

Country differences appear much larger when looking at narrowly defined *health-related* benefits only, i.e., sickness and disability benefit programs. Across all OECD countries, one in two nonworking persons with severe disability and one in four with moderate disability receive a health-related benefit (Fig. 5, Panel B). Country differences range from only 20% for people with severe disability in France to almost 70% for persons with moderate disability in Norway. This reflects how the role of different working-age benefits varies across countries. In Nordic countries, disability and sickness benefits are generous and with lenient eligibility criteria, while in other countries social assistance plays a greater role.

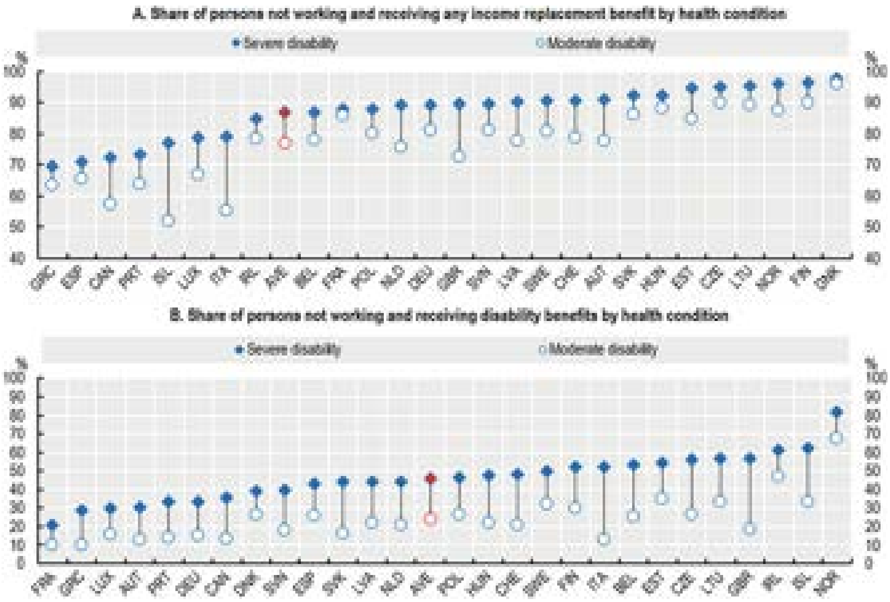

Fig. 5 Share of persons not working and receiving income replacement benefits by health condition.

Note: Any income replacement benefits include disability, sickness, unemployment, old age, and social assistance benefits. For Canada, any income replacement benefits include health-related or unemployment or old age or social assistance and refer to 2017. The purple markers (AVE) represent the unweighted average of the 26 countries shown. Data are not available in 2019 (Belgium, Ireland, Iceland, Italy, and United Kingdom) and 2018 (Estonia). (Source: Data provided by Employment and Social Development Canada based on the Canadian Survey on Disability, 2017, and European Union Statistics on Income and Living Conditions (EU-SILC, 2016–2019))

These charts show that, in many countries, PwD are frequently supported through social assistance, i.e., a mainstream program, rather than disability or health-specific benefits. This raises a more general question: **Can PWD be covered through mainstream programs (such as social assistance benefits), or are they better off when covered through specific programs (such as disability programs)**? To answer this question, the following section looks at the poverty-alleviating effects of social assistance and health benefits.

The Poverty Reduction of Social Protection Is Not Very Large Despite the Broad Coverage

Beyond social protection coverage, it is also crucial to look at its poverty-prevention role. To do so, one can look at how poverty would look like for PwD would there be no social transfers. Figure 6 shows that across European OECD countries, social protection prevents almost 50% of persons with disabilities from falling into poverty.

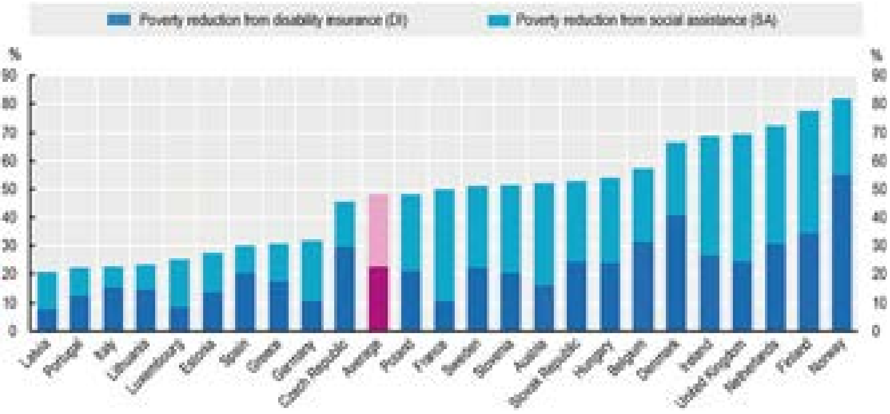

Fig. 6 Change in poverty headcount pre- and postsocial transfers, 2019.
Note: Poverty headcount among persons with disabilities is defined using 60% of median-equivalized income as poverty line. All poverty reductions are calculated as the actual poverty headcount minus the hypothetical poverty headcount resulting using a pretransfer (DI, SA, or SP) share of income. Pretransfer income is calculated following Ravaillon (2008). This approach assumes that in the absence of social insurance, individuals will self-insure (work more, intrahousehold substitution, etc.), but only partially compared to social insurance. For social assistance, it assumes two behavioral responses: (1) Pre-DI income is measured by subtracting to the equivalized income 50% of the equivalized income from disability benefits; (2) pre-SA income is measured by subtracting to the equivalized income 100% of the equivalized income from social assistance. SA includes cash-based means-tested programs (e.g., social assistance, child support, and any other social exclusion program). The purple bar represents the unweighted average of the countries shown. (Source: OECD calculations based on the European Union Statistics on Income and Living Conditions (EU-SILC))

Seen differently, however, this means that **more than 50% of PwD fall into poverty despite the coverage of social protection**, meaning that there is still a long way to go in eradicating poverty through social protection. Disaggregating this result by type of benefit lifting PwD out of poverty reveals substantial differences across countries. Social assistance has a greater impact on the poverty reduction of PwD than disability benefits in countries where disability insurance has strict eligibility conditions (e.g., Austria), or where disability benefits are low and often topped up by means-tested support (e.g., the UK). Instead, in Mediterranean countries (where take-up of social assistance is low) and most Nordic countries (where disability benefits are generous), disability benefits have a greater poverty-alleviating effect than social assistance.

Extra Costs of Disability May Not Be Well Accounted for in Social Protection Programs

How is it that despite the substantial coverage of PwD in social protection programs their poverty-alleviating role remains limited? A potential argument is that benefits may be too low for PwD, which makes it crucial to think about **PwD's extra direct and indirect costs of disability**. Direct costs refer to additional expenditures caused by a disability, i.e., higher costs for PWD and their families to access essential services or achieve social and economic participation. Indirect costs refer to foregone income due to limited access to education and barriers to gaining and retaining employment, as well as the foregone income for family members that give up school or work opportunities to provide support (Mont & Cote, 2020). Indirect costs may be captured in Fig. 6, where there is still a long way to go to eliminate PwD's poverty through social protection as PwD are not adequately supported through mainstream social protection, and are often excluded from disability benefits. Direct costs instead imply that the poverty level of PwD is underestimated when using standard poverty thresholds, as PwD will often have a higher level of consumption to maintain the same standard of living as PwoD.

The literature has relied on several **strategies for measuring the additional direct costs of disability** (see (Mont & Cote, 2020) for an in-depth review):

- **Goods and services used**. This approach surveys PwD to ask how much they have spent on goods and services necessitated by their condition. While straightforward, this strategy does not capture what the real costs for equal participation are, as it provides a measure of what is spent, which could be different to what is needed.
- **Goods and services required**. This method expands on the goods and services used approach by asking PwD what expenditures would be needed for equal participation, thus trying to approximate the realized and necessary additional expenditures of disability. This method however can be misleading, as it runs the risk of underestimating the costs, especially if PwD are not fully aware of what goods and services could potentially be available to them or could support them in equal participation.
- **Standard of living (SOL)**. This approach approximates the costs of disability by looking at the additional income needed for a household with PwD to achieve the same SOL as a household without PwD of similar characteristics. The main challenge of this approach is to measure a SOL. Zaidi and Burchardt (2005) propose three SOL indicators: (1) whether the household has any savings; (2) an index of possession of consumer durables; and (3) a subjective assessment of the household's financial situation. The SOL approach, with various SOL definitions, is frequently used as it can be implemented with most expenditure or living standards surveys, as long as they have questions identifying PwD.

Mitra et al. (2017) summarize the results of 20 studies evaluating the additional costs of disability using the three methods explained above. Estimated costs have a wide range, but most studies fall between the range of one-third to two-thirds of the average income, confirming the substantial direct costs of disability. These results need to be qualified by the severity of disability: persons with severe disabilities have costs of disability 30 to 50% higher than those with moderate disabilities, particularly on health-related expenditures, assistance with daily needs, and transportation costs (Zaidi & Burchardt, 2005; Cullinan et al., 2011; Vu et al., 2020). Higher costs are also estimated for PwD living alone or in small households, potentially explained by a more limited informal caregiving (Mitra et al., 2017). This means, however, that these costs could be indirect in larger households, as family members forego formal employment to give informal care. Morris and Zaidi (2020) evaluate how the poverty measurement of PwD changes when accounting for the additional costs of disability on a sample of older working-age adults. They find that on average across European countries, poverty among PwD doubles when considering the extra direct costs of disability.

Disability-Inclusive Social Protection Must Account for the Extra Costs of Disability

In line with the evidence of substantial additional costs of disability and its impact on perceived poverty, **how can mainstream social protection be designed to be inclusive to PwD by accounting for the extra costs of disability?** One first approach is to adapt means-tests to poverty lines that represent PwD, under the assumption that PwD require a higher income than PwoD to live out of poverty. Mont and Cote (2020) propose setting higher means-tested levels for PwD, to incorporate the additional income used for disability-related expenditures. Foregone income in the household should also be taken into account, as this could represent additional expenditures in care. A second approach is to set the right level of social assistance benefits by ensuring a guaranteed standard of living rather than a guaranteed minimum income. This means increasing the minimum level of benefits for PwD, for example, using equivalence scales that would give a higher weight to a PwD within a household, and calculating benefits accordingly (Mont & Cote, 2020). Another approach, which is implemented in many OECD countries, is to provide separate programs that cover the extra costs of disability. These programs can take the form of additional cash to cover disability-related costs (such as the attendance allowance in the UK), or in-kind benefits (Zantomio, 2013).

One approach to effectively support PwD would be to consider a more unified system of income support provisions for out-of-work individuals. As presented by MacDonald, Prinz, and Immervoll (2020), such a system could take the form of a (single) benefit to compensate for the loss of earnings and tailored extra support to respond to individual circumstances, including covering the extra costs of disability. Designing such an approach, which effectively aims at addressing the fragmentation of social protection through its mainstreaming, fits into the much broader debate on how to design social protection optimally. What role should social insurance have, compared to social assistance? The rising numbers of nonstandard workers pose a problem for traditional contributive social insurance, as just as with many PwD, they do not fit into the framework of social insurance (OECD, 2018). The need to make social protection future ready has brought the idea of a universal basic income back to the center of the debate (Gentilini et al., 2020). One argument frequently used against universal basic income is that there is limited empirical evidence on how such a program could look and be delivered. However, the increasing role that social assistance is playing is bringing most social protection programs to a state which is, conceptually, not too far away from that of a single working-age payment, but with numerous inequalities and poverty traps. This is particularly so for PwD, as social assistance in most countries is not disability inclusive and does not cater to the needs of PwD. Thinking about how to design social protection for all should thus be a priority among governments.

Employment Promotion: The Key to Preventing Poverty Traps

Providing social protection is key to preventing PwD from falling into poverty, by allowing them to cover the direct and indirect costs of disability and breaking the liquidity constraints that would prevent them from making investments toward self-sufficiency. However, as the vast majority of PwD receive disability benefits and other benefit income, often for most of their adult lives, it is a well-studied fact that social protection income may crowd out work income (Autor & Duggan, 2006). This is worrying, as the longer people rely on benefits without working, the more their skills depreciate and distance to the labor market increases, making it increasingly difficult to return to work. This generates a self-reinforcing mechanism, which can make PwD fall into poverty traps. To break the link between poverty and disability in a sustainable way, it is key to promote the employment of PwD. Governments may do so by designing social protection programs that focus on early intervention as a tool to promote the employment of PwD, and by ensuring that they have the skills to thrive in the labor market.

Designing Social Protection for Early Intervention

To promote the employment of PwD, policymakers should design disability benefit systems and, more generally, **social protection policies that aim at identifying barriers to work early and intervening quickly**. Early identification of barriers to employment requires giving a great role to the stages preceding application to disability benefits, in particular, during sickness benefit programs. Efforts made in the first months of sickness absence are crucial, as a return to work is very unlikely after a period of sickness absence of 5–6 months (OECD, 2015). One of the key elements to a successful return-to-work during sick leave is to secure the **strong involvement of employers** by introducing the right incentives to support a return to work (OECD, 2022a). Employer involvement can take the form of giving them a participating role in funding sick-leave compensation. The Dutch Gatekeeper protocol is a successful example of such a policy, by requiring employers and employees to draft a return-to-work plan, and the employer to finance sick pay for up to 2 years (Koning and Lindeboom, 2015). Employers' involvement can also be ensured through the promotion of graded return-to-work, which is shown to promote full return-to-work, at least in the short term (Meneses-Echavez et al., 2018; Kools &

Koning, 2019). Another key element to a successful early intervention is to **setting limits to the sickness scheme**, for instance, by capping the duration of sickness schemes, keeping a close monitoring of sick-listed individuals by regularly reassessing them, and avoiding overly generous sickness insurance programs (De Jong & Van Der Klaauw, 2011; Hägglund, 2013). Lastly, **return-to-work strategies should be flexible**, focusing initially on supporting a return to the previous employer, but expanding the support to the entire labor market as soon as a return to that employer is unviable (OECD, 2022a) and (OECD, 2022b). This expansion to the entire labor market requires a fluid cooperation with the Public Employment Services (PES).

A substantial share of PwD enters disability programs through the unemployment or social assistance system. Disability claimants not following the standard pathway of sickness insurance may fall between the cracks of standard early intervention measures, which gives a larger role to other institutions, such as the PES. Jobseekers must register with the PES in most OECD countries, which puts the institution in a good position to identify early barriers to employment among jobseekers and to support them. Once barriers to employment are identified, PES interventions should focus on finding new employment, with a strong focus on providing inclusive and personalized career guidance (OECD, 2022b). Participation in PES measures to find employment should not be automatically halted in the face of health issues or disability but rather should complement health rehabilitation (OECD, 2022a). This requires a strong cooperation between the PES and the health sector, which in most countries is insufficient.

Tackling the Skills Mismatch of Persons with Disabilities

PwD can only fill a vacancy or keep a job if they have the required skills and upgrade those skills in a constantly changing labor market. Yet, data suggest that the skills disadvantage of PwD is large, which makes **closing the skills gap is a condition for closing the employment gap of PwD**. Figure 7 shows the share of low literacy and numeracy skills among selected groups extracted from the PIAAC survey. Almost 50% of those with a permanent disability have low literacy skills and 55% have low numeracy skills. This compares to just over 20% and 25%, respectively, for the total population; 30% and 35%, respectively, for older workers; and 40% and 45%, respectively, for the low-educated population. Is it important to note that the PIAAC data only include information on persons with permanent disabilities, e.g., those who say that “permanently disabled” best describes their current labor market situation. This group likely contains those with more severe disabilities who are furthest away from the labor market. This substantial skills gap should therefore be seen as an upper bound estimate of the share of those with disabilities with low skills.

The education and skills gap start very early in life (OECD, 2022b), and so policies should first focus on **providing inclusive education to all**. Countries have made considerable efforts toward inclusive education systems: first, through the

Fig. 7 Share of low literacy and numeracy skills aged 15–69 among selected groups, OECD average, 2019.
Note: See https://www.oecd.org/skills/piaac/Key%20facts%20about%20the%20Survey%20of%20Adult%20Skills.pdf for definition of low skills. With permanent disability: "permanently disabled" best describes their current labor market situation. Older: aged 55–65. Low-educated: below upper secondary education. Data for Belgium refer to Flanders. OECD is an unweighted average and excludes countries not participating in PIAAC (Colombia, Costa Rica, Iceland, Latvia, Luxembourg, Portugal, and Switzerland) and countries with low number of observations (Australia, Japan, Sweden, and Tûrkiye). (Source: OECD calculations based on the Survey of Adult Skills (PIAAC), https://www.oecd.org/skills/piaac/)

identification of special education needs, and second through the enrollment of young PwD in mainstream classes. Efforts should continue to achieve a greater inclusion of PwD in mainstream classes, not through disability labeling, but by implementing inclusive education principles, which rely on individualized educational planning and understanding the needs of every child. Inclusive schooling has become the norm in many countries at primary school age but not at higher levels of education. For many young PwD, the transition to mainstream secondary school, including vocational schools and apprenticeships, and correspondingly also mainstream tertiary education, is still difficult. To complete the transition toward inclusive education systems, countries need to focus on ensuring that secondary and tertiary education is also inclusive.

PES play a key role in supporting the transition from school to education, and in providing adult learning that makes up for lower levels of education and skills. Data show that few PwD that receive sickness and disability benefits participate in PES-provided adult learning (OECD, 2022b). A principal reason for this is that few PwD register with the PES. Increasing the number of persons on incapacity benefits who register with PES is an essential first step toward promoting adult learning rates among PwD. The second key step is to tackle the motivational barriers of PwD by making adult learning relevant for employment. To do so, PES should focus on providing programs that aim at improving basic skills, including digital skills, and that are practical, such as work-based learning.

Linking social protection to policies supporting the transition from school to education is crucial to support young people with disability, including those with congenital disabilities, thrive in the labor market. On its own, social protection for young people with disability may result in lower employment during adulthood, by giving rise to perverse incentives and a welfare culture. On the other hand, school-to-work supports and services alone are not sufficient for many young people with disability, as they do not provide the safety net necessary to enable investments in human capital for young people (OECD, 2022b).

Policy Discussion: A Need for Rigorous Mainstreaming

This chapter has illustrated not only the critical role of social protection in providing a safety net to PwD, but also its importance in promoting the employment of PwD when combined with early intervention and measures to close the disability skills gap. Over the past decades, countries have made considerable efforts to make disability programs more active and compatible with work, with a focus on early intervention during sickness insurance. Yet, PwD continue to face high poverty levels, largely because their work potential has not been unlocked. This suggests that the necessary policy transformation is incomplete and **resources invested in creating equal opportunities for PwD continue to be insufficient**:

- The share of rehabilitation and employment-related measures in total spending on incapacity across all OECD countries has barely changed from 9% in 2007 to 10% in 2017.
- The focus in policy has been on promoting employment efforts in disability benefit programs, not recognizing that people applying for a disability benefit will often have had fragile and interrupted employment experiences and may have been navigating the welfare system for years. Interventions should start early in life or as soon as any barriers to employment become visible.
- The skills gap has not been tackled sufficiently. Despite longer schooling and school completion at a higher average level, the education and skills gap has not closed, or not enough. This means that PwD are still less skilled than PwoD and thereby often less attractive to employers.

Truly achieving a policy transformation that promotes the employment of PwD while ensuring their safety net within existing systems and structures appears difficult. Current systems and structures tend to support PwD through special programs and measures, almost always requiring a disability certification, which in most cases delays intervention and creates difference between PwD and PwoD. In addition, current structures generate dualities in how PwD are supported: Some fall under the coverage of special programs, while others are covered by mainstream programs. Yet, current mainstream programs are not necessarily disability inclusive, generating unfairness within the group of PwD. The United Nations (UN) Convention on the Rights of Persons with Disabilities proposes a new thinking approach, by calling on

States parties to ensure that persons with disabilities receive equal access to mainstream social protection programs and services as well as access to specific programs and services for disability-related needs and expenses such as support services. More generally, there is a need to think about **how can all PwD be better supported through mainstream supports and institutions** – in education policy, labor market policy, and social protection policy.

A first key element of disability mainstreaming is the **personalization and individualization of supports**. Individualized, targeted approaches are key, but they are key for everyone who needs support, irrespective of where the need for support originates from. Policies should aim at actively understanding and reducing the impact of any barriers, including barriers and disabilities, within all mainstream systems.

A second element of disability mainstreaming is to ensure that **mainstream policies are accountable for disability inclusion**. Successful mainstreaming requires strong responsibilities for all stakeholders and institutions, including PwD themselves. It also relies on the application of the principle of full participation and equalization of opportunities for, by, and with people with disability (*Nothing about Us, Without Us*).

Disability mainstreaming will need to be different in the future and **expanded to all policies and services**. This is also important in view of the big ongoing shifts in the economy and labor market, which come with new risks and new opportunities. For PwD to benefit fully and equally, a mainstreaming approach should take into account the diversity of PwD, and be adopted through all areas of policy to avoid that future risks outweigh future opportunities.

Abstract

Persons with psychosocial disabilities face.

Introduction

Despite the fact that many African countries have signed and ratified the UN Convention on the Rights of Persons with Disabilities (CRPD)[1] and adopted the Sustainable Development Goals (SDGs),[2] yet employment of persons with psychosocial disabilities in Africa is perceived to be much lower when compared to the general population and when compared to the different categories of disabilities. Considering the aspirations of SDG8[3] read with Article 27 of the CRPD,[4] there are substantial barriers to the participation of persons with psychosocial disabilities that need to be addressed.

Heightened levels of exclusion are often faced by individuals with specific types of impairments, such as persons with psychosocial disabilities, as well as by those experiencing multiple discrimination due to the intersection of disability with other aspects of identity such as gender and age.[5] There is generally a lack of data on disability and employment but available evidence suggests that people with disabilities are more likely to be unemployed than their peers without disability, especially youth and women.[6]

Women and youth with psychosocial disabilities face several barriers in access to employment in the open labor market that include attitudinal barriers related to mental illness, lack of supports in case of crisis, social stigma and discrimination, and perceptions of persons with psychosocial disabilities as lazy, destructive, and unproductive (Ebuenyi et al., 2020). Other barriers include the lack of social support,

social protection measures to cover disability related extra costs that are compatible with work including health insurance and denial of reasonable accommodation at workplaces (Ebuenyi et al., 2019).

While many impairments are observable, and thus are generally accepted by employers as requiring accommodation on the job (e.g., in the form of assistive technology, duty modifications, and assistive devices), a psychosocial disability is not obvious. Persons with psychosocial disabilities are denied reasonable accommodation discussed in the proceeding chapter (for example, flexible working hours, short but frequent breaks, breaking down large projects into smaller achievable tasks, minimizing environmental stimuli – noise, lights, access to a resting place in the middle of a working day) in work places because there is generally a lack of clarity as to their reasonable accommodation needs (Holness, 2016), as stipulated in Article 2 of the CRPD establishing that denial of reasonable accommodation constitutes discrimination on the basis of disability.

As observed by the Stakeholder Group of Persons with Disabilities for Sustainable Development, “Multiple intersecting factors restrict persons with disabilities’ access to decent work and employment, including: inadequate laws and policies; discriminatory social norms and hiring practices; a lack of access to education and training; unequal access to resources, information, technology and networks; accessibility challenges; lack of reasonable accommodations in the workplace.”[7]

Many women with psychosocial disabilities live in poverty; given that many are unemployed, those who are employed work mostly in marginal, seasonal, and menial jobs.[8] Indeed, persons with psychosocial disabilities in Africa are vulnerable to situations of forced labor and exploitation due to prejudice related to the misconceptions around their “mental capacity.”[9] Africa has the world’s youngest population, and it is growing rapidly. The 2030 Agenda for Sustainable Development underscores the importance of promoting rights of young people and meeting their needs, in all their diversity.[10]

Existing vulnerabilities and discrimination also need to be considered especially in the context of the COVID-19 pandemic and its aftermath. The marginalization faced by persons with disabilities in social, economic, and health terms, as well as limited access to public services, will add to the threat to lives and livelihoods that the COVID-19 crisis poses.[11]

This chapter has been developed from research conducted under the fellowship awarded to Dorothy under the "Making DPOs equal partners of inclusive development in Africa" project, funded by the Norwegian Agency for Development Cooperation (Norad), implemented by the International Disability Alliance and its members.[12] The focus of this particular fellowship was on women and youth with psychosocial disability and the right to employment under Article 27 of the CRPD.

Analytical Framework

The framework of this research initiative is based on the human rights related to work and employment in the CRPD and other human rights frameworks.

The right to work is a fundamental human right. The Universal Declaration of Human Rights recognizes that everyone has the right to work, to free choice of employment, to just and favorable conditions of work, and to protection against unemployment (art. 23, para. 1).[13] The right to work has been reiterated in different contexts in a number of human rights instruments, and as human rights are indivisible and interdependent, they must all be read as a continuum.

Referring specifically to persons with disabilities, Article 27 of the Convention sets out the right to work of persons with disabilities and constitutes one of the most detailed provisions of the Convention.

The Article opens with the reiteration of the right of persons with disabilities to work on an equal basis with others and emphasizes the free choice and acceptance of work, elimination of discrimination (including through provision of reasonable accommodation), and a work environment that is open, inclusive, and accessible to persons with disabilities. The Article also reflects the eight fundamental conventions related to rights at work as identified by the ILO[14] by addressing access to labor

---

[12] The project, implemented by the International Disability Alliance and the African Disability Forum, is working towards influencing the disability rights movement to shape the development agenda in sub-Saharan Africa towards the full and effective realization of human rights of persons with disabilities has increased. One important component of the project is supporting IDA's members' members in sub-Saharan African to develop and strengthen underrepresented groups of persons with disabilities by the disability rights movement, to build evidence for advocacy and engage in using this to reform laws, policies, programs, and/or hold governments and INGOs accountable for progress in leaving no person with disability behind. To this end, fellowships were awarded to members of IDA members of Down Syndrome International, Inclusion International, World Blind Union, World Network of Users and Survivors of Psychiatry, and World Federation of Deafblind. Dorothy Nakato is a fellow with the World Network of Users and Survivors of Psychiatry. This project is specifically focused ensuring that policies, programs, and investments necessary to realize their human rights are developed, implemented, and monitored with clear and evidence-based guidance and their direct participation, through their representative organizations. https://www.internationaldisabilityalliance.org/norad

[14] Forced Labour Convention, 1930 (No. 29), and the Protocol of 2014 thereto; the Freedom of Association and Protection of the Right to Organise Convention, 1948 (No. 87); the Right to Organise and Collective Bargaining Convention, 1949 (No. 98); the Equal Remuneration

and trade union rights, general technical and vocational guidance programs, employment services, career advancement, job retention, and return to work programs. Persons with disabilities are protected from servitude, slavery, forced or compulsory labor, on an equal basis with others. Importantly, the Article also addresses inclusion within the private sector. This Article has been further supported by the recent General Comment on Article 27 issued by the Committee on the Rights of Persons with Disabilities.[15]

Article 11 of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) mandates States Parties shall take all appropriate measures to eliminate all forms of discrimination against women in the field of employment, in order to ensure, on a basis of equality of men and women, the same rights.

Article 15 of the African Charter on Human and People's Rights[16] provides for every individual's right to work under equitable and satisfactory conditions and for equal pay for equal work.

Article 3(1) of the Protocol to the African Charter on the Rights of Women in Africa and the right to work reaffirms women's right to dignity inherent in all human beings.[17]

The researcher also considered the legal frameworks of the different countries included in the study (Uganda, Kenya, Malawi, Zambia, and Nigeria), such as national constitutions, employment legislations, disability legislations, mental health legislations, among others.

An important guiding point to this research were Dorothy's anecdotal experiences from her peer support work on the challenges that were being experienced by women and youth with psychosocial disabilities, which developed into a study.[18] In this chapter, based on the case studies collected during the research, the authors seek to highlight:

- Barriers that women and youth with psychosocial disabilities face in access to gainful employment in the open labor market
- Key elements that support access to the rights of women and youth with psychosocial disabilities to work and employment under Article 27 of the CRPD
- Recommendations to States Parties and Organizations of Persons with Disabilities towards realization of the rights under Article 27 for women and youth with psychosocial disabilities

Barriers and Enablers: Learnings from the KII Discussions

The study found that in general, employment is a huge challenge in these countries, especially for youth and women, due to many factors including lack of spaces and supports created for youth to join employment, social and cultural norms that hinder women from accessing employment, lack of policies and procedures for employment for the general public, and lack of disaggregated data on employment.

The employment situation for youth and women with psychosocial disabilities is worse due to the misconceptions and prejudice against persons with psychosocial disabilities.

Youth and women with psychosocial disabilities face enormous challenges. Being mostly employed in the informal sector, they have less employment opportunities due to their invisibility in the mainstream of society. There is also no disaggregated data by age, sex, or disability, which poses the challenge of finding out how many persons with psychosocial disabilities are in employment.

In this section, general learnings will be presented, along with select case studies from the research.

Job Placement and Affirmative Action

Most respondents were not aware of the specific policies addressing job placement for persons with disabilities in their countries. This lack of awareness means that employers, especially in the private sector, and persons with disabilities themselves cannot benefit from these policies. It is important that States popularizes these polices including through the media.

In addition, specific policies addressing job placement for persons with disabilities in all the five countries are not sufficient and do not promote employment of persons with disabilities. For example, in Uganda, the Income Tax Act provides for a 20% tax incentive to every private company where 5% of its employees are persons with disabilities. However, this tax incentive is not attractive enough for the private companies for it has not yielded any results.

It is important to ensure that affirmative actions are in line with the Convention. Some examples of affirmative action consistent with the Convention include:[19]

(a) Ensuring that employers do not restrict persons with disabilities to certain occupations, reserved jobs, or specific employment units.
(b) Ensuring that employers do not restrict persons with disabilities from opportunities for promotion and career growth.

---

[19] General Comment No. 8, para. 42.

(c) Taking steps to ensure that work promoted under these measures does not constitute "fake" employment, whereby persons with disabilities are engaged by employers but do not perform work or do not have meaningful employment on an equal basis with others.
(d) Incorporating a disability, gender, and age perspective across the organization.

Recruitment Processes, Including Advertising, Selection, and Interviewing

Most of these processes do not include and address the needs of women and youth with psychosocial disabilities seeking employment. During interviews, most persons with psychosocial disabilities do not disclose their disabilities owing to the fact that if disclosed at that stage, there will be high chances of not continuing to the next stage due to prejudices and misconceptions that employers have about psychosocial disabilities such as "incompetency," "dangerous," and "destructive." Privacy is an important issue to be considered as consequences of disclosing a disability can expose a person to stigma and discrimination.[20]

Case Study: The Job Interview (Nigeria)

> "I must have passed the interview but due to my disclosure, I lost the employment opportunity"

A young woman with a psychosocial disability living in Nigeria shared that she was called for an interview in which she did well. At the end of the interview, she disclosed that she had a psychosocial disability. She observed a negative facial expression from the interviewers. They told her they would contact her for the next steps. She never heard back from them.

Participation of OPDs and Professional Training Programs for Staff

The research found that to some extent public and private employers have conducted training programs on disability awareness for staff, but there has been no specific training on enabling inclusion of person with disabilities at workplaces. In the case of Uganda, the National Union of Persons with Disabilities (NUDIPU) confirmed that training on inclusion of persons with disabilities at workplaces for staff is mandated in human resource manuals but are not implemented. NUDIPU is keen on conducting staff orientation trainings including trainings on disability inclusion at workplaces in

---

[20] From the General Comment No. 8, para. 74: Respect for the privacy of employees with disabilities requires employers to obtain the consent of an employee with disabilities to share the disability – or impairment-related information that is disclosed to them, for example, with the staff in the human resources department.

the near future. Many organizations choose to put the burden of sensitization on the person with disability who has been hired. Not only is that problematic but also, as explained by the CEO of NUDIPU, "It does not guarantee that when you have a disability, you know disability inclusion." That underlines the importance of conducting trainings on inclusion of person with disabilities at workplaces with proper methodologies that are based on a cross-disability and equity lens.

Kenyan OPDs got an opportunity through Inclusion Works (IW) project to conduct trainings on inclusion of persons with disabilities at workplaces. In Uganda and through IW, human resource managers through the Human Resource Managers' Association of Uganda (HRMAU) benefitted from sessions on disability inclusion.

Case Study: Isaac (Uganda)

> "I am enjoying my work, feel supported and I do not experience any stigma at the workplace"

Isaac is a youth with psychosocial disabilities, aged 25, from the Jinja District of Uganda. He is a member of the TRIUMPH Mental Health Support and Recovery Program (TRIUMPH). He applied for a job through the Inclusion Works program[21], which links youth with disabilities to potential employers. He feels that he benefited greatly from this experience.

The Inclusion Works program worked in close consultation with TRIUMPH. This helped to support Isaac through peer support, sharing work-related issues with peers and mentors, and access to psychosocial support. TRIUMPH also supported the employing organization – Child Restoration Outreach (CRO), Jinja – to create an enabling work environment, including creating a resting space for any staff who may need it on occasion.

CRO staff received training on disability inclusion at the workplace from the National Union of Disabled Persons of Uganda (***NUDIPU***), an umbrella organization of persons with disabilities. CRO representatives reported appreciating working with persons with psychosocial disabilities as part of the team that together brings development of the organization. After his internship of 3 months, this organization retained him as a full staff member. CRO staff reaffirmed that working with Isaac helped them to also undo the fears, the stigma that they had working with persons with psychosocial disabilities.

Addressing Discrimination and Harassment

The research found that discrimination on the basis of disability is prohibited in most of the countries' legal framework including their constitutions, equal opportunity laws, and employment laws. In International Human Rights Law, discrimination

---

[21] https://www.internationaldisabilityalliance.org/inclusion-works

takes several forms and may occur simultaneously as well: direct discrimination, indirect discrimination, denial of reasonable accommodation, harassment, and discrimination by association. This expansive definition is not always reflected.

Harassment is a form of discrimination when unwanted conduct related to disability or other prohibited grounds takes place with the purpose or effect of violating the dignity of a person and of creating an intimidating, hostile, degrading, humiliating, or offensive environment.[22] This is commonly experienced by persons with psychosocial disabilities at the workplace. Protection from harassment in connection with work and employment extends throughout the employment cycle and States Parties must implement effective remedies through the enactment and enforcement of specific and comprehensive antidiscrimination legislation.[23]

Case Study: Mark (Uganda)

> "My supervisor at one time doubted whether I am telling the truth about my disability since it is invisible"

Mark is a 28-year-old youth with psychosocial disabilities. He disclosed his disability to his employer along with the work schedule adjustments he needed, which were initially agreed upon. Even so, his own suggested adjustments were not respected, and measures were taken purportedly in his best interests, but hampered his full and effective participation at the workplace.

Along the course of employment, his supervisor violated the agreement especially on work schedules and he was called to work longer hours and more days than initially agreed.

At one point, he requested to take a week off while taking medication as he had gone for a medical review and was not feeling well. The medication he was prescribed required him to get adequate sleep. On informing his supervisor, the response was that the supervisor was "...tired of those issues of yours - going for medical reviews" and instead told him to go for a month's leave, which he never asked for. These insensitive and incapacitating words and gestures made him feel guilty and reinforced the belief that disability is an individual problem.

Providing Reasonable Accommodation

The research found that in all the countries there has been no complete harmonization of all the domestic laws with the CRPD. The mandate to provide reasonable accommodation has not been explicitly stated in the domestic laws, including the employment laws of the different countries as provided in Article 2 of the CRPD.

---

[22] Committee on the Rights of Persons with Disabilities, General Comment No. 6 (2018), para. 18.

[23] Committee on the Rights of Persons with Disabilities, General Comment No. 6 (2018), para. 22.

In Uganda, reasonable accommodation is recognized under the Persons with Disabilities Act of 2020. However, it has not entirely come into force since the Government is still in the process of issuing regulations to support the legislation. In Kenya, the circular on remuneration for a personal guide for public officers living with disability[24] issued by the Salaries and Remuneration Commission has provisions for support but does not include persons with psychosocial disabilities. There are efforts to amend the Kenya Persons with Disabilities Act 2003, with a proposal on reasonable accommodation.[25]

Reasonable accommodation is a relatively new concept that governments are struggling to understand.[26] There is an added complexity when it comes to persons with psychosocial disabilities, compared to other disabilities that are generally accepted by employers as requiring accommodations that are tangible: for example, customized seating, assistive devices and technology, and sign language. In that sense, the supports required by persons with psychosocial disability are not obvious and there can be considerable diversity in the range of supports that persons with psychosocial disability need to thrive in the workforce.

There is no exhaustive list of reasonable accommodations possible, nor is it desirable. The CRPD recognizes the diversity of the disability movement. Even so, from the research, some examples of reasonable accommodations that were proposed by persons with psychosocial disabilities included:

- Time off for follow-up visits to clinic/psychiatrist/psychologist.
- Flexible time to accommodate effects of medication such as drowsiness.
- Frequent breaks.
- Extended sick leave should a relapse occur.
- Reduced stress working environment.
- Use of email for daily instructions.
- Minimize distractions by enclosed office.
- Need for job coach or mentor.
- Easing the employee into changes in the organization.
- Breaking large tasks into small achievable tasks that promotes motivation and improves the mood of the employee.
- Access to peer supports.
- Working from home if one chooses.

[26] This is reflected in the General Comment No. 6 on equality and nondiscrimination CRPD/C/GC/6.

Case Study: Support from Staff (Uganda)

A woman was hired by an electricity transmission company and did not disclose the fact that she had been diagnosed with bipolar disorder at the time of interview. After a period of 2 years of great work and having shown greater potential over other employees, she experienced a mental health-linked relapse. It was like a surprise to the employer, but because the employer had appreciated her potential, the employer and fellow staff have supported her to continue working. She has been with the same company for close to 8 years now.

Equal Pay for Equal Work

In the formal employment sector, there is likely to be equal pay for equal work for women and youth with psychosocial disabilities. However, if the pay is based on output, which is becoming increasingly common in the "gig economy," women and youth with psychosocial disabilities will face barriers, because reasonable accommodation is still unknown and unavailable for them to effectively participate in the workforce, thus affecting their equal pay for equal work.

In the informal sector, women and youth with psychosocial disabilities face great challenges to get equal pay for equal work. The common misconception is that employers are doing them a favor and also that women and youth with psychosocial disabilities, especially those in rural areas, are not right holders. Women with psychosocial disabilities are often paid in kind instead of money.

Career Advancement

Inclusive employment does not stop at the point of entry into the workplace. Persons with disabilities should also have access to career advancement opportunities including the right, on an equal basis with others, to be considered for promotion through fair, merit-based, and transparent processes. However, persons with disabilities experience higher barriers to career advancement for a variety of reasons, and this is even more so for women with disabilities. The CRPD Committee has recommended that States Parties evaluate direct and indirect barriers to career advancement encountered by persons with disabilities, in particular by women with disabilities.[27]

Case Study: Stigma-Based Evaluations (Uganda)

A woman with psychosocial disabilities was appointed as a head teacher in one of the private schools in Uganda. After 1.5 years of excellent performance, she experienced a mental health episode. She was hospitalized, and after 2 months of recovery, she felt she was ready to return to work, though she still experienced

---

[27] Committee on the Rights of Persons with Disabilities, General Comment No. 8 (2022), para. 36.

physical weakness and drowsiness as side effects of the medication. She faced high levels of exclusion and stigma from her fellow teachers to the extent that she felt isolated at school.

The school Board of Directors held several meetings to dismiss her based on fears of nonperformance and that she could endanger learners. With the support of an OPD – TRIUMPH – representing persons with psychosocial disabilities, the school Board of Directors was supported to retain her, but she was still demoted to a class room teacher. She did not know that she could request for reasonable accommodation and the school did not know how to support her.

Access to Technical and Vocational Training and Rehabilitation

The study found that there is little access to technical and vocational trainings for women and youth with psychosocial disabilities. This is because women and youth with psychosocial disabilities do not have access to information about the training opportunities, especially those in rural areas. Technical and vocational training is important, because women and youth with psychosocial disabilities face greater challenges in the formal education systems coupled with lack of adequate community support services. As a result, very few are able to complete school to be able to compete favorably in the open labor market.

There is also no reasonable accommodation in the training institutions for persons with psychosocial disabilities. The instructors in these institutions are not trained on disability inclusion on how to work with a diversity of disability groups. This leads to many dropping out before completion of the course.

Case Study: No Accommodation (Malawi)

At an institute for technical and vocational training, a young woman with psychosocial disability was keen on joining a course. She shared that she has social anxiety so she would perform well working with few people like groups of 10 or less or one to one. The institution said that they could not offer such a service. She therefore could not benefit from the training.

Access to Self-Employment, Entrepreneurship, the Development of Cooperatives, and Starting One’s Own Business

Due to a labor market that is often unfriendly to persons with disabilities, self-employment has often been seen as one of the few options available – indeed, it is for many persons with disabilities the only real option to work.

The study found many mainstream economic empowerment programs for women and youth that would benefit those with disabilities such as Youth Livelihood Programs, Women Empowerment Fund, and other disability specific programs being implemented in different countries. But it can be surmised that not many women and youth with psychosocial disabilities benefit from these programs.

In the countries examined, there was no process for ensuring the inclusion of the diversity of persons with disabilities. The procedure for assessment of psychosocial disability was also problematic. Issues around processes mean that people who do not have disabilities that are evident, including psychosocial disabilities, are more at risk of being excluded. Individuals and groups are required to register and open bank accounts before their application, which are made in English, can even be considered. This creates additional barriers for persons with disabilities. There is also a lack of disaggregated data by sex, age, and disability on the beneficiaries of these programs.

Exploitation and Forced Labor

It is evident that women and youth with psychosocial disabilities are faced with situations of forced labor and exploitation. As has been elaborated in the General Comment, States Parties should pay attention to the right of persons with disabilities to choice, consent, and freedom from coercion. The risk of coercion stems from the fact that persons with disabilities often face wider social vulnerability, a lack of meaningful alternatives, and relations of dependency or care that become exploitative. This risk needs to be considered for the purposes of understanding whether consent has been given.[28]

Women and youth with psychosocial disabilities are forced to do work that they have not freely chosen. And this mainly stems from their families, who see them as a "burden" and unable to contribute anything to their well-being and that of their family, increasing family expenses in terms of psychiatric medicines, food, and loss of time and work for the caregivers. So, they are at times forced by family members to engage in work they have not chosen but instead chosen for them by family members or forced to engage in domestic work that is unpaid.

Case Study: "Keeping Her Occupied" (Uganda)

A young woman with psychosocial disabilities who has been employed in an office was told to chase away loitering goats which were eating up flowers. This young lady spent a whole day under the sun, sweating, using a lot of energy throwing sticks at the stubborn goats. Her line manager explained that this was the only way to keep her occupied. The researcher also found out that there was no pay for the work done, which clearly makes this an instance of exploitation.

Impact of COVID-19

Inequalities for persons with psychosocial disabilities with regards to work and employment existed before COVID-19. The pandemic, however, has vastly

---

[28] Committee on the Rights of Persons with Disabilities, General Comment No. 8 (2022), para. 52.

exacerbated the situation. Increased stress and anxiety have been difficult for persons with psychosocial disabilities, leading to frequent relapses and many people experiencing mental breakdowns.[29]

The breakdown in the support systems for persons with psychosocial disabilities like peer support group meetings stopped due to the lockdown measures, inaccessible psychiatric and psychosocial support services, inability to take walks which is therapeutic to some persons with psychosocial disabilities, etc.

There has also been a documented increase in abuses and human rights violations towards women and youth with psychosocial disabilities.[30] While many pivoted easily into the online world, the same was not as easy for women and youth with psychosocial disabilities.

Observations on Legal Reform and Policy Initiatives

Following the review, in these countries, there has been a progress on legal reforms and policy initiatives.

In Uganda

IGA Daniel v. AG[31] is a strong step forward for the equality rights of persons with disabilities. In particular, the Constitutional Court of Uganda at Kampala reviewed the human rights framework applicable in Africa, the Ugandan Constitution, and previous Court decisions and then decided as follows at page 22, lines 11–17:

> "Following the reasoning and decision in the above case, we find that the language of section 130 of the Penal Code Act is dehumanizing. The words "idiots" and "imbeciles" are derogatory and detract from the dignity that should be accorded to all disabled persons under Article 24. We find this is not permissible and justifiable as the language contravenes Articles 20, 21(1), (2) and (3), 23, 24, 28 and 35 of the Constitution"

---

[29] See also Ebuenyi et al. (2022).

> "In the face of the existing challenges faced by people with psychosocial disabilities and the inaccessibility of social assistance provision, the pandemic containment measures worsened participants' psychological well-being. The lockdowns and other restrictions caused much worry and distress for persons with psychosocial disabilities. Participants reported that they felt hopeless, helpless and depressed in the worst times of the crisis."

[30] See, for example, UNFPA and Women Enabled, "The impact of COVID-10 on women and girls with disabilities" https://www.unfpa.org/sites/default/files/pub-pdf/NEW_UNPRPD_UNFPA_WEI_-_The_Impact_of_COVID-19_on_Women_and_Girls_with_Disabilities.pdf

[31] Center for Health, Human Rights and Development (CEHURD) and Iga Daniel vs. the Attorney General https://www.cehurd.org/wp-content/uploads/2015/11/constitutional-petition-64.pdf

The Uganda Persons with Disability Act, 2020, explicitly has a provision on nondiscrimination in employment for persons with disabilities.[32] It further recognizes a failure to provide reasonable accommodation as discrimination.

In Kenya

The Access to Government Procurement Opportunities (AGPO) initiative[33] for women, youth, and persons with disabilities was operationalized in the Public Procurement and Disposal Act 2005. In the Public Procurement and Disposal (Preference and Reservations) Amendment Regulations, 2013, procuring entities are mandated to allocate at least 30% of its procurement spending for the purposes of procuring goods, works, and services from micro and small enterprises owned by youth, women, and persons with disabilities.[34] However, it has been found that the scheme has not benefitted persons with disabilities as much as it was intended, with currently only 4.9% of businesses being owned by persons with disabilities.[35] The situation regarding underrepresented groups of persons with disabilities is even more concerning, for instance, of the 3000 odd persons with intellectual disabilities that are members of the Kenyan Association of the Intellectually Handicapped, none of them has accessed this scheme, attributing this to the qualifications for the process, which are quite onerous for small organizations run by persons with disabilities.[36] It is important for the authorities to capture disaggregated data on the persons with disabilities who do access this program and to ensure that in the overall 30%, each beneficiary group is allocated a 10% quota, for it to be truly effective.

Recommendations

This section of the study offers general recommendations to States Parties and also specific recommendations to organizations of persons with psychosocial disabilities.

---

[32] Uganda Persons with Disability Act, 2020, https://ulii.org/akn/ug/act/2020/3/eng%402020-02-14

[33] http://wtochairs.org/sites/default/files/KENYA%20ASSESSMENT%20OF%20ACCESS%20TO%20GOVERNMENT%20PUBLIC%20PROCUREMENT%20OPPORTUNITIES%20FOR%20

[34] Regulation (31) (1). This particular kind of clause has been highlighted by the CRPD Committee with caution: while procurement measures giving preference to enterprises run by or employing persons with disabilities is a form of affirmative action, preferential purchasing policies that promote or support segregated employment are not affirmative action measures consistent with the Convention (Committee on the Rights of Persons with Disabilities, General Comment No. 8 (2022), paras. 41 and 42).

[35] Hivos, *Kenya's Efforts to Empower Women, Youth and Persons with Disability through Public Procurement* https://hivos.org/assets/2021/02/Agpo-Report-Web-version-Full-Report.pdf

[36] Interview with Fatma Haji, KAIH, February 2023.

Recommendations to States Parties

States are obligated to respect, protect, and fulfill the right to inclusive employment in its full presentation under Article 27. This entails:

- Removal of all laws and policies or guidelines that prohibit or interfere with the employment of persons with psychosocial disabilities, including laws related that interfere with the equal recognition before the law of persons with psychosocial disabilities.
- Prohibiting disability-based discrimination, including workplace harassment, in the area of work and employment, and ensuring that legislation creates the obligation to provide reasonable accommodation and stipulates that denial of reasonable accommodation constitutes discrimination.
- Ensuring that private sector and informal sector employers do not discriminate against persons with psychosocial disabilities.
- Promoting widespread understanding and acceptance among employers, including in the private sector, as well as persons with disabilities themselves, of the concept of reasonable accommodation and the consequences of unlawful denial of the same.

In addition, States Parties should adopt positive measures, including affirmative action to increase employment of persons with psychosocial disabilities in the public and private sectors, including affirmative action measures which are non-discriminatory and fully inclusive of persons with disabilities.

Access to employment does not stand alone; there are multiple rights that, when realized, support the realization of Article 27. This includes inclusive education, the right to live independently and within the community, the implementation of social protection schemes that support addressing disability-related costs in seeking employment, and access to assistive devices, among others. This is especially important for persons with psychosocial disabilities who are moving from institutional care into the community as Article 19 of the CRPD is progressively realized. States must also mobilize resources for persons with psychosocial disabilities to start their own enterprises by providing access to financial services, seed funding, etc., for persons with psychosocial disabilities to start their own enterprises.

Both State actors and employers carry the responsibility of ensuring that all positive measures or programs are designed and promoted in a way that recognizes the value of diversity in the workplace and equal career development for all.

States Parties should ensure equal access to vocational training and rehabilitation programs that are nondiscriminatory, accessible to, and inclusive of all persons with disabilities, especially those experiencing multiple and intersecting forms of marginalization, including through providing reasonable accommodation.

States Parties must include indicators on disability when collecting data on employment so as to allow for well-informed and targeted efforts to be made to improve the employment situation of persons with disabilities, and capture data on the inclusion of underrepresented groups.

States must involve representative organizations of persons with disabilities in the design, implementation, evaluation, and monitoring of all policies and programs related to the employment of persons with disabilities. An independent mechanism to monitor the implementation of the Convention, as provided for under Article 33 of the Convention, can play a role in helping to create stronger links between social partners already engaged in employment policy and monitoring and representative organizations of persons with disabilities.

Recommendations to the Private Sector

While the private sector engagement depends a lot on the involvement of the State (by framing laws, regulations, and offering incentives) and the OPDs (for providing expertise), still there are a few suggestions for the private sector as they are increasingly being seen as desirable employers of persons with disabilities with several private sector-led initiatives to promote employment of persons with disabilities.[37]

- National Chambers of Commerce and Industry should engage with OPDs to learn about good practices for the employment of persons with disabilities, including psychosocial disabilities.
- Human Resource Managers' Associations and similar bodies should develop, in consultation with OPDs, equal opportunity policies for all employees, including for persons with disabilities. This should include clear policies on reasonable accommodation and supports for the career path of persons with disabilities for industry-wide adoption.
- Recognition of private sector organizations that employ and successfully retain a diverse pool of persons with disabilities, including youth and women.

Recommendations to Organizations of Persons with Psychosocial Disabilities

OPDs have an important role in ensuring that persons with disabilities are aware of their rights and have the support of an organization to realize them. In the case of psychosocial disability, this is especially important, as conditions remain extremely medicalized and a shift to the social model is happening gradually. OPDs must:

---

[37] For example, the Valuable 500, which is a global collective of 500 CEOs and their companies committed to employing persons with disabilities and innovating for disability inclusion. https://www.thevaluable500.com/

- Build the capacities of women and youth with psychosocial disabilities on the CRPD to know and advocate for their rights, and to also include more women and young people in leadership roles.
- Raise awareness on the rights and potential of persons with psychosocial disabilities. This will combat stigma and misconceptions about persons with psychosocial disabilities and also combat gender stereotypes against women and youth with psychosocial disabilities.
- Build partnerships and collaborations with both public and private employers to give support and job coaching to employees with psychosocial disabilities.
- Conduct trainings on inclusion of persons with disabilities at workplaces in different workplaces (private and public) including OPDs.
- Increase advocacy for inclusion of persons with psychosocial disabilities in all development spheres.
- Advocate for inclusive policies at workplaces such as gender policies alongside Human resource policies.

Good Practice

TRIUMPH is an OPD in Uganda that advocates for the inclusion and rights of persons with psychosocial disabilities and also employs persons with psychosocial disabilities. They have identified some good practices in their experience that have worked for inclusive employers.

Mentorship and job coaching.

Appreciating the diversity and value that each one of them brings to the organization.

Avoid work-related stress that can result in many errors.

Sharing love, and everybody comes to work with the courage that she/he is loved and valued. This is because persons with psychosocial disabilities come from a journey full of loss and suffered violence.

Respecting the recovery journey using the World Health Organization (WHO) Recovery wellness plan. Here we ask “What keeps you well at work? And what causes you to become unwell?”. Share with the management the support that you need to be productive at work.

Using empowering words; consistently communicating their value to the organization.

Entering from the point of strength, not only bring out the negatives about the employee.

Listen nonjudgmentally.

Determine not to give up on an employee with psychosocial disabilities.

Promoting exposure since most persons with psychosocial disabilities are not even exposed due to many barriers they face in the society.

Conclusion

Notwithstanding the specific manner in which the right to dignified employment has been articulated under the human rights instruments and in CRPD Committee jurisprudence, the trickle-down effect into national legislation and frameworks, and further into the reality of labor force participation, is yet to be seen. The labor force participation rate of women and youth with psychosocial disabilities in Africa continues to be very low and undesirable when compared to the general population and when compared to the different categories of disabilities.

The dearth of context-relevant scientific evidence on issues of persons with psychosocial disabilities, particularly on the situation of women and youth with psychosocial disabilities in Africa, is of concern. There is a lack of evidence on work and employment of women and youth with psychosocial disabilities in Africa. It is hoped that this study will benefit the policy makers, governments, public and private employers, and OPDs. The experience of women and youth with psychosocial disability in the labor force is also essential for any study or programs on the transition from informal economy to formal economy for rural women and youth with psychosocial disabilities, as well as while studying access to social protection.

In this study, it is evident that women and youth with psychosocial disabilities are willing and can work on an equal basis with others, given the appropriate support they require to perform the inherent requirements of their work on an equal basis with others. It highlights the numerous challenges they face in their course of work and employment, including: disclosure of mental health impairments amounting to discrimination; failure to articulate and understand reasonable accommodation; lack of meaningful alternatives and situations of coercion; unequal pay and recognition for work of equal value; and the myriad ways in which women and youth with psychosocial disabilities experience multiple and intersectional discrimination in work.

However, this study also highlights the facilitators to gainful employment for women with psychosocial disabilities, such as empathetic employers and simple measures for reasonable accommodations. Other factors that have shown to be important are closer and meaningful consultation and involvement of OPDs of persons with psychosocial disabilities right from the hiring process; linking women and youth with psychosocial disabilities to potential employers; and mentorship and coaching.

The first-person accounts that were shared with the primary researcher also underline the transformative nature of steady and dignified employment. There is a global shift in medicalized approaches to mental health to a recognition that socioeconomic factors, including unemployment, have a huge impact on mental health (Macintyre et al., 2018). While this was not something focused on during the KIIs, where participants received support, they appeared to have overall better outcomes in other facets of their lives. Any measures to improve outcomes for persons with psychosocial disabilities and to support their inclusion in the community must also include measures towards inclusive employment. As we move towards implementation of the deinstitutionalization guidelines[38] and discussions on community inclusion[39], it becomes essential to also consider the barriers being experienced by women and youth with psychosocial disabilities and to address them by scaling up some of the good practices that have been seen.

Annexure 1: Key Terminologies

United Nations Convention on the Rights of Persons with Disabilities (CRPD): An international human rights treaty of the United Nations intended to protect the rights and dignity of persons with disabilities.

Disability: The preamble of the CRPD recognizes that “disability is an evolving concept and that disability results from the interaction between persons with impairments and attitudinal and environmental barriers that hinder their full and effective participation in society on an equal basis with others.”

Persons with disabilities: CRPD Article 1 states that “persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.”

Organizations of persons with disabilities (OPDs): These are organizations established predominantly with the aim of collectively acting, expressing, promoting, pursuing, and/or defending the rights of persons with disabilities. OPDs. They employ, are represented by, entrust or specifically nominate/appoint persons with disabilities themselves. They may represent one or more constituencies of persons with disabilities or operate cross disability. General Comment No. 7[40] gives more clarity on what OPDs are, as opposed to organizations working for persons with disabilities.

Psychosocial disabilities: The Mental Health and Human Rights Resolution of the Office of the United Nations High Commissioner for Human Rights (OHCHR, 2017) defines persons with psychosocial disabilities as, “persons who, regardless of self-identification or diagnosis of a mental health condition, *face restrictions in the exercise of their rights* and *barriers* to *participation* on the basis of an *actual* or *perceived* impairment.”

The term “**work**” is broad and includes unpaid work in the home or in a family enterprise, paid work for another person or organization in the formal or informal economy, and self-employment.

[40] Committee on the Rights of Persons with Disabilities, General Comment No. 7 (2018), paras. 10–14.

Livelihood is “the means by which an individual secures the necessities of life.” It may involve work at home or in the community, work alone or in a group, or for an organization, a government body, or a business. It may be work that is remunerated in kind, in cash, or by a daily wage or a salary.

Reasonable accommodation means necessary and appropriate modification and adjustments not imposing a disproportionate or undue burden, where needed in a particular case, to ensure to persons with disabilities the enjoyment or exercise on an equal basis with others of all human rights and fundamental freedoms. Discrimination on the basis of disability includes all forms of discrimination, including denial of reasonable accommodation (CRPD).

The **formal economy** is regulated by the government and includes employment in the public and private sectors, where workers are hired on contracts with a salary and benefits, such as pension schemes and health insurance.

The **informal economy** is the unregulated part of a country’s economy. It includes small-scale agriculture, petty trading, home-based enterprises, small businesses employing a few workers, and other similar activities.

Annexure 2: Researcher Standpoint and Background

Dorothy Nakato is an Indigenous woman with psychosocial disabilities from rural Uganda.

She experienced many barriers as a learner with psychosocial disabilities and earned a bachelor’s degree in commerce majoring in accounting from Makerere University. She began advocacy for persons with psychosocial disabilities in 2017. Dorothy is a co-founder and Executive Director of Uganda National Self-Advocacy Initiative (UNSAI) – A peer-led organization of persons with psychosocial disabilities.

After completing the Bridge CRPD-SDGs Training, Dorothy began passionately advocating for policy change through conducting research, writing policy papers, and storytelling on good practices. She has also been trained as an inclusive facilitator on the rights of persons with disabilities. She has been awarded fellowships with IDA-WNUSP, Transforming Communities for Inclusion, and the Zero Project as an Impact Transfer Fellow. Recently, Dorothy won a prestigious award with Zero Project on independent living and being included in the community for persons with psychosocial disabilities.

The International Disability Alliance (IDA) is a global alliance of organizations of persons with disabilities. With member organizations around the world, IDA represents the estimated one billion people worldwide living with a disability. This is the world’s largest – and most frequently overlooked – minority group. IDA aims to promote the effective and full implementation of the UN CRPD worldwide, as well as compliance with the UN CRPD within the UN system, through the active and coordinated involvement of representative organizations of persons with disabilities at the national, regional, and international levels. IDA supports organizations of persons with disabilities (OPDs) at national and regional levels through trainings and disseminating resources and information.[41]

Annexure 3: Methodology of the Study

As this project was being conceived in a context where there was little or no research, the methodology developed was around Key Informant Interviews (KII). The interviewees included youth and women with psychosocial disabilities both from the rural and urban areas.

Interviewees also included a few individuals in pivotal positions related to the implementation and/or monitoring of Article 27 of the CRPD, including organizations of persons with disabilities (OPDs), Human Rights Commissions, and government bodies. These interviews were conducted online because of COVID-19 restrictions.

A semi-structured interview guide was developed and used with 21 participants of the KIIs. A desk review was conducted to complement the qualitative interviews and contextualize individual experiences, as well as inform recommendations. Information was also collected from stakeholders by way of a discussion webinar on gainful employment for women and youth with psychosocial disability.

Limitations

There were several limitations to this study:

COVID-19 hindered face-to-face KIIs. Consequently, these were held online. This meant that many KII participants especially women and youth with psychosocial disabilities in the rural areas could not participate, as they do not have access to computers or smart phones.

Challenges posed by frequent internet disconnections with the KII participants consumed a lot of time.

With regards to Kenya, there was a specific challenge, as the researcher had not obtained a “research license.”[42] Government officials in Kenya who were contacted

---

[41] For IDA, Amba Salelkar, Capacity Building Senior Technical Advisor, worked on this paper with Dorothy.

[42] In Kenya, a research license denotes permission to undertake research and is issued by the National Commission for Science, Technology and Innovation (NACOSTI) as per the ST&I Act to regulate and assure quality in science, technology, and innovation sector and advice government on matters related thereto. The Science, Technology and Innovation (ST&I) Regulations 2014, Legal Notice No. 108 (Research Licensing) Regulations, 2014, obligates all persons intending to undertake scientific research in Kenya to obtain a license in accordance with the Act. The Act states that any person undertaking or intending to undertake research in the country, or who accesses, handles, or transfers any materials or technology or moves it within, from, or into the country, shall apply to the Commission for the grant of a license. This was a learning for the overall fellowship program as well, in that in many country contexts, a license was required for research of any kind.

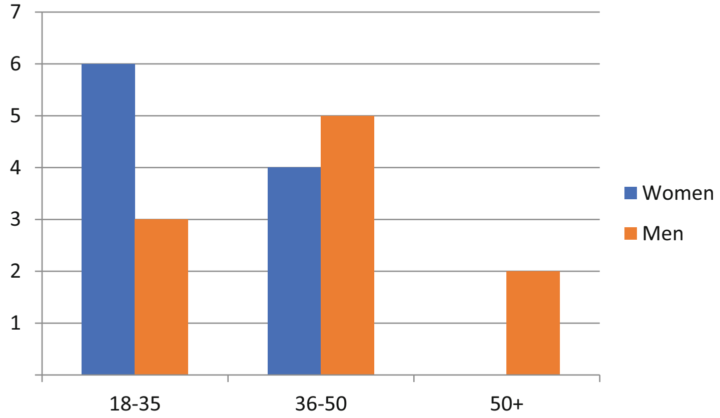

Fig. 1 Chart showing number of participants disaggregated by age and gender

for the research expressed an inability to participate as there was no research license issued by the National Commission for Science, Technology and Innovation to the researcher.

Participants

A total of 21(14 women and 7 men)[43] between the ages of 18 and 60 years responded to the Key Informant Interview. Most key informants were between the ages of 18 and 35 and women because they were directly targeted as they face multiple and intersecting forms of discrimination in the area of work and employment (Fig. 1).

Abstract

Canada's disability income expenditures are rising at an unsustainable rate and the largest and fastest growing program is income or social assistance. We provide critical insight into the intricate drivers behind the alarming rise of disability income expenditures. Drawing on new data and original research, we review the many disability income support programs available to Ontarians, including recent changes to their eligibility and entitlement. We make a strong case for the profound effect that changes in the labor market are having on the ability of individuals to qualify for and to access programs. These trends continue into the third decade of the new millennium.

The report suggests that for many people with disabilities, social assistance is the only program able to provide the level of financial support and employment incentives they need to stabilize their circumstances and find a way to enter or reenter the workforce.

We examine regional similarities and differences, illustrate the complexity of our disability support systems, and call for reform through careful consideration of the whole system and all levels of government along with private and public sector employers and insurers.

Introduction

In 2013, I wrote a paper called the "Welfareization of Disability Incomes in Ontario."[1] Earlier that year, I wrote a similar paper with colleagues called "What is happening to disability incomes in Canada?"[2] Now a new Canada Disability Benefit (CDB) is on the policy horizon and was first announced on August 20, 2020, but yet to be implemented. Framework legislation was reintroduced as Bill C-22 in June 2022. This new benefit will be designed to stop welfareization and reduce poverty among people with disabilities. The real question is: will it?

Before the announcement, most of the disability benefits systems in Canada were tightening their belts, but the result was unprecedented growth in income assistance or social assistance programs for people with disabilities. In effect, social assistance programs played the part of the "volunteer" in the anecdote. Social assistance was the program that volunteered by default when the other programs and systems started to curtail their expenditures.

---

[1] https://metcalffoundation.com/publication/the-welfareization-of-disability-incomes-in-ontario/

[2] http://www.ccdonline.ca/en/socialpolicy/poverty-citizenship/income-security-reform/disability-income-systems

In this context, it is not difficult to understand why caseloads comprised of low-income people with disabilities ballooned across Canada in the new millennium. Although many thought that social assistance based on disability must have become easier to obtain, the truth is that income and needs tested programs form the safety net that backstops all the other programs. And most other programs[3] simply grew more slowly when they went through cost containment exercises to curtail expenditure growth.

Some of the cost containment exercises in other disability incomes included:

- Workers' compensation programs that generally reduced benefits to a two-year maximum while reducing the reasons for which claims could be made.
- Tightened appeals mechanisms for programs run through Service Canada (CPP-D and EI) resulting in delays and fewer successful appeals.
- Changes to Veterans' disability benefits that restricted lifetime benefits to dwindling numbers of (legacy) Veterans of WWII and the Korean War.
- Cuts to private sector disability benefits that (again) generally restricted benefits to two years in duration.

The categorical result is an ever-growing share of expenditures in the disability income "space" that are paid through social assistance programs. The *welfareization* process continues to be unrelenting.

In fiscal 2018–19, the total expenditures of disability income programs in Canada, both private and public, were $37.8 billion. Of this amount:

- $11.4 billion were expended through social assistance program or 30.1% of the total. Social assistance is, by far, the single largest set of programs.
- Private programs accounted for $7.6 billion (20.1%).
- CPP-D and EI sickness combined spent $6.8 billion (18.0%).
- Workers Compensation programs spent $5.9 billion (15.6%).
- All disability tax measures combined spent $3.6 billion (9.5%).

In 2005–06, social assistance disability expenditures comprised 25.9% of disability income expenditures. This means – in comparison to later numbers – that the share of disability income accounted for by social assistance has risen by 8.6% since 2005–06. The shares comprised by other programs as a whole therefore continue to fall.

In human terms, people with disabilities now comprise a plurality of social assistance recipients in some provinces. In Ontario, the number of disability payments surpassed basic welfare payments in 2013. This was the first time since 1941 that this has happened. The human face of a welfare payment in Canada is now a person with disabilities.

---

[3] EI sickness is the one notable exception.

Two Observations Concerning the Welfareization of Disability Incomes

Observation 1: Social assistance for people with disabilities will remain under pressure and subnational governments will continue to take opportunities to reduce expenditures. The implementation of a Canada Disability Benefit (CDB) could form one of those opportunities.

Observation 2: The relentless *welfareization* of disability benefits will only continue and the same fiscal pressures that force programs to reduce their eligibility and expenditures will mean that the implementation of a CDB could accelerate this process.

Social Assistance for Persons with Disabilities Will Remain Under Pressure and a CDB Must Recognize This Fact

Social assistance for people with disabilities has expenditure increase of over **91%** from 2005–06 to 2017–18 and increased its share of all disability income programs expenditures by **8.6%** to **30.1%**.

Accordingly, these programs have come under sustained fiscal pressure across Canada.

Alberta Premier Jason Kenney openly discussed cutting benefits in the Assured Income for the Severely Handicapped (AISH) in 2019 and 2020.

Ontario Social Services Minister Lisa Macleod announced that she would be tightening the disability definition in the Ontario Disability Support Plan (ODSP in 2018).

Similar threats to cut disability incomes have been made in Saskatchewan and Manitoba.[4]

Caseloads have risen for many different reasons. These include:

- Workforce changes whereby persons with disabilities and others do not have tenured salary and wage jobs that would trigger disability benefits.
- Cuts in some seven disability income systems leaving social assistance with more to do.
- Embedded rules that do not support work in older disability income systems (like CPP-D).
- Changes in medical treatment and especially advances in medicine and trauma treatment.
- Aging of the population.
- Inclusion of mood disorders and neuroses as disabilities.

---

[4] https://north99.org/2019/12/13/conservatives-across-the-country-are-slashing-funding-for-disabled-canadians/

- The existence of separate social assistance disability programs and large differences in benefit levels between them and general social assistance.
- Reductions in OAS and GIS for immigrant seniors.
- Structural unemployment and underemployment among persons with disabilities and continuing economic stagnation.
- Lack of knowledge about disability income systems other than social assistance.
- Post-recession differences in employment patterns and benefits.
- Differing financial incentives among programs to bring people with disabilities back to work.
- Barriers to work in general.

Differences in caseload pressures are accounted for by the following factors that place greater pressure on provinces in Ontario and the West:

- Huge differences in EI coverage that reduces number of persons going on social assistance in eastern provinces. As regular social assistance is often a precursor to application for disability benefits, more robust regular EI appears to reduce social assistance overall.
- Social assistance disability programs that are smaller, less generous, and not separate in eastern provinces.
- Smaller social assistance based Disability components for First Nations in Eastern Provinces.
- A greater presence of interventions by other disability systems in eastern provinces.
- Fewer persons with disabilities that are ineligible for (or eligible for reduced benefits for) Old Age Security at age 65 in eastern provinces.

All of these factors figured in the decision of a majority of the provinces to claw back the CERB and all but one jurisdiction in respect of the CRB (BC).

In other words, provinces and territories that usually exempt federal tax benefits and especially those designed to meet other objectives succumbed to fiscal pressure to offset pandemic benefits.

This is a cautionary tale as a precedent has been set and provinces and territories may choose to vacate their place of providing basic disability benefits when the new CDB is implemented.

It will be important for the federal government to work together closely with provinces and territories to ensure that the CDB and social assistance programs both "stay in the game."

The federal news release of June 22, 2021, is somewhat ambiguous on this point as it says:

> The legislation also recognizes the leading role that provinces and territories play in providing supports and services to Canadians with disabilities and the importance of engaging with them in developing income and other supports.

But in an earlier passage, it says:

> The Canada Disability Benefit would supplement, not replace, existing federal and provincial-territorial supports with a goal of lifting hundreds of thousands of persons with disabilities out of poverty.

The clear problem for the federal government in supplementing provincial and Territorial benefits is that it would have **to “accept” 13 differing definitions of disability in the provinces and territories if it is to act as a top up to those benefits**.

This would be on top of “accepting” the disability definitions for the DTC, CPP-D, and Veterans’ benefits.

In this sense, the federal government would in fact be accepting a lead role while provinces and territories **could easily decide to lower their own benefits while allowing the CDB to fill the gap**.

If that were to be the case, an epic dogfight would ensue that helps neither side.

Clearly, there is much more to do.

But the federal government does need to recognize the massive financial pressures provinces and territories have borne in terms of the other disability income systems that have forced the expansion of the only set of disability programs that actually specifically assist people with disabilities living in poverty and in need.

What If the Welfareization of Disability Incomes Continues?

It will be important for the federal government to understand that pressures on all disability income programs except social assistance have been handled by offloading program expenditures onto social assistance across Canada.

Federal programs such as Veterans’ disability incomes have done it by tightening eligibility and placing time limits on the receipt of benefits. CPP-D EI and Veterans’ programs have done it by tightening appeals processes. Only relatively small federal programs like the DTC and EI sickness have not participated in decades-long cost controls.

At the provincial and territorial levels, most Workers’ compensation programs have cut back while private and public sector employer programs have placed stricter time limits on the receipt of benefits (usually in the two-year range).

In this sense, these programs have gotten used to *welfareizing* disability benefits.

In addition, accident insurance programs will have great pressures placed upon them to reduce premiums when a CDB is implemented unless mitigating action is taken beforehand.

The bottom line is that programs – that have gotten used to belt tightening with no real problem with offloading their clientele onto social assistance programs – will be no less interested in reducing expenditures with the advent of the CDP.

The real question is how to stop them and to stop the *welfareizing* that in many ways has provided the impetus to create a CDB in the first instance.

Two Case Studies

Angelica

Angelica, an office cleaner in her early 60 s who lives in Toronto, suffered her first major workplace injury after working for the government for 18 years. It was 1993. She was earning $21 an hour and regularly saving 5% of her net pay.

When she was injured, she immediately received workplace medical attention and was admitted to the hospital. She was given time off work at full pay and was able to deploy a robust bank of sick days. She received the benefits of a multifaceted workplace program that provided rehabilitation and other services including orthotic supplies, physiotherapy, and chiropractic treatment.

Following her in-house government coverage, Angelica qualified for workers' compensation. She also received 15 weeks of sickness benefits through employment insurance (EI) followed by regular EI benefits for the entire time she was off work.

Eighteen years later, in 2011, Angelica sustained a similar workplace accident. She now had 36 years' experience completing the same tasks in the same workplace.

However, 13 years earlier, in 1998, the work she was doing was contracted to an outside firm. The firm that successfully bid on the cleaning contract for the government offered Angelica a position as a self-employed contractor. In her new position she was offered a pay rate equivalent to the minimum wage. This meant that in 2011 Angelica was making $10.25 an hour – about one half (in nominal terms) of what she made before the 1998 changes.

At the time of Angelica's 2011 injury there was no workplace infirmary, so she phoned 911. New and heavy security in the government building delayed her hospital visit, increasing her stress.

As a self-employed contract worker she had no sick days and no other source of income. She had no access to rehabilitation and no workplace benefit program because, in technical terms, she was not an employee. She had to pay for her own orthotics, and because physiotherapy and chiropractic were delisted as insured provincial health care services, Angelica faced paying for any use of these services at full fee rates.

Angelica might have qualified for workers' compensation but she would have had to demonstrate to the Workplace Safety and Insurance Board that her relationship to the cleaning firm was, in principle, one of an employee.

Due to her injury, she is currently unable to return to work as a cleaner and is currently unemployed. She has the added worry that if her injury results in a permanent disability, she will not qualify for CPP disability benefits. She could have qualified if she had been making ongoing payments representing both the employer and employee portions, but she had determined that she was unable to afford these payroll levies on $10.25 an hour.

As a self-employed contractor, Angelica did not pay into EI and therefore does not qualify for the standard 15 weeks of EI sickness benefits or regular EI benefits.

Angelica has applied for welfare (Ontario Works) of $626 a month with an application in place for ODSP. The application is currently pending. If she takes early CPP, based on her earlier contributions as an employee, it will be deducted from her Ontario Works cheque (or ODSP if her application is accepted) at 100%. If she receives ODSP, she will be forced to apply for CPP-D. Otherwise, she can wait until age 65, although the higher CPP payment will further reduce her Guaranteed Income Supplement (GIS) entitlement.

Bob

In the 1990s, Bob was in his twenties and attending university. He had finally moved away from the small, isolated town in which he grew up. He was happy to be away from his dysfunctional family home and away from the beatings and the constant walking on eggshells.

Then, rather suddenly, he found he could not concentrate on his studies. Some very negative feelings started to come over him.

After talking to his friends, Bob came to the conclusion that he needed help and contacted the counseling services at the university. The counselors were sympathetic. They told him that a lot of young people have trouble with their studies. They offered study tips and assured him that what he was experiencing was a normal part of university life and he would get over it.

Bob did feel better for a while. He completed his year and secured a summer job. It involved strenuous physical activity. He liked it because it kept his mind away from that part of his psyche that was debilitating. But the next year, the dark feelings came back with a vengeance. This time, he went back to the counseling center. He received a similar response as the previous year, although one of the counselors worried about him and asked whether he would like to take some psychological tests. He agreed.

After a few weeks, the diagnosis came back that he was depressed and that he may be harboring deep hostilities toward some family members. Would he like to come back for some more testing? Once again, he agreed. Then, suddenly, he seemed to be doing a bit better, and the small dose of Valium they gave him seemed to be helping. Or was he imagining it?

Bob was going to graduate with a four-year degree, but he changed it to a three-year B.A. He went back to his summer job but was let go and then bounced around from job to job. He collected EI and, at the end of that, managed to hang on to work at a fast-food place but found it increasingly stressful.

Some days, he would feel so “up” he was sure he could take on the world. Others – now more frequent – were filled with darkness. He suffered greater anxiety at the thought of seeing either one of his parents. Eventually, Bob moved to a smaller town where rents were cheaper. He bunked in with two other fellows he knew from back in high school and applied for welfare. Months, and then years, went by in a fog.

Bob bounced from clinic to clinic, doctor to doctor, but he couldn’t seem to change his situation.

Then, in 2009, something in the back of Bob’s mind came to the fore when he attended a workshop sponsored by a legal clinic. They told him that he could apply for ODSP if he was sick. Bob didn’t think he was sick but he knew things were horribly wrong. He was not working and was still on welfare. The jobs and placements he was able to access were all dead ends.

Bob received a referral from the legal clinic to a mental health center, where he took a series of tests. After a period of time, the center came back with a diagnosis of bipolar disorder and post-traumatic stress disorder (PTSD).

Finally, this explained it. His application for ODSP went to the government and, after a wait of six months, was accepted. At this point, Bob was able to access more money because ODSP payments are over 70% higher than Ontario Works payments. He began to look after himself more. He ate better, went to therapy, was put on a drug treatment program, and began to understand how much his early experiences had affected him.

> Bob has always wanted to work but he knew that he would first need to find more stable housing. In 2011, he found the housing he required, enrolled in an employment program, and began to gain work experience.

The Rise of Disability Income Expenditures

Disability income expenditures are on the rise in Canada. In 2005,[5] total income support for Canadians with disabilities was estimated to be $23.2 billion. Five years later, in 2010, it was estimated to be $28.6 billion.[6] That’s an increase of 22.9%. (see Figs. 1 and 2).

A variety of factors are contributing to this overall increase. One of the most obvious is our **aging population**. We know, for example, that in 1971, the median age of Canadians was 26.2; in 2010, it was 39.7.[7] In 1971, Canadians aged 65 and older accounted for 8% of the population; in 2010, they accounted for just over 14%.[8]

There are many repercussions to an aging population in terms of providing appropriate support for people with disabilities. Extended lifespans for people with

---

[5] In this paper, I refer to the Ontario and Canadian government fiscal year that runs from April 1 to March 31. Therefore, in this case, 2005 refers to fiscal April 1, 2005, to March 31, 2006.

[6] The original expenditure and survey data collected for this paper may be obtained by writing to the author at jsbb@rogers.com. The first data set includes administrative data and program costs compiled from publicly available expenditures on a program-by-program basis by researcher Anne Tweddle, which she aggregated for the purpose of this analysis. (See Annex 1 for primary sources and methodology.) A second original data set is also available that is based on survey data from Statistics Canada’s Longitudinal Assistance Database (LAD) for the purposes of verifying the direction of disability program expenditures over time.

Canada Catalogue no. 91-209-X, *Report on the Demographic Situation in Canada*. Pg 2. http://www.statcan.gc.ca/pub/91-209-x/2011001/article/11511-eng.pdf

[8] http://www4.hrsdc.gc.ca/.3ndic.1t.4r@-eng.jsp?iid=33

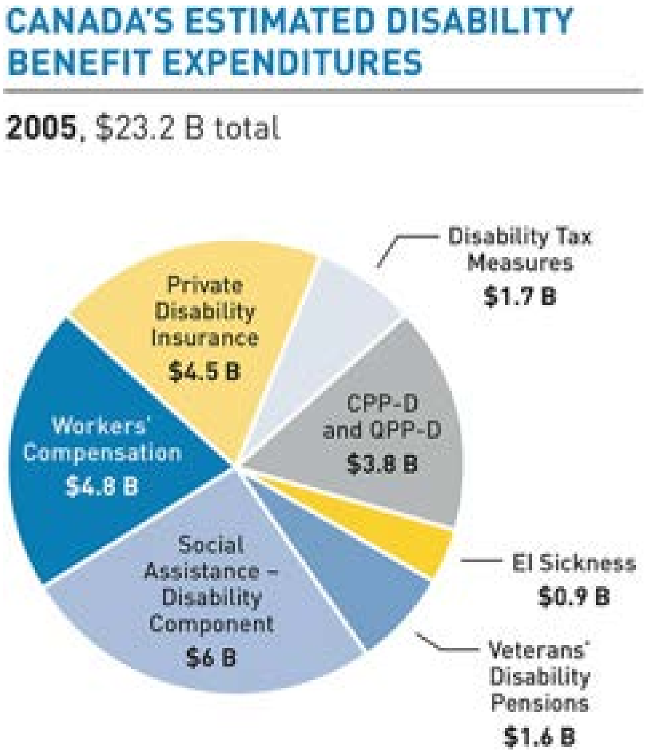

Fig. 1 Canada's estimated disability benefit expenditures

disabilities means that more Canadians are living longer with early-onset or birth disabilities. It also means that more Canadians are contracting late-onset disabilities.[9]

Another factor contributing to the growth of disability income expenditures is **continued difficulties people with disabilities face in accessing the workplace**. As noted by the Council of Canadians with Disabilities, among working-age people (15 to 64 years) living in poverty when the Participation and Activity Limitation Survey (PALS) was conducted, 48.4% of people without disabilities were employed compared with 23.1% of people with disabilities.[10]

There are also **growing numbers of people with disabilities living in poverty**. As the Council of Canadians with Disabilities points out, in 2006, the poverty rate for adult Canadians with disabilities was 14.4%. In terms of poverty among

[10] Statistics Canada, *Participation and Activity Limitation Survey 2006: Labour Force Experience of People with Disabilities in Canada*.

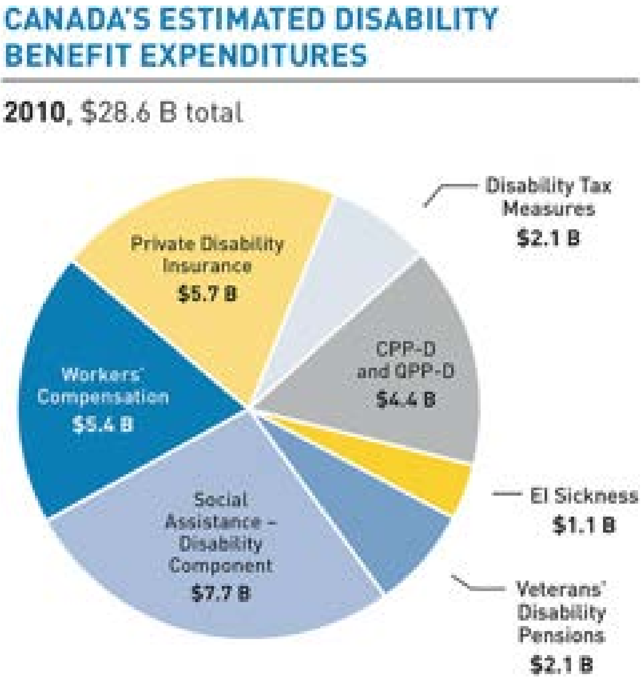

Fig. 2 Canada's estimated disability benefit expenditures

working-age people, the Conference Board of Canada recently ranked Canada in 15th place out of 17 countries and gave Canada a "D" rating.[11]

Another factor is the marked increase in Canadians seeking income support as a result of **more kinds of mental illness now being recognized**.[12] Mental disorders (psychoses, neuroses, and developmental delays) represented about 52% of the primary conditions of applicants granted ODSP in 2009.[13]

These external factors help explain the overall increased demand on our disability income system. But they don't account for the disproportionate increase of social assistance as a disability income support program; what I call the welfareization of disability incomes.

Canada-wide, social assistance has come to represent an increasingly large slice of the disability income support pie,[14] growing from $6 billion in 2005 to an

[12] See *Brighter Prospects*, http://www.socialassistancereview.ca/uploads/File/COMM_Report_FinalH-t-Eng.pdf, Appendix F, p. 160–163.

[13] For example, ODSP growth in persons with neuroses and psychoses in 2011 was double the growth in the program overall.

[14] Expenditures exclude Registered Disability Savings Programs (RDSPs) due to their small size.

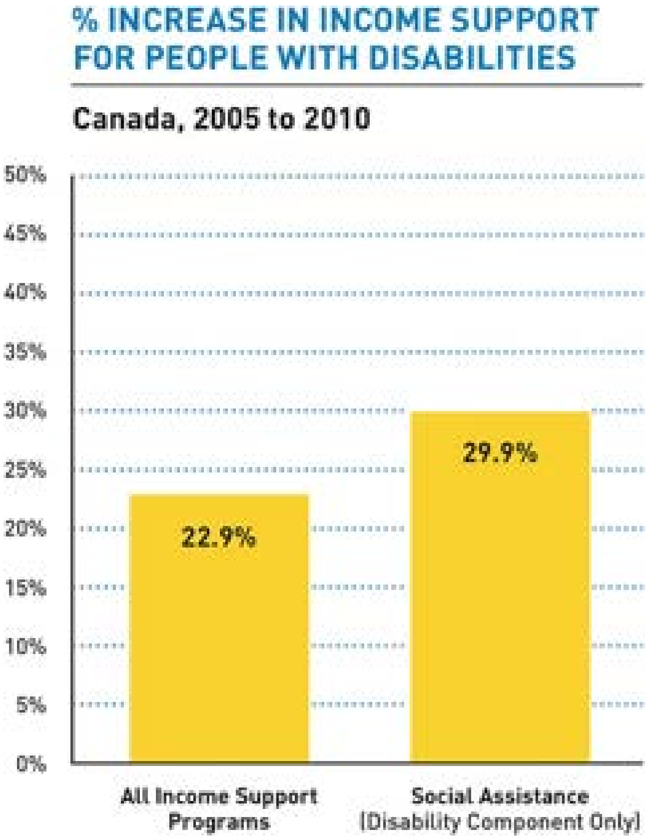

Fig. 3 % increase in income support for people with disabilities

estimated $7.7 billion in 2010. As a percentage, total income support for people with disabilities has increased by almost 23% over five years; social assistance disability spending increased by almost 30% (see Fig. 3).

The percentage increase in social assistance disability income program spending is most pronounced in Ontario (see Fig. 4). Total income support increased by 27.4%, while spending on ODSP increased 44.8%. Expenditures in 2011 totaled $3.8 billion.[15]

This means that in Ontario in 2010, ODSP comprised almost 30% of total disability income system expenditures. This was by far the highest percentage among the provinces examined and was a key area of concern for Ontario's recent social assistance review, *Brighter Prospects: Transforming Social Assistance in*

---

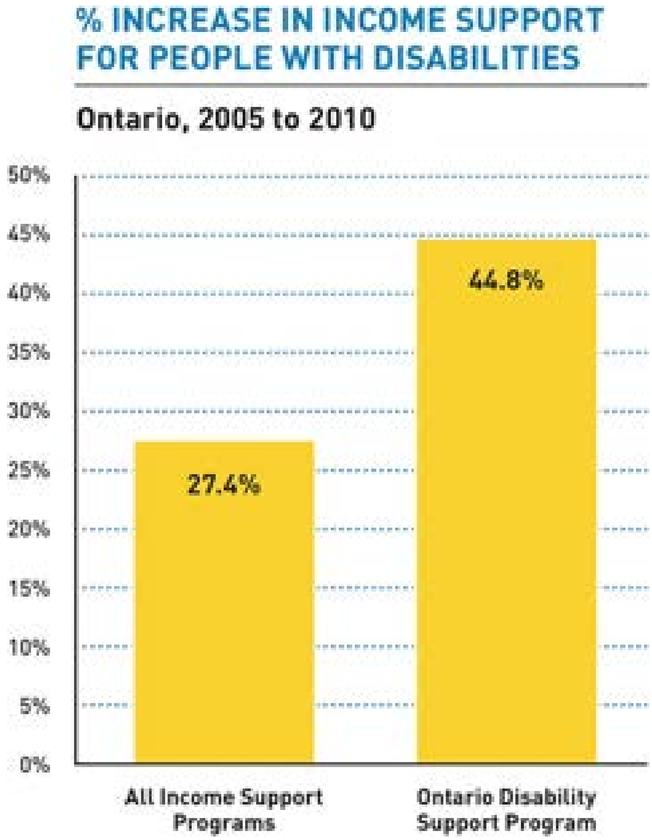

Fig. 4 % increase in income support for people with disabilities

Ontario.[16] In addition to being the largest percentage component, it is increasing at a disproportionately fast rate (see Fig. 5).

Ontario’s Disability Programs

Fifty years ago, in almost all instances, disability programs in Canada compensated persons because they could not work. The idea was to provide insurance against the hazard of disability. Most programs compensated an individual with a disability, but they didn’t focus on that person’s future.

Fundamentally, the large social insurance programs (CPP and EI), as well as private disability programs, continue to operate according to this insurance principle that views disability as a hazard that prevents workforce participation. When

---

[16] Munir Sheikh and Frances Lankin, *Brighter Prospects*, 2012, Appendix F.

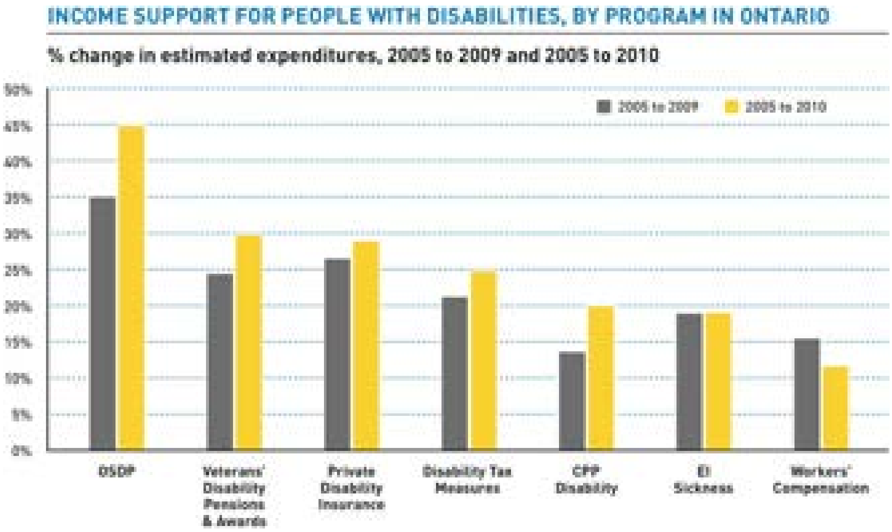

Fig. 5 Income support for people with disabilities, by program in Ontario

someone returns to work, the hazard is no longer present and therefore the insurance is no longer payable.

Since the 1980s, and especially with the publication in 1981 of the landmark *Obstacles* report,[17] we have wanted disability income programs that encourage persons with disabilities to work. We wish to compensate the person and find ways to accommodate the disability in favor of a future in work. However, there is little systematic movement to modernize and coordinate the programs with contemporary goals. This means we have a set of disability income systems that do not sit well beside each other. In Ontario, some set out to insist on a return to work (WSIB), some actually create disincentives to work (CPP-D), and one assists workplace re-entry with money, supports, and benefits (ODSP). They each have their own definitions of disability and their own terms of eligibility and benefit generosity. Taken as a system of benefits, they are not well coordinated and are focused more on individual program outcomes than client well-being.

It is in this context of real philosophical differences between programs, especially with respect to their disposition toward work, that we attempt to reframe the debate over why social assistance benefits for people with disabilities are changing. And, specifically, why ODSP is growing so fast.

The following is a description of disability income systems available to Ontario residents. Some are federally administered, some provincially. We'll look at them in order of overall size and significance.

Ontario Disability Support Program

ODSP, as with social assistance programs in all provinces, provides benefits to persons with disabilities. In Ontario and in most provinces, eligibility is determined by a combination of the duration of disability and needs testing.[18] Disability status is established by a doctor’s certificate indicating the severity of disability. One notable exception is Alberta, where the Assured Income for the Severely Handicapped (AISH) program provides flat-rate benefits that are not needs tested in the traditional way.

ODSP benefits are over 70% higher than base welfare rates. Asset limits are also considerably higher. Work requirements are mandatory for basic social assistance, but there are no mandatory work requirements for persons with disabilities. Unlike most disability income systems, ODSP has no time limit. Employment supports and incentives are offered on an ongoing basis. Many critics have suggested that if the system’s superior incentive system could be integrated with the best aspects of a pension that does not impose strict needs testing or time limits, Canada could have the best possible disability income system.[19]

Ontario is the only province that pays First Nations people with disabilities through the provincial program. In other provinces Aboriginal Affairs and Northern Development Canada administers the program. However, based on separate First Nations numbers from these other provinces and a relatively small proportion of First Nations people in Ontario, this is most likely not a significant contributor to the rise in ODSP.

Over the past two decades, the benefit and asset limits under ODSP and its predecessor programs have steadily declined in real terms (to inflation).

Programs like the Special Diet Allowance have been reduced, while Community Start Up benefits have been pared. In 2005, basic income exemptions were cancelled (and only recently reinstated). Yet, throughout the course of this recent history, ODSP expenditure and caseload growth has accelerated (see Fig. 6), making it clear that program reductions and cuts have had little or no effect on caseload growth.

Private Disability Insurance

Most large employers offer employment-based short- and long-term disability (STD/LTD) plans. The share of premiums paid by the employer and employees varies widely.

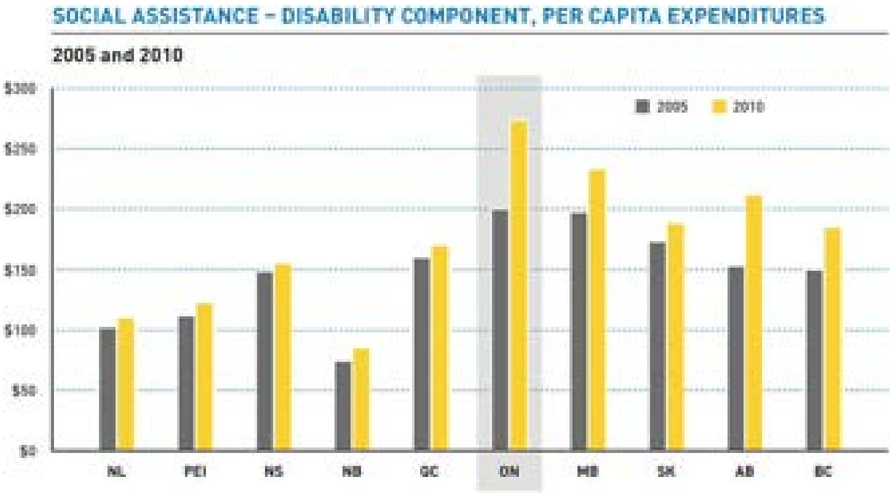

Fig. 6 Social assistance – disability component, per capita expenditures

Most plans provide a 2-year period of benefits for persons unable to perform their pre-disability occupation and who have medical evidence of a permanent or long-duration impairment. Thereafter, benefits are provided only if the beneficiary is unable to perform *any* occupation for which he or she is reasonably trained or educated.

Plan benefits are scheduled at 50% to 75% of pre-disability income. Benefits are reduced dollar-for-dollar by any CPP-D or workers' compensation benefits. Approximately 25% of all CPP-D insurance claimants have coverage from private disability insurance.[20]

Figure 7 illustrates that private disability insurance is growing in Canada on a per capita basis and has its strongest presence in Ontario. This increase suggests that changes to private disability insurance are not a strong contributor to the welfareization of disability incomes on an aggregate basis. Nevertheless, for persons like Angelica, loss of coverage through loss of employment status may be significant on an individual basis.

Workers' Compensation

Provincial workers' compensation agencies administer income security benefits for wage losses arising from disabling disease or injury caused by work exposures. The federal government also administers a workers' compensation program for federal employees. Employers pay the insurance premiums. The large majority of recipients

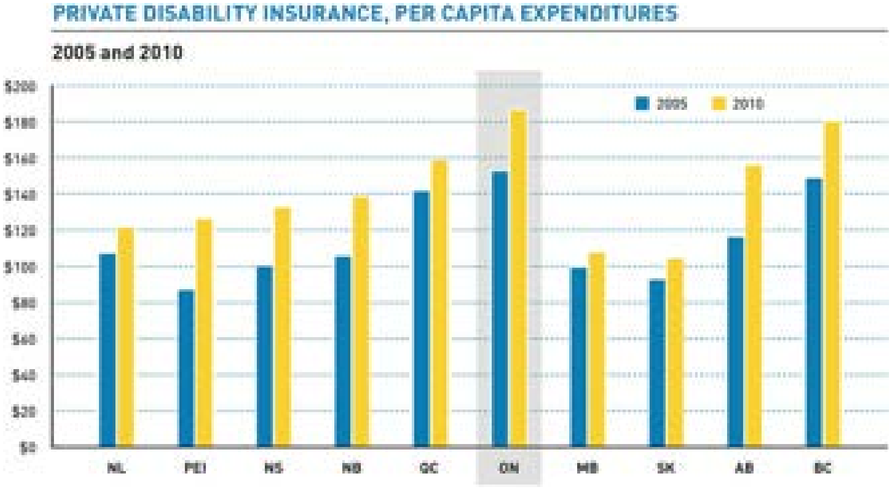

Fig. 7 Private disability insurance, per capita expenditures

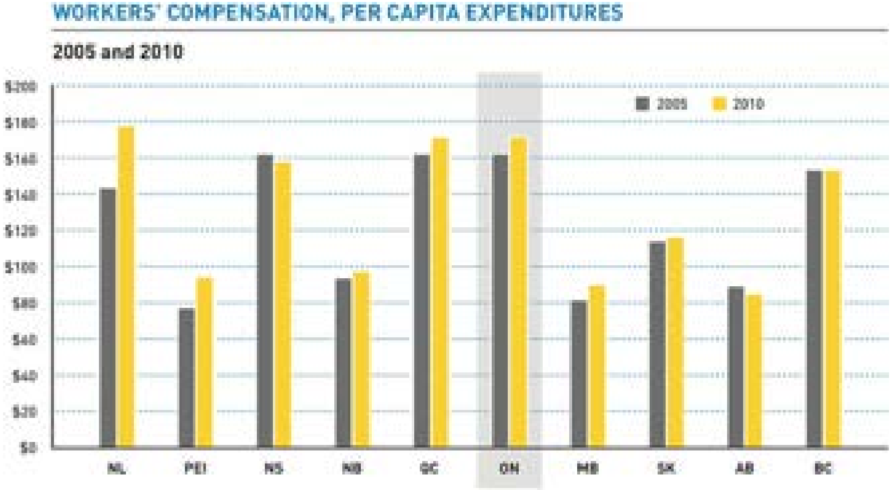

Fig. 8 Workers’ compensation, per capita expenditures

of provincial workers’ compensation wage replacement benefits experience temporary disability. However, provincial workers’ compensation agencies also administer benefits that acknowledge permanent impairment arising from a work-related injury or illness. Permanent partial disability benefits are payable to age 65. Benefit levels vary slightly among plans.

Figure 8 shows that workers’ compensation benefits, paid on a per capita basis, have been growing modestly and that Ontario is among the highest in expenditures. By 2010, Quebec, Ontario, and Newfoundland and Labrador continued to lead per capita spending, while the other provinces remain behind. It is worthy of note that changes to eligibility reducing WSIB benefits have been a matter of serious concern, especially in the post-2010 period.[21] These recent developments would appear to signal new pressures on ODSP.

Canada Pension Plan

The federally administered Canada Pension Plan is a compulsory contributory social insurance scheme. It provides income and protection in the event of retirement, disability, or death. Employers and employees contribute to CPP.

Eligibility for the Canada Pension Plan Disability program (CPP-D) is based on a stringent definition of disability: "severe and prolonged disability such that the person is incapable of gainful employment." CPP-D is treated as a "first- payer" by private long-term disability plans, provincial social assistance programs, and provincial workers' compensation agencies.

Confusion over the role of payroll taxes in Canada remains a serious concern, especially among immigrants. As CPP is contribution-based, only those who pay into the program through payroll taxes can receive CPP. Because programs like Old Age Security (OAS) and the Guaranteed Income Supplement (GIS) do not require contributions, the assumption is sometimes made that CPP is the same. In our first case example, Angelica did not fully realize the importance of not contributing once she became a contract worker.

The large differences in per capita payments between Atlantic provinces and Ontario (Fig. 9) cannot be explained by a prevalence of disability, demographics, or other factors. It may very well point to differences in appeal results in different parts of Canada. Lower per capita CPP payments are likely a major contributor to the welfareization of disability incomes in Ontario.

Veterans' Disability Pensions and Awards

Canadian Forces veterans, Merchant Navy veterans of the WWII or Korean War, current or former members of the regular or reserve force, and civilians who served in close support of the Armed Forces during wartime are eligible for a disability benefit administered by Veterans Affairs Canada (VAC).

Entitlement to a disability benefit is based on adjudication of the attribution of disability to exposures arising from service and the severity of disability. The disability benefit is reduced if the recipient is receiving benefits from an employment-based group disability insurance plan.

[21] National Union of Public and General Employees (NUPGE), Injured workers protest WSIB cuts: KPMG recommends cuts to workers' compensation benefits http://www.nupge.ca/content/4706/injured-workers-protest-wsib-cuts-kpmg-recommends-cuts-workers-compensation-benefits

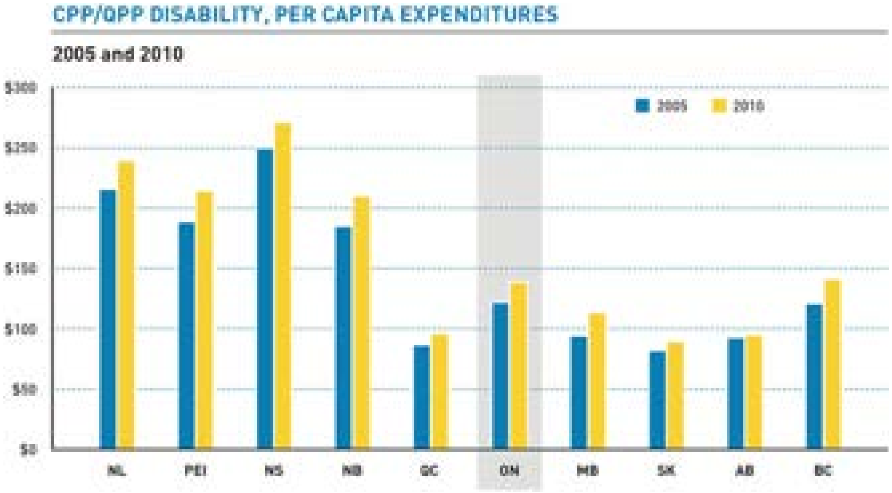

Fig. 9 CPP/QPP disability, per capita expenditures
Note: Quebec administers the Quebec Pension Plan. A digest of differences between CPP and QPP is available in a useful article by Canadian Payroll Consulting. (Canadian Payroll Consulting, Recent changes increase the differences between CPP and QPP, June 2012, http://alanrmcewen.com/2012/06/20/recent-changes-increase-the-differences-between-cpp- and-qpp/)

Pursuant to the *New Veterans Charter*, which came into force on April 1, 2006, disabled veterans are eligible for a disability award. This may be paid as a lump sum, as an annual payment, or as a combination of the two. Veterans' disability benefits have increased significantly in the new millennium due to two factors. One is Canada's enhanced military role (e.g., Afghanistan). The other is the increased recognition of trauma (post-traumatic stress disorder) as a disabling condition. Prior to 2006, eligible military veterans received ongoing pensions from VAC. With the conversion of some pension entitlements to lump sum payments, once the lump sum payment is spent, many veterans may be applying for social assistance disability programs.

It's uncertain what's causing the lower per capita payments in Quebec, Ontario, and western provinces – it may reflect differences in appeal results – but, like CPP-D, what is certain is that they put pressure on social assistance disability programs in these provinces. Veterans who have less access to military pensions are faced with the need to access social assistance to meet their ongoing needs (see Fig. 10).

Employment Insurance Sickness Benefit

The EI sickness benefit is administered by the federal government. It provides benefits for temporary disabilities for up to 15 weeks. To qualify, the worker must demonstrate that regular weekly earnings have decreased more than 40% due to

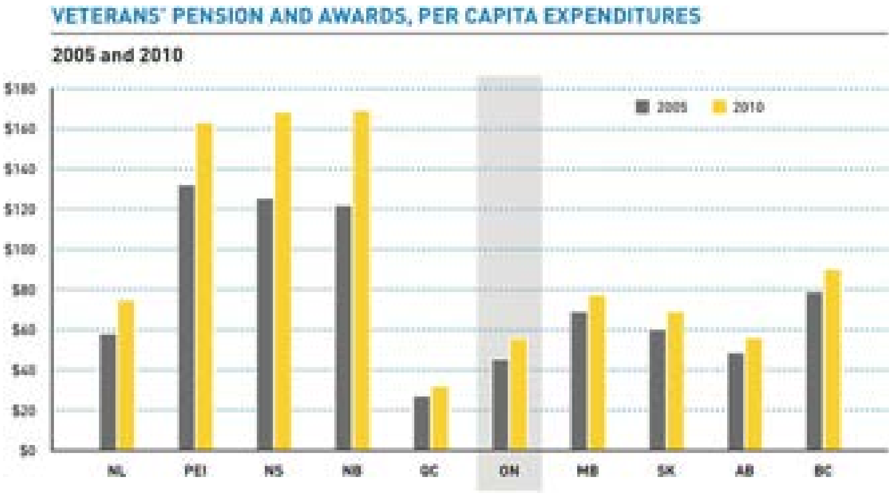

Fig. 10 Veterans' pension and awards, per capita expenditures

disability and that 600 insured hours have accumulated over the previous 52 weeks or since the worker's last claim.

The basic benefit rate for EI sickness is 55% of a worker's average insured earnings, up to a yearly maximum insurable amount. Employment insurance sickness benefits are administered as a "last-payer" program. Benefits are reduced when beneficiaries receive benefits from workers' compensation, group insurance income, and accident compensation for lost wages.

EI sickness benefits per capita are far higher in the Atlantic provinces than in the rest of Canada. This likely is a significant reason why the Atlantic provinces have a more moderate growth in their social assistance programs for persons with disabilities (see Fig. 11).

Tax Measures

Disability Tax Credits

The Disability Tax Credit (DTC) is administered by the Canada Revenue Agency under the *Income Tax Act*. It is non-refundable and is available to persons who are blind, are receiving life-sustaining therapy, or who have an impairment of physical or mental functions that has lasted or is expected to last one year. These non-refundable tax credits are used to reduce the amount that the person owes on federal income tax.[22]

---

[22] Other tax measures include the medical expense tax credit, caregiver credit, infirm dependent credit, disability supports deduction, and the refundable medical expense supplement. Some of these tax measures are available to people without disabilities who have qualifying medical expenses.

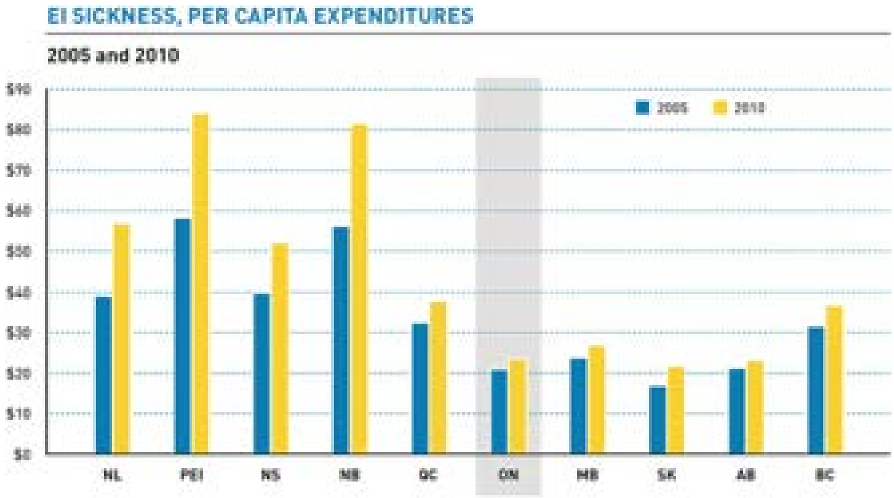

Fig. 11 EI sickness, per capita expenditures

In rare instances, social assistance recipients may have sufficient taxable income to benefit from the DTC, but in most instances the DTC benefits persons with disabilities who would otherwise be paying income tax. Social assistance itself is non-taxable, but other benefits like CPP and EI are taxable. The more tax payable, the more the DTC is worth.

Registered Disability Savings Plan

The registered disability savings plan (RDSP), established in December 2008, is delivered by the Canada Revenue Agency. Canadians who are eligible for a DTC and are under 60 years of age are eligible to open a RDSP. The RDSP includes a matching government grant and a savings bond. The lifetime contribution limit is $200,000 and there is no annual limit. Contributions are not tax-deductible and are not included in income when paid out of an RDSP.

Investment income accumulates tax-free but is included in the beneficiary's income for tax purposes when paid out.

Although a significant expenditure, these tax measures have no effect one way or the other on the rise of ODSP.

Ontario's Disability Programs: What Can We Conclude?

The increase of ODSP expenditures is a complex issue. Of the many intricate factors causing the spike in ODSP, I believe the most significant one is the current labor market. It has become precarious with an increase in part-time, temporary, and contract work. Fewer people in stable salary and wage jobs means that employer-triggered disability income systems have fewer wage and salaried employees to support while they tighten eligibility requirements for their services. This is especially true for workers' compensation.[23]

A significant number of individuals with disabilities are discovering that they are not eligible for employer-triggered disability income programs – private insurance, workers' compensation, CPP-D, veterans' disability, and EI sickness. And many who are eligible for employer-triggered disability income programs exhaust their benefits. Once their savings and assets are depleted, ODSP becomes the only possible income support program.

It's important to note that when employer-triggered programs are available, they are limited in their efforts and ability to help people return to work. This is documented in the CPP study: *Wrestling With the Poor Cousin: Canada Pension Plan Disability Policy and Practice, 1964–2001*.[24]

In the past, employer-triggered disability income programs were expected to provide the supports required in the disability income arena. They were designed to do the "heavy lifting" by compensating the loss of income due to an inability or incapacity to work. Social assistance, on the other hand, was not designed to be a disability income program; it was designed to provide support to low-income people living with disabilities and, wherever possible, compensate efforts made to secure employment. However, changing relationships between employers and employees combined with cuts in access and new tougher rules in some disability income systems – especially the employer-triggered ones – is expediting a shift of disability expenditures to the public purse.

In addition to cuts in many employer-triggered programs, tighter eligibility rules in OAS and GIS for immigrant seniors are also contributing to a rise in ODSP. OAS and GIS combined usually exceed the amounts paid by ODSP, meaning that seniors are not eligible for ODSP. However, a growing number of seniors (immigrants and persons returning to Canada) cannot access full OAS because they do not meet Canadian residency requirements. In these situations, seniors with disabilities may be eligible for a social assistance top-up.

Statistics Canada's Longitudinal Assistance Database (LAD) provides Canada-wide information about program usage and overlap. If we use the database to compare the period between 1992 and 2009, it shows that the proportion of the population receiving workers' compensation has declined steadily. The workers' compensation figures are particularly troublesome, showing a decrease from 4.2% in 1992 to 2.4% in 2009. Conversely, the proportion of the population receiving CPP/QPP disability benefits or claiming the disability tax credit has been increasing steadily since 2000.

Over this 17-year period, the proportion of the population receiving social assistance who were also receiving other CPP-D/QPP-D benefits has more than

---

[23] *2012–2016 Strategic Plan: Measuring Results*. Workplace Safety & Insurance Board, August 8, 2012, p.14. http://www.wsib.on.ca/files/Content/MeasuresReportsQ22012MeasuresReport/Corporate%20MeasuresQ22012.pdf

[24] http://books.google.ca/books/about/Wrestling_with_the_Poor_Cousin.html?id=yc5jQwAACAAJ&redir_esc=y

doubled – increasing from just under 2% to nearly 5%. Similarly, the proportion of social assistance recipients receiving one or more of CPP-D/QPP-D or workers’ compensation increased from 5% to over 10%. It is worth noting that in Ontario, the number of ODSP recipients who also receive CPP-D totals more than 30,000.

This means, in part, that more people with disabilities are not able to fulfill their income security requirements through other programs and, eventually, become eligible for social assistance. In other words, increases in CPP and ODSP are not inconsistent. With reduced labor force attachment in general, many more people with disabilities access lower amounts of CPP while the aggregate number of recipients continues to increase. In any instance where CPP benefits (based on contribution) fall below the benefits available through ODSP, the CPP recipient becomes eligible for a top-up from ODSP and aggregate numbers of recipients increase over the same time period.

Although the increasing demand on ODSP is problematic in terms of benefit adequacy, ODSP is providing a critical safety net. For persons with disabilities it is the only system with neither time limits nor specific previous work requirements. As such, its emphasis on providing workplace and employment supports, along with structural incentives to work without threat of disentitlement, provides an important model for the future redesign of disability income programs.

Regional Variations

Outside of Ontario, social assistance disability expenditures are rising fastest in Alberta and British Columbia, followed by Manitoba (see Fig. 12). In these provinces, other disability income support program expenditures are not increasing at the same rate.

One regional variation that may not account for significant numbers but is worth noting is that Ontario and the four western provinces have larger Aboriginal populations. In 2011, First Nations Social Assistance for people with disabilities accounted for 11.4% of total spending in both Manitoba and Saskatchewan. By contrast, in New Brunswick, spending on First Nations Social Assistance for people with disabilities amounted to 3.4%. This was the highest amount of any of the eastern provinces.

Another distinguishing factor of Ontario, Alberta, and British Columbia is their high rate of urbanization.[25] We know that big cities have much higher levels of part-time and temporary employment, and lower levels of full-time and permanent wage and salaried positions.[26] By extension, it is highly likely that these provinces also have a smaller portion of people with disabilities in the mainstream workforce.

---

[25] http://www.statcan.gc.ca/tables-tableaux/sum-som/l01/cst01/demo62n-eng.htm

[26] Based on StatCan data from 2001 and 2003 and from the *Survey of Income and Labour Dynamics.*

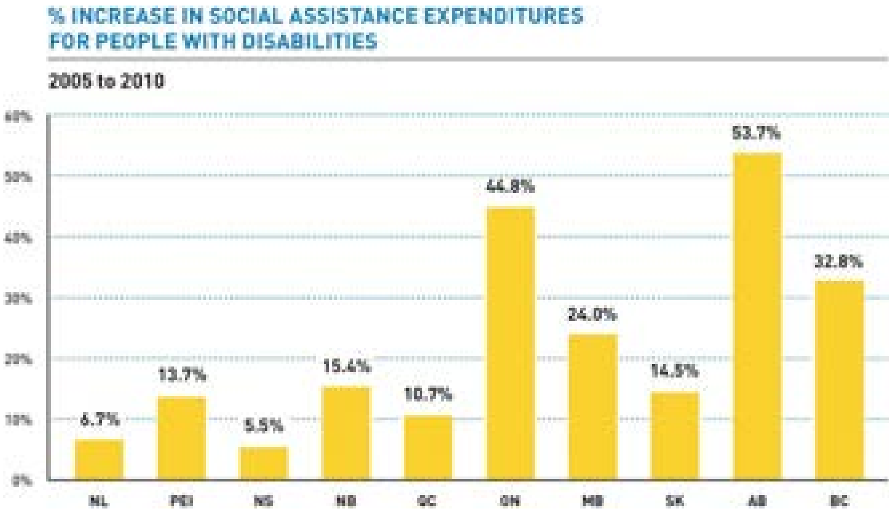

Fig. 12 % increase in social assistance expenditures for people with disabilities
Note: Alberta shows the highest rate of growth. This is largely explained by the generosity of design and benefits in the Assured Income for the Severely Handicapped (AISH) program

The fact that Canada's biggest cities are in provinces that have fewer full-time permanent jobs shows a correlation with higher social assistance disability incidence (especially in Ontario, with Toronto, and in B.C., with Vancouver). The correlation is relevant, as persons with disabilities have a demonstrated lower access to full-time permanent jobs.

Urbanization may account for several other factors that Ontario, Alberta, and British Columbia have in common, including lower per capita access to employer-triggered disability systems and more generous social assistance programs.

Access and Eligibility to Employer-Triggered Disability Income Systems

Ontario and provinces westward have lower per capita coverage from employer-triggered disability income systems. This may relate to fewer workers being in the regular workforce in more urbanized centers. For example, EI regular payments provide stronger coverage in Quebec and eastward versus Ontario and provinces to the west (see Fig. 13).

Generosity of Programs

Ontario, Saskatchewan, Alberta, and British Columbia all have demonstrably larger, more generous, separate social assistance programs for people with disabilities. In all

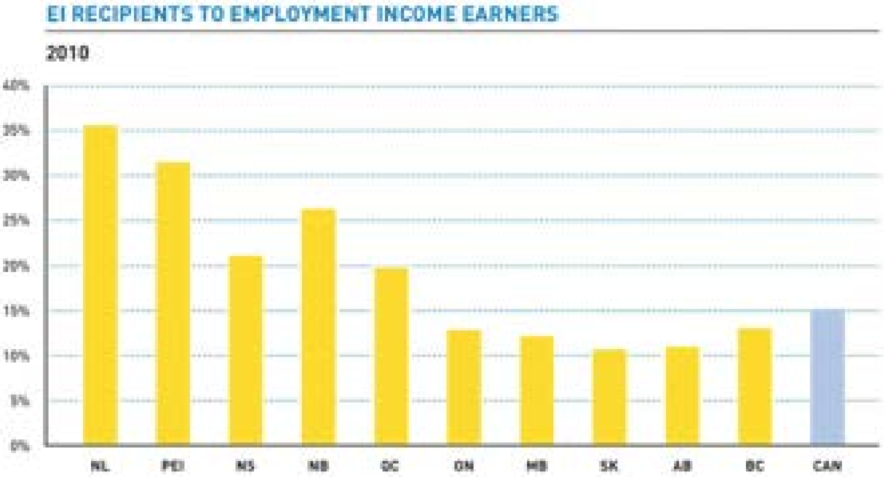

Fig. 13 EI recipients to employment income earners

other provinces, benefits for people with disabilities are provided through the existing social assistance legislation.[27]

In previous research I conducted,[28] it was demonstrated that the effects of the recession of 2008–09 on the number of social assistance recipients were markedly different in Ontario and the western provinces than in Quebec and the eastern provinces. Social assistance caseloads in the eastern provinces had returned to pre-recession levels, but in Ontario and the western provinces they were up an average of 23%. It may be the case that regular EI availability (in addition to EI sickness benefits) plays an important role in reducing social assistance disability benefits in Eastern Canada. As Fig. 14 shows, EI per capita claims are much higher in the Atlantic provinces. As EI keeps people from applying for social assistance, social assistance caseloads are more modest in the Atlantic provinces. There is a strong correlation between higher EI caseloads and lower social assistance caseloads.

The asymmetry of regular EI benefits across Canada (Fig. 14) is widely acknowledged. It is less well known that three other major income security programs – CPP-D, veterans’ benefits, and EI sickness – share this same asymmetry (Refer to Figs. 9, 10, and 11). More generous CPP-D, veterans’ benefits, and EI sickness in the Atlantic provinces may help explain why the increase in social assistance disability benefits has not happened there.

---

[27] The legislation may provide for distinct program streams for different types of clients.

[28] http://www.mowateitaskforce.ca/sites/default/files/Stapleton.pdf

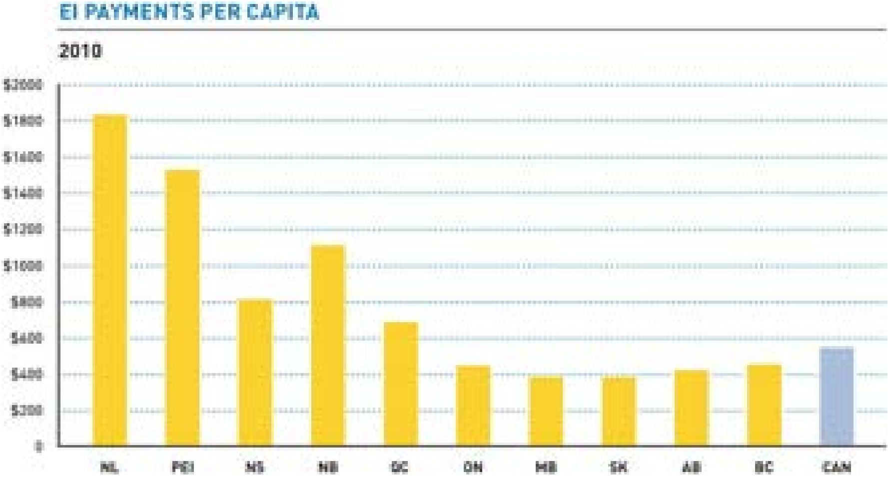

Fig. 14 EI payments per capita

Consequences of Current Trends

If this startling increase in social assistance disability expenditures in Ontario (and other large urbanized provinces) continues, along with the shift from employee-based programs to the public purse, it will likely have serious consequences for beneficiaries of the various income support systems and the governments providing these benefits.

Reasons to be concerned include the fact that the changes we have noted here constitute the development of social policy by default. No government nor any group within civil society or the private sector sat down and set these policy directions in advance. As such, they have evolved based on unintended consequences of various changes that have taken place.

It may be the case that governments, civil society, and the private sector don’t fully understand the consequences of reducing overall expenditures of, and the number of clients in, disability income systems other than social assistance. It is also likely that they do not see increases in social assistance disability expenditures as a natural “hydraulic” reaction to the erosion of stable jobs and subsequent reductions in growth of employer-triggered disability income programs.

The perception remains that if you are active in the labor market you have systems at your disposal to support you in dealing with a disability. There is also an important message here for workers who do not have disabilities – particularly contract and part-time workers. The message is that whether or not you are an active member of the work force, if you do not have payroll deductions or pay into a private disability plan, you are not protected against the hazard of future disability and you risk looking to ODSP as the only option for an ongoing stable, but low, income.

As noted earlier, one advantage of ODSP carrying a larger load is that social assistance permits a recipient to work and receive benefits. Unlike employer-triggered programs, there is no automatic cut-off when a recipient engages in paid employment. For this critical reason alone, there is a case to be made that other disability income systems should consider aligning themselves more closely with approaches taken by social assistance. In addition, social assistance benefits are statutory, not time limited (except once the recipient reaches age 65), and often come with good ancillary benefits such as medical transportation, disability-related supplies, and dental care. It is important to note that most other disability income programs do not provide similar benefits.

It is also important to be cognizant that the amount of money an ODSP recipient receives is less than the support he or she would receive from an employer-triggered program. Also, income from other sources is deducted from social assistance payments. In addition, social assistance imposes limits on the assets recipients are allowed, so those receiving social assistance disability income supports generally have limited means. Finally, social assistance itself is stigmatized.

This trend is definitely not free of consequences and more research is required to understand the ramifications and to ascertain whether it is good social policy to increase the prominence and the role of social assistance as the single largest source of disability income. Appendices A and B list a number of topics for further research and potential sources of data for this research.

Closing Thoughts

In this chapter, I have presented possible reasons why the Ontario Disability Support Program is growing so fast. I have proposed that the driving force behind this trend is changes that are occurring within the labor market. These changes mean an increase in the number of individuals who are no longer able to qualify for or access employer-triggered disability income programs, despite the fact that many of these people – such as Angelica – have a history of continuous work. This results in a **shift of coverage and responsibility from employee-based disability income programs to the public purse in the form of social assistance**.

It is beyond the scope of this chapter to conclusively verify this hypothesis. Instead, I have outlined what I believe to be the most significant factors at play. Ultimately, I hope that future research will enable us to understand more thoroughly the causes and consequences of the welfareization of disability. In turn, this will enable policy-makers to provide more effective, robust, and humane support to Ontarians and Canadians with disabilities.

Given the complexity of our disability income systems, changes to programs that are done in isolation will not necessarily create the desired result. For example, the Ontario government may follow some of the recommendations in *Brighter Prospects* to achieve savings through reduced caseloads or more modest caseload growth. But putting new strictures on ODSP in order to achieve savings and slow the increase in caseloads is unlikely to be successful, as the reasons ODSP is growing have little to do with rates, rules, or policies. This can be illustrated clearly through the example of our case studies. The reasons that Angelica and Bob are applying to ODSP relate entirely to changes that are outside of the purview of ODSP rules: changes in the social, medical, economic, and labor market environments in which ODSP operates today.

What both Angelica and Bob have in common is that they are each likely to receive social assistance disability income benefits that would not have been paid a short generation earlier. Both Angelica and Bob have needed to turn to ODSP because there is no other program that can provide them with the assistance they need. Bob, and Angelica if her application is approved, will receive ODSP without any internal changes to ODSP itself.

The lesson for policymakers is that any impulse to change program rules in order to bring caseloads down may not have the desired effect, since the reasons that Angelica and Bob applied to ODSP have nothing to do with those rules.

Given the complexity of disability income systems, it is clear that they cannot be understood in isolation from each other. What I have tried to do in this paper is frame the social assistance disability income system within the context of all eight disability programs operating in Ontario in order to gain a clearer understanding of what is going on – how they are growing and moving as one single, interconnected system. Only in this way does the growth of social assistance begin to be meaningful and understandable. Only then does it become clear that many of the reasons for its extraordinary growth are external to itself.

The challenge we face in trying to find a way to transform our disability income systems is that **programs have widely varying purposes**, they are administered at various levels of government and the private sector, they are funded differently through income and payroll taxes or employer levies, and they have vastly varying governance structures that together produce a wave of haphazard gaps, overlaps, and unintended consequences.

Disability income programs vary widely on the issue of workforce participation. Some programs encourage or insist on workforce participation or return to work, while others reduce or end coverage once workforce participation begins. **Social assistance, as a system that encourages work, is often stymied by other disability income systems** that stop coverage when a person participates in significant work or if they believe the person has not tried hard enough to return to work.

Some programs have benefits that are time-limited, others have benefits that are limited to particular interventions, and others have benefits that are permanent. Two of the programs (EI and CPP) are in place because of constitutional amendments undertaken many decades ago. Both programs would require multilateral discussions between the federal government and the provinces in order to effect reform.

Clearly, if there was an opportunity to start from scratch, no one would ever devise the array of disability income programs that currently exists. Neither individually nor as a collective set of systems do they begin to meet the real needs and expectations of people with disabilities. So, how do we find our way forward to transform the convoluted quagmire of eight very different disability income systems? Although opportunities to mount this discussion are limited at best, there is a desperate need for reform.

Any changes made to disability income programs require careful consideration of the whole system and I believe this is our best starting point. Should all parties agree to the creation of just one more commission dedicated to the task of disability income system transformation and supported by all levels of government and private and non-profit sectors, there would be reason to be optimistic that there is a way forward to a coherent set of policies that could guide us through a successful transformation.

Conclusion

Our income security system in Canada is inadequate as it relates to the poor and many parts of it are confusing, outmoded, and unfair. But that does not make it a terrible system. In many ways, it reflects our culture and much that is good within it. We need to be very careful about what we dismantle or allow to disappear inadvertently.

Old Age Security, the Guaranteed Income Supplement, our new child benefit system, CPP and EI are very good programs that – with a little bit of redesign work – could take vast swaths of people out of poverty. There is no good reason to throw them out and every reason to build enhancements using them as key building blocks of a new system.

Carl Jung said in his famous defense of astrology:

> We are born at a given moment in a given place and like vintage years of wine we have the qualities of the year and of the season in which we are born. Astrology does not lay claim to anything else.[29]

Our income security programs that pay out over $200 billion a year (much more during the pandemic) all bear the earmarks of their vintage. The beginning era of modern social assistance in Canada spanned from 1916 to 1939. Social insurance’ beginnings (in Canada) span the 26 years from 1940 to 1966. Old Age and disability pensions began in 1927 and took their present form at the end of the 1960s. The era of refundable tax credits began at the federal level in 1978 and continues to this day. Pandemic benefits reflect their obvious relationship to infection, illness, death, and recovery. Much of our system is now settled in place well beyond their eras of invention. This history is both remarkable and important.[30]

Still, to many, our present income security system can look like a couple of dozen cats in a bag. To a young person it must look like a horrible hodge-podge of divergent efforts mummified by Band-Aids. But as Wade Davis said, our system, like our culture is:

---

[29] http://www.wisdom-of-astrology.com/thewisdomofastrology%3Ayourlife'sblueprint

[30] The Covid19 pandemic and the unprecedented addition and withdrawal of pandemic benefits froze -for a moment in time- the welfareization process. It is likely to continue as there have been no fundamental changes to income security immediately following the pandemic.

> . . .a vast archive of knowledge and expertise, a catalogue of the imagination, an oral and written language composed of the memories of countless elders and healers. . .[31]

Throughout the history of man, there have been countless movements to fix the burden of an unsatisfactory present with a clean slate, a “tabula rasa.” “Starting over” appeals to an element within the human spirit – it is neither right nor wrong.

Tinkering and fixing things with “chicken wire and glue” is equally an element of our humanity. Most of us admire the 1950s cars in Cuba that still run with hundreds of reengineered parts and workarounds. The point is that they still work. “Clean slaters” and “fixer/tinkerers” each have their own place in the annals of reform and depending on the problem at hand, they are equally revered or reviled.

In all of the discussions of a guaranteed annual income or basic income over the years, many have said that Canada could start with a basic income for people with disabilities. In my report for the Metcalf Foundation called the Welfareization of Disability Incomes in Ontario, I said the following:

> Clearly, if there was an opportunity to start from scratch, no one would ever devise the array of disability income programs that currently exists. Neither individually nor as a collective set of systems do they begin to meet the real needs and expectations of people with disabilities. So, how do we find our way forward to transform the convoluted quagmire of ten large very different disability income systems? Although opportunities to mount this discussion are limited at best, there is a desperate need for reform.[32]

It would seem a lot easier to mount a basic income for people with disabilities for two reasons:

1. It is cheaper – $12 billion nationally as opposed to $50 billion + for everyone.
2. Few are worried about work *requirements* for people with disabilities – in other words, the public would not worry that people with disabilities should be forced to work to obtain income assistance in the same way they worry about people without disabilities.

So, with those two great policy and public opinion advantages, why is it so hard to take a logical first step toward a basic income by ushering in a basic income for people with disabilities?

Before answering the question, let’s look at all the expenditures made in Canada under our various income programs. There are ten large separate disability income systems in Canada depending on who is counting. They spend over $40 billion a year in transfers to individuals:

[31] Wade Davis, The Wayfinders – Why ancient wisdom matters in the modern world – CBC Massey Lectures- 2009, House of Anansi Press, page 34.

[32] http://metcalffoundation.com/wp-content/uploads/2013/12/Welfareization-of-Disability-Incomes-in-Ontario.pdf p.30 – updated 2021.

- Private disability accident insurance
- The Registered Disability Savings Plan (RDSP)
- The Canada Workers Benefit for people with disabilities
- Social assistance
- Workers' Compensation
- The Disability Tax Credit
- Veterans' programs
- Private programs
- CPP – Disability
- EI sickness

The reality is that it is not simpler to implement a basic income for people with disabilities. In fact, it would be harder. The Disability income system would be much more difficult to reform than the systems for either seniors or children. In addition:

- Eight of the ten systems pay benefits to people who are not poor. Only social assistance and the CWB-D have specific rules that direct payments to low-income people with disabilities.
- Four of the programs/systems pay temporary benefits only – they are not designed to pay long term benefits, i.e.,
  - EI Sickness – 26 weeks.
  - Workers' Compensation – generally up to two years.
  - Private programs – generally up to two years.
  - Veterans' program – only permanent for WWII and Korea veterans.
- The programs that are paid to low-income people with disabilities are not indexed and are inadequate (i.e., social assistance and the CWB-D).
- Six of the ten disability income programs can only be accessed through previous or current employment.
- Two of the ten programs (EI and CPP) are subject to Constitutional protections.
- The most inadequate program (social assistance) is increasing its share of overall expenditures on people with disabilities.

In sum, Canada has an overall disability income system paying out more than $40 billion in benefits that:

- Is largely not directed (by design) to low-income people.
- Pays only temporary benefits under half of its programs.
- Is largely inadequate and only partially indexed.
- Exhibits a growing "market share" represented by inadequate social assistance benefits.
- Is largely based on previous or current employment.
- Is Constitutionally entangled.

Accordingly, it would be no easier to mount a basic income for persons with disabilities than any other subset of the population. Nevertheless, with a

$40 billion base and with political will, it would be far easier to disentangle current programs.

This is the way I ended my paper on the Welfareization of disability benefits:

> Any changes made to disability income programs require careful consideration of the whole system and I believe this is our best starting point. Should all parties agree to the creation of just one more commission dedicated to the task of disability income system transformation and supported by all levels of government and private and non-profit sectors, there would be reason to be optimistic that there is a way forward to a coherent set of policies that could guide us through a successful transformation.[33]

We await the process and the new design ten years later.

Appendix A: Other Research Topics

The following research topics could shed light on possible reasons why employer-triggered programs are not "pulling their weight." These may provide further explanation in answer to the question of why social assistance is becoming the dominant income system. These alternative hypotheses also require additional research.

Job Security

A hypothesis very much intertwined with our original hypothesis is that the deterioration of traditional employment is steering increasing numbers of people with disabilities away from employer-triggered income support programs.

Additional research should examine the experience of people with disabilities with non-traditional employment.

Lack of Knowledge

An alternative hypothesis is that some regularly employed individuals with disabilities may not be aware that they are eligible for employer-triggered supports. They may turn to social assistance as a more familiar form of income support. Further research should test employees' knowledge of various income support programs for people with disabilities.

---

[33] http://metcalffoundation.com/wp-content/uploads/2013/12/Welfareization-of-Disability-Incomes-in-Ontario.pdf p.30

Economic Recession and Workplace Injury

Another hypothesis is that workers' compensation expenditures are lower during a recession, boosting the relative importance of other income supports, including social assistance. The theory is that less experienced workers are more likely to get hurt on the job but are also the first to be laid off in a recession. As they are laid off, workplace injury rates and overall workers' compensation expenditures decline. In addition, an economic recession inhibits job-seeking efforts of those on claim to get re-employed, so they are eventually funneled into social assistance.

Additional research is required to understand the interplay between economic conditions, workplace injury, and access to employer-triggered supports.

Time Limits/Accelerated Decay of Benefits

Another hypothesis is that the workers' compensation benefits share of total disability income support expenditures is declining because employers have a financial incentive to bring injured workers back to work. The experience rating process ties the premiums employers pay for workers' compensation to actual reported losses. The longer an employee receives workers' compensation benefits, the larger the increase in the employer's premiums. The possible result of this financial incentive is that employers work harder to bring injured workers back to work.

Further research is required to understand the effects of the various incentives on employer behavior and the ultimate rates of reintegration of people with disabilities into the workplace.

An alternative hypothesis relating to workers' compensation addresses fiscal pressures associated with long-duration disability episodes. Ten percent of people receiving workers' compensation benefits are offered retraining/employment assistance programming. Once these avenues are exhausted, they can be deemed unemployable. For example, 30% of the flow into B.C.'s social assistance disability benefit program is of people who used to be receiving workers' compensation benefits.

Disability Culture

The disability culture hypothesis focuses on choice, positing that individuals will choose to access social assistance disability benefits over retaining work or accessing other benefits.

Further research is necessary to investigate this theory. Are individuals choosing not to work and marshaling existing impediments in such a way as to obtain disability benefits? Are individuals who do not believe they have a reasonable opportunity to work marshaling these impediments in this way because disability benefits are greater than regular social assistance benefits? In Ontario, for example, disability benefits on ODSP are over 70% higher than regular Ontario Works social assistance benefits. Benefits for a single disabled person in British Columbia are almost 50% higher than regular social assistance benefits.

An additional factor to consider is the other perceived benefits of social assistance support. For example, a recipient of social assistance may still work sporadically. The recipient would also be eligible for health benefits not provided by other programs. Social assistance programs also frequently provide rapid reinstatement for people with disabilities who try to exit.

One issue to explore is the labor force participation of people with disabilities. How and to what extent are people with disabilities participating in the labor force? How and to what extent are they engaged in non-traditional work, making them ineligible for employer-triggered supports? Statistic Canada's Participation and Activity Limitation Survey provides some data about labor force participation:

> According to the Participation and Activity Limitation Survey (Statistics Canada, 2008b), 2,457,350 persons with disabilities between the ages of 15 and 64 could have participated in the labour force. Of this group, 51.3% were employed, 43.9% were not in the labour force, and 4.9% were unemployed. In contrast, among those without disabilities, 75.0% were employed, 20.0% were not in the labour force, and 5.0% were unemployed.
>
> The unemployment rate was 10.4% for persons with disabilities, compared to 6.8% for the population without disabilities.[34]

Another question addresses the demographics of those benefiting from social assistance disability income programs versus those benefiting from the employer-triggered programs. It will be important to explore the extent to which individuals are accessing multiple benefits and how this affects total income support received.

Appendix B: Data Sources for Further Research

Data Sources Relating to Demographics and Labor Market Participation of People with Disabilities

The **Longitudinal Administrative Databank (LAD)** comprises a 20% sample of the annual T1 Family File provided to the Canada Revenue Agency. It contains demographic information and income information about labor market participants, including amount of labor market earnings and income from other sources.

The **Survey of Labor and Income Dynamics (SLID)** provides longitudinal data on more than 30,000 Canadian households. Two panels of households are surveyed for six consecutive years, answering the same questions. One limitation of this source is that it provides data on disability, but not workplace disability specifically.

---

[34] The Centre for Addiction and Mental Health, *The Aspiring Workforce: Employment and Income for People with Serious Mental Illness*, pg. 87.

The **Participation and Activity Limitation Survey (PALS)** contains useful data on people living with activity limitations. However, the last survey was conducted in 2006, which may make the data not useable.

Data Sources Relating to Disability Expenditures

Statistics Canada provides data on disability expenditures in a variety of sources. No single source can provide all the data needed, but information from several sources can help confirm the trends identified.

The LAD provides data on disability tax credits, CPP-D, workers’ compensation, and social assistance from 1992 to 2009. It can also follow people with disabilities over time, enabling an analysis of, for example, the duration of individuals’ use of disability deductions/credits. However, the LAD does not distinguish between regular EI benefits and EI sickness benefits. A significant limitation is that it cannot identify people with disabilities unless they are receiving disability tax credits, CPP-D, workers’ compensation, and/or social assistance.

As for veterans’ pensions, no information can be found in tax data or on SLID.

Disability and Employment Research: Mind the Gap

62

Douglas Waxman

Contents

Abstract

This chapter examines the gap in how we study disability employment by examining 130 studies from 2000 to 2022 on employers' perceptions of employees with disabilities. Most of the studies are subject to social desirability bias, being largely based on employer self-reports. Expressed intention has been shown not to be coincident with employers' actual behavior. Another gap identified include a lack of generalizability of research studying employers' perceptions of employees with disabilities. A further gap is that this concept is understudied in the Global South. Researchers are challenged to find data that gets at employers' actual behaviors. A potential example of such research is provided. The annexed annotated bibliography of extant literature on employer's perceptions and behaviors towards employees with disabilities is a significant resource.

Gap in the Extant Literature

Employment is considered essential, in addition to remuneration, for its contribution to human flourishing, self-actualization, and dignity. The right to equality in employment for persons with disabilities is enshrined in multitudes of national human rights codes and at the international level in the *Convention on the Rights of Persons with Disabilities*. And yet, persons with disabilities continue to be underutilized, subject to involuntary unemployment despite having untapped work capacity. This persists even in tight job markets. Persons with disabilities are subject to high rates of employment discrimination. This apprehension to hiring persons with disabilities clearly derives from employer biases.

Barriers to disability employment is an important construct to study if we hope to overcome the gap between the work potential of persons with disabilities and their actual utilization. Not only what we study is important but so is how we study disability employment if we hope to fully understand the issues. While there seems to be considerable research on employers' self-reported perceptions of employees with disabilities, little research has been conducted that surfaces employers' actual behaviors towards employees with disabilities. We have a multiplicity of focus groups and survey data, where employers speak favorably about the potential of employees with disabilities, but given the low levels of employment of persons with disabilities, they seemingly do not actually hire persons from this population.

Not only is there a gap in the utilization of persons with disabilities in the labor force but there is a gap in how we study this issue. In order to further understand the research gap, an exhaustive survey of the extant literature is presented here. While the substantive findings of the various papers referenced are significant in their respective research contexts, their import here is for what they tell us cumulatively about the state of research methodology in the field of disability employment discrimination. It will become apparent from the extensive review of the extant literature and examination of methodologies applied that there is an overreliance on employer s' self-reporting, which is often disconnected from employers' actual behaviors. It is argued here that there is a gap in methodology in how we study employers *vis á vis* employees with disabilities, in that we principally focus on what employers say not what they actually do.

Methodology

This research was conducted initially as part of the literature review for my doctoral dissertation (Waxman, 2022). The study involved initial systematic database searches primarily using Google Scholar. Searches used combinations of key search terms: employees with disabilities, employer, behaviors, perceptions, preferences, attitudes, beliefs, and perspectives.

The time frame for the searchers was bound by the years 2000 to the present. The year 2000 presented a natural (if somewhat arbitrary) breakpoint, giving a date range sufficiently far back so as to capture the significant works on this construct and methodological trends but without reaching back so far as to include pieces that may be outdated. There would only be a few studies prior to 2000. Twenty-two years provides a significant time frame to assess the state of research and view trends.

The research was primarily iterative. Reading various pieces of the literature leads to other referred literature meeting the search criteria. I refer to this form of literature retrieval as akin to the snowball sampling technique. This search technique allows access to articles about preferences, attitudes, and behaviors not caught by searches using key terms. Ultimately, the initial round of research bound by the years 2000–2017 led to 95 papers.

In subsequent years, I collected further literature on the concept of employers' perceptions of employees with disabilities as they became available. This aggregation was largely passive, collecting relevant articles as they appeared on feeds from Academia, Research Gate, Mendeley, and Science Direct. My continued reading to research employers' discrimination towards persons with disabilities led to unearthing other papers. In total, this generated 35 additional papers on the concept of interest. Thirteen of those papers related to the original search period 2003–2017. The balance was research published in 2018–2022. Thus, the total literature sample was 130 papers.

Papers that did not expressly discuss employer or managers' behaviors or attitudes were excluded. Papers about more general perceptions of disability that did not have an employment component were excluded. Papers about best practices for employing persons with disabilities were excluded, unless they had some element of employers' perception or behaviors. Papers that examined employer attitudes towards certain labor activation policies were also excluded. Articles focused on hiring or accommodation best practices but not assessing behaviors or attitudes towards employees with disabilities were excluded. Papers that addressed the concept but were only about validating a survey scale measuring employers' dispositions without providing findings about employers' attitudes or behaviors were excluded. Papers surveying discrimination generally, including disability, were excluded. Papers about employees' or coworkers' attitudes towards persons with disabilities were also excluded. However, the excluded papers contributed to the snowball effect as a source of other papers dealing with employer disability-related preferences. Consideration was given to excluding studies where the subjects were university students; however, this is a relatively common source of research data and only represents four studies (Gouvier et al., 2003; Louvet, 2007; Requero et al., 2020; Weigand, 2008).

The vast majority of the studies are published in academic journal articles. Seven are reports emanating from governments, research institutes, and consulting firms. However, most of the reports use academic methodologies. They consist of two surveys, three literature reviews, one focus group, and one mixed method, including interviews and online submissions. Searches were not conducted on a country-by-country basis, which may have generated reports from other countries that were not otherwise caught. Regardless, it is likely that adding such studies would only skew the survey, focus group, interview, and literature reviews categories further. It is unlikely that government studies, which are the most prevalent of the three non-journal sources (n-3), would conduct experimental research.

Profile of the Research Studies

As can be seen from Fig. 1, 2011–2015 seems to be the zenith of research productivity in this field. Fifty-four of the 130 studies, or 43%, occurred over these 5 years. In comparison, in the preceding 10 years, only saw 43 studies conducted on the issue. This 10-year period's lower number may reflect the nascent state of disability employment research. Searches only netted 30 studies for the 6 years, from 2016 to 2021. It is unclear whether this reflects a sense of saturation or an appreciation of methodological limitations. The lower number (n-4) for 2020 and 2021 may be due to the COVID pandemic. However, 2016 (n-2) and 2019 (n-4) also had similarly low volumes of research in this area. The current year (2022) is excluded from this discussion, given that it represents, to date, an incomplete year and, therefore, is not comparable.

The national origins of the studies, as seen in Fig. 2, are dominated, as expected by the Global North. One hundred sixteen (116) of the studies, or 88%, are from the Global North (including Australia, Israel, South Korea, and Taiwan). Of those, 77 were from America and Canada. Fifty-two of those were from America. The field is clearly dominated by research from America and is North American-centric. This ratio in studies might be altered if the search included literature in other languages. This might be considered a limitation of this study.

There were only 16 studies from the Global South. Regionally, there were 2 studies from Africa (South Africa and Zimbabwe), 11 studies from Asia, 1 from the Middle East (Saudi Arabia), and 2 from South America. The Asian numbers were dominated by India and Malaysia, with four studies each. The South American

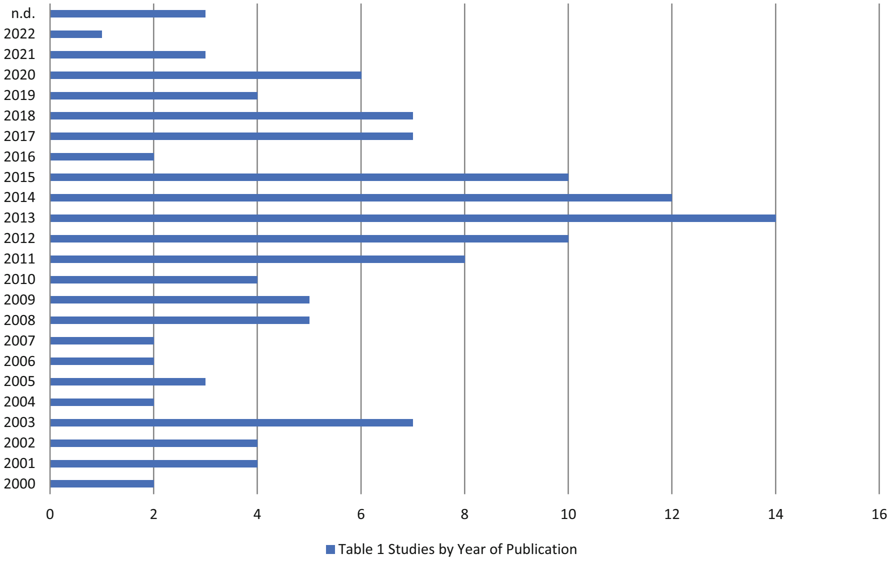

Fig. 1 Studies by year of publication

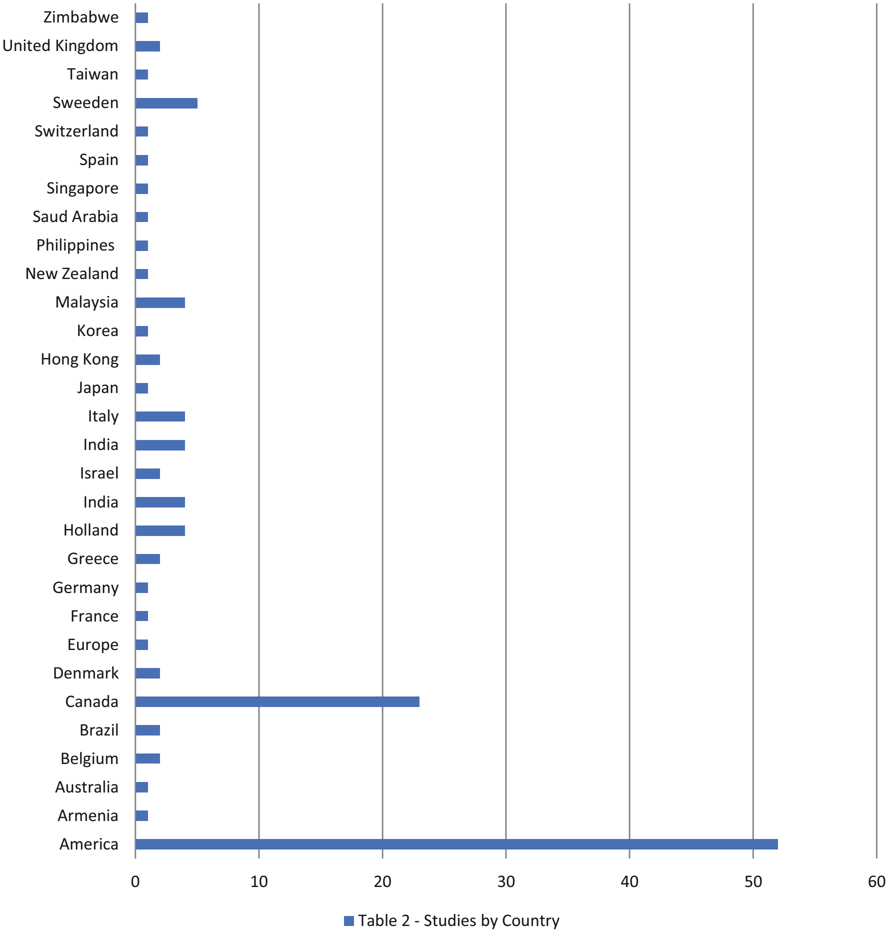

Fig. 2 Studies by country

studies were both from Brazil. There were no studies from Latin America. Studies from the Global South ranged from 2003 until 2022. However, 13 of the 16 studies were from 2014 to 2022. The low number of studies from the Global South is not surprising. As Meekosha (2008) notes, "Little is documented about disability in the non-industrial world" (p. 2). Hwa (2017) states, for example, "Disability research in the Asia context is also still few and far between, resulting in a dearth of data on the disabled population (p. 2). And Katsui and Swartz (2021) note that increases in disability studies in the Global South are recent. Employers' behaviors towards persons with disabilities in the Global South remain understudied and thus there is a geographic research gap as well.

As with the North, in the Global South, surveys dominate the methodology landscape, consisting of 8 out of 16 studies, followed by 4 interviews, 2 literature reviews, 1 mixed methods study, and 1 experimental study. Thus, the methodological gap, as will be discussed in the next section, persists both in the Global North and South, except in the Global South, as mentioned above, it remains understudied.

Intention Versus Behaviors

Most of the extant research measures managers' intentions, as can be seen by the level of research reliant on employer self-reports. Few assessments of employers' actual behaviors have been conducted. Typically, research has attempted to gauge employer attitudes toward employees with disabilities to judge employers' prejudices as barriers to employment. Hernandez et al. (2008) pointed out that there are many studies examining employers' perceptions of workers with disabilities, of which the vast majority are quasi-experimental designs or quantitative surveys. They note, "While such data are valuable, the in-depth experiences of employers have not been more fully explored" (Hernandez et al., 2008, p. 158). The review of the literature from 2000 to 2022 concerning employers' perceptions of employees with disabilities (Appendix) reveals 130 studies of this construct. As can be seen from Fig. 3, the majority, 61 studies, are surveys, followed by 20 interviews, 6 mixed methods, 8 focus groups, 19 experimental designs, 20 literature reviews, 1 theoretical review, and 1 essay that does not disclose methodology.[1] Taken together, 95 of the research papers were dependent on researcher self-reports, thus evidencing a gap in how we study disability employment, that does not actually surface employers' actual behavior towards employees with disabilities.

Studies from Israel, the United States, the Netherlands, and Sweden reveal that managers' intentions are not a significant predictor of actual behavior (Andersson, 2012; Araten-Bergman, 2016; Hernandez et al., 2000; Sālājeanu, 2012; Zissi et al.,

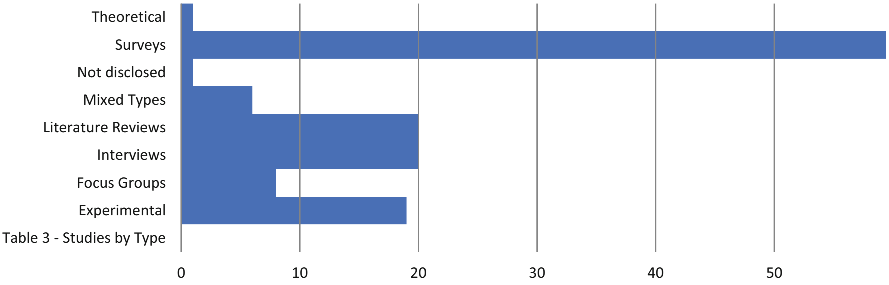

Fig. 3 Studies by type

---

[1] Peck and Kirkbridge (2001) does not advert to a method but is a fairly foundational, early discussion of employers' attitudes, so it has been retained.

2007). As Araten-Bergman (2016) stated, most studies use “managers’ expressed intentions as an adequate proxy for actual hiring, making little effort to validate the conjecture” (p. 1511). Araten-Bergman (2016) further stated that, “although potential employers generally tend to express positive attitudes and a willingness to hire PWD in employers’ surveys, they rarely do so in real-world situations” (p. 1511). Bredgaard and Salado-Rasmussen (2021) distinguish between attitudes and behaviors. “Employers generally express positive attitudes towards recruitment of persons with disabilities. Field experiments of actual recruitment practices, however, reveal that employers are less likely to invite job applicants disclosing disabilities compared to job applicants without disabilities” (p. 4). That is, employers’ positive attitudes about employees with disabilities do not translate into corresponding hiring behaviors.

Research Quality

Most of the nonexperimental studies do not get at actual lived experience and discrimination. At best, according to Ren et al. (2008), correlation studies frame research questions that need further exploration through experimental investigation. However, not all experimental designs get at actual behavior. Kulkarni and Lengnick-Hall (2014) note a disconnect between laboratory and field studies, pointing out that the former are more likely to demonstrate positive attitudes towards employees with disabilities. Further, the analogue nature of certain experimental designs means that the results are not generalizable (Cook & Rumrill, 2005).

Most surveys in the literature that are created to reveal employers’ attitudes toward persons with disabilities are designed by individual research teams. Lengnick-Hall et al. (2001) pointed out that only a small percentage of the structured surveys reviewed used validated scales. Lindsay et al. (2013) note that most disability employment research “lacks a rigorous design” (p. 9). The review of the studies in Appendix found that a few used published scales. However, at least 24 of the studies relied on researcher-constructed surveys. Most of these studies, if not all, are limited by the absence of preexisting psychometric development (Antonak & Livneh, 2000; Mak et al., 2014; Palad et al., 2016). In an extensive review of the organizational behavior literature, Hinkin (2008) found that “inappropriate domain sampling, poor factor structure, low internal consistency and reliability and poor reporting of newly developed measures continue to threaten our understanding of organizational phenomena” (Hinkin, 2008, p. 1). As Lengnick-Hall et al. (2001) noted, “While author-created surveys are not necessarily, by definition, lacking validity, their one-time use makes them difficult to assess” (para. 4). It has been found that there are conflicting findings with respect to various factors on acceptance of employees with a disability (Unger, 2002; Vornholt et al., 2013), which suggests concerns about the reliability and generalizability of the studies. Another significant gap is the lack of longitudinal studies (Heera & Devi, 2016; Vornholt et al., 2013), with the exception of the study by Araten-Bergman (2016). The lack of generalizability is often a necessary and accepted limitation in qualitative research and while all the studies in Schedule A contribute to our understanding of the disability-employment construct, there may be an overall lack of generalizability in how we study employers' perceptions of employees with disabilities, which contributes a methodological gap.

Social Desirability Bias

The most significant issue with self-reported data is its potential to be confounded by social desirability bias, which may skew the data. This bias is the result of respondents deliberately distorting their views, chiefly to give a good account of themselves or to provide a socially appropriate response (Antonak & Livneh, 2000; Araten-Bergman, 2016; Wilson & Scior, 2015), which the researcher then, "interprets as a meaningful, typical or stable attitude" (Antonak & Livneh, 2000, p. 215). Bredgaard and Salado-Rasmussen (2021) note that survey research is more susceptible to social desirability bias than field experiments. Some papers in Appendix indicate that social desirability bias is a possible limitation of the survey research (Araten-Bergman, 2016; Gustafsson et al., 2014; Jasper & Waldhart, 2013; Wilson & Scior, 2015). Further, Wilson and Scior (2015) found no association between implicit attitudes, which were somewhat negative, and explicit self-reported attitudes towards, in that research, persons with intellectual disabilities.

Robert and Harlan (2006) advise "that motivations are unobservable and empirically unverifiable … they must be imputed based on indirect evidence" (pp. 601–602). "That motivations are unobservable and empirically unverifiable" leaves us with indirect evidence. The indirect evidence would be employers' actual behaviors. And while all the forms of research enumerated above add to the cannon of disability studies and contribute to our understanding, for which we owe a debt of gratitude, we, in the disability-employment academy, need to focus more on surfacing actual employer behaviors than empirically unobservable intentions and attitudes.

No doubt, finding sources of data evidencing actual employer discriminatory behavior to study is challenging, particularly in the world of work characterized by aversive discrimination (Deal, 2007; Friedman & Owen, 2017; VanPuymbrouck et al., 2020). That is, norms in modern society make it less acceptable to discriminate on an overt basis, such as disability. Most employers are sophisticated enough not to be honest in rejecting a job applicant overtly because of their disability, for example.

The Challenge

Finding data that renders employers' behaviors that are not dependent on employers' intentions or confounded by employers' attempts to be socially acceptable is a challenge and necessitates researchers to be creative. Waxman (2022) recent research is humbly offered as a potential example of using such data for researching employers' behavior. In an effort to contribute to filling the gap in the literature, Ontario Human Rights Tribunal cases were utilized. The cases were culled down to those in which the employer was found in breach of the *Ontario Human Rights Code* on the ground of disability discrimination in employment. These cases were an untapped resource, as they have never been used empirically for this purpose. They are an abundant source of relevant data, as Tribunals Ontario (2020) reports that 62% of Ontario Human Rights Tribunal cases were on the grounds of employment, and 53% of the claims were on the grounds of disability.

Legal cases have the benefit of being a source of naturally occurring data (Darcy et al., 2016). As Silverman (2006) stated, "Naturally occurring texts document what participants are actually doing in the world – without being dependent on being asked by researchers" (p. 163). The cases as a data set constitute a random sample. Given the way the Human Rights system works, there is no way to predict or control which cases would meet the established search criteria. There is no way to know what claimants will bring a claim, and out of the thousands of cases filed annually, which ones will not settle out or be subject to dismissal for various procedural reasons. Moreover, the cases, as data, are less susceptible to social desirability bias, given that the behavior has already occurred (Potter, 2004; Silverman, 2006). They are retrospective data from which employers' actual behaviors could be studied. Unlike susceptible data, cases could be relied on as presenting "meaningful, typical or stable" information (Antonak & Livneh, 2000, p. 215). Documents have been recognized as being able to consist of an entire study (Charmaz, 2014; Glaser & Straus, 1967; Pandit, 1996; Turner, 1983). Legal decisions are a valid source for empirical document analysis (Darcy et al., 2011, 2016; Darcy & Taylor, 2009; Hall & Wright, 2008). Hall and Wright (2008) note legal cases are no more imperfect than other forms of social science data; "though judge-reported facts may not 'purport to be the real facts' they are 'near enough'" (p. 97).

It was found that employers were saying one thing, proffering a bevy of excuses, but the adjudicators, upon looking at the evidence, i.e., the employers and employee behaviors, were able to determine a different, more accurate picture of employment in each of the cases examined. However, the adjudicators found none the reasons (defenses) offered by the employers to be true, on the balance of probabilities. What employers stated was disconnected from the actual evidence. The employers' actual behaviors differed from the employers' assertions. The most significant conclusion is that the employers' discriminatory behavior differed from their espoused reasons.

Limitations

That this research was not systematic in adhering strictly to database searches bound by key search terms, in the classic sense, may be a limitation, which is admittedly ironic in a review of methodology. I would, however, argue it is comprehensive and relatively exhaustive of the literature on the concept. Systematic research also misses relevant literature and is as good as its search terms. The research is sufficiently robust to opine on the state of how research of the concept in question is being conducted. Another possible limitation is that searches did not include specific disabilities or specific countries, or studies in languages other than English (with the exception of Zappella, 2015a), which may have led to additional studies.

Conclusions

The review of the studies of employers' perceptions of persons with disabilities from 2000 to 2022, presented here, contributes to understanding how researchers have studied this phenomenon and identifies a gap in our knowledge resulting from the type of methods deployed. The extensive literature canvased here revels that researchers largely rely on self-reported intentions of employers, which are subject to social desirability bias. The disconnect between what employers say and what they do evidences a gap in the methodology researchers utilize to study the phenomena of employers' behavior towards persons with disabilities. Further, we see other gaps in the generalizability of the typical research methods used to study this construct, as well a global gap in the disability employment being understudied in the Global South.

The challenge for researchers seeking to understand employers' discrimination of employees with disabilities is to find creative ways to get at employers' actual behaviors. All research contributes to our understanding of this phenomenon. However, there is a need to move beyond employers' self-reported attitudes or intentions.

Given that unemployment of persons with disabilities wastes human capital is a barrier to individual self-actualization and increases demand on social welfare systems, it is essential that we deepen our understanding of the barriers impeding employment of persons with disabilities in all its complexity. Therefore, researchers must continue to find data that accesses employers' actual behaviors and fills the gap.

Appendix

Studies on employers' attitudes towards persons with disabilities 2000–2021

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Alfasi	n.d.	Israel	Survey	1900 businesses		Generally, no difference in attitude between firms employing persons with disabilities and those not employing persons with disabilities was found
Ameri, Schur, Adya, Bentley, et al.	2015	The United States	Field experiment (sent three different applications)	6016 advertised positions		Applications with disabilities received 26% fewer expressions of interest
Andersson	2012	Sweden	Survey	68 head hunters or employers	Psychological disabilities	Employers hold favorable attitudes towards persons with disabilities
Andersson, Luthra, Hurtig, and Tideman	2015	Sweden	Survey Vignette	212 employers		Employers' interest in hiring persons with disabilities varies with the nature of the disability and their previous experience with persons with disabilities. Employers with experience with persons with disabilities were more interested in hiring persons with disabilities and believed they were more open to hiring employees with disabilities than other employers. Access to financial compensation, extra resources, guidance, and openness about disability was seen as essential
Ang	2017	Japan and Malaysia	Semi-structured interviews	20 hiring managers		Found a belief that persons with disabilities are incapable of work. Malaysian respondents stated a lack of suitable work and that hiring was motivated by the company's corporate social responsibility agenda

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Annett	2017	Canada	Semi-structured interviews	6 supervisors		Supervisors perceived risks of hiring persons with disabilities in cognitive terms, largely associated with increased workload for themselves
Applications Management Consulting Ltd.	2014	Canada	Survey – annual Calgary and area labor market report	801 business	Dispel myths and provide more information	53% of employers surveyed do not employ persons with disabilities Only 15% proactively recruited persons with disabilities 49% were unaware of available employment supports More can be done to understand employers' concerns
Baker, Linden, LaForce, Routledge, Goughnour	2018	America	Comparative literature review	200 articles		The themes that emerged include variance in employer perspectives on hiring individuals with disabilities, the impact of perceived versus actual cost as a hiring barrier, and the perceived mismatch of education and/or skills to job qualifications among applicants with disabilities There is a knowledge translation gap between both academic and business literature
Araten-Bergman	2016	Israel	Survey Theory of Planned Behavior Questionnaire Longitudinal (6 months)	146		The Theory of Planned Behavior failed to predict actual hiring Managers' intentions were not significant predictors of actual behavior

Baert	2016	Belgium	Field experiment	768 job vacancies		The likelihood of a disabled candidate receiving a positive response to a job application is not positively influenced by disclosing entitlement to a wage subsidy
Baert, De Visschere, Schoors, and Omey	2014	Belgium	Experimental Matched pair	304 job vacancies	Depression	Identifying previous depression as a reason for unemployment is rewarded by female recruiters and is treated negatively by males. Depression is also treated less favorably in low-skill occupations
Mapuranga and Mutswanga	2014	Zimbabwe	Interviews	10 employers 10 coworkers 10 employees with disabilities		Employers felt that some persons with disabilities were not as competent, would scare away customers, and some were dependent on coworkers to complete tasks, were ignorant, and had poor time management. While managers tend to reject disability as divine will, there is a prevalence of charitable attitudes. Most see disability as a social problem, while some see it as an individual problem. Many managers see hiring persons with disabilities as affected by organizational contextual factors aside from performance. These conceptions influence integration vs segregation attitudes
Beaton, Kabano, and Léger	2012	Canada	Associative techniques, open-ended and semi-structured interviews	64 directors of human resources or head of the company		They found implicit discrimination or aversive disablism Employers apply the logic of the labor market as a way to evaluate persons with disabilities Employers associate that different is incompatible with their business priorities in

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						that they perceive limitations, underperformance, increased cost, and extra supervision
Bell and Klein	2001	The United States	16 experimental conditions Ranking of hypothetical job applicants	98 psychology undergraduates 88 employees		An applicant with paraplegia was ranked higher for activity and potency than an applicant with depression or an applicant without a disability All three applicants with a disability were ranked higher on activity than the applicant without a disability, and the applicants with paraplegia and epilepsy were rated higher for potency than the applicant without a disability Female applicants were ranked higher than male applicants on all variables except potency Male applicants were ranked higher than female applicants for supervisory roles, but females were ranked higher for non-supervisory roles
Bellemare, Goussé, Lacroix, Marchand	2018	Canada	Field experiment	1477 private firms	Mobility impairment	Found mention of disability in job application reduced incidences of call back by 50%. Signaling a subsidy to adapt the workplace does significantly reduce discrimination
Bendick	2018	The United States	Experimental Matched pair	31	Mobility	Those with a disability were only 27% as likely to receive a job offer or otherwise advance as far in the hiring process compared to their equally qualified counterparts without a disability. Discrimination, either conscious or

						unconscious, was documented by 41% of retailers tested
Benoit, Jansson, Jansenberger, and Phillips	2013	Canada	Mixed methods Quantitative analysis of Participation and Activity Limitation Survey 2006 Semi-structured interviews	41,750 18	Blind	They found very low labor force inclusion and lower inclusion than other disabilities They found the major barrier is stigma
Bonaccio, Connelly, Gellantly, Jetha, Ginis	2019		Literature review	Literature addressing 11 specific concerns that employers have about people with disabilities		Based on empirical evidence, examines employers' concerns about employing persons with disabilities across the various components of the employment cycle
Boni-Saenz, Heinemann, Crown, and Emanuel	2006	The United States	In-depth semi-structured interviews Four case studies Longitudinal	Interviewed CEOs and other senior management executives, directors of human resources, hiring managers, recruiting specialists, and directors of		Businesses generally employ people with disabilities because of some commitment that derives from a variety of sources The major perceived benefits of hiring people with disabilities focused on the diverse perspective they provide to the company and the loyalty they show the company that hires them The major perceived barriers to hiring people with disabilities included attitudinal barriers Smaller companies see employing people with disabilities as a larger risk than larger

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
				diversity and inclusion, in each of the four businesses		companies perceive. Larger companies also had differing views of the *Americans with Disabilities Act*, with larger companies having a more positive view of the law Companies generally desired vocational rehabilitation and job counsellors to aim for a good match between an applicant with a disability and the job position rather than just a placement. Lack of business knowledge among vocational rehabilitation counsellors was a complaint Health care costs were not seen as a barrier Companies do not generally use tax credits to employ people with disabilities or for accommodations Outsourcing is a serious issue in the technology sector for people with mobility impairments. As with "offshoring," outsourcing eliminates a large class of entry-level jobs and telecommuting opportunities for individuals with disabilities. In addition, the opportunities that are still available in the United States may not present the same opportunities for career advancement as they would if the jobs were still housed in a large, disability-friendly corporation
Bredgaard, Salado-Rasmussen	2021	Holland	Survey of employers' attitudes,	1901 hiring managers		They found a moderate but significant correlation between employer attitudes and behaviors

			experiences, and behaviors			
Breen, Havaei, Piassi	2019	Armenia	Questionnaire – Perceived Barriers to Employing Persons with Disabilities Scale	158 employers		Found that employers were more concerned about acceptance by supervisors, coworkers, and customers than about performance (though this was also a factor). This result differs from findings in other jurisdictions
Bricourt and Bentley	2000	The United States	Survey Employers' employability ratings of hypothetical job applicants *Employment Characteristics Scale*	248 hiring managers		Nondisabled job applicants were rated more employable than applicants with severe disabilities Employees with acquired brain injury and schizophrenia were rated similarly
Brite, Nunes, Souza	2015	Brazil	Survey – Conceptions of Disability Inventory	90 managers	Supermarkets	Managers' perceptions regarding people with disabilities contribute to their actions of inclusion or exclusion
Borghouts-van de Pas, Freese	2021	Holland	Mixed methods – interviews and focus groups	38 employers		Employers respond to institutional pressures (quotas) in a contextual and strategic way assessing environmental, strategic, organizational, and internal fit
Burke, Bezyak, Fraser, Pete, et al.	2013	The United States	Literature Review	34		The study found that employers were either very optimistic or very pessimistic about employees with disabilities' skills. Employers need accurate information to dispel myths

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Center for Information, Training & Evaluation Services, Florida State University	2003	The United States	Survey	306 businesses		Persons with prior experience with employees with disabilities have a more favorable attitude, as do employers with formal disability policies Behavioral disabilities were perceived as the hardest to accommodate Employers may not be aware of available workplace supports and programs Two out of three employers were unaware of disability issues
Chan, Strauser, Maher, Lee, Jones, and Johnson	2010	The United States	Survey *SPR/nAblement Employer Survey*	132 human resource managers and line managers		Managers are moderately positive (ambivalent) about the productivity and reliability of employees with disabilities Barriers identified are (1) lack of commitment to including disability in companies' diversity plans, (2) lack of resources to recruit and retain persons with disabilities, and (3) inadequate training in ADA and workplace accommodations Points 1 and 2 are key predictors of corporate and management commitment to hiring persons with disabilities
Chan Ho-ting and Wong Ming-Wai	2015	Hong Kong	Mixed methods – interviews Survey	8 209		This research discusses perceived additional costs of training, supervision of accommodation, lack of management commitment, and concern over requisite skills

Chen, Blankenship, Austin, Cantu, and Kotbungkair	2016	The United States	38-item Employer Attitudes Questionnaire and 33-item Small Business Owners Survey	270 Hispanic small business owners	Hispanic small business owners	This research discussed significant predictors of hiring persons with disabilities: prior contact with persons with disabilities, marital status, and awareness of the ADA
Chi-Geng	2004	The United States	Survey	500 restaurant employers	Restaurant sector	This research found that employers preferred persons with sensory impairments or physical disabilities to those with mental disabilities Employers' attitudes towards employees with sensory impairments and physical disabilities had a positive impact on the probability of employing persons with disabilities Prior work experience with disabled persons leads to a more favorable attitude towards employees with disabilities
Copeland, Chan, Bezyak, and Fraser	2010	The United States	Survey *Disability Questionnaire*	142 employers		The findings support the reliability of the scale Employers did not have significant negative cognitive or affective reactions towards employees with disabilities. Employers had a moderately positive attitude towards accommodations Employers had a high positive attitude towards treating these employees like other employees Experience working with persons with disabilities can result in a high positive attitude

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Deloitte	2010	Canada	Focus group Roundtable	90 representatives from business and government agencies, employees		This identified barriers to employment, accommodation, and accessibility, including attitudes and myths, the business case, and the need to educate individuals involved in hiring and solutions
Deuchert, Kauer	2013	Switzerland	Field experiment	384 applications		Found that the subsidy is ineffective or even counterproductive in a group of adolescents who are at the end of their vocational training program but may increase callback rates of clients of job coaching services. For the first group, the subsidy signaling effect is stronger, while for the second group, the incentive effect is stronger
Deuchert, Kauer, and Zannol	2011	Switzerland	Discrete choice experiment	533	Mental disorders	They found few employers willing to train apprentices with special needs, even though there were no direct costs. Very low acceptance rate of the employee profiles presented. Noncognitive dysfunctions are the main deterrent
Domzal, Houtenville, and Sharma	2008	The United States	Survey	3797 companies		Large companies are more likely to hire Small and medium-sized companies require information about job performance and are more concerned about health care costs and workers' compensation premiums, and they prefer employer tax credits Large companies found their challenge to be in recruiting and prefer mentoring as a strategy The nature of the work was more of a

						concern in industries with physically demanding work For companies that employ persons with disabilities, there is more of a challenge around advancement than the attitudes of customers or coworkers The public sector is more likely to recruit persons with disabilities than the private sector
Drydakis	2009	Greece	Field experiment	862 applications	HIV	Uninfected applicants were systematically preferred over applicants that disclosed their HIV-positive status. The results imply that employers use health conditions as a screening factor
Ebrahim, Lorenzo, Kathard	2022	South Africa	Case study – critical conversation interviews	Two employers		Employment of persons with disabilities is motivated by obligations to fulfill mandates. They are seen not for their ability but by their impairment
Employment Monitoring and Evaluation Branch	2011	Australia	Survey Online Employer Forum	1230 40		Key findings from 2011 online employer forum: (1) Honesty up front should be encouraged. (2) Employment is all about getting the right person for the job. (3) Workers with a disability are often considered the more reliable and loyal employees. (4) DES support plays a large role in the employment decision. (5) Financial incentive is a decision helper and not a deal breaker (for most). (6) Employer incentives are deemed to be more than just wage subsidies (for most). (7) Ideally, for employers, financial

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						incentives are linked to worker productivity and are paid in instalments. (8) Employers desire incentives to be longer and more substantial. DES providers are highly praised The standout message from the forum is the importance of getting the right person for the job
Fraser, Ajzen, Johnson, Hebert, and Chan	2011	The United States	Survey Theory of Planned Behavior	92		This research looks at how companies' size affects norms and control beliefs and how small, medium, and large companies' concerns regarding hiring persons with disabilities vary
Fraser, Johnson, Hebert, Ajzen et al.	2010	The United States	Semi-structured focus groups Theory of Planned Behavior	20		This research found that education and marketing approaches to companies hiring persons with disabilities need to be tailored based on company size Behavioral concerns include fear of potential litigation, loss of revenue, and fear of affording changes for physical accommodation Normative concerns, including coworker and management attitudes Control beliefs around effectiveness and efficiency of contact with vocational rehabilitation Behavioral concerns were more salient to small companies, with normative concerns being more relevant to midsize companies. All companies, independent of size, were concerned with the control issue

Fredeen, Martin, Birch, and Wafer	2013	Canada	Mixed methods About 70 in-person and telephone interviews Consultations Approx. 130 online submissions	About 200 employers		Education and training are required to overcome barriers, dispel myths, and put theory into practice
Gaspeer, Muz, Palan	2020	America	Survey of Employer Policies on the Employment of People with Disabilities	2023 senior executives		Found increases in the percentage of companies that employ, recruit, and hire persons with disabilities compared to the 2008 survey The most frequent concern was about safety on the job Concerns were higher among small firms and in the goods-producing sector Concerns were higher among owners and chief executive officers vs. human resources, supervisors, and managers
Gaspar	n.d.	India	Questionnaire	40 human resource managers 40 disabled employees		Found employees with disabilities were considered to have appropriate social behaviors and satisfactory loyalty to the organization and performance. Respondents agreed with the provision of accommodations but believed it is difficult to terminate an employee with a disability. Managers are concerned about health and safety expenses, and that extra supervision will be required. They believe hiring persons with disabilities will improve corporate image

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Gatchalian et al. (Abstract only)	2014	Philippines	Survey of employers and HR practitioners	210		Employers generally have positive attitudes about persons with disabilities. Attitudes vary with the company and disability characteristics
Gilbride, Stensurd, Vandergoot, and Golden	2003	The United States	Focus groups and interviews Grounded theory	16 successfully employed consumers 39+ employers 8 placement service providers		This research discusses three major categories of characteristics (comprising 13 specific characteristics of employers open to hiring and accommodating persons with disabilities): inclusive work, cultural issues, quality job match, employer experience with diversity and support in accommodating
Gould-Werth, Morrison, Ben-Shalom	2018	The United States	Semi-structured interviews	14 human resource professionals rendering 50 cases		Found that employers' efforts to accommodate and retain employees were affected by the employees' previous work performance, physically active work vs. sedentary work: the type of health condition, the employee's available resources, and the ability to communicate across stakeholders. Employers are less likely to make an effort to accommodate poor performers or employees of short duration
Gouvier, Sytsma-Jordan, and Mayville	2003	The United States	Experimental – four medical conditions and four sample resumes for two job positions Forced choice	295 undergraduate, business-related major students		The authors found hiring discrimination varies as a function of the type of disability and the interaction of the type of disability with contextual variables Physical disabilities are more likely to be preferred over mental disabilities

Graffam, Shinkfield, Smith, and Polzin	2002	Australia	Survey	643 employers who had employed persons with disabilities		Employers place the greatest emphasis on work performance both individually and as it affects the organization/work group Four underlying employer values were identified: (1) they value their business, so factors affecting the business were of greater importance, (2) factors related to personal performance were ranked highly, (3) they value the whole organization, so they consider social integration/acceptance as a factor of job performance, and (4) they value partnership and expect employment services and employees to consult in planning, implementation, and maintenance of the job
Gröschl	2007	Canada	Qualitative semi-structured interviews	42 hotel managers	Hospitality industry	This research identified a number of barriers to hiring persons with disabilities in the hospitality industry due to managers' perceptions, such as lack of legislative pressure, concerns around aesthetics, productivity, training costs, accommodation costs, inflexibility, and the need for constant management
Gröschl	2011	Germany	Case study Semi-structured interviews	5 integrated hotels		This research concludes that artificial barriers (perceptions and stereotypes) of employers at nonintegrated hotels are barriers to greater disability inclusion
Gustafsson, Peralta, and Danermark	2014	Sweden	Semi-structured interviews Content analysis	19	Wage subsidies	Four factors were found: employers' attitude (based on previous experience with persons with disabilities), job matching, wage subsidies as incentives, and the necessity of soft accommodations. The cost was less important than performance

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Hand and Tryssenaar	2006	Canada	Cross-sectional survey involving interviews and a questionnaire	58 employers	Mental health	Employers have concerns about persons with disabilities characteristics and particularly their work personalities, and concern over potential violence
Hartnett, Stuart, Thurman, Loy, and Batiste	2011	The United States	Structured survey	387 employers	Accommodations	This research found that satisfaction with accommodations is high, costs are minimal, positive financial outcomes, increased productivity and retention, and enhanced public image
Heera	2016	India	Literature review	44 articles		Found (1) previous experience with persons with disabilities leads to more favorable perception; (2) disability type impacts inclusion; (3) concerns over work performance; (4) fear of litigation; (5) decisions impacted by customer and coworker reactions; (6) concerned about the cost of hiring and accommodating; and (7) employer gender and education impact attitudes
Heera and Devi	2016	India	Literature review	44 studies		The authors found the following factors influence employers' perspectives on hiring persons with disabilities: (1) Previous experience with persons with disabilities creates more favorable perceptions (2) The type of disability has an impact on inclusion (3) Concerns over work performance are a factor (4) Concerns over possible legal ramifications

						(5) Concerns over customer and co-worker reactions (6) Concerns about the added cost of accommodation (7) Employers' level of education, gender, and organizational characteristics
Hemenway, King, Rohani, and Word	2003	The United States	Survey	306 employers		The authors found differences between the chamber of commerce and non-chamber groups, employers' lack of awareness of disability issues and resources, and employer attitudes toward individuals with disabilities
Henry, Petkauskos, Stanislawzyk, and Vogt	2014	The United States	Focus groups	51 employers, 16 community rehabilitation providers, 7 persons with disabilities		The employer saw stigma, uncertainties concerning applicants' abilities and the complexity of the public disability employment service system as hiring barriers They saw diversity, expanded talent, and improved brand loyalty as advantageous
Hernandez, Chen, Araten-Bergman, Levy, Kramer, and Rimmerman	2012	The United States	Theory of Planned Behavior, focus group	12 employers		The Theory of Planned Behavior can predict employers' intentions to hire persons with disabilities Not-for-profit organizations' attitudes are more favorable than those of for-profit organizations
Hernandez, Keys, and Balcazar	2000	The United States	Literature review	37 studies		Employers with prior positive contact have a favorable perception of employees with disabilities Willingness to hire still exceeds actual hiring There is a preferential hierarchy of disability

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						types The trend of a relationship between a positive perception of persons with disabilities and employers' level of academic achievement and company size is diminishing Employers are positive about employees placed by vocational, employment, and supported-employment programs
Hernandez, McDonald, Divilbiss, Horin, Velcoff, and Donoso	2008	The United States	Focus groups	21 employers	Health care, hospitality, and retail sectors	Five themes emerged: (1) the importance of disability employment agencies and disability advocates, (2) the persistence of manager bias, (3) the lack of promotional opportunities for persons with disabilities, (4) perceptions of costs associated with having employees with disabilities, and (5) there are benefits associated with hiring persons with disabilities (low absenteeism, long tenure, diversification, more positive work environment)
Houtenville and Kalargyrou	2012	The United States	Analysed 2008 ODEP Survey of Employer Perspectives on the Employment of People with Disabilities	320 hospitality companies	Hospitality and leisure sector	The study found prejudice and stereotyping, but the chief concern was the bottom line
Houtenville and Kalargyrou	2015	The United States	2008 ODEP Survey of Employer Perspectives on the	263 leisure and hospitality companies	Hospitality and leisure sector	Service-producing companies are more likely to hire than goods-producing companies Service companies with direct customer

			Employment of People with Disabilities			interaction are more likely to identify customer attitudes as a reason not to hire
Huang and Chen	2015	Taiwan	Interviews	12 employers		Four reasons for employing persons with disabilities were found: personal experience with a disability; cost-effectiveness due to reduced turnover; altruism and charitable perspectives (i.e., improved image CSR); and compliance with the quota Employers were more concerned with the recruitment stage than after hiring Once hired, they tended to focus on capabilities rather than limitations, training, and job match All employers agreed with accommodations The authors found limited career advancement opportunities for persons with disabilities
Hwa	2017	Malaysia	Survey	201 employers		Employers have different perceptions of employees with disabilities by gender, with more favorable perceptions toward women. They also have different perceptions of employees with disabilities based on the type of disability. Men with physical disabilities and women with auditory/communication details were viewed more favorably
Jasper and Waldhart	2013	The United States	Statistical analysis of 2008 ODEP Survey of Employer	320 leisure and hospitality companies	Leisure and hospitality	The authors found chief concerns were job performance and the cost of accommodation These were of more concern for smaller employers

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
			Perspectives on the Employment of People with Disabilities Theory of Planned Behavior			The most appealing practices were positive employee and manager attitudes, job mentoring, and financial incentives
Jasper and Waldhart	2012	The United States	Statistical analysis of 2008 ODEP Survey of Employer Perspectives on the Employment of People with Disabilities Perceptions of Challenges Index		Retail	Employer size is a significant predictor of retailer perceptions of hiring people with disabilities
Ju, Zhang, and Pacha	2012	The United States	Survey	168 employers		The authors found that employers' four most valued employability skills (integrity/honesty, ability to follow instructions, respect for others, and timeliness) were the same for persons with disabilities and those without disabilities. A discrepancy arises with the fifth most valued employability skill, where employers value regard for safety for persons with disabilities vs. the ability to read with understanding for persons without disabilities Employers ranked all five skill areas the

						same Employers expect more skills from employees without disabilities Employers from the service business area had higher expectations regarding higher-order thinking skills, social skills, and personal traits Women had higher expectations regarding certain skills than male employers
Ju, Roberts, and Zhang	2013	The United States	Literature review	15 studies		The review found that employers showed more positive general attitudes toward employees with disabilities. Employers had concerns about specific types of disabilities. Positive past experience with persons with disabilities contributed to a greater willingness to hire. Employers expressed concerns over employability issues but expressed fewer issues and more benefits than in previous studies, and there was a greater realization of the low cost of accommodations
Kang	2013	Korea	Interview	20 human resource directors		The study makes several recommendations to government, including improving the job skills of persons with disabilities; decreasing employers' fears about industrial accidents for workers with disabilities; and supporting employing persons with disabilities through tax and social insurance breaks, a national campaign to alter people's attitudes, adjustments to quotas, providing a database

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						of job seekers with disabilities and strict enforcement of the quota system
Kaye, Jans, and Jones	2011	The United States	Survey of known ADA – recalcitrant employers	463 human resource professionals and managers		Chief barriers are a lack of awareness of disability and accommodation issues, cost perceptions, and fear of liability
Kulkarni and Lengnick-Hall	2014	The United States	Literature review			Obstacles identified in the literature may only represent partial reality due to the significant reliance on laboratory studies
Kocman, Fischer, Weber	2018	Austria	Mixed methods: semi-structured interviews, 3 questionnaires (disability-specific barriers questionnaire, community living attitude scale, ID-ability-questionnaire)	30 hiring managers	Intellectual disability	Perceive more problems and barriers in employing persons with intellectual disabilities and mental disorders than persons with physical disabilities
Lengnick-Hall, Gaunt, and Brooks	2001	The United States	Literature review			This research reviews several factors affecting the employment of persons with disabilities and how those perceptions are not based on evidence
Lindsay, Goodfellow, Stergiou-Kita, Kirsh and Lero	2013	Canada	Scoping review	61 studies		This research identifies promising policies, programs, and practices for service providers, employers, and policymakers For employers, it identifies the need for more employer awareness of disability, strong senior management commitment to the

						success of disability employment initiatives, and the need for employers to interface with service providers to provide expertise on integration and accommodation
Lindsay, Robinson, McDougall, Sanford, and Adams	2012	Canada	Survey	33 employers	Adolescents	This research found supervising youth with disability improved employers' perceptions concerning employing persons with disabilities
Lindsay, McDougall, and Sanford	2012	Canada	Survey	36 supervisors	Youth	The study focused on supervising rather than hiring Supervisors improved their assumptions concerning persons with disabilities after supervising youth with disabilities
Lindsay, Robinson, McDougall, Sanford, and Adams	2005	Canada	Survey Qualitative and quantitative	33 employers	Youth	This research identified some concerns about accommodations and workload Overall, employers had a positive experience supervising youth with disabilities
Loo	2002	Canada	Survey, Attitudes Toward Employing Persons with Disabilities and Marlow-Crowne Social Desirability Scale	231 management undergrads		This research found that there were positive attitudes towards employing persons with disabilities but also conflicting attitudes (i.e., organizations should not give special staffing consideration for persons with disabilities)
Loo	2004	Canada	Survey, MacLean and Gannon's Discomfort-	231 management undergrads		This research found that discomfort dimensions play a dominant role in attitudes toward employing persons with disabilities

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
			Sympathy categories and Attitudes Toward Employing Persons with Disabilities and Interaction with Disabled Persons Scale			
Louvet	2007	France	Experimental	132 management undergrads 152 graduate business students		The study found a job fit effect; applicants with a disability were rated more negatively than nondisabled in poor fit conditions (i.e., requiring public contact or perceived as a typically male job) It also found that persons with disabilities were perceived to be warm but not competent
Luecking	2008	The United States	Literature review			Despite more enlightened views of disability, employers still hold confused and stereotypical views about employees with disabilities Usually, exposure to persons with disabilities improves employers' views, so the real barrier may be the lack of being prepared to support these employees Job developers need to refocus on demand-side concerns by being customer-oriented, focusing on understanding employers' needs and taking on a role more like an organizational consultant than a job finder, as well as providing post-placement

						services, being responsive to employer needs and focusing on improving employers' financial situation
Mak, Ho, and Kim	2014	Singapore	Theory of Planned Behavior and Social Cognitive Theory Quantitative 72-item online survey	145	Cancer	The strongest factors related to the intention to hire are efficacy, followed by attitude The strongest factors regarding retention were perceived moral obligation and attitude towards cancer
Mansour	2009	Saudi Arabia	Survey	27 employers		Perceived issues with productivity, work performance, and lack of employee skills were the top factors for not hiring persons with disabilities
Mansour	2009	Saudi Arabia	Questionnaire	27 companies		Employers' main concerns were productivity, work performance, and lack of skills and experience
Marques, Romeo, Matalinares, Yepes-Baldó	2020	Brazil	Survey-Disability Conceptions Inventory	257 managers		They found that managers had three conceptions of disability: spiritual conception, conception based on the assumption of normalcy, and conception based on the assumption of inclusion
McDonnall	2014	The United States	Survey 11-item attitude scale developed	158 in hiring positions	Blind	They found the instrument has criterion validity The authors found that some employers have negative attitudes toward visually impaired employees, and others have positive attitudes

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
McDonnall, Antonelli	2019	The United States	Survey	388 hiring managers	Blind/visually impaired	Found prior communication with vocational rehabilitation, company size, company policy, receipt of an application, prior personal relationship with the visually impaired and employer attitudes were associated with hiring
McDonnall, Antonelli	2020	The United States	Experimental – pre, post, and 4-month follow-up. Random assignment to four conditions involving two interventions	59 hiring managers	Blind/visually impaired	A brief intervention consisting of a meeting with a vocational rehab professional can improve attitudes about this population. Improved attitude and knowledge were retained, although intent to hire was not retained on follow-up. Meeting with a blind vocational rehab professional did not increase the attitude and intent to hire. The educational approach vs. the dual customer approach increased knowledge somewhat
McDonnall, Cmar, Antonelli, Markoski	2019	The United States	Survey-implicit association test-blind/visually impaired	450 managers/supervisors, director/chief executive and human resource personnel	Blind/visually impaired	Found blind professionals have more positive implicit attitudes than employers. Employers had a stronger association between blindness and incompetence
McDonnall, Cruden, and Zhou	2013	The United States	Survey	183 rehabilitation counsellors and business relations staff	Blind/visually impaired	Vocational rehabilitation staff have a more negative view of employers' attitudes concerning the likelihood of employing blind or visually impaired employees than business relations staff

McDonnall, Lund	2020	The United States	Survey – including four Theory of Planned Behavior construct measures	388 hiring managers	Blind/visually impaired	Found intent to hire was affected most by employers’ attitudes about the productivity of persons who are blind, followed by subjective norms and perceive behavioral controls
McDonnall and O’Mally	2015	The United States	Survey	181 employers	Blind/visually impaired	The findings show that employers’ attitudes improve with contact with vocational rehabilitation agency personnel
McDonough, Ham, Brooke, Wehman, Wright, Godwin, Junod, Hurst	2021	The United States	Focus groups	27 executives	Health care	Found that these organizations’ faith-based missions and values align with employing persons with disabilities. These managers actively socialize with their staff and live their values. Entrenched in these beliefs is treating all employees as individuals who require tailored, unique employment solutions Organizations benefit from (1) employing persons with disabilities from a diversity target perspective, (2) work done better than other developing employees, and (3) their presence improves morale
Millington, Miller, Asner-Self, Linkowski	2003	The United States	Theoretical			While the article examines management functions through a vocational rehabilitation lens, it contributes by assessing the intersection of different management functions (staffing, planning, organizing, controlling, and directing)
Moon and Baker	2012	The United States	Delphi survey	44	Accommodations	There is a perception that employers fail to accommodate because they are unaware of the range of options or assume they are too expensive

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Morgan and Alexander	2005	The United States	Survey	534 employers		Most respondents with experience indicated that the employment usually or sometimes worked well, and they were likely to hire again. Many inexperienced respondents were also receptive to hiring. Experienced respondents identified advantages to employing individuals with disabilities at higher rates than inexperienced respondents
Murray	2014	Canada	Policy analysis and semi-structured interviews	3 employers		This research found variance in the application of the policies and less understanding of the policies in organizations without a human resource department. Interviews revealed employers' views of disability, knowledge, and application of the disability policies, the "fit" of a prospective employee, the importance of a human resources department, and the presence of accessibility in the workplace
Noor, Isa, Manaf	2018	Malaysia	Semi-structured interviews	6 employers		Hesitancy to hire persons with disabilities stems from a lack of exposure, and government supports for persons with disabilities is inadequate
Nota, Santili, Ginevera, and Soresi	2013	Italy	Experimental design – randomly assigned to two conditions, one where candidates presented the difficulties of their	80 employers		The authors found participants' attitudes were more negative concerning people with psychological problems than those with an intellectual disability or a sensory disability. All types of disabilities presented benefited from positive presentations of their disability

			disability and another where they discussed their positive aspects			
Olson, Cioffi, Yavanoff, and Mank	2001	The United States	Survey	126 HR personnel, managers and corporate executives		Employers perceive that employees with mental retardation have a positive impact on the workplace, except that they will require additional training and supervision
Paez and Arendt	2014	The United States	Survey	124 hotel and restaurant managers		Found a slightly positive attitude toward working with persons with disabilities
Papakonstantinou and Papadopoulos	2017	Europe	Test-retest after short information program	40 employers		Employers' behaviors can be modified by providing information
Peck and Kirkbride	2001	The United States	Review of rehabilitation strategies to respond to employers' fears about employing persons with disabilities			Employers' four main fears are the cost associated with hiring, the need for additional supervision and lost productivity, not being able to terminate a bad hire and concern over being stuck with an unqualified employee
Pearson, Ip, Hui, Ho, and Lo	2003	Hong Kong	Experimental Multiple pairwise comparison	409 job advertisements × 4 application letters each = application 1636 letters 331 responses		Found statistically significant preference for the non-disability group when compared with each of the disability groups. Found a clear ranking of preference; people without a disability, followed by those with a hearing impairment, those using crutches to walk and finally, those who had had depression

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
Piramanayagam, Seal	2020	India	Questionnaire	31 managers	Hotel industry	Employers have positive attitudes toward persons with disabilities concerning employee loyalty, reliability, and work quality. They have negative attitudes concerning aesthetic anxiety, cost of training, extended supervision, lack of work experience, litigation, and time management
Popovich, Scherbaum, Scherbaum, and Polinko	2003	The United States	Survey Two studies without and one with the ADA definition of disability	118 undergraduates 147 undergraduates		Participants had little knowledge of what a disability is under the ADA Women favor more reasonable accommodations Experience with people with disabilities is associated with more positive affective reactions but not with more reasonable accommodations
Quesnel	n.d.	Canada	Local survey	30 persons with disabilities 62 employers		This research identifies that less than 50% of businesses surveyed hire persons with disabilities Those who did employ persons with disabilities only experienced minor challenges Most of those who had not employed persons with disabilities would not know how to attract them
Ren, Paetzold, and Colella	2008	The United States	Meta-analysis literature review	23 articles re experimental studies		Having a disability and especially a mental disability is causally connected to negative human resource judgments
Requero, Santos, Pareded, Brińol, Petty	2020	Spain	Experimental to assess meta-cognitive process	Study 1–65 undergraduate students		The study shows the connection between thought vallance and thought confidence. Higher thought confidence was more

			concerning attitudes toward people with disabilities	Study 2–264 undergraduate students		predictive of attitude towards persons with disabilities
Rooth (Abstract)	2009	Sweden	Field experiment		Obesity	Indications of obesity result in a significantly lower callback rate
Sālājeanu	2012	Holland	Interview	10 employers		Employers' willingness to hire persons with disabilities and actual practices differ
Schur, Kruse, and Blank	2005	The United States	Literature review Study corporate culture			Corporate commitment in and of itself is not sufficient. If supervisors and fellow employees do not accept disabled workers' disability, initiatives will fail. These attitudes are affected by stereotypes, discomfort in being around persons with disabilities, the strain caused by communication difficulties, personality, and prior experience with disabled persons
Scott, Jacob, Hendrie, Parsons, Girdler, Falkmer, Falkmer	2017	Australia	Survey	59 employers	Autism spectrum disorder	Employers demonstrated concerns over cost and work performance, but findings do not bear out those concerns. Larger organizations, previous experience, and collaboration between employers and disability employment services seem to have a more favorable view of employees with an autism spectrum disorder
Shamshiri-Petersen, Krogh	2020	Denmark	Experimental (vignette survey)	1901 managers	Physical disability	Intention to hire declines substantially when wheelchair use is introduced
Shankar et al.	2014	Canada	Interviews	28 employers	Mental illness	A high percentage of the employers were in favor of hiring persons with disabilities Previous negative experiences with an employee with mental illness may be a

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						barrier to employment Employers with positive experiences or who worked with employment placement providers have less prejudicial attitudes The findings suggest the need for support for frontline managers
Shaw	2013	Canada	Scoping review/ literature -review	38 evidence articles 19 gray literature		Four predominant barriers are identified: attitudinal barriers, employer barriers about performance, employers' lack of awareness of disability and managing disability, and lack of integration of services and policies to promote hiring
Shier, Graham, and Jones	2009	Canada	One-to-one semi-structured open-ended interviews and focus groups	Mixed methods 56 persons with a disability participating in employment training programs in Calgary and Regina		Persons with disabilities face extensive stigmatization and discrimination within the labor market Discrimination and labelling are the primary barriers
Stevens	2002	The United Kingdom	Survey	120 companies		Specific impairments seen as obstacles to employment are limited keyboard/writing ability and speech and vision impairment Important personal skills for successful work performance were seen as interpersonal social skills and the ability to handle information
Stone and Wright	2013	The United Kingdom	Experimental – Replied to job	144 companies		The study found recruitment discrimination against persons with facial disfigurement in

			postings with three CVs in three conditions (facial disfigurement, wheelchair and nondisabled)		Facial disfigurement, wheelchair users	jobs involving a greater degree of customer contact. Wheelchair users were treated unfavorably regardless of the amount of customer contact
Strindlund, Abrandt-Dahlgren, Ståhl	2018	Sweden	Semi-structured interviews	27 employers		Three categories of different views of employees with disabilities emerged. (1) Constrained by disability – lacked competence, work experience and personal characteristics, unreliable due to absenteeism, difficult to integrate, and lacking interest in the field. Other constraints were – a belief that accommodations could not compensate for reduced work capacity, the employer's high workload, limited human resources support, and a lack of knowledge about accommodations. Constraints due to suboptimal government cooperation (2) Employability as independent of disability – the right competence, experience, characteristics, will to work, and interest in the field were more important than disability limitations (3) Employability as conditional – employability was not predetermined by disability but context-dependent on a variety of factors Also, found cross-cutting themes of trust of persons with disabilities, that persons with

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						disabilities contribute to the workplace, and the availability and organization of support impacted employability
Ta, Wah, and Leng	2011	Malaysia	Survey	39 companies		Barriers to employing persons with disabilities are lack of knowledge and lack of experience in managing persons with disabilities. Employers perceive that they require more expense to supervise and train employees with disabilities. Most employers lack accessible environments
Unger	2002	The United States	Literature review	24 studies		The type and severity of disability may affect the likelihood of employment Employers may sacrifice productivity for dependability Employers recognize the potential to enhance their community image Employers with previous experience are more willing to employ persons with disabilities
Vornholt, Uitdweillgen, and Nijhuis	2013	The Netherlands	Literature review	48 articles		Employers see hiring persons with a disability as a risk and resist making reasonable accommodations. They are motivated by concerns over cost, safety, legal liability, or managerial biases. However, employers open to hiring who are characterized by openness to diversity and equality are also identified

Waterhouse, Kimberly, Jonas, and Glover	2010	Australia	Focus group	40 employers		Employers see their lack of knowledge, understanding and capability as the problem. They perceive difficulties in hiring persons with disabilities, and this creates barriers
Weigand	2008	The United States	Experimental Ranking 50 mock job applicants	3 students		Emphasis on work experience is the most significant influence on preference ratings Ratings are improved when a disability is presented in a positive way
Wilton and Schuer	2006	Canada	Semi-structured interview	46 employers		This research found: (1) some manufacturing employers are concerned about the feasibility of accommodating the physically disabled
Woodley and Metzger	2012	New Zealand	Mixed methods Interviews and survey	106		There is a hierarchy of disabilities that does impact employers' perceptions Perceptions about how staff and customers react may give social permission not to hire
Zappella	2015a	Italy	Literature review (Abstract only)			The findings synthesized around some broad categories: personal characteristics of employers (perceptions about the legislation, emotional reactions, obstacles, and concerns), characteristics of the organization (type of the activity and methods of recruitment), and characteristics of the worker (physical, intellectual, or acquired disabilities)
Zappella	2015c	Italy	Interviews Phenomenological approach	30	Intellectual disabilities	Found that decisions to hire were affected by (1) the personal characteristics of the employer concerning their concept of disability and past experience with persons with disabilities, (2) the selection process,

(continued)

Study	Year	Location	Methodology	Sample Size	Focus	Findings
						i.e., identification of tasks and whether candidates are assessed by the employer or a third party, evaluated for limitations or abilities, (3) concerns of the employer over the law, productivity, safety, and managing the employee's emotions
Zappella	2015b	Italy	Interviews Phenomenological approach Delphi	30	Small and medium-sized companies	"The results show that experience towards the employee with a disability are influenced by three important topics: the[re] previous experience, the [choice] of the tasks and the reasons that lead to the recruitment process."
Zissi, Rontos, Papgeorgiou, Pierrakou, and Chtouris	2007	Greece	Cross-sectional survey	102 employers		Employers' attitudes differ depending on the type of disability

Economic Inclusion and Empowerment of People with Disabilities

63

Peter Blanck, Fitore Hyseni, and Nanette Goodman

Contents

Abstract

People with disabilities continue to face extreme disparities in economic inclusion. They have lower employment rates, earn significantly less, are more likely to engage in precarious work, report barriers to receiving workplace accommodations, avoid disclosure of invisible and stigmatized identities, and are more likely to report discrimination than their non-marginalized counterparts. These challenges are heightened by and interrelated with other inequalities that marginalized populations experience such as higher rates of poverty and lack of access to education, housing, transportation, medical care, banking, and food. The COVID-19 pandemic has amplified the employment disparities between people with and without disabilities and within the non-monolithic disability community. Many people with disabilities experienced job losses, lower earnings, and challenges getting access to adequate social support. This chapter discusses barriers to economic inclusion of people with disabilities. In particular, it focuses on employment and financial inclusion as two key markers of larger economic empowerment. In helping to illuminate the many complex issues faced in the employment of persons with disabilities, this chapter aims to identify new and

promising means to address barriers faced by people with disabilities. With increased partnership and collaboration, with the disability community leading this effort, the public and private sectors must seek to address the employment of persons with disabilities, which affects millions in the United States and around the world.

Keywords

Disability · Employment · Workplace discrimination · Economic inclusion · Diversity · Equity · Inclusion

Introduction

People with disabilities continue to face extreme disparities in economic inclusion. The US Bureau of Labor Statistics data show that only one in three working-age people with disabilities (31.4%) were employed in 2021, as compared to three-quarters (72.5%) of their nondisabled peers (U.S. Bureau of Labor Statistics, 2022). This large chasm in employment exists despite studies showing that people with disabilities have similar qualifications and motivation for employment as people without disabilities (Ali et al., 2011).

Even when employed, people with disabilities earn, on average, significantly less per year than those without disabilities (Schur et al., 2013, 2020; Kruse et al., 2018). Due in large part to lower employment and earnings, people with disabilities are more than twice as likely to live in poverty (Goodman et al., 2019). People with disabilities and in particular those who embody other marginalized identities based on race, ethnicity, age, sexual orientation, and gender identity experience substantial employment and economic disparities beyond those faced more broadly by people without disabilities (Badgett et al., 2020; Blanck et al., 2020; BLS, 2022; Goodman et al., 2019; Medina et al., 2021).

The COVID-19 pandemic amplified the employment disparities between people with and without disabilities and within the non-monolithic disability community (Blanck, 2020). Many people with disabilities experienced job losses, lower earnings, and challenges getting access to adequate social support. The pandemic hit people with disabilities especially hard, resulting in initial substantial employment losses due largely to their greater prevalence in the most hard-hit industries and occupations such as construction and food services (BLS, 2022; Houtenville et al., 2021; Schur et al., 2021).

Evidence suggests that hourly, contingent, and lower-wage employees were more likely to be fired, furloughed, and suffer pandemic-related employment and economic decline (Schur et al., 2021). People with disabilities are almost twice as likely to fall into those employment categories (Harpur & Blanck, 2020; Schur, 2003). Although employment rates have seen an increase since August 2020 and have continued trending upward in 2022 (Houtenville et al., 2021), people with disabilities continue to experience low employment and labor force participation rates that exclude them from the financial mainstream.

This chapter provides a broad picture of economic inclusion of people with disabilities in the United States. Specifically, we focus on labor force participation as a crucial axis for the larger economic inclusion and empowerment of people with disabilities. We present emerging issues related to the employment of people with disabilities during the pandemic and potentially thereafter. We review existing research and evidence and situate it in the current post-pandemic context to establish a picture of how the future of economic inclusion may look for people with disabilities. We organize the evidence into three sections: employment disparities, financial inclusion, and attitudinal barriers. These sections overlap and are interrelated at different junctures. Nonetheless, we present them as separate sections to make the classification of evidence possible.

We use an intersectional lens to highlight how structural and attitudinal barriers to and opportunities for economic empowerment, employment, and meaningful workplace participation differ for marginalized populations. Finally, we discuss new approaches and recent research being conducted to address employment barriers faced by people with disabilities. We highlight collaborative efforts among members of the disability community, researchers, employers, activists, and other organizations as part of the two new employment policy and employer-focused Rehabilitation Research and Training Centers (RRTCs), funded by the National Institute of Disability, Independent Living, and Rehabilitation Research (NIDILRR), led by Syracuse University and Rutgers University, respectively.

Economic Inclusion Through an Intersectional Lens

Informed by recent calls for critical assessments of inequalities we adopt and prioritize an intersectional lens in presenting the evidence in this chapter. Intersectionality, as initially theorized by Professor Kimberly Crenshaw, is a nuanced view that an individual's lived experience is greater than the sum of their identities and that forms of inequality can and do operate together and exacerbate each other (Crenshaw, 1989, 1990). Intersectionality suggests that inequalities should be considered through an interactive rather than a mono-categorical lens. Intersectionality is not an additive, individual, or ranking approach to identity or inequality (Conejo, 2013). Rather, it is a paradigm or lens to identify and analyze systemic inequalities that diverse individuals face. These inequalities coalesce to create and further social oppression, and efforts are needed to address these inequalities by focusing on the complex processes that produce them (Conejo, 2013; Erevelles & Minear, 2010).

Intersectionality represents a corresponding paradigm shift in research, law, and policy that has prompted an enhanced focus on socio-economic inequalities and their underlying interconnections (Collins, 2019). The detailed use of intersectionality as a scientific orientation in studying employment of persons with disabilities, however, thus far is limited. In the existing literature that applies an intersectional lens, disability has received relatively little attention (Berghs & Dyson, 2022; Frederick & Shifrer, 2019; Mauldin, 2021; Naples et al., 2019). There is a dearth of information about the multi-identity experiences of marginalized communities along the axis of disability.

Existing empirical research on the inequalities people with disabilities face in employment and other areas of daily life has also had limited success in embracing the idea of intersectionality. Some researchers note the framing of disability as a "master status," a raceless, genderless, and heteronormative identity that dominates individual identity and validates other forms of oppression (Barnartt, 2013; Brooks, 2021; Conejo, 2013; Frederick & Shifrer, 2019; Stienstra, 2019). Others believe the historical lack of diversity within the disability movement and research community hinders research documenting the experiences of marginalized populations with disabilities (Frederick & Shifrer, 2019).

This chapter brings into discussion existing literature on economic inclusion of people with disabilities reflecting scholars that have taken steps to use intersectional approaches in studies of employment outcomes which recognize that disability identity coexists with other minoritized identities (Blanck et al., 2020, 2021; Brooks, 2021; Goodman et al., 2019; Hyseni et al., 2022; Maroto et al., 2019; Pettinicchio & Maroto, 2017; Schur et al., 2021; Sevak et al., 2015). In doing so, we recognize the effect of complex individual identities as well as group-level and systemic factors that create structural inequalities (Bowleg & Bauer, 2016; Goethals et al., 2015; Miles, 2019).

Labor Force Inclusion

People with disabilities continue to experience disparities in labor force participation as well as equal employment opportunities. The passing and subsequent amendment of the Americans with Disabilities Act (Americans with Disabilities Act Amendments Act of 2008 or ADAAA) as well as the impact of the Disability Rights Movement have had a positive influence in improving employment outcomes for people with disabilities (Blanck, 2020). Nonetheless, recent research shows that disparities in employment still exist.

At the same time, the COVID-19 pandemic has resulted in major and ongoing socio-economic changes shifting work norms, such as telecommuting. This may be a "silver lining" for some people with disabilities while it could further marginalize others, as Professor Schur and colleagues suggest (Schur et al., 2020). Next, we discuss recent research documenting the current disability employment gap and the role of the COVID-19 pandemic. Through an intersectional lens, we also consider the future of work post-pandemic for people with disabilities.

The Disability Employment Gap

As mentioned, studies consistently show that people with disabilities are less likely to be employed than those without disabilities. Working-age people with disabilities are less than half as likely to be employed as people without disabilities (BLS, 2022). Historically and prior to the pandemic, the employment gap between people with and without disabilities had increased over time up until 2015 (Lauer & Houtenville, 2018; Schur et al., 2021). The employment gap was reduced between 2015 and 2019 when people with disabilities saw bigger employment gains (4.0-point increase) compared to people without disabilities (2.4-point increase) (Schur et al., 2021).

This gap in employment rates between people with and without disabilities has persisted despite studies showing that people with disabilities have similar qualifications and motivation for employment as people without disabilities (Ali et al., 2011). Despite the employment gap, research shows that close to 80% of non-employed people with disabilities want to work (Ali et al., 2011), which is a comparable percentage to unemployed adults without disabilities (Bonaccio et al., 2020).

Among people with disabilities, those who embody multiple marginalized identities face more complicated and nuanced challenges to employment. Multiply marginalized people with disabilities report lower employment rates (Brooks, 2021; Ciprikis et al., 2020; Charlton et al., 2018; James et al., 2016; Leppel, 2021; Pettinicchio & Maroto, 2017). In 2021, among working-age individuals with disabilities, only 29% of women and 34% of men were employed compared with 68% of women and 79% of men without disabilities. Non-Hispanic Whites with and without disabilities had the highest employment rates relative to other races and ethnicities (BLS, 2022).

Research suggests that the relationship between sexual orientation, gender identity, race, age, and disability is complex (Blanck, 2020). The combined effect of disability and gender on employment is greatest for women of color with disabilities, yet the impact of disability alone is greater for men (Brooks, 2021; Maroto et al., 2019; Pettinicchio & Maroto, 2017; Sevak et al., 2015). Research on the employment outcomes of other marginalized groups of people with disabilities, including lesbian, gay, bisexual, transgender, queer, and individuals with other sexual or gender identities (LGBTQ+), demonstrates that these individuals also experience higher rates of unemployment relative to their counterparts (Blanck et al., 2021; Charlton et al., 2018; Ciprikis et al., 2020; Leppel, 2021; James et al., 2016).

These documented disparities highlight the complex ways multiple forms of oppression such as racism, sexism, ageism, and ableism coalesce to disadvantage some groups. In particular, for people of color (POC) who have disabilities, participating in the labor force remains particularly difficult. Lack of employment has clear implications for economic inclusion as it keeps groups of population who are already marginalized and experiencing other forms of oppression from becoming financially independent and empowered.

Disparities in Standard Employment

Even when people with disabilities gain employment, they are more likely to work in low-wage, part-time, gig work, or other contingent jobs (Harpur & Blanck, 2020; Schur, 2003; Schur et al., 2013). A recent study by Schur and Kruse (2021) shows that workers with disabilities are more likely than those without disabilities to be in precarious jobs. Among employed people with disabilities, Black women, Black men, and Hispanic men are more likely to engage in precarious work such as temporary jobs and gig work. Schur and Kruse argue that precarious work represents a double-edged sword for people with disabilities. While some might choose it due to the flexibility it provides, others resort to precarious jobs as they face discrimination in obtaining standard jobs.

Precarious and nonstandard jobs typically do not provide paid sick leave, family and medical leave, and other benefits held by people without disabilities in standard jobs (Harpur & Blanck, 2020; Kruse et al., 2022). Workers in precarious jobs have limited opportunities for advancement and few, if any, worker protections, albeit some state law protections which vary by state. They also are often not covered by state and federal employment laws that provide income and other protection for workers such as unemployment insurance and workers' compensation (Harpur & Blanck, 2020; Kruse et al., 2018). As a result, employees who are unable to work due to a workplace injury or recurring illness, not only lose income, but also do not collect transitional income benefits that workers displaced from standard employment receive. This disproportionately drives large numbers of the target population into poverty, decreasing their ability to be economically self-sufficient.

Working in jobs such as contingent, precarious, and gig jobs that do not have a safety net of paid sick or medical leave or options for remote work puts people with disabilities at higher risk compared to those in standard jobs. They are more likely to lose their jobs and salary and thus their economic independence (Kruse et al., 2022). People with disabilities have, on average, higher numbers of doctor's office and hospital visits than those without disabilities (Kruse, 1998). They also have lengthier periods before they can return to workplace when they are injured or ill (Smith et al., 2014). For those in precarious jobs without benefits, the stark choice often becomes to overlook their health or quit working, thus limiting the opportunities for people with disabilities to remain employed.

While precarious jobs are sometimes beneficial for people with disabilities who are seeking flexibility, generally they lack a safety net required by all employees. Given the higher representation of people with disabilities in these jobs, they are often placed in the margins of employment where job and thus economic security is unstable.

Disparate Effects of the COVID-19 Pandemic

The COVID-19 pandemic exacerbated the employment and economic well-being disparities between people with disabilities and their counterparts (Blanck, 2020, 2022). Research prior to the pandemic shows that people with disabilities were more likely to be laid off by employers when times were bad and expressed feelings of lower job security (Mitra & Kruse, 2016; Schur et al., 2009, 2017). Expectedly, the start of the COVID-19 pandemic saw the number of people with disabilities employed drop significantly (Houtenville et al., 2021). Consequently, the disability employment gap increased early in the pandemic (Schur et al., 2021). In particular, White and Black women with disabilities experienced relatively greater employment losses during the pandemic compared to White men without disabilities.

The pandemic hit people with disabilities especially hard for several reasons. First, their jobs were more likely to be in occupations most affected, such as construction and food services (Schur et al., 2021). Second, hourly, contingent, and low-wage employees were more likely to be fired or furloughed (Bartik et al., 2020) and people with disabilities were twice as likely to be in these work situations as people without disabilities (Harpur & Blanck, 2020; Schur, 2003). In addition, such nonstandard jobs were disproportionately eliminated due to the COVID-19 pandemic (Harpur & Blanck, 2020). Consequently, workers with disabilities were more likely to experience unemployment than workers without disabilities during the COVID-19 pandemic.

Third, during the pandemic many office workers experienced the shift to remote or hybrid work. However, this shift in norms fueled by safety concerns often did not translate to jobs for people with disabilities. While workers with disabilities were more likely than those without disabilities to be teleworking before the pandemic, they were less likely to be teleworking as a result of the pandemic. The existing occupational differences between people with and without disabilities account for most of this difference (Schur et al., 2020; Kruse et al., 2022).

Despite the initial increase in the employment gap in 2020, the tight labor market post-pandemic and the shifts in work culture presented some "silver linings" for workers with disabilities (Schur et al., 2020). The employment rate of people with disabilities increased during 2021 economic recovery, regaining the losses caused by the pandemic (BLS, 2022; Houtenville et al., 2021). Nonetheless, the disability employment gap has persisted. A substantial portion of the increased gap is explained by differential effects of the pandemic across occupations, as mentioned. The unexplained portion of the employment gap, however, may reflect the growing attitudinal and structural discrimination that people with disabilities experience in employment, especially those embodying multiple marginalized identities (Schur et al., 2021).

The pandemic not only highlighted the existing inequalities and barriers to economic inclusion experienced by people with disabilities, but in some cases, it exacerbated them. Such is the case for many multiply marginalized people with disabilities who saw their employment opportunities dwindle.

Financial Disparities

People with disabilities are more than twice as likely to live in poverty than those without disabilities (Goodman et al., 2019). Black, Indigenous, and people of color (BIPOC) and women with disabilities are more likely to live in poverty than their counterparts (Goodman et al., 2019; Maroto et al., 2019; Pettinicchio & Maroto, 2017). The relationship between poverty and disability is strongly circular. Poverty causes disability by limiting access to health care and preventive services, increasing the likelihood that a person lives and works in an environment that may adversely affect health. The stress of poverty, overcrowded and poor living conditions, and shaky nutrition, all impact health and ultimately create disabilities.

Thus, marginalized groups are overrepresented among people with disabilities. Older individuals, women, BIPOC, those with less than high school education, and those with low incomes are disproportionally represented among the population with disabilities (Courtney-Long et al., 2015; Lauer & Houtenville, 2018; Okoro et al., 2018; Varadaraj et al., 2021; Warner & Brown, 2011). LGBTQ+ individuals are more likely to report disabilities and poor mental health compared to their counterparts (Fredriksen-Goldsen et al., 2012; Medina et al., 2021; James et al., 2016; Mulcahy et al., 2022; Pharr & Batra, 2021). Disabilities are disproportionately represented in rural counties relative to metropolitan areas. Much of these disparities are explained by differences in socio-economic factors such as lower education, income, and employment, but they persist even after controlling for these factors (Rhubart & Monnat, 2022; von Reichert et al., 2014; Zhao et al., 2019).

At the same time, disability causes poverty by limiting access to employment and full inclusion in the economic mainstream. These economic challenges have profound impacts on the well-being of marginalized people affecting access to housing, medical care, banking, transportation, and food security (Goodman et al., 2019; Medina et al., 2021; Henly & Brucker, 2019). Adults with disabilities struggle to pay their bills on time, save money for the future, and make ends meet (Goodman et al., 2017).

The next section addresses financial disparities such as low wages and lack of access to financial institutions. It then considers the implications of such financial disparities for people with disabilities and in particular for those from marginalized communities.

Disparities in Earnings

Even when people with disabilities gain employment, they have lower earnings, less upward mobility, and fewer opportunities for social and vocational inclusion (Goodman et al., 2019). They have lower average pay levels compared to employee without disabilities (Schur et al., 2017; Kruse et al., 2018). In addition, they are more likely to work in low-wage, part-time, and other contingent jobs (Harpur & Blanck, 2020; Schur, 2003; Schur et al., 2013), where the disability pay gap is higher than in standard, full-time, and permanent jobs (Schur & Kruse, 2021).

The COVID-19 pandemic worsened the financial situation of people with disabilities. In particular, workers with disabilities experienced greater health and financial concerns (Gignac et al., 2021a; Pettinicchio et al., 2021). They also likely experienced higher work-related stress and unmet workplace accommodation needs (Kruse et al., 2022). These initial studies highlight the importance of documenting the potential differential impacts of the pandemic on marginalized populations. They also call into question the “we are all in this together” approach promoted during the COVID-19 pandemic, as this may obscure deep structural inequalities experienced by marginalized populations that put them at greater risk of poverty, unemployment, mass incarceration, and COVID-19 infection (Bowleg, 2020).

For multiply marginalized individuals, disability interacts with other axes of inequality to limit economic empowerment and create layers of oppression and discrimination (Blanck et al., 2021). For example, women and people of color with disabilities report lower total income than their counterparts (Maroto et al., 2019). Similarly, LGBTQ+ individuals with disabilities report lower income and higher economic insecurity than cisgender and heterosexual people (Badgett et al., 2020; James et al., 2016; Medina et al., 2021).

Due to the many documented labor market inequalities, people with disabilities also often rely on financial support from the government. Around two-thirds of working-age adults with disabilities participate in at least one type of benefits program compared to one-sixth of those without a disability (Morris & Goodman, 2021). Programs such as Social Security Disability Insurance (SSDI), Supplemental Security Income (SSI), and Medicaid health insurance are important for the well-being of people with disabilities. Millions of people with disabilities use these financial and benefit programs to receive medical care, supports, and services they need to live independently to the maximum of their capabilities (Morris & Goodman, 2021).

These programs, however, have proven to be advantageous and disadvantageous, depending on the individual situation. For example, even when people with disabilities are able to achieve and maintain gainful employment that is crucial for their economic inclusion, rules for public benefit programs may prevent them from working to their full capabilities and prevent them from saving to become more financially stable (Maestas, 2019; Morris & Goodman, 2021). One such example is the case of SSI recipients who are encouraged to seek work but their ability to purchase supports needed to return to work is limited (Morris & Goodman, 2021). This situation is complicated by increased costs associated with inflation as well as disability-related out-of-pocket costs, which are discussed in the next sections.

Disparities in earnings, whether due to unemployment, occupational differences, or restrictions from benefit programs, put people with disabilities on an unequal footing compared to their nondisabled counterparts. Low salaries and benefits limit economic independence and worsen other inequalities such as access to education, housing, and transportation (Goodman et al., 2019), compounding the barriers that people with disabilities experience.

Disparities in Financial Inclusion

Access to financial services is important for the full economic inclusion of people with disabilities. Persons with disabilities remain underserved by banks and financial institutions. Despite the passing of the ADA, physical and digital access to formal financial services is often limited. Data from 2019 show that the unbanked rate for working-age disabled households was 16.2% compared to the 4.5% unbanked rate for working-age nondisabled households (FDIC, 2019).

Financial exclusion of people with disabilities is made worse by the high unemployment rates brought on by the employment constraints addressed in this chapter, as well as by low financial literacy levels, and inaccessible information provided by financial institutions (Goodman et al., 2019). One recent study by the Southeast ADA Center showed that many of the people with disabilities surveyed reported that they felt unwelcomed or disrespected by bank employees. More than half of the participants reported that their bank branch building was physically inaccessible. They also reported that mobile or internet banking apps, ATMs, and telephone banking options were not accessible to them (Whaley et al., 2022).

These challenges are intensified for those who are multiply marginalized and have disabilities. In particular, people with disabilities who are also Black and Hispanic report higher unbanked rates compared to non-Hispanic White and Asian people. These two groups also have the highest rate of using alternative and often predatory lending services (Goodman et al., 2019). These disparities highlight the compounding and unique effect of racism and ableism in shaping access to financial institutions.

Extra Out-of-Pocket Costs of Disability

Although government programs provide some economic support for people with disabilities, having a disability creates additional out-of-pocket costs for people and can limit their economic opportunities. These costs include medical and pharmaceutical treatment, mobility equipment or assistive technologies, and caregiving services essential for them to participate independently in the society and often live independently. These expenses that are incurred by people with disabilities but not by nondisabled peers worsen the economic situation of people with disabilities.

One recent study shows that adjusting the poverty rate to account for the direct additional costs of disability increases the rate from 24% to 35% (Morris et al., 2021). This would result in an estimated 2.2 million more people with disabilities counted as poor (Morris et al., 2021). These annual costs were estimated to be $18,322, and that would require, on average, 29% more income for households with a person with a disability to obtain the same standard of living as households without a member with a disability (Morris et al., 2021).

The existing barriers to economic inclusion, such as disparities in labor force participation, earnings, and occupation status, interact with other systems of oppression to often push people with disabilities into poverty. Despite this interaction between poverty and disability, governmental social service systems often consider them as separate issues (Morris & Goodman, 2021). For instance, receiving disability benefits frequently requires demonstrating that one is unable to work, while anti-poverty programs require that you participate in the labor force. As such, people with disabilities living in poverty are often faced with conflicting information or a lack of options to improve their economic situation.

Attitudinal Barriers

People with disabilities continue to face attitudinal barriers and stigma in all facets of their lives (Blanck, 2020). While we recognize that these broader challenges of discrimination impact the economic inclusion of people with disabilities, in line with the focus of this chapter, we examine the pernicious attitudinal barriers too often experienced in employment by people with disabilities.

Employer discriminatory attitudes and toxic organizational cultures can hinder employment of people with disabilities and thus serve as a barrier to economic inclusion (Blanck, 2020; Schur et al., 2014). Workplace culture that is unwelcoming discourages marginalized workers with disabilities from getting or keeping a job

(Araten-Bergman, 2016; Dimoff & Kelloway, 2019; Hanisch et al., 2016; von Schrader et al., 2014).

This section overviews the experience of workers with disabilities and the workplace barriers they face such as attitudinal discrimination and access to workplace accommodations. It then discusses emerging issues in labor studies such as the use of automated decision making (ADM) and algorithms in the workplace and the implications for the economic inclusion of people with disabilities.

Discrimination

People with disabilities face a variety of barriers from employers in getting and keeping a job. At the hiring stage, they typically encounter unfounded stereotypes and discrimination regarding their ability to work (Baert, 2018; Ameri et al., 2018; Blanck, 2020; Kaye et al., 2011). Employer audit studies show that employers are less interested in job applicants with disabilities, even when their resumes are identical to those of applicants without disabilities. These findings persist even in cases where one's disability is irrelevant to required job tasks and performance (Ameri et al., 2018; Baert, 2018).

Research suggests that this type of discrimination may be due to interviewers and managers being unaware of or untrained in best practices in hiring, mentoring, accommodating, and working with people with disabilities (Blanck et al., 2020). Another reported barrier that often discourages individuals with disabilities in the hiring stage is a lack of commitment, inclusive language, and targeted recruitment efforts (Araten-Bergman, 2016; Ball et al., 2005).

Once employed, many workers with disabilities face attitudinal barriers such as discrimination as well as more subtle biases such as low expectations from managers, supervisors, and co-workers. These barriers limit opportunities for career development and positive workplace experiences for people with disabilities (Schur et al., 2017). The prevalent ableism, sexism, ageism, and racism, coupled with other forms of oppression, often result in overt and more subtle (sometimes called "unconscious") workplace discrimination (Blanck et al., 2021). Marginalized employees with disabilities are more likely to experience and report discrimination in the workplace (Blanck et al., 2021; Dispenza et al., 2018; Jones et al., 2018; McMahon et al., 2012; Medina et al., 2021; Shaw et al., 2012). Despite having similar levels of organizational commitment and turnover intention as workers without disabilities, workers with disabilities have lower job satisfaction due to attitudinal barriers they experience in the workplace (Schur et al., 2017).

Discrimination in the hiring stage serves as gatekeeping to labor force participation for people with disabilities. As such, it limits their access to gainful employment and economic independence. Whether it is explicit discrimination, subtle discrimination, or lack of knowledge on how to be inclusive, employers may put candidates with disabilities at a disadvantage through their discriminatory treatment.

Workplace Accommodations

Workplace accommodations are individualized modifications to how the job is performed or the work environment itself. By addressing employment barriers, accommodations are essential in allowing qualified people with disabilities to join the labor market and fully engage and participate in job functions (Blanck, 2020). Studies by our research team and those of others show receipt of accommodations is positively associated with job tenure, higher job performance, and work-life satisfaction (Anand & Sevak, 2017; Blanck, 2020; Maestas et al., 2019).

Nonetheless, effective accommodations are not always available to all workers. Access to workplace accommodations remains a barrier to employees with disabilities (Schur et al., 2014; Anand & Sevak, 2017; Blanck et al., 2020; Dong, 2018; McDowell & Fossey, 2015). One prior study of accommodations by Blanck and colleagues provides a pre-COVID-19 baseline of workplace experiences, showing those who need accommodations most receive them less often (Blanck et al., 2020). Another study focusing on a nationally representative sample found that 47–58% of accommodation-sensitive individuals lack accommodation and that such accommodation would enable them to join the workforce (Maestas et al., 2019).

Workers with less visible disabilities (Anand & Sevak, 2017; Blanck et al., 2020; McDowell & Fossey, 2015; Dong, 2018) and those with multiple marginalized identities (Blanck et al., 2020; Hill et al., 2016) are least likely to access needed accommodations. Individuals with less visible disabilities and other marginalized identities may not request workplace accommodations due to the potential for discrimination associated with disclosure (Hickox & Case, 2020; Logue & Blanck, 2020; Hyseni et al., 2022). One recent study of legal professionals showed that women, young people, and parents are less likely to disclose disabilities (Hyseni et al., 2022).

Stigma and discrimination associated with mental health and less visible condition is widely documented (Blanck, 2020). To avoid stigma and discrimination, individuals with invisible and stigmatized disabilities and health conditions often choose to forgo disclosing their disability and requesting accommodations (Dewa, 2014). In particular, stereotypical perceptions of mental health have implications on what accommodations are viewed as “reasonable” (Telwatte et al., 2017).

Another major barrier to accessing accommodations for people with disabilities remains the lack of adequate and practical information and self-advocacy (Gignac et al., 2021). Many employees are not familiar with workplace accommodations (Price et al., 2017), especially those who have invisible disabilities. Many others with chronic health conditions such as addiction do not know they are recognized as having an ADA-covered disability, and others may now be recognizing the first signs and symptoms of mental health conditions (Hudson et al., 2016), making it difficult to know if they can request accommodations and what types of accommodations to request.

Lack of workplace accommodations creates a unique barrier for people with disabilities when it comes to maintaining gainful employment. Successful participation in the labor force is often contingent on these accommodations being provided. As such, when accommodations are not granted, they put people with disabilities at a disadvantage that impacts their economic security. The challenges in receiving accommodations are further heightened for marginalized workers (Hyseni et al., 2022). For those embodying other marginalized identities, disclosing and requesting workplace accommodations means an increased risk of experiencing additional discrimination.

Emerging Issues-Algorithmic Hiring

Discussions of discrimination have become more complex due to the growing use of algorithms and artificial intelligence (AI) in hiring and other decision making (Harpur et al., 2022). While AI is often proclaimed as a solution to reducing workplace discrimination by reducing human judgment, research shows that algorithms and the use of AI remain flawed in many respects and may lead to unfair outcomes in employment if not carefully considered.

These concerns were heightened during COVID-19 and its aftermath, due to widespread health-related data collection in the workplace that impacted worker privacy and employment opportunities (Harpur et al., 2022). Workers with disabilities have been put at an increased risk for discrimination due to either forced disability disclosure or "data mining" that makes their disability known to the employer.

The US Equal Employment Opportunity Commission (EEOC) is responsible for enforcing federal laws that make it illegal to discriminate against an employee because of race, religion, sex, national origin, age, disability, and genetic information. While the EEOC provides guidelines on the applicability of the ADA for algorithmic discrimination and intersectionality, this guidance typically is not legally binding (EEOC, 2022). Courts have applied different practices to intersectionality in their rulings, and plaintiffs have struggled to prove claims of intersectional discrimination (Abrokwa, 2018; Mazaheri & Bonano, 2022).

The wide use of algorithms in the workplace, such as for hiring, promotions, and monitoring the conditions of work, puts people with disabilities at an increased risk for disparate outcomes, for example, should they not be effectively accommodated (Harpur et al., 2022). The overall prevalence of workplace attitudinal and structural discrimination against people with disabilities cautions employers in using AI and automation in decision making. If unchecked, increased automation and data collection may unjustly and unknowingly discriminate against otherwise qualified people with disabilities, thus acting to reduce their opportunities for equal participation in the labor force and limiting their economic inclusion.

Paths Forward

Two new RRTCs led by Syracuse and Rutgers Universities are working to address many of the barriers identified in this chapter prior and to enhance the economic inclusion of persons with disabilities. These two national centers aim to directly inform the disability community, and employment and employer policies and practices to improve labor outcomes for people with disabilities. In this section, we overview areas for new research emanating from these centers and possible paths forward to promote economic empowerment.

Millions of individuals with disabilities become dislocated from work due to increasing severity of disability and new medical conditions. As a result, this group of individuals becomes connected to Supplemental Security Income (SSI) and Social Security Disability Insurance (SSDI) systems for income support and critical public benefits such as health care. In challenging economic times, they are also more likely than people without disabilities to be laid off and receive Unemployment Insurance (UI) and/or apply for SSDI (Maestas et al., 2021). A recent study from scholars from the RRTCs shows that this was not the case during the COVID-19 pandemic (Mullen & Maestas, 2022).

Under the right conditions, many individuals have the potential and desire to make a successful return to the workforce. Three recent research studies illustrate our examination of ways to enhance opportunities for return to work. Specifically, they examine policies that promote a successful return to work from SSDI (including the impact of the Affordable Care Act, and state investments in home- and community-based services); policies to improve benefits counseling integrated with financial coaching to significantly promote a return to work from SSDI; and policies to enhance temporary increases in UI resulting from the COVID-19 pandemic (e.g., the important role that UI can have in helping people with disabilities sustain income and be able to return to employment).

We have overviewed that people with disabilities confront obstacles in obtaining employment, including from stereotypes, discrimination, insufficient accommodations, and lack of best practices, as well as in obtaining competitively meaningful "good" jobs. Future research coming from the RRTCs will consider: (1) expansion of the work activities of people with disabilities in the gig economy, who often have insecure contingent or nonstandard jobs, and how effective policy can improve this situation; (2) expansion of non-traditional routes to employment, such as in Disability-Owned Business Enterprises ("DOBEs") as locally based suppliers to corporations and governments, and to create niche opportunities for people with disabilities to demonstrate their abilities; and (3) expansion of proven apprenticeships, which is a core path to employment presently of renewed importance to promote economic advancement and employment for people with disabilities. These efforts will pay particular attention to increasing access to employment opportunities to marginalized groups.

Even when people with disabilities obtain employment via these strategies, however, they encounter challenges that can make it difficult to earn a living wage above poverty levels and retain employment. The RRTC researchers are exploring ways post-pandemic policy and practice changes can improve economic well-being of people with disabilities. For example, we are assessing the impact of increased wages of people with disabilities as a result of state policies that raise minimum wage rates above the federal level and state programs that eliminate subminimum wage levels for people with significant disabilities.

We are also investigating how paid leave benefits people with disabilities and helps them retain employment (e.g., particularly paid sick leave and paid family and medical leave). Finally, with workplace norms changing, we are examining the expansion of telework and remote work as triggered by the COVID-19 crisis. We are closely investigating the importance and effects of home-based work for people with disabilities, who are already more likely than those without disabilities to work from home and who can reap the benefits of flexible scheduling, individualized accommodations, and "natural" home-based supports.

As identified by extant research, individuals with disabilities experience extreme difficulties obtaining jobs, disparities in job outcomes once employed, discrimination, and insufficient workplace accommodations and are at greater risk of losing their jobs compared to their counterparts without disabilities. Adopting new governmental and employer policies and practices that target hiring and retention of people with disabilities, provision of effective accommodations, and increasing inclusion and support within the organization may help to significantly reduce these barriers to successful employment. However, employers lack clear best-practice frameworks and metrics to address these barriers. Our RRTC researchers are working to systematically identify, using quasi-experimental evidence, the effects of employer disability practices at large and smaller organizations on hiring, career advancement, retention, wage, and accommodation levels of people with disabilities.

As also discussed, people with disabilities face employment obstacles, including finding support and allies within organizations once employed. The importance of addressing these challenges and opportunities is more pertinent today because the COVID-19 pandemic has generally increased workers' stress and anxiety and has necessitated changes in the workplace such as telework and more reliance on individual technology.

Therefore, we are examining the effectiveness of signaling manager and co-worker acceptance and inclusion in hiring to build trust in people with disabilities, in an effort to help employers create better hiring process that is inclusive of people with disabilities. In addition, given the increased incidence of mental health disabilities post-pandemic, our RRTC team is working to enhance the use of workplace accommodations through supervisor and employee targeted information and workshops to increase knowledge on self-advocacy and appropriate disclosure in support of effective accommodations such as individualized digital accessibility and supervisor supports. These trainings will provide information to employers and employees on the unique challenges experienced by multiply marginalized workers with mental health disabilities.

Finally, challenges that workers with disabilities face are shaped by industry and organizational type and size and by changing job tasks. Practices used by large businesses in office settings often are not adaptable or successful in addressing barriers for other types of smaller organizations. Working with our partners, through qualitative and quantitative research, the RRTC researchers are systematically identifying best practices to increase employment and retention of employees with disabilities and other under-represented diverse groups in smaller businesses. To improve employment outcomes of people with disabilities across labor sectors, especially in those with a higher representation of minority and marginalized groups, the RRTC studies are documenting best practices for workers with disabilities in the healthcare industry, for example, having a high concentration of workers with disabilities, with a close study of the effects of the COVID-19 pandemic and intersectional dimensions and workers' experiences.

Conclusion

Ongoing studies show that the economic inclusion of individuals with disabilities remains elusive and, if not addressed, will continue to be a major societal challenge. Many individuals with disabilities still experience serious and systemic challenges in accessing financial resources and services that would allow for greater economic self-sufficiency. Discrimination and bias in the workplace remain prevalent and access to workplace accommodations remains limited for those with stigmatized disabilities such as mental health conditions and for those with multiple marginalized identities. Finally, employment rates remain low for individuals with disabilities from marginalized communities, especially along the axis of race.

In helping to illuminate the many complex issues faced in the employment of persons with disabilities, this chapter aimed to identify new and promising means to address this societal challenge. With increased partnership and collaboration, with the disability community leading this effort, the public and private sectors must seek to address the employment of persons with disabilities, which affects millions in the United States and around the world.

Acknowledgments This line of study was supported in part by grants to Syracuse University, Peter Blanck (Principal Investigator), from the National Institute on Disability, Independent Living, and Rehabilitation Research (NIDILRR) for: the Rehabilitation Research & Training (RRTC) on Employment Policy: Center for Disability-Inclusive Employment Policy Research, Grant #90RTEM0006-01-00; the Southeast ADA Center, Grants #90DP0090-01-00 and 90DPAD0005-01-00; Increasing Supported Decision Making in Community Living, Grant #90DP0076-01-00; and sub-grants to Syracuse University, Peter Blanck (PI), for the ADA-PARC, Lex Frieden PI, Grant #H133A12000, and the RRTC on Employer Practices Leading to Successful Employment Outcomes Among People with Disabilities, Douglas Kruse PI, Grant Application #RTEM21000058. NIDILRR is a center within the Administration for Community Living (ACL), Department of Health and Human Services (HHS). The views provided herein do not necessarily reflect the official policies of NIDILRR nor do they imply endorsement by the Federal Government. This program of study is also in part supported by the American Bar Association ("ABA") Commission on Disability Rights (we thank Amy Allbright, Director) and the ABA Commission on Sexual Orientation and Gender Identity (we thank Malcolm "Skip" Harsch, Director). This investigation has been a collaborative effort, with many people and organizations graciously giving of their time to enhance the diversity and inclusiveness of the legal profession. Leaders from the ABA, Chairman Scott LaBarre of the Disability Rights Bar Association ("DRBA"), President Wes Bizzell of the National LGBT Bar Association, and other nonprofit and state legal leaders and associations contributed to this effort. Many people from across the United States acted as members of the project's Blue-Ribbon Advisory Panel, providing feedback and insight into the development of the first phase survey. Countless other legal professionals provided feedback, and we have vetted our ideas at national and state legal association meetings and educational programs. This investigation would not be possible but for this engagement by such leaders in the diverse community of legal professionals, law firms, state bar associations, not-for-profit legal associations, and others. As mentioned, the views expressed herein represent the opinions of the authors, and not those of any funding agency, university, or other entity. They have not been approved by the House of Delegates or the Board of Governors of the ABA and, accordingly, should not be construed as representing the position of the ABA or any of its entities.

Disability, Ethics, and Law

Disability, Ethics, and Law: Introduction

64

Francisco J. Bariffi and Gerard Quinn

Contents

Abstract

This section explores the intersection between disability, law, and ethics, and anticipates the challenges that the twenty-first century will bring. This brief introduction aims to anticipate key issues and significant challenges as the twenty-first century unfolds. To some extent, these are long-standing challenges. But many take on new forms, especially as medical and other technologies evolve exponentially. Evolving medical and technological advancements ignite a new ethical discussion regarding the risks and opportunities offered by disruptive technologies such as genetic engineering, neurotechnologies, or AI systems. Accordingly, this section is about the coming revolution – which is widely expected to occur – and the new legal framework required to regulate it from a disability rights perspective.

Introduction

This section of the book gets at the intersection between disability (law and policy) with ethics. It aims to be forward-looking and to anticipate flashpoints and significant challenges as the twenty-first century beckons. To some extent, these are long-

standing challenges. But many are given new expressions, especially as medical and other technologies evolve exponentially.

The story of human evolution has been well-captured by authoritative commentators such as Yuval Harari et al. (2015). This story concerns the emergence of civilization from hunter-gathers into organized communities that can tackle common problems by combining resources and the mastery of tools to control nature. This accelerated during the Industrial Revolution to the point that humankind now has the power to control nature and destroy it and even life itself. The next phase will be even more telling and challenging. While humanity has used technology so far to control its environment, the next step will entail using technology and associated biomedical insights to change the nature of man himself.

We live in a digital revolution, which refers to the profound and widespread changes brought about by the advancement of digital technology. It has transformed our lives, including how we communicate, work, learn, and access information (Stibel, 2013). The digital revolution is like a massive shift from analogue to digital. Previously, information, such as text, images, and sounds, was stored and processed in analogue formats, like physical books, film negatives, or vinyl records. However, with the digital revolution, this information is now converted into digital form, represented as binary code consisting of 0s and 1s (Isaacson, 2014).

This technological development was triggered by the vertiginous evolution of interconnected computers and their use in neuroscience, genetics, robotics, and artificial intelligence (Bostrom, 2013; Kelly, 2016; Venter, 2013). Some authors have described this phenomenon as a new Renaissance (Goldin & Kutarna, 2017), as a new age in human history (Reese, 2018), or as the era of singularity (Kurzweil, 2005).

In this context, a new scenario of human-machine integration becomes a reality. It refers to combining or merging human abilities and actions with machines or technology (Schwab, 2017). Overall, human-machine integration aims to combine the strengths of humans and machines to enhance productivity, efficiency, and quality of life. By working together, humans and machines can accomplish tasks that neither can achieve alone, leading to new possibilities and improved outcomes in various domains (Kelly, 1994). Conversely, human-machine integration raises several ethical and legal dilemmas, most of which remain unanswered.

New techniques are emerging in neuroscience to “reveal” the person behind the mask of even those in persistent vegetative states (Fins, 2015). Neuroscientists are now beginning to talk openly about emerging technologies to, merge minds, i.e., integrating the human brain with advanced technologies to enhance or expand cognitive abilities and establish direct communication between brains (Mangan, 2018). This breakthrough has been possible with brain-computer interfaces (BCIs) development. BCIs are devices or systems that establish a direct connection between the brain and an external device, allowing bidirectional communication. BCIs could potentially enable direct communication between two or more brains. This could involve sharing thoughts, emotions, or sensory experiences among individuals. By establishing a direct neural link, people could communicate without needing verbal or written language. Additionally, new techniques and technologies are being discussed to enhance a person's cognitive abilities and potentially download a person's mind before expiration (Kaku, 2014).

Deep brain stimulation (DBS) is a neurosurgical procedure involving the placement of a medical device called a neurostimulator which sends electrical impulses, through implanted electrodes, to specific targets in the brain. While this technique is currently used for brain movement disorders, there is no technological impediment to its potential use in controlling antisocial human behavior (Farah & Wolpe, 2004).

Transcranial magnetic stimulation (TMS) is a form of brain stimulation in which a changing magnetic field is used to cause electric current at a specific brain area through electromagnetic induction. This technique is said to have shown diagnostic and therapeutic potential in mental health treatment. However, does this innovation offer a fundamental change in psychiatric intervention, or is it just an updated "electroshock treatment" form?

Optogenetics is a technique in neuroscience in which genes for light-sensitive proteins are introduced into specific types of brain cells to monitor and control their activity precisely using light signals. This technique is said to have led to insights into autism, schizophrenia, anxiety, or depression.

In sum, neurotechnology development is giving rise to ethical and legal dilemmas. The possibility of intervening in the brain to enhance its state, select individuals, erase fragments of memory, prevent behaviors, or determine if we are telling the truth is being raised. Neuroethics focuses on what is right or wrong regarding the treatment, enhancement, or manipulation of the human brain. What is specific to neuroethics compared to classical bioethical issues is that it questions the very definition of what is human. It addresses the ethics of neuroscience (such as regulating its advances, determining limits, and understanding their implications) and the neuroscience of ethics (how we construct moral principles and how our consciousness works).

There is enormous potential for states, companies, and non-state actors to infringe upon human rights through the misuse or abuse of neurotechnology. For this reason, a new approach toward the legal protection of the human brain is gaining wide acceptance. Neurorights refer to a set of rights and ethical principles aimed at protecting individuals' privacy, autonomy, and dignity in the context of advancements in neuroscience and neurotechnology. These rights address the ethical, legal, and social implications that arise from our increasing understanding of the brain and our ability to intervene and interact with it (Neurorights Foundation, 2022).

The development of modern biology and the study of the human genome has opened the doors to genetic manipulation, which makes it possible to create, edit, or discard embryos according to the expectations or wishes of the parents (Mukherjee, 2017; Ridley, 2000). The development of neuroscience has allowed us to know not only the physical-chemical functioning of the human mind but also its potential manipulation to influence the individual's behavior (Eagleman, 2017; Sapolsky, 2017). Algorithms govern what we know as "big data" and impact the searches and preferences of all users of digital content online (Bartlett, 2018; O'Neil, 2018). Artificial intelligence has replaced human intelligence in critical tasks in producing goods and services and in the free movement of people (Tegmark, 2017; West, 2018).

Significant shifts in technological growth with direct consequences in daily life conversely pose major ethical and legal questions, significantly when the rate of change has been growing exponentially. Let's think briefly about what these breakthroughs could accomplish in improving human life.

Gene editing using the so-called CRISPR method can be used to identify cures for many human genetic diseases. CRISPR (clustered regularly interspaced short palindromic repeats) is a revolutionary gene-editing tool that allows scientists to make precise changes to the DNA of living organisms, including plants, animals, and even humans. It's like a pair of molecular scissors that can cut DNA at specific locations and then change the genetic code (Carrey, 2019). As leading experts assert, "Now that science has a cheap and easy-to-use genetic editing tool at its fingertips, we could soon see the rise of precise genetic therapies that usher in a new era of medicine" (Doudna & Sternberg, 2018). Conversely, what could prevent gene editing from being used for choosing a baby's gender or implanting genes associated with desirable characteristics? (Rochman, 2018).

Prenatal genetic diagnosis (PGD) techniques allow the current medical practice to test embryos to detect the most common fetal chromosomal abnormalities. The natural question that follows is what could/should be done if such chromosomal abnormalities were to be detected. Is the purpose of these techniques to fix abnormal embryos or to discharge them (Parens & Asch, 2000)?

In 2015 the Council of Europe organized an International Conference on "Emerging Technologies and Human Rights" to identify priority human rights challenges raised by emerging technologies and their convergence while proposing interdisciplinary debate. The gathering concluded, *inter alia*, that science and technology have a growing impact on society, and it should be dealt with as a matter of priority; that convergence brings together the medical and nonmedical fields; and that the current legal framework is inadequate to address issues that are constantly evolving (COE, 2015).

In this respect, the "Rathenau Report" stresses that emerging technologies are seen to go beyond therapy and healthcare, blurring boundaries between medical/nonmedical applications and between health/illness. The scenarios outlined are generally complex, uncertain, and likely to reach an unpredictable (for some aspects imaginable, for others unimaginable) benefit/risk balance between individuals and society and present and future generations. That's why the question of safety (physical and mental integrity), individual privacy, and social acceptability is generally at the center of discussion. Still, there is another ethical challenge at stake: the challenge of justice (Van Est et al., 2014).

Consequently, a huge debate is on the table which clearly transcends the boundaries of biomedical innovations to social and military domains. It is not necessary to be an expert philosopher or rights advocate to easily understand that these innovations raise fundamental ethical and legal questions in relation to any existing domestic, regional, or international human rights protection framework. Let's think, for example, about the implications of gene editing in relation to the protection of the right to life, to equality and nondiscrimination, or to health or the implications of deep brain stimulation in the protection of the right to physical and mental integrity, the right to identity, or the right to autonomy and freedom of thought and belief.

While these technological innovations pose a threat to the general human rights discourse, they become particularly challenging in the context of disability rights (Quinn et al., 2016). Over a decade ago (2006) the United Nations approved the Convention on the Rights of Persons with Disabilities (CRPD) which is said to have adopted the so-called social model of disability (Bantekas et al., 2018). This transcendental legal body is considered the greatest motor for the paradigm shift from the medical to a social model of disability, and it has been able to establish as a binding obligation a series of legal standards to eliminate systematic discrimination that persons with disabilities face in their daily life.

The CRPD has become, in a surprisingly short time, a universal reference legal instrument, especially in the European context. The treaty has been signed, ratified, and implemented at the domestic level for nearly all Member States and ratified and implemented by the Union according to its international legal capacity. Likewise, for the Council of Europe, the CRPD has played and still plays a crucial role in interpreting human rights obligations in the context of disability rights.

Therefore, in this complex and unstable balance between progress and respect for human dignity, we must add a new element of consideration: "human diversity." The social model of disability has been, at its core, a critique of the status quo. And by doing so has evolved as a natural motor to challenge social structures, legal practices, and ethical thinking.

The ongoing influx of the physical sciences into the biological sciences goes hand in hand with a growing influence of an engineering approach to life. Therefore, the "biology becoming technology" trend implies and promises a strong increase in new interventions into living organisms, including the human body and brain (Van Est et al., 2014).

If we consider all these innovations described above and try to find a common feature or link between them, the answer becomes more evident. Science is on the quest to intervene in human evolution by selecting, modifying, or correcting abnormal physical and mental traits. Conversely, the modern notion of disability, i.e., the result of social barriers that hinder persons with physical, mental, intellectual, or sensorial impairments from enjoying equality of opportunities in life, actually includes those persons with "abnormal physical and mental traits" for rights protection purposes.

Consequently, could science fix disabling impairments? Or, instead, could this new impairment-fix scenario could allow the rebirth of the medical model of disability and, accordingly, a shift backwards on disability rights recognition and enjoyment? Will the future foresee the birth of a new human/artificial category?

Overall, the debate surrounding the impact of technology on the rights of people with disabilities ultimately revolves around the concept or definition of disability itself. The prevailing social model distinguishes between impairment (a personal element) and barriers (a social element). Agustina Palacios argues that disability has at least three dimensions. The first is the condition of disability, which is the personal dimension. How this condition is defined and conceived undoubtedly affects a person's identity. If the perspective arises exclusively from a medical diagnosis, such as impairment, it becomes an identity of insufficiency and a lack of autonomy. The second dimension to consider is the situation of disability; the interrelational, situational, and dynamic dimension arises when social barriers come into play. This situation is what truly "disables," restricts, and/or prevents the exercise of rights on equal terms with others. It has been highlighted by political activism and the social model of disability since the 1970s. The third dimension is the position of disability, which is structural. It resides in representations, evaluations, and culture, resulting from our prejudices and stereotypes (Palacios, 2020).

The condition of disability is related to impairment, while the situation and position are related to social barriers. The condition of disability cannot be a requirement or reason for exclusion in the enjoyment and exercise of rights, as that would be discriminatory.

However, the distinction between the condition and situation of disability, or in other words, between impairment and barriers, brings a new ethical debate to light regarding the risks and opportunities offered by disruptive technologies such as genetic engineering, neurotechnologies, or AI systems. On the one hand, technology offers tools to correct or eliminate disabling impairments, and on the other hand, it offers tools to remove various barriers. Unlike predecessor technology (primarily analogy), AI-based technology (digital) enables predictive schemes that potentially impact human biology. In other words, AI-based technologies offer, for the first time, the possibility to modify a person's cellular and neurological structure to restore sensory and cognitive functionalities that virtually eliminate the impairment or condition of disability (Bariffi, 2021).

Nevertheless, when we think about the relationship between technological development and disability, we cannot ignore the historical fact. Science has frequently been used to justify and implement eugenic practices, concealment, marginalization, institutionalization, and medical experimentation (Bariffi, 2018).

Undoubtedly, technology has allowed certain groups within the disability community to access greater rights and better opportunities. From the very beginning of the medical model, technology has provided individuals with sensory and motor impairments with a tool for social integration. However, it is known that this approach only allowed the integration of a tiny minority while promoting the exclusion of people with disabilities from society. It is often said that the medical model was more a model of institutionalization (psychiatric institutions, rehabilitation centers, education, employment, etc.) than a rehabilitation model. From the development of prosthetics to the Braille language, technological advancements have always been presented as beneficial for people with disabilities while also becoming a new factor of exclusion or segregation. The current debate on disruptive technologies is no different from this historical dynamic.

This section is about the coming revolution – which seems inevitable – and the new legal framework required to regulate it. It will stand back from it to understand the standard account of what it means to be a human (human personhood) and mainly whether "cognition" or cognitive capacity defines what it means to be a person. It looks at how that "standard account" of what it means to be a human is no longer "standard," especially from the perspective of new science.

Rafael de Asis Roig examines the transhumanist approach to disability, focusing on its defining feature: human enhancement. The study of what underlies the philosophy of enhancement allows for connecting original humanism (lying at the foundations of modern human rights theory) with the transhumanist discourse. Both humanists and transhumanists, but particularly transhumanists, understand human nature in a way that discriminates against persons with disabilities. Diversity-based humanism comes in response to this, allowing us to address the role of emerging technologies vis-à-vis disability.

Bernadette McSherry deals with the ethical and legal aspects of neuroscience and neurointerventions. She argues that while neuroscience can aid in providing information about how the brain works, understanding how things can go wrong in brain function and how to address perceived impairments remain elusive. The article considers some of the ethical issues raised by the burgeoning industry of "neurointerventions," with a focus on brain-computer interfaces and brain stimulation and modification techniques. It argues that legal regulation may go some way toward alleviating ethical concerns about consent and autonomy. However, putting too much faith in neurointerventions as a cure for mental impairments ignores the importance of the social determinants associated with good and poor mental health and may serve to reinforce discrimination.

Francisco Bariffi explores the intersection between genetic engineering and disability. The article explores the basics of the genetic revolution, the crucial ethical implications, and the impact on the rights and dignity of persons with disabilities. He argues that recent breakthroughs opened up a world of new opportunities in the face of the CRISPR-Cas9 gene-editing method which allows high-precision cutting and editing of genetic information in the DNA of any living organism, including humans. The need for a new regulatory framework is evident. Existing human rights treaties – including biomedical treaties – do not give clear guidance. They were meant to prohibit and control certain things happening to humans but not to deal with humans becoming potentially superhumans or even nonhumans. The article concludes that any new policy conversation and the eventual regulatory regime must be based on the voices of those most directly concerned. Persons with disabilities are among the first to be directly concerned.

Piers Gooding deals with power, personhood, and data-driven technologies in the lives of disabled people, focusing on the rise of profiling technologies in mental health settings. The article focuses on the use of "digital phenotyping" or "behavioral" sensing in settings as diverse as hospitals, community-based services, homes, criminal legal settings, and direct-to-consumer products. It further explores the potential implications of biometric monitoring on individual dignity and personhood but expands the focus to collective concerns beyond an individualistic focus on the rights of data subjects. To reflect on these implications, the chapter brings together scholarship on algorithmic accountability, the Convention on the Rights of Persons with Disabilities, and Michel Foucault's "panopticism." The author concludes that governance would encompass the identification of harmful social consequences, as well as identifying benefits that may emerge and helping to adjudicate any societal trade-offs that may be required to achieve them.

Lastly, **Agustina Palacios and Iñaki Regueiro** address the intersection between gender and disability focusing on the exercise and enjoyment of sexual, reproductive, and nonreproductive rights. Based on the rights of autonomy and legal capacity, the article addresses the intersectionality between gender and disability. It includes a focus on both reproductive and nonreproductive rights, namely, the rights to have sex and to access to sexual assistance. An overview of the main barriers to the exercise of these rights is also present, including serious human rights violations, such as forced sterilizations. Finally, the authors propose three specific tools under the Convention on the Rights of Persons with Disabilities to prevent infringements of rights: accessibility, accommodations, and support.

Introduction

Throughout history, categorizing humans as distinct beings has been a constant, and it has been part of modern humanism, which gave rise to the human rights rationale and the ideal of human dignity. Within this framework or discourse, such distinctiveness allows to consider human beings as unique. Note, however, that uniqueness here is not a synonym for singularity or specificity: when applied to human nature, uniqueness is tied to perfection.

Within this context, such distinctiveness and perfection arise from "the standard," i.e., a construct of "normal" traits allegedly shared by all human beings. This standard is represented by the body and the mind. Perfection thus results from the further development and enhancement of this standard through social constructs, giving rise to human excellence. As human beings depart from these perfect traits, they become less distinct, thereby moving further away from being considered human.

This approach to human nature has played a major role in ethics and law, and it ultimately pervaded the ties between the two, i.e., human rights along with a capacity-based or skills-oriented notion of human dignity. Within modern humanism's ideal of human dignity, there is an underlying concept of "person" that (i) entails having a set of abilities and (ii) gives rise to an inextricable relationship between "person" and "capacity" (De Asís 2004).

Capacity has always been a defining feature of moral agency or, better said, of the concept of "moral agent," construed as a being capable of acting with reference to right or wrong and engaging in moral discussion. Moral capacity means the ability to (i) make moral judgments and (ii) define and pursue life plans. Also, individuals have entered legal frameworks through the acknowledgment of capacity (Bariffi 2015). In order to hold rights and obligations, one must have been acknowledged legal capacity.

Capacity and ability also play a major role in individual rights. Human rights theory has been traditionally rooted in a model individual largely defined by (i) his or her rational "capacity;" (ii) his or her "ability" to feel; and (iii) his or her "ability" to communicate. This skill set is provided as the justification for human dignity and the acknowledgment of rights aimed at safeguarding the exercise of such dignity, i.e., the exercise of these abilities and capacities.

When building the notion of what is actually "human," the human rights theory embraced a contextual, situational, or environmental dimension. Barriers and their implications are also essential within this framework.

Therefore, human rights qualify as mechanisms designed to protect the exercise of human dignity by limiting, restricting, or removing any barriers hindering the aforesaid "abilities" or "capacities."

For a long time, only those meeting a (not always explicit) rationality standard could qualify as human rights holders, i.e., "able" persons or individuals with "capacity." Those failing to meet the rationality standard or having any cognitive disabilities (whether permanent or temporary) were not entitled to human rights, falling outside the scope of the human rights framework but still subject to it. Accordingly, their moral horizon depended on the “able” persons. As a result, the approach to persons with disabilities has relied on solidarity but has not necessarily been a matter of rights.

According to modern humanism, the ethical world is made up of dignified individuals or, better said, those who (abiding by a model of social life) are capable of reasoning, feeling, and communicating, orienting this skill set toward the achievement of their life plans while playing a specific and helpful role within society or their community. Anyone lacking these abilities can be entitled to rights, but these entitlements would not be justified on the basis of human dignity. The rights of the “non-able” would thus result from the decision of those “able,” who might consider them worthy of the said entitlements. Therefore, the approach to disability falls outside the scope of the rights framework – which caters to the “able.” Rather, disability is tied to benefits, assistance, and services.

This ethical, legal, and rights-based framework is fully in line with the so-called medical model of disability.

The medical model views disability as a scientific problem. Medical model advocates refer to disability as a health-related matter, i.e., an illness, so that persons with disabilities are defined by this condition. Therefore, they qualify as defective, faulty, sick, or abnormal persons.

Despite the designations (e.g., disabled or handicapped), the medical model provides a dignity-based definition of persons with disabilities. However, it is a passive form of dignity, where these persons are passive subjects and not active agents. Persons with disabilities are somehow granted dignity by able persons. Also, according to the medical model, persons with disabilities can contribute to society depending on how well they are rehabilitated.

Due to the close ties between disability and disease, disability policymaking is mostly health-related and assistance-based. The medical model aims at normalizing persons with disabilities, achieving their successful rehabilitation. Disability policies are thus subject to political discretion and resource availability. Therefore, in societies where the medical model prevails, fulfilling the rights of persons with disabilities largely depends on solidarity.

The medical model considers disability as a medical condition, portraying disability as a “personal tragedy,” defining disability in a fundamentally negative way. Consequently, this model gives rise to a negative outlook on disability in terms of diversity.

Until recently, these have been the main strands of the human rights discourse’s approach to disability. Nevertheless, there has been a shift in both the notion of disability and the human rights framework. A new form of humanism (humanism of diversity or diversity-based humanism) emerged in the late twentieth and early twenty-first century. It is a theoretical as well as legal and regulatory shift that has not yet permeated society.

Under this paradigm shift, the definition of disability does not only revolve around individual traits. In fact, disability becomes mostly defined on the basis of the barriers that might be encountered. According to this social model, disability does not have a scientific origin (Palacios 2008). Conversely, disability stems from social barriers, both physical and behavioral. From this perspective, the definition of persons with disabilities relies on condition (defects) and situation (barriers), but the model focuses on the contextual or situational dimension. In sum, under the social model, situation or context supersede any conditions or defects. Note that the social model of disability has placed disability within the human rights framework.

Persons with disabilities are as dignified as anyone else, but such dignity must be construed as an active dignity, meaning that persons with disabilities are the ones shaping the consequences of this acknowledgment regarding their life plans.

Disability-related policies cease to be assistance-based. The spotlight is no longer on benefits and assistance, which are superseded by rights and entitlements. Under the social model, the claims of persons with disabilities are legally secured and no longer depend on political discretion and resource availability.

Although the social model focuses on barriers to define disability, it does not dismiss the role of condition and thus the role of diversity. According to the social model, disability also expresses the richness of human diversity.

Furthermore, the human rights discourse has modified the notion of dignity and the equality narrative, detaching (to some extent) the ties between capacity and dignity. The human rights discourse has contextualized dignity, opening to potential and departing from the talent or skills-oriented narrative. A dignified human life, combining autonomy and dependency as core human dimensions, has become the essence of dignity.

At the inception of individual rights, inherent equality was a defining feature shared by all human beings and thus a guiding principle. However, the current rights discourse regarding equality is difference-based. We are different from each other, and we are in different situations. Therefore, equality and non-discrimination revolve around two main dimensions: negative and positive difference. Negative difference entails finding the aspects making us different that are irrelevant to justify unequal treatment. Positive difference entails finding the aspects setting us apart that provide grounds for a different treatment.

From this approach, treating someone differently would qualify as discriminatory if there are no grounds for such difference or if, there being any potential grounds or justifications, these are superseded by overriding arguments or interests. Consequently, discrimination occurs (i) when meaningless differences are taken into account to provide a prejudicial treatment (whether directly or indirectly) and (ii) if meaningful or relevant differences are overlooked to provide a beneficial treatment (whether directly or indirectly). The relevance of differences and reasonability of arguments have become core aspects when discussing equality within the human rights framework.

As noted above, this new humanist discourse can be found in both human rights theory and human rights law, but not within society.

However, a philosophical movement seems to be emerging to challenge these premises. This movement does not only rely on the medical model, but also reminds us of a previous approach to disability: the disregarding model. This discourse's starting point is the aforesaid perfect "standard," seeking to improve it through technology. Watch out for transhumanism.

On Transhumanism

Transhumanists seek to enhance the human condition physically, intellectually, emotionally, and morally relying on science and biotechnology (Ferry, 2017). The proponents of this philosophical movement advocate the use of technology to improve persons' lives and to enhance longevity, mood, and cognitive abilities.

For transhumanism, the end of mankind is inevitable if the developments of science and technology are not embraced, obtaining instruments and apparatus that allow fighting against this outcome. This development shall create unlimited unique machines that could merge with humans.

Transhumanists defend human beings' freedom to use technology in order to enhance their lives and the lives of others, to be stronger, to live longer, to be less violent, etc. Transhumanist thinkers firmly believe that (i) technology can solve contemporary social problems (Llano, 2018); (ii) human enhancement technologies should be widely disseminated; (iii) individuals should be free to choose from these technologies; and (iv) parents should have complete authority over which enhancements – if any – they apply to their children.

The *Transhumanist Manifesto* was published in 1983, and the *Transhumanist Declaration* was drafted in 1998. The *Transhumanist Declaration* was signed by the most prominent transhumanists, it has been amended several times, and it lays down the guiding principles of transhumanism. Some of these principles and premises stem from humanist thinking.

The *Transhumanist Declaration* is worded as follows: "Policy making ought to be guided by responsible and inclusive moral vision, taking seriously both opportunities and risks, respecting autonomy and individual rights, and showing solidarity with and concern for the interests and dignity of all people around the globe. We must also consider our moral responsibilities towards generations that will exist in the future." The *Transhumanist Declaration* also refers to technology-related risks: "Research effort needs to be invested into understanding these prospects. We need to carefully deliberate how best to reduce risks and expedite beneficial applications. We also need forums where people can constructively discuss what should be done, and a social order where responsible decisions can be implemented."

One of the first works on transhumanism (More 1990) defines it as the successor of humanism although going beyond humanism by peering into the future in order to better understand our possibilities. Transhumanists argue that human nature is not an end in itself, nor should we abide by it. Technology will turn us into posthumans, thereby creating a new species (Harari 2017).

Other transhumanist claims, however, seem to depart from humanist thinking: "We favour allowing individuals wide personal choice over how they enable their lives. This includes use of techniques that may be developed to assist memory, concentration, and mental energy; life extension therapies; reproductive choice technologies; cryonics procedures; and many other possible human modification and enhancement technologies" (*Transhumanist Declaration*).

Transhumanism advocates the need for achieving a concept of human dignity that could be extended to posthuman beings (Bostrom 2005a). Transhumanists claim that we can legitimately reform ourselves and our natures in accordance with *humane* values and personal aspirations.

In any event, it is worth differentiating between three versions of transhumanism (Diéguez 2017). First, there is cultural transhumanism, based on postmodern theories. Cultural transhumanism challenges premises such as the boundaries of nature, the potential of human enhancement or the concept of human dignity. Second, there is biological transhumanism, supporting biological enhancement, improving cognitive abilities (biological uplift), enhancing longevity, and replacing natural randomness by selection and artificial genetic design. Third, cybernetic transhumanism intends to create a new species by merging human and machine.

Transhumanism rejects the view of nature as something constant and unchanging and argues that the moral value of human beings does not exist because they belong to a species but because of what humans do. Therefore, technological advances should be used for the moral improvement of humankind. This improvement will not produce negative effects, since it aims to enhance the moral behaviour of people, so it could hardly be considered as a moral evil (Persson 2012).

Nick Bostrom, a prominent transhumanist, relies on “The Fable of the Dragon-Tyrant” (Bostrom 2005b) to justify the use of technology for human enhancement with the aim of “killing death.” In this tale, ten thousand human bodies had to be delivered every evening to the foot of the mountain where the dragon-tyrant lived. Some would be devoured upon arrival, and others would be locked up in the mountain before eventually being devoured. Unable to beat the dragon, humans simply obeyed its commands, and they even set up a social structure abiding by the dragon’s needs. However, a group of eminent engineers began to think that they could beat the dragon, and they came up with the way to do it. After a struggle with priests, bureaucrats, dragonologists, etc., the engineers killed the dragon once and for all.

The dragon embodies death, and its victims represent the ill and dying human beings. The fable provides three stances against the dragon: (i) resignation, surrender, or graceful accommodation; (ii) cooperation; and (iii) fighting evil. Transhumanism represents this third stance.

If limited to the enhancement of human life, the purpose of transhumanism could be acceptable. But even in this simple wording, it raises concerns, since the concept of enhancement (or improvement) remains unclear. In addition, the notion of enhancement needs a starting point, the subject of enhancement, i.e., what needs improvement, whose value steadily diminishes as the enhancement is performed and the starting point is pushed away from the status to be achieved. There is no doubt that this has implications for persons with disabilities.

Aside from the most radical transhumanist stances – expressly claiming that persons with disabilities are not as morally worthy as “able” persons – the substance of transhumanism is that of the medical model: disability is an illness or disorder that can be cured through technology. This claim even overlaps with disregarding model claims (Fletcher 2014): (i) disability causes suffering, thereby rendering meaningless the lives of the disabled; and (ii) curing disability (if possible) is not worth the costs or social changes required.

The disregarding model advocates dismissing or disregarding persons with disabilities or, at best, socially excluding them. Under the disregarding model, persons with disabilities are defined on the basis of their condition. They have various defects, and thus they fall outside the standard giving rise to human dignity. As a result, they are not granted human dignity.

Public authorities have no obligations whatsoever toward persons with disabilities, so public policymaking need not address disability. If there were public policies in the field of disability, they would be intended to protect society from the (financial or moral) damage caused by persons with disabilities. Accordingly, disregarding model advocates consider that it makes no sense to deal with non-discrimination regarding persons with disabilities, since their disabilities are regarded as a source of suffering, both for the disabled and for society as a whole.

Although the disregarding model can be traced back to the classical world, some of its models remain in place, upheld by some twentieth-century tragic experiences (like Nazi Germany). Even now, in the twenty-first century, we can feel its presence.

The COVID-19 pandemic has evidenced that the disregarding model is out there, still present, and that it can openly and boldly project itself beyond disability, affecting the elderly. In fact, this approach to disability might have never disappeared. The notion of human dignity stems from an ability-based or skills-oriented human model that relies on individuals' contribution to society. The clearest expression of the disregarding model is the social utility or social worth criterion, stated in many associations' and national and international committees' documents when setting the priorities to allocate health-related resources.

Regarding transhumanism and its impact on disability, it is worth mentioning a transhumanist claim shared by other schools of thought. The claim refers to the effort and cost of building a society where persons with disabilities had equal opportunities as anyone else (Buchanan, Brock, Daniels and Wikler 2000).

Limiting a right on the basis of its excessive costs is an argument for which there is no room in the context of rights, unless it is proven that the mentioned cost is unbearably harmful for other rights. At this point what is really relevant is not the cost itself, but the impact on the right. Economy is a tool which, as such, shall be at the service of rights and not the other way around.

A given right can be restricted based on its cost only if such cost entails nonfulfillment of other rights at stake. The use of an argument based on an unreasonable cost shall be examined with great care, and it shall be even deemed as lacking proper justification when this cost does not entail a real and blatant nonfulfillment of third parties' human rights. In other words, there is no room for an argument that takes into account the cost with no regard to the context of rights. Its use, as an admissible argument when it comes to rights, requires to be tied to these (in terms of expressing a limitation set on the rights of others).

On Cyborgs and Enhancements

Keep in mind that improving living conditions is not a solely transhumanist ideal. It is shared by almost all philosophical movements. Mankind has always been concerned with human enhancement, including salient humanist thinkers like Pico della Mirandola, Bacon, Rousseau, Condorcet, Kant, Ortega y Gasset, or Hannah Arendt.

Human enhancement can also be found within the persons with disabilities' discourse, regarding both situation and condition, alongside the notions of support, assistance, and the fight against barriers. The struggle against disability-based discrimination has given rise to a support system founded on both material and human resources. Material resources include basic tools, such as walking sticks, as well as more sophisticated devices, e.g., wheelchairs, bionic arms, or chips. Indeed, the concept of "cyborg," commonly used in transhumanist scholarly works, is not foreign to disability.

Currently, there are some really famous cyborgs. Neil Harbisson is best known for having an antenna fixed to his skull to "hear" colors. Moon Ribas wears seismic sensors in her feet. Chris Dancy has 11 sensors implanted throughout his body monitoring his vital signs 24 hours a day. In 2002, Kevin Warwick (scientific, engineer and college professor) implanted a device into his arm connecting his nervous system to the Internet, allowing him to control an electric wheelchair and an intelligent artificial hand. In 2016, Switzerland held the First Cyborg Olympics (the event was officially called *Cybathlon*), where cyborg athletes with bionic implants across the world competed against each other.

However, let us stop here for a moment: are these news related in any way to the world of disability? The answer will depend on our understanding of the concept of "cyborg" and "disability."

We have already discussed the meaning of "persons with disabilities" and the existing models or approaches thereto. The concept of "cyborg" was coined by Manfred E. Clynes (Austrian scientist and musician) and Nathan S. Kline (US scientist) referring to an enhanced human being. Cyborg comes from "*cyb*ernetic *org*anism," meaning a human being with an electronic device permanently implanted in his or her body.

Nevertheless, not everybody construes "cyborg" in the same way. Some argue that the device need not be electronic. Others claim that there are temporary cyborgs (human beings with devices temporarily implanted or fixed to their body parts).

Cyborgs are nothing new. Yet again, the history of cyborgs depends on our understanding of this notion. If cyborgs are necessarily tied to electronic devices, their history begins with science fiction literature in the late nineteenth century and, mostly, over the twentieth century. However, if cyborgs do not need to have electronic devices to qualify as such, the concept of cyborg could be traced back to the year 1550 B.C. and ancient Egyptian prosthetics.

Prosthetics brings us closer to the disability framework. In fact, a broad notion of cyborg could encompass the merge of a human being and his or her wheelchair or, even with any technological assistance, aid or support (in 2014, the US Supreme Court ruled that cell phones were part of the human anatomy in *Riley v. California*). Yet again, there are some outstanding examples in the media.

In 2014, 10 years after he was paralyzed due to a car accident, Nathan Copeland (at 28 years old) became the first human being to recover a "natural" sense of touch using a mind-controlled robotic arm. Les Baugh is a double amputee who lost both arms in the 1970s and now has two mind-controlled robotic arms. Hugh Herr, a biophysics professor, has two bionic limbs; he is best known for his achievements in biomechanical engineering and for being BionX's founder (according to the corporate website, a company focused on improving human imperfection).

In a nutshell, "cyborg" refers to the merge of human and technology, thus covering both persons with and without disabilities – as the anthropologist Amber Case points out: "We are all cyborgs now."

In any event, cyborgs are controversial. We probably deem some of the previous examples acceptable without further concerns, whereas some others could be objectionable. We tend to consider acceptable or unobjectionable that the enhancements be aimed at correcting social disadvantages.

It is a well-known issue for bioethics: the clash between therapy and enhancement (i.e., between therapeutical and enhancement treatment) or between curative medicine and perfective or augmentative medicine. This clash has major implications, since it allows to draw the boundary between what is considered admissible and what is not. In November 2018, He Jiankui, a Chinese scientist, was all over the news worldwide after claiming to have created two genetically edited babies. More specifically, he had modified the gene called CCR5, used by HIV as the gateway to attack our immune system. As criticism mounted, He Jiankui responded that he had performed a therapeutic intervention.

The boundary between enhancement and therapy is blurry. What some call enhancement is most certainly considered therapy by others. A medical product for children's ADHD (therapy) can also be used to perform better on a test (enhancement). Treatments that are objectionable at first end up being accepted if applied to persons with disabilities. For instance, we are fine with giving growth hormones to short people, but giving them to tall persons would be frowned upon. We agree that individuals with depression should take antidepressants, but otherwise we are not fine with the use of antidepressant drugs.

Enhancements raise concerns, which become more serious if persons with disabilities are involved. As noted above, the distinction between enhancement and therapy is unclear, but the first problem is that we do not know if there is such a thing as "objective enhancements."

Some claim that enhancing longevity (Singer 2002) or trying to lead the best life (Savulescu 2002) are objective enhancements. It is not a stretch to question that longevity or leading the best life are absolute or objectively good, arguing that the very notion of enhancement is subjective by definition and that it can vary depending on context and culture.

Let us think of former NBA player Yao Ming. He was 2.29 meters tall (7′6″), which clearly gave him a competitive advantage for professional basketball, thus allowing him to make a lot of money. Nonetheless, there is no doubt that this is a matter of context. Being that tall can help you, but it can also be a problem. See, for example, the so-called *Club de los altos y altas en Chile* (a Chilean institution were tall men and women share their problems).

In the field of disability, in 2002, Sharon Duchesneau and Candace McCullough announced their decision to have a child via artificial insemination; so far, so good.

But they were both deaf, and they decided that their children should be too. As is well-known, members of the deaf community consider themselves a cultural minority defined by their use of sign language. In fact, members of the deaf community define themselves as persons using sign language to communicate.

Even admitting that there are "objective enhancements," these can be discriminatory and unreasonable (Lema 2015). Nicholas Agar discusses parents' ability to alter their children's skin color through genetic engineering (Agar 2004). They can either (i) darken the children's skin, to mitigate ozone layer depletion effects, or (ii) lighten the skin, in order to prevent racial discrimination in a racist society. Agar supports the first option, but rejects the latter on grounds of discrimination, adding that it is not admissible to make a person's worth depend on his or her skin color.

There are similar examples in the field of disability. Imagine that losing our lower limb puts us in a wheelchair forcing us to face numerous barriers, but we can get a prosthetic leg choosing between two options. On the one hand, we can pick a prosthetic limb that works exactly as our missing leg but without a leg's appearance. On the other, we can choose a less functional prosthetic limb that looks exactly like a leg. Some would not hesitate to pick the first option based on its functionality, but others might consider that such strange looking limb would stigmatize the person using it and therefore would pick the second option. The latter choice evidences empathy and understanding toward the discriminatory treatment suffered by many persons with disabilities.

Overlooking this potential discrimination regarding human enhancements could lead us to accept discriminatory and exclusionary decisions affecting life choices and persons. Savulescu is in favor of leading the best life, i.e., maximizing well-being. He put forward the "Principle of Procreative Beneficence," according to which parents should pick among the possible children those who are expected to have the best life. Otherwise, they are immoral parents (Savulescu 2002).

Admittedly, many enhancements are performed on oneself, so that they only involve an individual deciding on his or her own body exercising individual autonomy. However, this neither makes this issue less complex nor excludes the possibility of discrimination.

Self-evidently, one of the largest ethical concerns regarding these enhancement technologies relates to securing equal opportunity and, therefore, to the possibility of widening the gap between rich and poor. There is no doubt that this gap particularly affects persons with disabilities.

Lee Silver aptly examined this issue. He predicts a future defined by the appearance of reprogenetics (i.e., the fusion of reproductive technologies and genetics), where prospective parents can choose which genes their children would receive (Silver 2007). Over time, society segregates into "Naturals" and "GenRich." In Silver's world, it is not a stretch to imagine that vulnerable persons would be "Naturals" (i.e., the underprivileged class) and that their rights would hardly be fulfilled.

We could also flip the argument and use technology to ensure equality. Technology is often portrayed as an instrument to end disabilities. Emerging technologies fuel this line of reasoning by disregarding persons with disabilities' actual well-being and experiences.

Aside from scholarly works, this is, surprisingly, the most widely spread approach to the use of technology in the field of disability. Technology is seen as an opportunity, as the chance of persons with disabilities to level the playing field. Certain technology supporters somehow rely on this idea. In fact, there are claims that a society of enhanced human beings would provide greater chances for redistribution. Still, this use of technology could be discriminatory for persons with disabilities in terms of stigmatization and devaluation.

Condition, Situation, Enhancements, and Human Rights

Considering the definition of persons with disabilities and its two axes, condition and situation, we notice how the discussion on human enhancement focuses more on the conditional side than on situational aspects. Most likely, this is why the persons with disabilities' movement, for its most part, reject these approaches (Romañach 2009) and rightly so, as discussed below.

Keep in mind that persons with disabilities also have a conditional dimension, i.e., they are also condition, not only situation, and they do not only face environmental and social barriers. Thus, the application of emerging technologies to disability should not be dismissed outright. In fact, some argue that using technology for human enhancement interventions is a moral imperative.

The enhancement discourse does not take into account that human life has always been a struggle against the limits of nature and social conventions (Nussbaum 2002) and that "(...) freedom consists in a persisting negotiation with the given" (Sandel 2007). Some enhancements threaten the moral development of personality. Many thinkers claim that moral development entails significant efforts and sacrifices that can disappear as a result of technological enhancement. These technologies have the ability of considerably lessening our autonomy and accountability and thus our own moral agency. J. Habermas draws upon the notion of human dignity, i.e., what actually allows us to recognize one another as members of the same species, claiming that there is no justification for any intervention that could alter such recognition (Habermas 2003).

At this point, however, we can hardly (i) determine the features and traits identifying human beings and making us distinct and therefore (ii) claim that those features and traits remain in place throughout the history of mankind. During our lives, we might suffer radical changes that can impact our personal identity. But these changes do not call into question that we remain part of the human species. So, why would artificial enhancements have this ability? Why would they allow to challenge our human nature?

Within this context, we often speak of "normalcy" or rely on standards. Accordingly, some argue that the limit for human enhancement is the standard, i.e., enhancements cannot provide humans with attributes or abilities that go beyond what is normal. But this is, indeed, one of the issues regarding the notion of enhancement: that the starting point be a standard that is blurred and arguably has any moral value. Moreover, “normalcy” or “the standard” are conflictive ideas in the field of disability.

When we seek the best for our loved ones, we often try to drastically alter environmental factors (we try that our children develop skills and our interventions relate to what they eat, their training, sports, etc.), but yet we question interventions related to other aspects (e.g., genetics). This also applies to prosthetic limbs and other devices used to improve or correct any defects. If we define human nature relying on both the conditional and situational axes, we should accept any conditional interventions just like we admit interventions to improve situational aspects (mostly those related to environmental factors).

Despite this, enhancements pose several challenges when applied to persons with disabilities. Within this context, enhancement advocates tend to consider persons with disabilities as ill, where the enhancements qualify as a therapeutic treatment from the medical model’s perspective (Hall 2020). Persons with disabilities are underestimated to the point where some argue that their lives are meaningless. Many of these claims are based on a model human being or standard that can exclude others and be the basis for discrimination. This standard is tied to perfection. It conveys the idea that as we move apart from it, life has a lesser meaning or happiness becomes harder to achieve. From this perspective, disability is portrayed as a source of imperfection or suffering and, at best, as a natural disadvantage to be removed.

Assuming that conditional diversity is an issue to be eliminated, enhancement technology promises to end it, disregarding what is most discriminatory toward persons with disabilities: situation. There is a quote from Rousseau’s *Emile, or On Education* that perfectly summarizes this: “What madness for a fleeting being like man always to look far into a future which comes so rarely and to neglect the present of which he is sure!” (Rousseau 2011).

We should prioritize overcoming barriers over fighting these so-called defects. Let us recall the parents from Agar’s example. They should be entitled to choose their children’s skin color to protect them from ozone layer depletion effects, but only for this reason, since lightening their skin to avoid discrimination in a racist society would be unacceptable and would make no sense. The point being that, aside from the parents’ choice – either darkening or lightening their children’s skin – the appropriate strategy from a human rights approach would be to (i) prevent ozone depletion and (ii) eradicate racism. The above example where a person needed a prosthetic leg to avoid the barriers attached to being in a wheelchair elicits the following question: why are we not implementing a strategy aimed at removing barriers altogether? Regarding technology, this could translate into prioritizing accessibility policies.

Assuming a rights-based approach, removing barriers should prevail over (i) trying to eliminate defects and (ii) human enhancement programs. Enhancement technology advocates should be aware that persons with disabilities do not “suffer” disability, but rather *suffer from* discrimination. The whole human enhancement framework must involve social and political action, not genetic and biological interventions (Hall 2016).

Original humanism, which remains in place, and transhumanism share this negative outlook on disability, as a conditional deficiency stemming from human nature. Both original humanists and transhumanists agree on human beings' distinctiveness, and they believe that disability exemplifies human imperfection. Both humanist and transhumanist discourses rely on "normalcy" or "the standard" (embodied in model persons and model societies) as a central reference.

Humanism was founded on a consideration of human nature that became increasingly more distinct as it reached higher degrees of excellence, resulting from social constructs. In a way, the ultimate expression of human dignity occurs when these degrees of excellence are achieved. Transhumanism simply takes another step with respect to humanism (despite some transhumanists' strong criticism of enlightened humanism). The transhumanist starting point is what humanists considered the "excellent" human being, which is now deemed imperfect (just like original humanists found that persons with disabilities were defective), thus seeking to enhance it (striving for human excellence) through technology. The expression of dignity occurs when these excellence levels are reached.

For humanists, human excellence was the aim (based on an ability-based or skills-oriented human model), whereas according to transhumanists, such ideal of human excellence is the starting point. This is why humanists considered disabilities as conditional defects to be cured and transhumanists deem them unacceptable. According to the humanist discourse, disabilities simply show human imperfection. Transhumanists agree, although apparently adding that the lives of the "disabled" are meaningless.

Looking at it from the disability models, humanists' approach to disability is based on the medical model. In contrast, transhumanists regard disability from the disregarding model.

As discussed above, we claim that humanism and transhumanism are closely connected. This might seem an overstatement. Nevertheless, if we examine children's education (which constitutes a defining aspect of philosophical movements), both humanists and transhumanists clearly consider and describe disability as a conditional defect or deficiency, although this consideration is even more intense within the transhumanist discourse (Alexandre 2017).

Therefore, we must support the so-called humanism of diversity or diversity-based humanism. It is in line with the social model, and it emerged with the UN Convention on the Rights of Persons with Disabilities.

Diversity-based humanism is not at odds with technology. Enhancements raise greater concerns if justified on the basis of (i) a discriminatory and stigmatizing model human being or (ii) a discriminating social structure lacking equal opportunities. The very word "enhancement" contributes to all this. Therefore, in order to neutralize the concerns reasonably raised from the disability framework, we must implement a change in society, normalizing it by eliminating discrimination against persons with disabilities. Accordingly, enhancements will not fall within a specific approach to persons with disabilities, but within the general framework under which the freedom to get enhancements is justified if they (i) are available to everyone; (ii) do not affect individual rights of human beings; and (iii) do not undermine diversity (which is both a reality and an essential asset that cannot be waived or left aside).

In this vein, technological development cannot favor a social structure undervaluing disabilities. If technological development is aimed at remedying personal defects overlooking social shortcomings (environment, habits, behaviors, contexts, etc.), such technological development is most certainly in conflict with human rights.

The ethical framework governing the rights theory in this field must be critical regarding the idea of human dignity in the manner it has been created and specified from modernity and Enlightenment. An idea of human dignity based on a conception of human beings and society that, in a certain sense, is also present at the origin of the search for machines and devices that achieve perfection. The human model of the Enlightenment was supported by some patterns based on perfection and a social model that, at times, imposed an exclusive lifestyle. Human dignity has been built highlighting what we might conceive as an abstract dimension of the person, leaving aside the contextual or location dimension. It has been built based on patterns of "normalcy" that historically have coincided with those of the powerful (Barranco 2011). Thus, we must eliminate certain ideal models we project on the concept of human dignity that make the situation in which some people are found unworthy and different (Cuenca Gómez 2015). Equally, we must value human diversity and consider it as one of the great wealth of our societies.

Human rights provide the ethical, legal, and political framework for contemporary societies. They are the guiding principles that should govern technological development. This human rights discourse gives rise to three general guiding statements applicable to emerging technologies from a rights-based approach: (i) scientific and technological advancements should serve humanity's well-being, sustainable development, world peace, and the protection and conservation of biodiversity; (ii) human interests and well-being prevail over society's or science's exclusive purposes, including respect for human dignity and human rights protection (e.g., the rights to life and moral integrity, privacy, free will or self-determination); and (iii) securing human dignity entails protecting human diversity, the environment, the biosphere, and biodiversity (including a sustainable use of resources and a fair allocation of the profit) (De Asís 2015).

The basis for diversity-based humanism governed by human rights must be H. Jonas' categorical imperative: "Act in such a manner that the effects of your actions are compatible with the permanence of genuine human life on Earth" (Jonas 1995). Diversity-based humanism should also be open to technological and scientific progress, which requires not fully dismissing transhumanism.

Transhumanists (i) disregard very significant matters regarding human enhancement and (ii) overestimate what can be accomplished through technological innovation. Therefore, their arguments are not convincing. However, there is nothing intrinsically wrong with trying that future generations' lives be longer and more fulfilling in terms of talent and accomplishments (Dworkin 2000).

It is for human beings and human beings only to categorize human nature, i.e., to define what should be considered "human," and must be done within an ethical, pluralistic, diversity-friendly, and nature-oriented framework. This categorization of human nature should take into account several circumstances, aspects, and traits making up our identity, such as death, dependency, pain, suffering, effort, imperfection, or limitations, which are often the clearest expression of human diversity and freedom.

Neuroscience and “Neurointerventions”: Ethical and Legal Issues

66

Bernadette McSherry

Contents

Abstract

“Neuroscience” is the modern term for the study of the brain and the nervous system, but attempting to explain what the brain does has occupied scholars for centuries. While neuroscience can aid in providing information about how the brain works, understanding how things can go wrong in brain function and how to address perceived impairments remain elusive. This chapter considers some of the ethical issues raised by the burgeoning industry of “neurointerventions,” with a focus on brain-computer interfaces and brain stimulation and modification techniques. It argues that legal regulation may go some way toward alleviating ethical concerns about consent and autonomy. However, putting too much faith in neurointerventions as a cure for mental impairments ignores the importance of the

Introduction

The brain is the most complex organ in the human body, both in structure and function. "Neuroscience" is a broad term used to describe the study of the brain and the nervous system, and substantial amounts of data have been and continue to be collected by neuroscientists to help understand what brains do. At the same time, new devices and technology are being developed to describe, stimulate, and manipulate brain activity.

In November 2019, for example, Elon Musk was reported as stating that the work of his neural-technology company, Neuralink, which is developing brain-computer interfaces, could "solve a lot of brain-related diseases" such as "autism, schizophrenia, memory loss" (Asher Hamilton, 2019). While issue could be taken with all these examples being considered "brain-related diseases," the idea that many "disorders" are, in the words of Thomas Insel (2013), "biological disorders involving brain circuits" is driving neuroscientific endeavors to understand and rectify perceived impairments.

This chapter considers some of the ethical and legal issues raised by the burgeoning industry of "neurointerventions," with a focus on brain-computer interfaces and brain stimulation and modification techniques.

The next section provides an overview of historical explanations of the brain as the source of certain impairments and how the development of a range of neurointerventions is part of an historical continuum. The chapter then examines the ethical issues associated with how best to conceptualize the continuing search for how to perfect the brain, before providing an overview of how the law has been and could be used to regulate the use of neurointerventions. The final section provides an overview of the drawbacks to focusing on neuroscience and neurointerventions to address perceived impairments.

The Allure of Neuroscience

Sabrina Ali et al. (2014: 1) refer to the "allure of neuroscience" and use the term "neuroenchantment" to describe the "sub-judicious fascination with brain science." This may in part explain the current focus on devices and technological interventions designed to enhance brain function as well as intracerebral manipulation to alleviate the symptoms of "biological disorders involving brain circuits" (Insel, 2013).

The US BRAIN Initiative, the European Union's Human Brain Project, and the Australian Brain Alliance are among some of the global initiatives that have invested more than US$7 billion into neuroscientific research (Carter, Walvisch & Haylock, 2019: 2).

However, the search for explanations of brain function, including in relation to consciousness, is nothing new. Neuroscience may be the modern term for the study of the brain and the nervous system but attempting to explain what the brain does has occupied scholars for centuries.

It is beyond the scope of this chapter to traverse the terrain of theories of mind. Suffice to say, it is doubtful whether there can ever be a single theory of brain function because the human brain is such an integrated, evolved structure. As Anne Churchland and Larry Abbott (2016: 349) point out:

> Given the range of phenomena studied in neuroscience, demanding unity of viewpoint, methodology or depth of understanding, even in a single system, seems both unrealistic and counterproductive.

In addition, Allen J Frances and Thomas Widiger (2012) argue that neuroscience can aid in providing information about how the "normal" brain works, but understanding how things can go wrong in brain function remains elusive.

The history of brain modification and stimulation techniques – from surgery to implanting technological devices into the brain – indicates that in relation to treating (perceived) brain disorders, neurointerventions are nothing new. The following provides a brief overview of some of these techniques.

Brain Surgery

There is some evidence that trepanation or trephining, whereby a hole is surgically made into a skull, occurred in prehistoric times (O'Callaghan & Carroll, 1982: 1). The anatomist Paul Broca (1867), for example, detailed an instance of this procedure having been performed on the head of a living human after analyzing a prehistoric skull found in the Cuzco district of Peru. Why trepanation occurred is subject to debate. Mark O'Callaghan and Douglas Carroll (1982: 4) suggest, however, that one rationale was to relieve the symptoms of perceived mental impairments. (The term "mental impairments" rather than other terminology is used throughout this chapter in line with its use in Article 1 of the United Nations *Convention on the Rights of Persons with Disabilities*).

O'Callaghan and Carroll (1982:4) point to a section in a twelfth century manuscript, which was possibly written by Ruggerio Frugardi of Palermo, that refers to the skull being perforated to allow matter to escape as a remedy for "mania and melancholy."

While neurosurgery to treat brain injuries such as skull fractures or to treat headaches, epilepsy, or neurological disorders such as Parkinson's disease has become an accepted part of medical practice, "psychosurgery" to treat mental impairments has been fraught with controversy.

In 1891, Gottlieb Burckhardt published an account of his experiments with "cortical extirpation," the severing of connections between certain brain areas, to treat his patients diagnosed with incurable psychoses who resided at a Swiss institution for the insane. O'Callaghan and Carroll (1982: 4–5) point out this was probably the first modern account of psychosurgery, but it took some time before these experiments were replicated given that while one patient's symptoms were relieved, one patient died and another developed epilepsy after the operation.

The Portuguese neurologist Egas Moniz (1935) wrote about a technique termed a prefrontal leucotomy as a method of treating severe mental impairments. This technique involved making incisions along the junction between white and gray matter that destroyed connections between the prefrontal region and its connections with the limbic system. Walter Freeman and James Watts (1947) subsequently developed a standardized method which became known as a lobotomy. James Caruso and Jason Sheehan (2017) detail the subsequent falling out between Freeman and Watts about surgical techniques and how poor outcomes for patients along with various social factors led to the decline of surgery that destroyed brain tissue to modulate neural function.

Electroconvulsive Therapy

During the 1930s, the Italian neurologist Ugo Cerletti and his assistant Lucio Bini began inducing seizures in animals by the administration of electrical stimulus via electrodes applied to parts of the head. In 1938, they used electroconvulsive therapy (ECT) for the first time on a person experiencing delusions (Cerletti & Bini, 1938). Clinicians subsequently found that ECT was associated with beneficial results for people diagnosed with severe depression (Metastasio & Dodwell, 2013).

Early ECT practice involved administration without muscle relaxants and anesthesia, leading in some instances to severe physical injuries because of full-scale convulsions. The use of ECT has been associated with memory loss (Fraser et al., 2008), but electrode placement and parameters can now be modified to decrease this likelihood.

How ECT works is yet to be determined. Changes to brain function appear to evolve over time which is why it is generally administered two or three times a week over several weeks. As with psychosurgery, the use of ECT has proved to be controversial, and its use is generally regulated through legislation (McSherry 2019).

Transcranial Magnetic Stimulation

Transcranial magnetic stimulation (TMS) is a noninvasive technique that involves creating a powerful electrical current via an electromagnetic coil resting on the scalp (Trimble & George, 2010: 320ff). The current creates a strong but brief magnetic field that can pass through the skull and soft tissue. This current can be pulsed in a way that stimulates neural activity in regions near the surface of the brain. Similarly, transcranial direct current stimulation (tDCS) involves running a low-level electric current through regions of the brain by placing pairs of electrodes on the scalp to change neural activity in the brain region underneath.

In the early 1900s, psychiatrists Adrian Pollacsek and Berthold Beer patented an electromagnetic device as a treatment for depression and neuroses (Beer, 1902), but it wasn't until the mid-1980s that experimentation with TMS became a focus for clinical research (Barker et al., 1985). In 1995, an American psychiatrist, Mark S George, and colleagues began experimenting with repetitive TMS as a treatment for depression (George et al., 1995). After several subsequent studies, the US Food and Drug Administration (FDA) agency approved repetitive TMS as a treatment for depression (Trimble & George, 2010: 323).

There is some research suggesting that repetitive TMS "transiently disrupt [s] neuronal activity for periods exceeding stimulation duration" (Horvath et al., 2011: 137). As with ECT, it is unclear how TMS works and which specific prefrontal or other brain location should be targeted by it.

Deep Brain Stimulation

The use of intracerebral electrodes to stimulate the brain (commonly referred to a deep brain stimulation) may be used to probe or modulate activity in neural circuits (Lozano & Lipsman, 2013). The electrodes are implanted unilaterally or bilaterally deep inside the brain and electrical currents are delivered from a pulse generator implanted in the abdomen or under the collarbone through leads into the electrodes.

While DBS was first approved in the 1990s as a treatment for tremors associated with Parkinson's disease, more recently it has been used to alleviate symptoms of severe depression (Holtzheimer & Mayberg, 2011) and obsessive-compulsive disorder (Figee et al., 2013).

Because DBS is invasive, it has more risks associated with it than TMS. On the other hand, it has fewer risks than ablative neurosurgery which is irreversible (Glannon, 2009). The stimulator for DBS can always be turned off and the implanted electrodes removed.

Walter Glannon (2009: 290) provides an overview of studies that have indicated significant risks with DBS being used to treat "psychiatric disorders," including inducing hypomania which was resolved after adjustment of the stimulator. He argues (2009: 290) that because any adverse effects are "not predictable from one patient to the next," extra care must be taken with weighing up potential beneficial and harmful effects.

Implantable Brain-Computer Interfaces

The rationale for brain-computer interfaces (BCI) has focused on enabling people with extensive paralysis or brain injury to control a limited range of motor functions. BCI involve direct connections between the brain and a computer, with bidirectional feedback between the user and the computer producing physical changes in the brain that can restore a degree of motion control (Hochberg & Cochrane, 2013). The feedback can allow the person to translate intentions into physical actions.

For example, a team led by researchers at the University of Melbourne has developed a device called a Stentrode which can be inserted into a vein that sits just under the skull and which transmits brain signals to a computer which then translates them into onscreen command (Oxley et al., 2020).

Elon Musk and his company Neuralink appear to be working toward increasing the number of electrode threads in their implantable device. In one published white paper (2019), they report building ultra-fine polymer probes, a neurosurgical robot, and custom high-density electronics and experimentation with inserting the flexible electrode threads into rats at a rate of six threads per minute. They refer to the aim of using such technology for individuals with spinal cord injury to operate a digital mouse and keyboard and conclude by stating that "[h]igh-bandwidth neural interfaces should enable a variety of novel therapeutic possibilities." In August 2020, Musk reportedly showed reporters a pig whom he claimed had the device surgically planted in her skull (Wong, 2020) and, in February 2021, stated that the device had been planted in a monkey's skull such that the monkey was able to play video games through thought processes (Shead, 2021).

Ethical Issues

Ethics may be defined in different ways, but generally the term refers to an internal assessment of how to behave in the face of conflicting choices. Codes of ethics consist of rules defined by a particular body such as a professional organization that may assist in ethical decision-making.

Any technique associated with controlling behavior requires careful ethical scrutiny. The (over)use of pharmaceuticals springs to mind here. There is an argument that because pharmaceuticals are readily available and open to a wider range of potential misuse than neurointerventions, their use should draw the focus of ethical debate. Over 40 years ago, Samuel Shuman stated (1977: 96):

> Even if we leave aside behaviour modification drugs dispensed by physicians untrained in psychiatry, prescribed for young children by so-called child psychiatrists, and prescribed by pediatricians, it is clear that the number reachable by drugs is enormously greater than the number reachable by surgery.

Nevertheless, techniques targeting the brain raise unique ethical issues because of the psychological or even spiritual significance that is associated with this organ. The notion of the inviolability of the brain may very well be a social construct (Delgado, 1969), but perceptions of the close connection between the brain and mind are such that issues of autonomy and consent need to be carefully navigated. These issues are explored further below.

It is worth noting here, however, that ethical questions also arise as to who has access to and who controls new technology. There may, for example, be an ethical argument for the design of neurointerventions such as implantable brain devices to be publicly shared on the basis that neuroenchantment could be alleviated if information concerning the design of neurointerventions were publicly available.

The concept of open-design relates to the free distribution and permitted modification of products and systems. In a review of current research on open-design, Étienne Boisseau, Jean-François Omhover, and Carole Bouchard (2018) provide the example of RepRap, an amateur-designed 3D printing machine, the documentation for which is freely available on the Internet and which has led to hundreds of customized derivatives. The open-design of brain-computer interfaces, for example, might enable sufficient public scrutiny to address issues with how these devices work.

Another ethical issue relates to possible third-party control of particular neurointerventions. Laurie Pycroft et al. (2016) raise the possibility of “brainjacking,” whereby a third party could control brain implants. They refer to demonstrations of unauthorized control of implantable medical devices such as insulin pumps and implantable cardiac defibrillators to argue that neurosecurity is a valid concern. These matters require further exploration, but the ensuing sections focus on two key ethical issues of consent and autonomy.

Consent

One way of lessening concerns about past controversies and adverse consequences concerning neurointerventions such as psychosurgery and ECT is to ensure that individuals consent to their application. Experimental neurointerventions, as with other novel interventions, are often tried by individuals who have exhausted other forms of accepted or established treatments. They may be desperate to find an alternative “solution” for their impairment. This may indicate that extra caution may need to be taken in relation to obtaining informed consent.

International human rights law provides guidance as to the importance of consent in relation to novel interventions or treatments. Article 15(1) of the United Nations *Convention of the Rights of Persons with Disabilities* (CRPD) sets out that “no one shall be subjected without his or her free consent to medical or scientific experimentation” and Article 25(d) requires “health professionals to provide care of the same quality to persons with disabilities as to others, including on the basis of free and informed consent.”

However, a presumption persists that individuals with certain mental impairments cannot make decisions for themselves because they lack a complete understanding of the nature of their impairment. Sometimes, psychiatrists refer to such a lack of understanding as a lack of “insight.” While this is a rather vague term, insight is generally taken to refer to a person’s self-awareness that there is a problem or an illness and an understanding of its cause or meaning (Strauss, 1995: 528). A lack of insight or “poor” insight has been associated with severe mental impairments such as schizophrenia and bipolar disorder, and while theories of the cause of this have ranged from denial to a preference for psychosis, there is a growing literature suggesting that damage to frontal lobe areas may lead to an unawareness of the impairment. This is sometimes referred to as anosognosia (Pia & Tamietto, 2006; Lehrer & Lorenz, 2014).

If a person is unaware, or only partially aware, that he or she has a mental impairment, an argument could be made that consent should be irrelevant; it is in that person's best interests to go ahead with treatment with the aim of improving insight. It could be said that the ends justify the means in relation to the application of neurointerventions that may benefit the individual concerned regardless of whether or not that person consents.

There are, however, criticisms of this approach. The presumption that those with severe mental impairments cannot make decisions concerning their health is one that is subject to debate, particularly in light of recent developments in human rights law. Article 12(2) of the CRPD recognizes that "persons with disabilities enjoy legal capacity on an equal basis with others in all aspects of life." The exercise of legal capacity reflects a person's right to make decisions and have them upheld by others, as well as the right to stop others making decisions on that person's behalf (McSherry, 2015). Whether Article 12 should be interpreted as preventing substitute decision-making or permitting it in certain circumstances has been a focus of debate by many scholars and clinicians in recent years.

Anna Bruce (2014: 160) notes that the issue of whether health interventions could ever be performed without the recipient's consent was one of the most controversial issues during the negotiations of the CRPD. The Committee on the CRPD (2014: para 41) subsequently addressed the issue of informed consent under Article 25 as follows:

> The right to enjoyment of the highest attainable standard of health (art. 25) includes the right to health care on the basis of free and informed consent. States parties have an obligation to require all health and medical professionals (including psychiatric professionals) to obtain the free and informed consent of persons with disabilities prior to any treatment. In conjunction with the right to legal capacity on an equal basis with others, States parties have an obligation not to permit substitute decision-makers to provide consent on behalf of persons with disabilities. All health and medical personnel should ensure appropriate consultation that directly engages the person with disabilities. They should also ensure, to the best of their ability, that assistants or support persons do not substitute or have undue influence over the decisions of persons with disabilities.

This paragraph suggests that all people, irrespective of their ability or disability, must give individual consent for medical treatment and that substituted decision-making will always be regarded as incompatible with the CRPD. This is reflected in Peter Bartlett's observation (2012: 753) that "the CRPD appears to proceed on the basis that disability cannot be used as a factor in determining whether compulsion may be imposed."

Because of the potential adverse consequences of neurointerventions, it appears preferable to follow the CRPD Committee's interpretation of the relevant Articles in the CRPD and ensure that any neurointerventions only proceed with the person's full and informed consent.

Autonomy

Interfering with the brain raises complex questions about autonomous and responsible agency. Any intervention in the structure or functioning of the brain may affect mental processes, some of which may affect a person's sense of self.

Walter Glannon (2020: 93) points out that autonomy encompasses being able to reflect on the mental states that lead to certain actions, with autonomous agency being "synonymous with the self-regulating process and being in control of one's behaviour." He argues that neurointerventions such as deep brain stimulation can be viewed as supporting a person's ability to be in control of their own behavior by modulating activity in neural circuits. On this basis, neurointerventions may be seen as enhancing or restoring autonomy. Glannon writes (2009: 291) in relation to one case study where a 62-year-old man underwent DBS and experienced a temporary episode of mania, alongside modification of symptoms of Parkinson's disease, that "[f]or the patient, an alteration of his self resulting in less suffering is preferable to a self with more suffering."

With deep brain stimulation and implantable brain-computer interfaces, autonomous agency could be enhanced if the individual had the ability to switch the stimulus on and off or control the frequency to regulate mood, for example (Nicolaidis, 2005). In some ways, the ethical issues that arise here echo those relating to pharmacological interventions for mental impairments. Is the person's sense of self the same with or without drug treatment? A narrative study of a 30-year-old man who received deep brain stimulation for severe obsessive-compulsive disorder points to the need for supports to navigate the uncertainty and intense distress that may accompany a changed identity (Bosanac et al., 2018). Ultimately, it should be up to each individual to weigh up the potential benefits and harms of the suggested neurointervention and sufficient support provided should it be used.

There is an added issue in relation to autonomy of third-party involvement. If someone can manipulate a device implanted in a person's brain, what does that mean for that person's responsibility for ensuing (criminal) actions? Any manipulation might be enough to amount to a mitigating factor in assessing responsibility, but the prospect of "brain-jacking" raises novel ethical issues. In this regard, the Senate of Chile has reportedly approved in its draft constitutional reform the protection of mental integrity in relation to the development of neurotechnologies (Vallat, 2020).

It is beyond the scope of this chapter to consider philosophical issues relating to the prospect of the replacement of neural circuits with a completely artificial human brain, suffice to say that neurointerventions raise ethical issues that require careful consideration beyond the clinical sphere.

Legal Issues

Ethical concerns may be alleviated to some extent by regulation. This can occur through the development of guidelines or the enactment of legislation. In relation to guidelines, for example, with TMS, a group of authorities met in 1996 and agreed on safety and ethical guidelines for clinical and laboratory settings (Wassermann, 1998). These were updated at a consensus conference in 2008 (Rossi et al., 2009).

However, complying with guidelines, policies, codes of practice, and the like is usually voluntary and dependent upon agreement among practitioners. Legislation can be a potent force for compliance because it can provide for both oversight and penalties for not complying with statutory requirements.

Given the history of psychosurgery, there is already legislation in operation in certain jurisdictions to either ban or regulate its use. The use of DBS, for example, is regulated under mental health legislation in certain jurisdictions, while all forms of "psychosurgery" are banned in others.

The inconsistent approach to regulation of psychosurgery is borne out, for example, in Australia in which six states and two territories each has its own mental health legislation. In the Northern Territory, Section 58(2) of the *Mental Health and Related Services Act 1998* states that "[a] person must not perform psychosurgery on another person" and includes within the definition of the term "the use of intracerebral electrodes to stimulate a person's brain" (Section 58(1)). Queensland has a similar provision with a penalty of up to 2 years' imprisonment (Section 241 of the *Mental Health Act 2016*).

In comparison, in South Australia, under Section 43 of the *Mental Health Act 2009,* a Psychiatric Treatment Panel can authorize "neurosurgery" even where the person has not consented, whereas in Victoria, under Section 102 of the *Mental Health Act 2014,* the Mental Health Tribunal can authorize neurosurgery, but only where the person has given informed consent in writing.

It is probably unrealistic to believe there can be consistency in approach to regulating neurointerventions across jurisdictions, but where there is regulation, at least some oversight by an independent body seems appropriate. Legislative provisions can also set out the requirements for full and informed consent and penalties for breaches.

The legislation relating to DBS generally relates to its use in public hospitals. Many experimental neurointerventions are being developed by private companies such as Neuralink which poses a dilemma for lawmakers. Consumer laws can regulate the sale and use of technological devices, but the lack of independent oversight of experimentation by private companies raises concerns about potential harms, even of noninvasive techniques. Adrian Carter, Jamie Walvisch, and Patrick Haylock (2019:2) point out that commercial versions of transcranial direct current stimulation devices that promise enhanced memory and concentration "are not without risk and may cause itching, burns, and headaches and impaired mood, memory and cognition."

Given the history of neurointerventions from trepanation to brain-computer interfaces, it is unlikely that experimentation can be completely banned. It does seem apposite, however, for enough checks and balances to be put in place to mitigate potential harms and unintended consequences.

Beyond Neuroscience and Neurointerventions

Even if ethical and legal issues relating to neurointerventions are addressed, Stephen Morse (2014: 243) has pointed out that “neuroscience has many things to say, but not nearly as much as people would hope.”

Kenneth Kendler (2005: 434–5) has argued that the search for “big, simple explanations” in psychiatry has been doomed to failure:

> We have hunted for big, simple neuropathological explanations for psychiatric disorders and have not found them. We have hunted for big, simple neurochemical explanations for psychiatric disorders and have not found them. We have hunted for big, simple genetic explanations for psychiatric disorders and have not found them.

Even Thomas Insel, the former head of the US National Institute of Mental Health has been quoted as questioning the value of focusing on neuroscience and neurointerventions alone (Rogers, 2017: 1):

> I spent 13 years at NIMH really pushing on the neuroscience and genetics of mental disorders, and when I look back on that I realize that while I think I succeeded at getting lots of really cool papers published by cool scientists at fairly large costs – I think $20 billion – I don’t think we moved the needs in reducing suicide, reducing hospitalizations, improving recovery for the tens of millions of people who have mental illness.

The World Health Organization’s Mental Health Action Plan (2013-2020: 10) acknowledges the need to take “social determinants” into account as one of its key objectives in responding to mental health conditions. Social determinants that are associated with good or poor mental health include the person’s social and cultural characteristics, environmental events, and neighborhood, as well as economic and demographic factors (Lund et al., 2018: 357). Socioeconomic disadvantage, for example, has been classified as a key risk factor associated with experiencing “mental disorders” (World Health Organization, 2014).

Further, there is some indication that public acceptance of neurobiological explanations of mental impairments may increase perceptions that people diagnosed with mental impairments are abnormal and dangerous, thereby increasing discrimination (Lebowitz & Ahn, 2014). Sven Speerforck et al. (2014) found that beliefs about “brain disease” were related to desires for social distance from those diagnosed with major depression or schizophrenia.

The emphasis on mental impairments being caused by something wrong in the brain may also undermine people’s belief in their ability to recover. Erlend P Kvaale et al. (2013) found that biogenetic explanations for mental impairments may induce prognostic pessimism. “Self-stigma” whereby a person internalizes stigmatizing beliefs about mental impairments may also be associated with a failure to seek help (Royal Commission into Victoria’s Mental Health System, 2019: 215).

There are therefore serious consequences associated with studying the brain as a biological machine in isolation from social factors. This adds impetus to ensuring neurointerventions are carefully regulated.

Conclusion

It is simplistic to assume that mental impairments stem solely from misfiring neural circuitry in the brain or that brain-computer interfaces will "solve a lot of brain-related diseases." Henry Louis Mencken (1920: 158) pointed out that "[e]xplanations exist; they have existed for all time; there is always a well-known solution to every human problem—neat, plausible, and wrong."

As history indicates, researchers and clinicians will persist in developing and using technological neurointerventions. For example, despite a complete ban on DBS in certain jurisdictions, it continues to be offered in others. Private companies such as Neuralink are unlikely to give up the search for ways to perfect the brain. While attempts to address mental impairments through some form of neurointervention have long existed, in the past century, there has been a move away from irreversible techniques that destroy brain tissue to reversible invasive and noninvasive techniques.

No matter what further technological developments occur, the main message is that the ethical and legal issues relating to neurointerventions must continue to be discussed and addressed.

Genetic Engineering and Disability: Ethical Dilemmas in the Verge of Artificial Evolution

67

Francisco J. Bariffi

Contents

Abstract

We are at the cusp of a new revolution shifting from natural to artificial evolution. Recent breakthroughs in genetic engineering opened up a world of new opportunities. The CRISPR-Cas9 gene-editing method allows high-precision cutting and editing of genetic information in the DNA of any living organism, including humans. We have used technology to master nature – now we are about to use technology to change human nature, that has both individual as well as intergenerational applications.

The need for a new regulatory framework is evident. Existing human rights treaties – including biomedical treaties – do not give clear guidance. They were meant to prohibit and control certain things happening to humans but not to deal with humans becoming potentially superhumans or even nonhumans.

Any new policy conversation and the eventual regulatory regime must be based on the voices of those most directly concerned. Persons with disabilities are among the first to be directly concerned. This chapter explores the basics of the genetic revolution, the crucial ethical implications, and the impact on the rights and dignity of persons with disabilities.

Keywords

Genome editing · CRISPR Cas9 · Bioethics · Disability · Human rights · Disease prevention · Embryonic manipulation · Human evolution

> In our time we are moving out of a world we never made. . .into, for better or for worse, a world of our own creation. (Robert L. Sinsheimer, CALTECH, December 1966)

Introduction

"A crack in creation," (Doudna and Sternberg 2018) "Hacking the code of life," (Carrey 2019) "The gene machine," (Rochman 2018) "Hacking Darwin," (Metzel 2019) "Modern Prometheus," (Kozubek 2018) "Editing mankind," (Davis 2020) and "Babies by design" (Green 2008) all these powerful titles belong to top-selling books dealing with perhaps the most transcendental breakthrough in genetic engineering to date: the CRISPR-Cas9 gene-editing method which allows high-precision cutting and editing of genetic information in the DNA of any living organism, including humans.

The CRISPR-Cas9 gene-editing method has opened the door to a world of new opportunities. Fast, precise, easy, and cheap, this novel method has proven to be applicable in both the somatic and the germline cells of living organisms. As Doudna and Sternberg (2018) attest, "now that science has a cheap and easy-to-use genetic editing tool at its fingertips, we could soon see the rise of precise genetic therapies that usher in a new era of medicine."[1]

Beyond its potential uses for basic research, somatic and germline interventions, genome editing may also be used for genetic "enhancement" – for changes beyond mere restoration or protection of health. As Metzel (2019) states, "at the dawn of the genetics evolution, DNA is becoming as readable, writable and hackable as our information technology."[2]

The notion of editing the genetic makeup of somatic cells – referred to as "gene therapy" – is not new, and some of its legal and ethical implications have already been addressed. However, the possibility of making heritable changes through germline genome editing shifts the conversation from individual-level concerns toward significantly more complex technical, social, and religious concerns

[2] Metzel (2019). op. cit.

regarding the appropriateness of this degree of intervention and how this may affect the acceptance of children born with disabilities (National Academies of Sciences, Engineering, and Medicine 2017, pp. 6–7).

Indeed, CRISP-Cas9 raises serious questions about whether the use of genetic technologies to tackle, and even eradicate, serious diseases and disabilities can be justified and, if so, under which circumstances. Unfettered use of ever-advancing genetic technologies may lead to societal intolerance of disability and genetic difference. Thus, it is necessary to anticipate misuse of genetic technologies and identify potential human rights at stake in order to provide guidelines for governmental regulation (De Paor and Blanck 2016).

As Shakespeare (2015) points out, to "fix" a genetic variation that causes a rare disease may seem an obvious act of beneficence. Nonetheless, such intervention assumes that there is a robust consensus regarding the boundaries between normal variation and disability. There is an urgent need to establish international guidelines and to hear the voices of people living with illness or impairment (Shakespeare 2015).

Genetics in a Nutshell

Since ancient times, humans have fantasized with the possibility to harness God's powers. In Greek mythology, Prometheus, the mankind creator, is punished by Zeus for stealing fire from the Gods and giving it to humanity, an act which enabled progress and civilization. Prometheus is also considered as the creator of science, and perhaps in the dilemma caused by his audacious sin underlies the first ever ethical questioning on the human ability to manipulate nature, including the risks represented by the appearance of Pandora holding the famous box.[3]

Besides the mythological component, in fact, humans have been crafting their ability to manipulate nature for millennia, including breeding of animals and plants. While the foundations of this "organism engineering" can be traced back to the early Phoenicians, it was not until Charles Darwin elaborated his groundbreaking theory "On the Origin of the Species" in 1859 that human understanding of natural and artificial evolution took a leap forward.

In 1864, the Austrian botanist Gregor Mendel, experimenting with plants discovered the patterns in hereditary information, which is passed down from generation to generation settling the building blocks for genetics. Some years later, Dutch botanist Hugo De Vries pushed Mendel's theories further, explaining why genetic differences, or variants, occur in the first place (*mutations*). The work of these three scientists combined to form a complete picture of species evolution (Kean 2013).

Nevertheless, breakthroughs in labs quickly acquired influenced beyond pure scientific endeavor, and in 1883, Francis Galton coined the term eugenics under the belief that selective breeding of human could improve the quality of world

---

[3] Kozubek (2018). op. cit.

population (Mukherjee 2017). The Nazi regime took this concept to terrifying extremes including the extermination of thousands of persons with disabilities, an atrocity that prompted the adoption of the first set of research ethics principles for human experimentation known as the Nuremberg Code (Annas and Grodin 1992).

The further discovery of DNA, and most importantly how it works and what it does, led scientists to explore ways to manipulate DNA in order to create new genetic combinations in a lab. In 1953, the protein-manufacturing process of genes was better understood when James Watson and Francis Crick famously discovered that DNA was shaped like a double helix (Watson and Gardner 2015). Furthermore, in the 1970s biochemists Paul Berg and David Jackson achieved the first DNA recombination which paved the way to gene cloning and gene sequencing.[4] Likewise, these breakthroughs allowed in the early 1990s the launch of the most important collective scientific project of all times, the Human Genome Project (HGP).

On June 26, 2000, the HGP announced they had successfully mapped the complete human genome revealing the common ancestry of our species, and much more astonishingly, how genetically close we are to Chimpanzees (98,6% shared genes) (Rutherford and Mukherjee 2018). In this respect, deciphering the human genetic code has unraveled several myths, perhaps the most important, that "as far as genetics is concerned, race does not exist."[5] Likewise, the understanding of how the genome works has helped discover the basis of fatal genetic illnesses (Ridley 2017).

Since the early 1980s, but most efficiently after the HGP mapped the human genome, genetics developed a new technique to fight illnesses named "gene-therapy." In essence, gene-therapy takes the genes the body needs to battle a particular disease and then introduces these genes into diseased cells, effectively stopping the disease.[6] In other words, gene-therapy "corrects or fixes" genetic variation causing diseases throw the genetic manipulation of the body in a living person.

Another development in genetics with huge impact in the genetic makeup of humans was the improvement, accuracy, and accessibility to genetic testing of embryos, especially in the last two decades.

Prenatal genetic testing (PGT) is an umbrella term that includes a number of tests performed on a fetus at varying stages of its development. PGT can be done in the first or second trimester of pregnancy, and they have evolved from invasive and risky techniques to a simple blood sample from the mother.[7] It can be completed in the

---

[4] "With DNA, as with words, the sequence carries the meaning, Dissolve DNA into its constituent bases, and it turns into a primordial four-letter alphabet soup." Mukherjee (2017). op. cit.

[5] Idem.

[6] Idem.

[7] Noninvasive prenatal tests (NIPT) can screen for trisomy 21 (Down syndrome) and other chromosomal abnormalities – as well as the sex of the baby – as early as 9 weeks of pregnancy, and with a high degree of accuracy. A few examples available in the market: MaterniT® 21 PLUS, screens for common trisomies (such as trisomy 21, Down syndrome), and can be customized to screen for more conditions (e.g., DiGeorge syndrome); MaterniT® GENOME reports on every chromosome; NACE® Noninvasive prenatal test.

form of screening that can inform expecting parents the chances that the fetus may have certain disorders or chromosomal anomalies.

Preimplantation genetics diagnosis (PGD) is a relatively new technology, first emerging in the 1990s. PGD permits the selection of embryos of a particular genotype prior to implantation in the womb of a woman; it is mostly used to avoid disorders of genetic origin (Knoppers et al. 2006). Two types of PGD are commonly used. The first is a DNA examination that can identify dominant or recessive genes leading to disease-causing mutations. This technology has been marked as a major breakthrough in reproductive therapies for couples who may be carriers of inherited diseases. The second kind of testing commonly performed on embryos before implantation reveals chromosomal abnormalities and can also reveal the sex of the embryo.[8]

Probably, the major breakthrough in genetics came with the discovery of a region of bacterial DNA known as CRISPR (clustered regularly interspaced short palindromic repeats), which can be utilized as a gene-editing tool. In 2012, Jennifer Doudna and Samuel Sternbeg published a groundbreaking paper demonstrating how the CRISPR-Cas9 gene-editing method could be applied to this end (Isaacson 2021). With CRISPR, scientists realized they could harness bacteria to track down and edit genes of our choosing. This has been identified as one of the fastest moving technologies in history with wild implications, such as the possibility of extinct species being revived, or animal genes being edited to grow human hearts and lungs for transplants.[9]

Genetics Through the Lens of Bioethics

Bioethical issues have been intensively discussed at all levels for several decades at the vertiginous rhythm of biomedical breakthroughs. By definition, bioethics is understood as the study of the implications for human beings, in particular human rights and dignity, of the developments of biomedicine. Therefore, bioethics pretend to bring a balance between human action encompassing biological and medical activities linked to advances in biological sciences techniques, and the respect of human rights standards.

Bioethical discussion has led to consensus toward the adoption of basic principles such as autonomy, integrity, identity, dignity, privacy, equity of access, consent, nondiscrimination, justice, and solidarity (Beauchamp and Childress 2019). Unlike other regions of the world, European governance has accomplished the only international legally binding framework to address bioethical challenges (Oviedo

Convention on Bioethics 1997 and the four Additional Protocols – from here on referred as OFC – Oviedo Framework Convention).[10]

The purpose of the OFC is to protect the dignity and identity of all human beings with regard to the application of biology and medicine. Consequently, while the OFC sets forth independent legal obligations, it has necessarily to be interpreted in light of other existing standards of human rights nature, namely, the European Convention on Human Rights (ECRH), and the Charter of Fundamental Rights of the European Union (CFREU) (Nawrot 2018). The inherent links between the OFC and the ECRH has allowed the European Court of Human Rights to address bioethical challenges in several cases.[11]

The systematic interpretation and application of the OFC in the last two decades has allowed European institutions to address ethical and legal challenges raised by developments in the biomedical field, such as biomedical research, human genetic testing and screening, cloning of human beings, xenotransplantation, transplantation of organs and tissues of human origin, and biobanks. Some of these issues have been enshrined in treaties, others in soft law instruments, others in working documents and white papers, and others in case law.[12]

While the OFC has been constantly trying to adapt to biomedical innovations, in recent years, the scope of bioethical issues has significantly expanded due to the development of emerging and converging technologies such as nanotechnology, biotechnology, and information and cognitive technologies (NBICs).[13] Legal and ethical discussions agree that these new and converging NBIC technologies might present challenges in a human rights framework, including areas such as privacy, safety, and autonomy (Van Est et al. 2014; Strand and Kaiser 2015).

In 2015, the Council of Europe (COE) organized an International Conference on "Emerging Technologies and Human Rights" aimed at identifying priority human rights challenges raised by emerging technologies and their convergence, while proposing interdisciplinary debate. The gathering concluded inter alia that science and technology have a growing impact on society and it should be dealt as a matter of priority; that convergence brings together the medical and nonmedical fields; and that current legal framework is inadequate to address issues that are constantly evolving.[14]

[13] The phrase "convergent technologies" refers to the synergistic combination of four major "NBIC" (nano-bio-info-cogno) provinces of science and technology, each of which is currently progressing at a rapid rate: (a) nanoscience and nanotechnology; (b) biotechnology and biomedicine, including genetic engineering; (c) information technology, including advanced computing and communications; (d) cognitive science, including cognitive neuroscience. Roco and Bainbridge (2002).

[14] Emerging Technologies and Human Rights, International Conference organized by the Committee on Bioethics (DH-BIO) of the Council of Europe under the auspices of the Belgian Chairmanship of the Committee of Ministers, 4–5 May 2015, Room 1, Palais de l'Europe, Strasbourg. Available at: https://www.coe.int/en/web/bioethics/emerging-technologies#{%2211067078%22:[1]}

In this respect, the Ratenau Report stresses that emerging technologies are seen to go beyond therapy and healthcare, blurring boundaries between medical/nonmedical applications, and between health/illness. The scenarios outlined are generally complex, uncertain, and likely to reach an unpredictable (for some aspects imaginable, for others unimaginable) benefit/risk balance with regard to individuals and society, present and future generations. That is why the question of safety (physical and mental integrity), individual privacy, and social acceptability is generally at the center of discussion, but there is another ethical challenge at stake: the challenge of justice.[15]

At the universal level, there are no binding instruments to address bioethics and genetics, but there are three universal declarations on bioethics and human rights, adopted at the heart of UNESCO.[16] As the lead UN agency in bioethics, UNESCO has been promoting universal bioethical norms and principles, and assisted countries in the translation of those principles to concrete policy outcomes for their citizens.

First, and the most important, is the Universal Declaration on the Human Genome and Human Rights (UDHGHR) of 1997.[17] Art. 1 states that "the human genome underlies the fundamental unity of all members of the human family, as well as the recognition of their inherent dignity and diversity. In a symbolic sense, it is the heritage of humanity." This fundamental statement enshrines the three core pillars, essential in any ethical analysis of genetic development, i.e., dignity, diversity, and heritage. Art. 2 indicates that "dignity makes it imperative not to reduce individuals to their genetic characteristics and to respect their uniqueness and diversity." Art.3 clarifies that "human genome, which by its nature evolves, is subject to mutations. It contains potentialities that are expressed differently according to each individual's natural and social environment, including the individual's state of health, living conditions, nutrition and education." Art.10 proclaims that "no research or research applications concerning the human genome, in particular in the fields of biology, genetics and medicine, should prevail over respect for the human rights, fundamental freedoms and human dignity of individuals or, where applicable, of groups of people." Additionally, the UDHGHR also asserts that the "human genome in its natural state shall not give rise to financial gains" (art. 4), ensures the "free and informed consent of the person concerned" (art. 5), prohibits "discrimination based on genetic characteristics" (art. 6), and protects the confidentiality of the "genetic data associated with an identifiable person" (art. 7). Lastly, art. 24 calls for the "identification of practices that could be contrary to human dignity, such as germline interventions."

Second, the Universal Declaration on Bioethics and Human Rights (UDBHR) of 2005 sheds light on the proposed balance between individual rights and science

---

[15] Van Est et al. (2014). op. cit.

[16] https://en.unesco.org/themes/ethics-science-and-technology/bioethics

[17] The Universal Declaration on the Human Genome and Human Rights was adopted unanimously and by acclamation at UNESCO's 29th General Conference on 11 November 1997. The following year, the United Nations General Assembly endorsed the Declaration.

referenced in the UDHGHR (Conti 2017). In essence, the UDBHR expands and clarifies the scope of the three foundational pillars enshrined in the UDHGHR. In relation to dignity, art.3 attests that the "interests and welfare of the individual should have priority over the sole interest of science or society," and art.4 declares that the direct and indirect benefits to "individuals should be maximized and any possible harm to such individuals should be minimized." In relation to diversity, art. 13 recognizes that the "importance of cultural diversity and pluralism should be given due regard." In relation to heritage, art. 16 proclaims that "the impact of life sciences on future generations, including on their genetic constitution, should be given due regard," and art. 15 that "due regard is to be given to the interconnection between human beings and other forms of life, to the importance of appropriate access and utilization of biological and genetic resources, to respect for traditional knowledge and to the role of human beings in the protection of the environment, the biosphere and biodiversity."

Lastly, the International Declaration on Human Genetic Data (IDHGD), of 2003, aims to ensure the respect of human dignity and protection of human rights and fundamental freedoms in the collection, processing, use, and storage of human genetic data, of human proteomic data, and of the biological samples. Two fundamental principles relevant to the ethics of gene editing are recognized. On the one hand, each individual has a characteristic genetic makeup, which is part of the person's identity (art. 3). On the other hand, human genetic data have a special status because they can be predictive of genetic predispositions concerning individuals, because they may have a significant impact on the family, including offspring, extending over generations, and in some instances on the whole group to which the person concerned belongs, and because they may have cultural significance for persons or groups (art. 4).

The bioethical implications of the CRISPR-Cas9 gene-editing method are unimaginably vast. In simple terms, this breakthrough allows us to modify, at will, the human genome – a powerful tool for determining our future as a species. Until now, humans have evolved through natural selection, with only some help from external interventions, such as assistive reproductive technologies, but hereditary genome editing with the current level of precision and availability of genetic information may signal a whole new epoch of artificial evolution (AE).

Gene editing in the human germline forces us to step into a very complex zone of the legal and ethical debate, i.e., the "status of the human embryo." Establishing the moral and legal status of the human embryo has been a challenge for researchers, lawmakers, and the international community throughout the past decades (Steinbock 2011). The question of when life begins, and when it begins to receive protection from the law, is contentious and is often influenced by deeply held religious or cultural beliefs. If the bioethical debate over prenatal genetic testing was already extremely controversial, now with these gene editing possibilities it has been pushed beyond its own limits (testing-editing-fixing seems now to be the trilogy covering the whole package).

For this reason, in 2015 an International Summit on Human Gene Editing was convened to explore the many questions surrounding the use of gene-editing tools in humans. In his opening remarks, the chair of the Summit expressed, “we are here as part of a historical process that dates from Darwin and Mendel‘s work in the 19th century. We are taking on a heavy responsibility for our society because we understand that we could be on the cusp of a new era in human history.” The Summit concluded inter alia that genome editing in early embryos or germline cells should not be used for pregnancy.[18]

The same year, the Committee on Bioethics of the Council of Europe released a formal statement emphasizing that – the application of genome editing technologies to human gametes or embryos raises many ethical, social, and safety issues, particularly from any modification of the human genome which could be passed on to future generations. Accordingly, the Committee called to examine the ethical and legal challenges raised by these emerging genome-editing technologies, in light of the principles laid down in the Oviedo Convention on Human Rights and Biomedicine.[19]

Similarly, Jennifer Doudna, Nobel Prize recipient in Chemistry 2020, has repeatedly called to take a prudent path forward (Doudna 2015). Other expert groups have recently published official statements urging caution when using genome editing on gametes or early embryos (The Hinxton Group 2015; National Institute of Health 2015; Progress Educational Trust and Genetic Alliance UK 2017; Mathews et al. 2015).

In 2018, the scientific community was shocked when a Chinese scientist claimed to have created the world’s first genetically edited babies. The researcher, He Jiankui from the Southern University of Science and Technology in Shenzhen, said he had altered embryos for seven couples during fertility treatments, resulting in one pregnancy so far. He said his goal was not to cure or prevent an inherited disease but to try to bestow a trait that few people naturally have: an ability to resist possible future infection with HIV (The Guardian 2018). If corroborated, this trial will be the first known act of human germline genome editing. More recently, a Russian biologist has communicated his desire to create more genome-edited babies (Cyranoski 2019).

These events have accelerated the discussion on the use of genome-editing technologies in humans. The ethical wall built by bioethics in the 1970s to block any heritable modifications of DNA, the “germline wall,” seems to be collapsing. The next wall, apparently still standing, is the wall between disease prevention and individual enhancement (Evans 2018), but further debate is imperative as the transition from somatic genetics (gene-therapy) to germline genetics (genome-editing) is already underway.

Accordingly, CRISPR germline gene editing can be implemented to “edit/fix” so-called “genetic diseases.” Determining the genetic problems that can be subject to this kind of intervention requires ethical consensus. While editing genetic variations

[19] DH-BIO/INF (2015) 13, FINAL, Council of Europe, Strasbourg, 2 December 2015.

that cause cystic fibrosis, Huntington's disease, or hemophilia, for example, may be less controversial, the prospective application of genome editing to other variations that cause deafness, Down syndrome, or achondroplasia, for instance, risk raising the bioethical stakes to unimaginable domains and dilemmas.

The use of gene editing in the human germline is as revolutionary and perilous as was control of fire by early humans. The fire certainly allowed *Homo erectus* to keep warm and cook food, but later on in the evolutionary process it was also used to create deadly weapons that have killed billions of humans up to these days. The Prometheus story is as vivid as ever, and humanity seems to be stepping on top of the slippery slope. Has the Chinese scientist opened a Pandora's box?

Genetics, Bioethics, and Disability Rights

The debate over the impact of emerging technologies, and more specifically the one dealing with gene editing of human germline, transcends the classic domains of general human rights to impact significantly on specific groups' rights recognition. While, the bioethical collapsing wall surrounding "eugenics" poses a threat to the general human rights discourse, it becomes particularly challenging in the context of disability rights (Quinn et al. 2016). Over a decade ago (2006), the United Nations approved the Convention on the Rights of Persons with Disabilities (CRPD) which adopted the so-called "social model of disability."(Quinn 2009–2010; Bantekas et al. 2018; Stein 2007) This transcendental legal body is considered as the greatest motor for the paradigm shift from the medical to a social model of disability, and it has been able to establish, as binding obligations, a series of legal standards to eliminate systematic discrimination that persons with disabilities face on their daily life.

In this delicate context, genetic technologies provide a new lens through which we can perceive disability. The ability to prevent a disease or a disability, not only in adulthood but also at the prenatal stage, both challenges traditional and existing conceptions of disability and threatens the human and civil rights of those with current and future disabilities.[20]

Only a handful of academics have tackled these issues. Some view these new technologies as a noncontroversial means of ameliorating or eradicating unwanted impairments (Malek 2010; Savulescu et al. 2016; Harris 2000), while others view these developments as a real threat to the rights of persons with disabilities, as they are concerned with potential discrimination, violations of privacy, and informed consent as well as an erosion of the concept of personhood.[21]

The rapid advance of genetic science has resurrected the specter of eugenics emerging from discriminatory use of genome editing. Indeed, genome editing may facilitate new eugenics of personal choice in health care and reproduction, whereby

[21] De Paor and Blanck (2016). op. cit.; Benston (2016). op. cit.; Wolbring and Diep (2016); Conti (2017). op. cit.

humans dictate their own "disability-free" evolution individually and throughout future generations.[22]

Even among disability rights activists and individuals with disabilities, there are diverse points of view. Some fully support potential medical cures, including gene therapy; others focus solely on the removal of social barriers, and others still champion a balance between medical and social interventions.[23] Shakespeare (2013) offers the reassurance that "medical cure or therapy is not incompatible with social change and civil rights: rather than seeing these as alternative strategies, it is possible to see them as complementary." (Shakespeare 2013).

As Benston (2016) points out, "it is hardly fanciful, to consider the counter-intuitive uses to which CRISPR/Cas9 may be put as a method of trait engineering potentially capable of addressing disability in a precise, efficient, and relatively affordable manner. Our continuing debate about whether—and, if so, how—CRISPR should be used and regulated must consider a spectrum of therapeutic approaches running from intentional reduction of disability, to non-interference, to the intentional induction of disability."[24]

Persons with disabilities have long been subject to eugenic practices, including concealment, marginalization, institutionalization, and medical experimentation (Bariffi 2018; Barnes 1997; Abberley 1987). Both theist beliefs and technological development have resulted in a harsh fate for persons with disabilities throughout history (Garland 1995; Stiker 1999). While theists' influence in ethics and law has been gradually decreasing, technological development is clearly on the rise. Therefore, the fears and mistrust of the disability community toward this new therapeutic "impairment fix scenario" are deeply justified. The discourse around genetic editing predominantly adheres to a medical model of the body, disablement, and the "cure sentiment."

Therefore, how we conceptualize disability, human rights, and genetic technologies like human germline engineering and the CRISPR method will frame the regulatory measures we believe are appropriate. Views favoring broad intervention generally argue that such intervention is protected under the right to health and, more specifically, under the right of the prospective child to live above a predetermined reasonable threshold. This view also considers the corresponding duties of potential parents prior to their children's conception.[25] Views favoring restricted intervention generally argue that crucial bioethical issues are involved, and therefore such intervention should be framed under universal (UNESCO universal soft law regime), regional (Oviedo Framework Convention), and domestic bioethical standards which strike a fair balance between biomedical developments and human dignity.[26] Those who are more reserved also advocate for the upholding of universal and regional

human rights standards as stipulated by the UN-CRPD, EU nondiscrimination directives, and domestic nondiscrimination acts – all of which promote human diversity, nondiscriminatory practices, and ultimately, a right to a disability.[27]

It is necessary to establish a holistic and comprehensive approach which accounts for the views and concerns of all relevant stakeholders, with special consideration of voices from the disability community. Compartmentalized legal approaches hamper effective public engagement. In this complex and instable balance between progress and respect for human dignity, we must add a new element of consideration, namely "*human diversity.*" A recent report by the National Academy of Sciences concluded that the distinction between disease and enhancement is hopelessly muddled (National Academies of Sciences, Engineering, and Medicine 2017, pp. 191–192). Therefore, if genetics is to advance irredeemable toward enhancement, the first social group to suffer this consequence will be persons with disabilities. A debate and legal scrutiny about the impact of this scientific development is therefore mandatory.

Framing the Ethical Dilemmas

Concisely, the ethical dilemmas arising from the current development of genetic engineering and disability at embryonic stage (CRISPR germline gene-editing method)[28] can be divided into two main domains, i.e., reproductive genetic disease prevention (RGDP) and reproductive genetic enhancement (RGE). Ethical implications in these two domains seem, at first glance, quite distinguishable. RGDP is about fixing or correcting traits considered as abnormal or undesirable, while RGE is about enhancing or improving "normal" traits. Under this perspective, advancement in the domain of RGDP appears to be ethically justified while advancement in the domain of RGE appears to be ethically unjustified, or at least dubious. As indicated above, under the current state of the art, boundaries between these two domains have become blurry and, probably, undistinguishable.

Reproductive Genetic Disease Prevention

RGDP has evolved at the rhythm of assisted human reproduction (AHR) technologies. In fact, until AHR was possible, RGDP was very limited. Nevertheless, the development of both reproductive and genetic technologies in the last two decades has been exponential.[29]

---

[27] Benston (2016). op. cit. p. 12–14; Conti (2017). op. cit. pp. 5–9.

[28] As indicated above, CRISPR gene-editing method can be used to edit and correct genetic traits in both germline and somatic cells. Germline intervention is carried out in the embryonic stage, while somatic intervention can be carried out in the body or a living person, for example, by gene-therapy. For the purpose of this chapter, somatic intervention will not be addressed.

[29] Metzel predicts that IVF will soon be adopted by the mainstream, surpassing sex as humanity's primary method of reproduction by around 2045. Metzel (2019). op. cit.

Current technology allows us to screen and map the genome of a human embryo. In plain terms, it is like getting a detailed blueprint of how that human will look like. That blueprint can also tell us if that human is likely to have genetic disorders. Such technologies include prenatal or preimplantation genetic diagnosis or screenings (PGD-PGT).

The ethical issues raised by prenatal and preimplantation diagnosis differ as the former involves an embryo gestating in a woman's womb; the latter involves an embryo (most commonly several embryos) fertilized and kept in vitro (IVF).[30] However, the ethical issues raised in relation to disability rights are actually the same. Both prenatal and preimplantation diagnosis raise two fundamental ethical dilemmas related to disability rights, i.e., what does "genetic disorder" actually include, and what to do if diagnosis reveals a genetic disorder.

In relation to what does "genetic disorder" actually include, there seems to be general understanding that it refers to genetic variations (mutations) causing diseases and/or disabling traits. It can be a mutation in a single gene (monogenic) or multiple genes (polygenic) or by a chromosomal abnormality. However, the notion of genetic disorder is far from being precise or accurate in terms of science. A genetic disorder is therefore a subset of genetic conditions that give rise to a wide range of characteristics (Nuffield Council on Bioethics 2018). A similar approach can be found in domestic legislations allowing for the interruption of pregnancy when the fetus is a carrier of a so-called "malformation."[31] Coined at the heart of the medical model, the notion of disorder or abnormality has been historically presented, as a scientific truth, when in fact, it is an ambiguous social concept that, most too often, relates abnormality with social undesirability.

The notion of genetic disorder is complex from both biological and social point of view, especially when it is associated with the notion of disease. As a benchmark, it could be argued that a genetic disorder causes a disease when it manifests in ways that significantly affect quality and length of life.[32] Accordingly, for biology a genetic disorder in order to cause disease must manifest beyond the genetic makeup. This is acknowledged in genetics with the distinction between the genotype-phenotype proposed by W. Johannsen in 1911 to make clear the difference between

---

[30] This has direct implications in relation to existing laws dealing with interruption of pregnancy. While practice differ considerably from country to country, it appears like legislations are more restrictive in allowing discarding embryos gestating in a mother's womb than discarding embryos fertilized in vitro. Jurisdictions allowing the interruption of pregnancy within the first trimester actually do no distinguish between prenatal and preimplantation testing.

[31] This concept has evolved in recent legislations recognizing the right of the woman to interrupt pregnancy. After the first trimester, interruption is also allowed when "the fetus carries a congenital disorder incompatible with extra uterine life." E.g., Chilean Law 21.030 of 2017; Spanish Organic Law 2/2010.

[32] The notion of quality and length of life also raises substantial ethical issues when used as criteria for the regulation of "assisted dying," or "medical rationing." Bagenstos (2020), Chen and Mcnamara (2020).

an organism's heredity and what that heredity produces.[33] Additionally, modern biology adheres to the notion of "extended phenotype" first proposed by R. Dawkins in 1982 arguing that an organism's phenotype extends beyond its own body to the natural or social environment (genetic environment).[34] Thus, embryonic genetic testing is an indicator of the organism's genotype but not necessarily its phenotype nor its extended phenotype. In other words, genetic testing may be an accurate indicator of genetic disorder in an embryo's DNA, but merely a probabilistic indicator of how that disorder would eventually turn into a disease.

This brings us directly to the social complexity of the notion of genetic disorder and its correlation to a genetic disease. The experience of disability has been inexorably associated throughout history with the notions of sin or sickness, giving rise to stigma and deep-rooted prejudices (Shakespeare 1994; Barnes and Mercer 1996). Goffman affirms that the Greeks "originated the term stigma to refer to bodily signs designated to expose something unusual and bad about the moral status of the signifier." (Goffman 1963) The rise of the medical model of disability somewhere in between the seventeenth and eighteen centuries reinforced the view of disability as a medical condition or abnormality. In contrast to the medical model, disability studies have long argued for understanding disability as a social construct (Stein 2007). The social model shifts the emphasis from individuals with impairments toward restricting environments or disabling barriers. Accordingly, under this perspective, disability is the result from the interaction between persons with impairments and attitudinal and environmental barriers that hinder their full and effective participation in society on an equal basis with others.[35] This has two major ethical/legal consequences. On the one hand, disability cannot be defined by the individual's impairment, and, on the other hand, the impairment defines the individual's identity and pride. Thus, impairment cannot be associated with abnormality nor with disease, nor it can be considered as intrinsically and/or socially negative or undesirable.

A century ago, the mathematician Karl Pearson coined the discipline of mathematical statistics basing his research mainly in genetics. His controversial theory of biometrical school for inheritance was later used as scientific source by eugenics proponents. As explained in a recent book by Pearl and Mackenzie, Pearson's view was misleading as he failed to acknowledge the adequate distinction and the logical relationship between causation and correlation. Causation indicates that a relationship is one of cause and effect, while correlation implies a connection of sorts between two variables, but nothing more (Pearl and Mackenzie 2018). Acknowledging that data alone can mislead when causality is neglected, these authors developed a process to look beyond the initial observation data called the Ladder

---

[33] The Online Mendelian Inheritance in Man (OMIM) is an Online Catalog of Human Genes and Genetic Disorders containing information on all known Mendelian disorders and over 15,000 genes. OMIM focuses on the relationship between phenotype and genotype. https://www.omim.org/

[34] Dawkins notes that when a biologist says something like, "the fruit fly has the red-eye gene," what they really mean is that the fly with this gene is more likely to have red eyes. Dawkins (2016).

[35] Paragraph e) Convention on the Rights of Persons with Disabilities (CRPD).

of Causation. Following this criteria, the authors assert that it is perfectly possible, in contradiction to received wisdom, to establish a logical process to determine when correlation implies a causation. Furthermore, they believe this method could also be programmed into computers so they can answer causal questions.

Purely statistical approaches to establish a logical process to determine when correlation implies a causation should be considered with great prudence, especially if they will eventually be part of Artificial Intelligence algorithms. However, it is important to understand the relationship between correlation and causation in genetic testing. Accordingly, a genetic disorder may have a correlation with a genetic disease but not necessarily a relationship of cause and effect. A genetic disease may have a correlation with a disabling impairment but not necessarily a relationship of cause and effect. Finally, a disabling impairment may have a correlation with social undesirability but not necessarily a relationship of cause and effect. For example, let us compare the genetic mutation causing cystic fibrosis with the genetic mutation causing Down syndrome. Both are genetic disorders, both are genetic diseases if we think of the impact on lifelong health,[36] and both could be considered as disabling impairments as they would be legally regarded as persons with disabilities. However, this does not necessarily mean that they are equally socially undesirable.[37] As noted by Scully, "there is no doubt that genetic factors are involved in illnesses and disabilities, but exactly how they interact with environmental and social factors is likely to differ for every condition. Critics of genetic determinism properly deplore the tendency to ignore non-genetic influences." (Scully 2004).

Human biological and social theorizing on the correlation/causation of the embryo's abnormal genetic makeup and the eventual manifestation of impairment or disease agree upon the need to understand both individual and social/environmental contexts. Therefore, if we cannot understand nor address impairment and disease in a vacuum abstraction, how can we talk about disease prevention in a stage where we only have one of the constituent elements? Some may argue that the current level of genetic engineering allows us to "predict" with great accuracy that a certain genetic disorder will eventually manifest in ways that significantly affect quality and length of life irrespective of any social or environmental context. If we take this pathway, we must agree upon a series of fundamental premises: First, there is no relationship of causation between a genetic disorder and the consideration of

---

[36] It should be noted that in the past Down syndrome was considered as a serious disease decreasing life expectancy up to 30 years and the presence of other chronic diseases like heart failure. However, advancement in medicine together with the inclusive paradigm shift of the social model has allowed to improve significantly the health and life of persons with Down syndrome.

[37] "Social undesirable" is used here as a way to think on human traits that we would not hesitate to consider as negative. This does not affect the rights and dignity of persons who actually experience an undesirable genetic disease, like cancer, or Alzheimer's. As Rebecca Cokley stresses out "there is still much desire to put those rendered undesirable in our place." Cokley R (2017). Please do not edit me out. The Washington Post. August 10, 2017. https://www.washingtonpost.com/opinions/if-we-start-editing-genes-people-like-me-might-not-exist/2017/08/10/e9adf206-7d27-11e7-a669-b400c5c7e1cc_story.html

such disorder as socially undesirable; second, the criteria of "significant affection to life length and quality" is not free from controversy in light of human rights standards; third, the criteria of "significant affection to life length and quality" cannot be determined solely in medical or scientific terms, but as result of a social consensus; fourth, there is no possible general rule to determine which genetic disorders are socially undesirable; and lastly, germline gene editing can only be carried out exceptionally in cases of disorders with robust social consensus.

In relation to what to do if diagnosis reveals a genetic disorder, practice shows that both PGD-PGT rely on the so-called "seek-and-destroy" approach, i.e., if a genetic disorder is detected, the embryo is discarded (Boardman 2020). While these technologies have been used in medical practice and AHR for over a decade now, they still pose substantial concerns in light of human rights as they ethically consider the disabling trait more significant than the life of the embryo or fetus (Parens and Asch 2003). Genetic disease prevention technologies raise irreconcilable worries in relation to disability rights and the CRPD itself.[38] We have already been able to see the impacts of the genomic revolution in countries such as Iceland who have almost completely eradicated Down syndrome.[39]

The seek and destroy approach could be labeled as contrary to human rights standards (discriminatory) in those jurisdictions allowing to discard only embryos with genetic disorders, but not in the case of those jurisdiction where the interruption of pregnancy is recognized as a woman's individual right without any further justification than her decision.[40] However, if we dig into disability rights, there is another prominent critique of selective reprogenetic practices known as the "expressivist objection." According to this approach, "selective reprogenetic practices not only prevent disabled people from coming into existence, but that their very availability—and the associated, and often clandestine, social pressures to use them both convey and perpetuate negative views about the particular disabling conditions they are targeted towards, and, by extension, people who currently live with those conditions." (Boardman 2020) Therefore, discarding only embryos with disabling traits could be labeled as contrary to disability human rights standards.

CRISPR germline gene-editing method entails a significant step forward in the domain of RGDP as it allows correcting or removing genetic disorders without the need to discard the human embryo – the seek-and-destroy approach shifts toward a seek-and-edit approach (Cavaliere 2018). At first glance, this major development may present CRISPR germline gene editing as undisputably beneficial and ethically justifiable. However, while overcoming the life-death dilemma of previous RGDP technologies, CRISPR germline gene-editing method creates an entirely new one,

---

[38] It should be noted, however, the most dominant view is that human rights protection starts at birth, and therefore, we would be here under a nonruled territory.

[39] Down syndrome in Iceland virtually disappearing, European Down Syndrome Association (EDSA), http://www.edsa.eu/down-syndrome-in-iceland-virtually-disappearing/

[40] Gender rights discussions differ on the approach to harmonize the right to autonomy and the right to access prenatal testing. Johnston et al. (2017), Morton (2015).

i.e., the inheritable impact of this human intervention (Howard et al. 2018). As stressed by Boardman "genome editing, by treating germ cells, not only eliminates genetic variations in the treated embryo, but also makes permanent and heritable changes to the germline that will invariably be transferred to offspring, consequently reducing the incidence of the genetic condition in the human gene pool in ways that currently used technologies are not capable of." (Boardman 2020).

In other words, CRISPR germline gene editing shifts the conversation from individual-level concerns toward significantly more complex technical, social, and religious concerns. Embryonic genetic editing moves away from exclusive individual human rights challenges to step into a new collective and intergenerational human rights scenario. For this reason, some scholars and policy statements acknowledge the need to implement a Human Rights Impact Assessment (HRIA), which captures concerns of public health and offers an opportunity to evaluate and anticipate the societal impact of germline gene editing iteratively as the technology advances, public sentiments evolve, and cultural contexts shift (Halpern et al. 2019). Additionally, given the strong support for the view that the human genome belongs to the world's cultural heritage, HRIA should also embrace cultural and environmental approaches.

The seek-and-edit approach of germline gene editing not only endures challenges to general human rights discourse, but also keeps open the dilemma toward disability rights and diversity. While germline gene editing does not eliminate the embryo per se*,* it does intervene in its genetic makeup in order to eliminate the disabling traits. Consequently, the rationale for expressivist objection argument remains fully applicable, with an additional ethical concern, i.e., the irreversible multiplying impact. For example, let us say we wish to prevent the birth of children with Down syndrome. If we use the seek-and-destroy approach, we would need to discard embryos during gestation or in vitro every time a test detects this genetic mutation, repeatedly. If we use the seek-and-edit approach, we would not need to discard the embryos, but due to the intervention in the germline, after a series of generations and the multiplying effect, that genetic mutation will eventually be eliminated from the human genome for good. This ethical concern is paramount in the discussion of another revolutionary CRISPR gene editing application in plant and animals, namely "gene drives." (Esvelt et al. 2014).

Reproductive Genetic Enhancement

Human germline editing might be used not to eradicate "abnormal" genetic variations per se, but to enhance or improve human traits. Gender, height, eyes, hair or skin color, and muscular structure – the possibilities are endless. The ethical implications of gene editing for enhancement individual traits are so profound that they may even threaten the fundamental building blocks of human rights values, especially considering that the boundaries between fixing and enhancing can easily become blurry. The recent reputed actions of the Chinese scientist leap over both the germline and the enhancement walls (The Guardian 2019).

Concerns about designer babies are very overblown. Complex traits are partly nature and nurture and require hundreds of interactions we do not understand. These complex traits, such as intelligence, are poor targets for technologies like CRISPR, as they are hard to locate within the genome. Currently, only single-cell-carrying diseases can be edited. Using PGD-PGT, cells are removed from IVF and tested for conditions and risks, but the screening can also detect other traits like sex and eye color. It could soon be possible to get a whole genome map at the PGD-PGT stage that could increase the potential for predicting complex traits such as intelligence. These predictions are called polygenic scores and are based on statistical correlations. While they have mostly stayed within academic research communities due to their relative inaccuracy, polygenic scoring may soon be available to the public in fertility clinics.

While still in its early stages, RGE is indeed a reality. If we can edit genes like sex, eyes color, or resistance to HIV, we need urgently to address the ethical implication for human rights in general, and more specifically, in relation to disability or gender rights.

Genetic enhancement was not possible until very recently, so there is limited criteria and only a handful controversial clinical trials. However, the ethical implications of human enhancement have been addressed by ethicists for several decades in the field of biomedicine and, more specifically, in the contentious distinction between biomedical therapy and biomedical enhancement (Harris 2011; Sandel 2009). Likewise, the discussion over transhumanism has resurrected the debate about the ethics over human enhancement in unimaginable ways (▶ Chap. 65, “Transhumanism and Disability”).

At first glance, it would look like genetic enhancement poses a whole set of different ethical dilemmas in relation to genetic disease prevention. Among the trenchant ethical questions of human enhancement are boundaries between therapy and enhancement; differences between normal and abnormal human traits; discrepancies between incremental and radical human enhancements; variations between absolute and relative human enhancements; differences between individual and substituted decision-making; or equality of opportunities in the access to and/or in the socioeconomic impact of human enhancement (Human Enhancement Study 2009).

As de Asís Roig points out, “enhancements raise concerns, which become more serious if persons with disabilities are involved (. . .) the distinction between enhancement and therapy is unclear, but the first problem is that we do not know if there is such a thing as “objective enhancements” (▶ Chap. 65, “Transhumanism and Disability”). Nevertheless, unlike in the context of RGDP, ethical concerns in the context of RGE cut both ways, namely enhancement shall neither be used to edit and eliminate “genetic disabling traits” nor be used to edit and include “genetic disabling traits.” Examples of the former include cases of parents willing to enhance their offspring with genetic mutations causing deafness (Wallis 2020) or dwarfism (Sanghavi 2006).

If we look closer at the core dilemmas underlying human germline enhancement and compare to those dealing with human germline disease prevention, they are actually the same. As indicated above, in RGDP the trenchant dilemmas are how to define “genetic disease” and what to do about it. In RGE, the trenchant dilemmas are how to define “genetic enhancement” and what to do about it. Within the boundaries of what is genetically normal, a genetic disease or genetic enhancement cannot be determined in abstract medical-moral terms, but as the result of social-environmental contexts based on robust societal consensus. Additionally, other indirect ethical questions such as the expressivist objection argument or the impact on equality and nondiscrimination apply equally in both RGDP and RGE (Nussbaum 2002).

Disability right is one among other ethical concerns raised by current and prospect applications of CRISPR germline gene-editing method (Wasserman 2002). However, disability rights reveal the bare bones complexity of genetic interventions in the human genome, and more precisely, the shortcomings of the philosophical attempts to outline general moral imperatives like the “Principle of Procreative Beneficence” (Savulescu 2002; Savulescu et al. 2015) or the safeguards of “informed consent.” (Pinker 2015) Conversely, disability rights show us the need to address germline genetic interventions in the human genome with prudence and a restrictive approach based on robust societal consensus.

Conclusion

We are at the cusp of a new revolution shifting from natural to artificial evolution. Recent breakthroughs in genetic engineering opened up a world of new opportunities. The CRISPR-Cas9 gene-editing method allows high-precision cutting and editing of genetic information in the DNA of any living organism, including humans.

Genetic technology is becoming more prevalent and will inevitably be used in mainstream health care practice. Very soon, when deciding on procreation, parents will face the dilemma of whether to let natural selection take its course or have their gametes or embryos genetically tested, edited, and eventually cleansed of genetic disorders.

While this technology is not yet regulated at domestic level and many of its applications are far from becoming a reality, there is a strong consensus among all relevant stakeholders that we should be having this discussion now. European tradition bears strong support for bioethical challenges, and the systematic interpretation and application of the Oviedo Framework Convention have allowed European institutions to address ethical and legal challenges raised by developments in the biomedical field. This new scenario poses new ethical challenges to the bioethical debate, especially regarding the implications for disability rights and human rights in general.

Germline genetic modification of human gametes or embryos will affect all cells of a resulting child and will be inherited by subsequent generations as part of the human gene pool. This impact is even greater if we use gene drive technologies. Extreme prudence is necessary when altering the human genome; thus, many questions and ethical issues must be assessed beforehand. Artificially altering the human genome will also likely have an environmental impact, and therefore valuable insights can be obtained from existing environmental protection frameworks.

Environmental law principles such as "sustainable development," "environmental impact assessment," or the "precautionary principle" may be of great relevance regarding this topic.

We have used technology to master nature – now we are about to use technology to change human nature. That has both individual as well as intergenerational applications. The need for a new regulatory framework is evident. Existing human rights treaties – including biomedical treaties – do not give clear guidance. They were meant to prohibit and control certain things happening to humans but not to deal with humans becoming potentially superhumans or even nonhumans.

Would it be possible that science could actually fix disabling impairments? Or instead, this new impairment-fix scenario could simply allow the rebirth of the medical model of disability and accordingly a shift backward on disability rights recognition and enjoyment? Will the future foresee the birth of a new human/ artificial category?

Any new policy conversation and the eventual regulatory regime must be based on the voices of those most directly concerned. Persons with disabilities are among the first to be directly concerned. These lesser-heard voices are likely to be absent unless conspicuous space is given to them now.

Crucial questions arise which will need to be dealt with both within and beyond the disability community. Is there a right to be disabled? Can we (parents) impose disability on our offspring? How extensive is the amplitude for prevention (option-duty)? Does the UN-CRPD enshrine particular obligations beyond existing bioethics instruments? What weight exactly is to be given to the collective voices of persons with disabilities in the process?

As we walk toward this transcendental human debate, we need to ensure the rights of persons with disabilities. This introductory chapter offers some basic fundamental premises to address CRISPR human germline interventions' prudence and a restrictive approach based on robust societal consensus while rejecting approaches based on general moral imperatives.

Power, Personhood, and Data-Driven Technologies in the Lives of Disabled People: The Rise of Profiling Technologies in Mental Health Settings

68

Piers Gooding

Contents

Abstract

This chapter examines the rise of biometric monitoring using AI and other automated decision systems in the disability and mental health context. It focuses on the use of "digital phenotyping" or "behavioral sensing" in settings as diverse as hospitals, community-based services, and homes, in criminal legal settings, and among direct-to-consumer products. The chapter surveys prominent critique of the impact of data-driven observation and surveillance for the general population, as well as the small but emerging literature on its effects on disabled people in particular. It explores the potential implications of biometric monitoring on individual dignity and personhood but expands the focus to collective concerns beyond an individualistic focus on the rights of data subjects. To reflect on these implications, the chapter brings together scholarship on algorithmic accountability, the Convention on the Rights of Persons with Disabilities, and Michel Foucault's "panopticism." The chapter makes the case for the active involvement of people with disabilities in the governance of automated profiling systems and the scientific discourse that drives them. Governance would encompass the

identification of harmful social consequences, as well as identifying benefits that may emerge and helping to adjudicate any societal trade-offs that may be required to achieve them.

Keywords

Artificial intelligence (AI) · Algorithmic accountability · Disability · Digital phenotyping · Machine learning · Mental health

Introduction

Some of the biggest ethical and legal debates on personhood in recent decades concern medical technologies designed to ameliorate disability and human impairment. Examples include prenatal screening for fetal chromosomal and genetic conditions and somatic cell gene therapy. “Disability” and “impairment” carry great normative significance in these debates. They remain entwined in conceptions of the person and in the practices, forms of governance, and scientific discourse that shape them. Automated and data-driven systems have started to extend and transform these concerns. Yet, according to Meredith Whitaker and colleagues, disability has been omitted from most discussions about artificial intelligence (“AI”) and other automated technologies (Whittaker et al., 2019). This chapter brings them to the fore.

It will focus on profiling technologies built on biometric data and automated decision systems. I will focus on the mental health context and the increasing experimentation with practices like “digital phenotyping” and “behavioral sensing” in psychiatry and psychology. Although scholars have articulated the implications of persistent observation and surveillance for the general population, including linking harms to privacy’s concern for defending individuality and personhood against the state and the market, this chapter will extend those concerns to the disability context, including asking what collective concerns may be raised and addressed beyond an individualistic focus on data subject rights (Viljoen, 2021). The chapter will seek to expand the examination of personhood and its uncertain future in the digital age by bringing together two strands of scholarship: one from law and technology, concerning “algorithmic accountability,” and the second from disability and law, concerning the Convention on the Rights of Persons with Disabilities (CRPD).

“Algorithmic accountability” has been promoted by some scholars to promote basic standards of algorithmic and technological transparency and auditing, but it also takes the opportunity to ask more fundamental questions like whether or not to use automated and digital systems in the first place in some circumstances and, if they are to be used, who should govern them (Pasquale, 2019). These issues are increasingly relevant following the COVID-19 pandemic, which has not only driven more of our lives online but has accelerated the digitization of various public services worldwide, including disability and mental healthcare services (Torous et al., 2020), and seen the expansion of private digital infrastructure throughout societies.

The CRPD, as is now well established, is premised on a rejection of the “view of persons with disabilities as objects of charity, medical treatment and social protection" (Arbour, 2006). The CRPD instead seeks to affirm them as "subjects of rights, able to claim those rights as active members of society" (Arbour, 2006). From this view, the idea of disability as one aspect of human diversity is affirmed by "respect for difference and acceptance of persons with disabilities as part of human diversity and humanity" (Degener, 2016). The CRPD sets standards for society where politics and law need to be fashioned around a complete, comprehensive vision of the human experience, of which disability is a natural part. Although the CRPD may appear at first glance to advance individualist justice claims, as per a common characterization of human rights, the CRPD has collective dimensions driven by a relational perspective on disability which views socioeconomic conditions as constitutive of disability itself.

To draw the threads of the CRPD and algorithmic accountability together, this chapter first articulates key terms to help frame the discussion. Defining "data concerning disability" is difficult, particularly given the rise of data that can be used as a proxy for a person's impairment or disability. To navigate this complexity, I will draw on key concepts from the European Union General Data Protection Regulation (GDPR) given its prominent place in contemporary data protection law (and notwithstanding critique of its relative merits). The CRPD provides an expansive, de facto definition of persons with disability that can also help reflect on how disability-related data might be conceptualized and, in turn, governed. The second section considers the expansion of profiling technologies and biometric data generation in the mental health context. It includes a range of examples, from direct-to-consumer products to largescale clinical and computational research for interventions in hospitals, community-based services, and criminal legal settings. The third section surveys critical engagement with these developments, exploring issues of justice and power and drawing on Michel Foucault's theorization of "panopticism." The final section seeks to move the discussion away from a focus on profiling technologies themselves and toward questions of who is benefiting and losing from their adoption. As with other chapters in this collection, I stress the active involvement of people with disabilities in governance, but I stress that this is particularly important in the context of automated and data-driven systems for exposing and addressing the potentially harmful social consequences of automation for all, including identifying the benefits that are possible and helping to adjudicate any societal trade-offs that may be required to achieve them.

A Note on Terminology: "Data Concerning Disability, Health, and Mental Health"

Finding clear terminology in areas of rapid technological change can be tricky. I will use "automated and data-driven systems" here to cover diverse technologies that use contemporary computer processing to analyze large amounts of data algorithmically, including via AI, machine learning, neural networks, deep learning, predictive analytics, natural language processing, robotics, speech processing, and other forms of automation used to making decisions (Castelluccia et al., 2019). These technologies will be considered in the context in which they are applied, including the people who use them – hence, referring to automated and data-driven systems rather than dwelling on the technology in isolation.

Some data-driven systems do not explicitly use sophisticated forms of AI and automation (e.g., electronic records management software or care labor platforms) but remain relevant, as they form part of a broader communication ecosystem that can generate and transmit data concerning human activity. "Communication ecosystem" refers here to the complex, global networks of information and communication technology, which encompasses disparate systems, such as the web, the Internet, and various public and private intranets, including those used by service providers, private data brokers, and welfare system operators. These systems are increasingly converging to create massive, complex, and interconnected flows of data.

Language concerning disability-related data also remains unsettled. A narrow view could suggest "data concerning disability" is individual in character, related to the clinical reporting of impairments, such as through medical records, functional assessment results, and so on. No one would deny the sensitivity of such data. Yet the CRPD clearly calls for a more expansive approach. The CRPD was strongly influenced by the social model of disability and arguably a newer "human rights model" of disability (Degener, 2016), both of which emphasize the social and physical barriers to disabled people's inclusion on an equal basis with others. This would mean that relevant "disability-related" data and information could come from an array of sources that reflect the ways disability is constituted by people's impairments in interaction with social and physical barriers to their participation in society. By way of example, this could include data that could be used to infer disability, such as a person's consumer transactions concerning particular medications or accessibility products, like hearing aids or prostheses.

Importantly, the CRPD covers people who experience harms due to *imputed* impairment or disability (CRPD, Arts 2, 4, and 5). This component of disability is important here because some automated decision systems purportedly function to deduce a person's impairment, including *inferring* matters like mental health conditions, dementia, and other cognitive impairments. At the time of writing, for example, Apple is working with multinational biotechnology company Biogen and the University of California Los Angeles to experiment using mobile device sensor data (such as mobility, apparent sleep patterns, and swiping patterns) as behavioral proxies to infer mental ill-health and cognitive impairment (Winkler, 2021).

Regardless of the accuracy of such predictions, there remains the very real likelihood that these practices will result in bias, discrimination, and other harms against people based on such data – again, whether or not *those data are false, misleading, or inaccurate*. To give a concrete example, advocacy group *Article 19* recently surveyed 27 Chinese companies whose emotion recognition technologies are being trialed in public security, driving safety, and educational settings (Emotional Entanglement, 2021). Companies like Taigusys Computing and EmoKit refer to autism, schizophrenia, and depression as conditions they can diagnose and monitor using "micro-expression recognition." The authors of the *Article 19* report observe that both the scientific basis for these claims and the harms that may arise concerning mental health remain unaddressed:

> While some emotion recognition companies allege they can detect sensitive attributes, such as mental health conditions and race, none have addressed the potentially discriminatory consequences of collecting this information in conjunction with emotion data... Firms that purportedly identify neurological diseases and psychological disorders from facial emotions fail to account for how their commercial emotion recognition applications might factor in these considerations when assessing people's emotions in non-medical settings, like classrooms. (Emotional Entanglement, 2021)

Traditional facial recognition processes based on "basic emotions theory" have been discredited as pseudoscientific (Feldman Barrett, 2017), and there is no evidence to support the claims of companies like Taigusys Computing. But for the purposes of defining "data concerning disability," it is irrelevant – such credibility gaps would not necessarily prevent harm to those reported by those systems to be cognitively impaired.

The wide definition of disability implied by the CRPD highlights that *all* persons – disabled and non-disabled alike – may interact with systems that generate data concerning disability, whether real or imagined. In the context of psychosocial disability, for example, if you carry a smartphone into a therapy service, visit a depression information website, write about distress on a social media platform, or even simply type and scroll on a mobile device in certain ways, then various "digital trails" will be generated that could be used to infer particular states of psychiatric disorder, distress, and cognitive impairment (Metz, 2018; Schneble et al., 2020; Wang et al., 2015).

This is not to endorse or accept such claims. Indeed, I will later critique the common claim that computational data can easily or neutrally represent reality, let alone "reveal" people's inner worlds. Instead, the point here is to reiterate that the rise of big data and automated decision systems has increased the likelihood of *inferences* and *predictions* being drawn from the behaviors, preferences, and private lives of individuals, which has important implications concerning disability. In the health context, these data have been described variously as "emergent health data" (Marks, 2020a) or "indirect, inferred, and invisible health data" (Schneble et al., 2020). Mason Marks proposes the term "emergent medical data" given that "digital traces have emergent properties; [and] when analyzed by machine learning, they reveal information that is greater than the sum of their parts" (Marks, 2020b).

As has been well established, these forms of inferred data create new opportunities for discriminatory, biased, and invasive decision-making about individuals and populations (Wachter & Mittelstadt, 2019). Thus, the type of profiling technologies discussed in this chapter raises issues that affect everyone. However, notwithstanding this universal relevance, high-risk applications of profiling and biometric technologies are likely to have the greatest impact on people who are presently marginalized. In the mental health context, this could include service users or those who are subject to involuntary mental health interventions, social security recipients, people in the criminal justice systems, and those facing intersecting forms of socioeconomic marginalization.

Given this chapter is concerned with profiling technologies in the mental health context, I will use the term "data concerning mental health." This term is taken to mean personal data related to the mental health of a person, including the provision of health and social care services, which reveal information about a person's mental health status. ("Data concerning disability" could be defined the same way, where "disability" replaces "mental health.") This definition draws on the European Union GDPR, which explicitly does not include the term "health data" and instead uses the broader phrase "data concerning health." "Data concerning health" is defined at Article 4(15) as "personal data related to the physical or mental health of a natural person, including the provision of healthcare services, which reveal information about his or her health status." Christophe Schneble and colleagues argue that this important distinction "opens the door to indirect and inferred health data falling within the scope of the GDPR" and therefore strengthens its application outside as within the formal healthcare system (Schneble et al., 2020). It is too early to determine the extent to which Schneble and colleagues are correct, and the GDPR remains subject to a wide field of debate.

Indeed, others remain skeptical that even leading data protection laws like the GDPR can sufficiently protect people in the mental health context against the full range of the harms that may arise. Nicole Martinez-Martin and colleagues refer to the potential misuse of inferred data concerning mental health, arguing that existing regulations, including the GDPR, "do not address or sufficiently protect individuals from companies and institutions drawing health inferences from personal data" (Martinez-Martin et al., 2021). They warn of insurance and employment discrimination and argue that "even clinical, *regulated* applications . . . present significant concerns regarding transparency, consent, and the distribution of risks and benefits for patients and users regarding how their data may be shared and used" (Martinez-Martin et al., 2021). Even where data protection laws are violated, enforcement remains an issue. For example, a Privacy International investigation showed how popular mental health websites in Western Europe were in clear breach of the GDPR, but enforcement was lacking, and breaches continued several months after the initial violation was exposed (Privacy International, 2021).

Questions remain about what exactly would fall within the definitions of data and information concerning mental health and disability, which seem likely to be a source of ongoing debate (see, e.g., Fisher & Appelbaum, 2017). Suffice to say that the rising use of such data is blurring the boundaries between "patient," "service user," "consumer," and "citizen," creating multiple issues around the commodification and commercialization of health, the rise of "bio-surveillance," and other issues which have profoundly implicated disabled and non-disabled people alike.

Profiling Technologies and Biometric Data Generation in the Mental Health Context: A Growing Industry and Scientific Practice

The GDPR defines "profiling" in Article 4(4) to mean:

> any form of automated processing of personal data consisting of the use of personal data to evaluate certain personal aspects relating to a natural person, in particular to analyse or predict aspects concerning that natural person's performance at work, economic situation, health, personal preferences, interests, reliability, behaviour, location or movements.

One means of profiling is via "biometric data," defined as:

> data resulting from specific technical processing relating to the physical, physiological or behavioural characteristics of a natural person, which allow or confirm the unique identification of that natural person, such as facial images or dactyloscopic [or fingerprinting] data. (GDPR, Article 4(14))

Various forms of profiling occur that generate biometric data in the disability context, raising many ethico-legal issues given the insights such technologies are purported to reveal about a person's health, body, cognition, affective state, and so on (Cosgrove et al., 2020a; Kak, 2021; Martinez-Martin et al., 2018). Biometric monitoring technologies use sensors in devices, including smartphones, "wearables," and cameras, and even in pills to generate and process data concerning a person's biology, physiology, or behavior.

There are various ways to describe such technologies. Computer scientists may refer to "context sensing," "personal sensing," or "mobile sensing." Mental health researchers have begun to refer to "digital phenotyping," particularly in relation to the assessment of behavior, mood, and cognition through biometric data generated by devices, such as smartphones and FitBits (Insel, 2017). An advertisement for the prominent direct-to-consumer app company, Mindstrong, for example, describes how the app is supposed to function:

> How you passively use your smartphone – typing, swiping, scrolling – is a new way to measure things like your stress, mental health symptoms, and well-being. If you're typing more slowly – even by a millisecond – it might mean there's a change. You can track your measurements in the mobile app, and they're shared with your clinical team so they can provide you with more personalized care. (Mindstrong, 2021)

Some mental health practitioners are enthusiastic about the "enormous potential" of this technology "to improve our understanding of the experience of individuals and our capacity to deliver behavioural health treatments" (Mohr et al., 2020). This potential could include the integration of monitoring apps into standard psychological treatments (e.g., apps that monitor behavior may be prescribed alongside talking therapy), the delivery of biometric monitoring as a standalone intervention, as well as using "[p]assive tracking of populations of at-risk people" to facilitate "early identification and intervention for behavioral problems" (Mohr et al., 2020).

In 2021, for example, up to 20,000 Australian high school students were to have their phone data monitored for up to 5 years in a trial aimed at tracking how mental health issues develop in adolescence (Black Dog Institute, 2021). According to the researchers, "[t]he study aims to discover how we can use smartphones to deliver preventive interventions on a large scale" and makes use of "[c]omprehensive, technology-assisted data collection and analysis [...] to determine what triggers the development of mental health symptoms" (Black Dog Institute, 2021). The authors report that no study of mental health apps has occurred at this scale anywhere in the world (Black Dog Institute, 2021). Many of the children and young people involved in the study would reportedly interact with game-based apps, have their movement and location tracked, and be asked specific questions about their state of mind, including whether they have contemplated suicide.

Forensic mental health settings are also deploying automated decision systems used to classify human behavior. In 2015 in Austria, for example, ten patients in a psychiatric hospital were given a mobile phone with an app that was "based on smartphone behavior and activity monitoring" over a 12-month period (Grünerbl et al., 2015). The app generated data that was "usable [by clinicians] as an 'objective' measurement that help[ed] detect state changes to guarantee the availability of in-time treatment" (Grünerbl et al., 2015). Researchers compared evaluations using standard scales (such as the Hamilton Depression Scale) with patient mood using sensors based on phone use, voice activity, and bodily movement. The findings indicated a "state change detection precision and recall of over 97%" (Grünerbl et al., 2015), suggesting almost perfect accuracy.

In acute psychiatric settings, computer vision has been developed that monitors patients using remote (and not on-body) sensors. In 2020, "digital assisted nurse observations" were trialed in a psychiatric ward in England (Barrera et al., 2020). This practice has been variously described as "video-algorithmic patient monitoring and surveillance," "artificial intelligence-enabled audio-visual surveillance and monitoring," "vision-based patient monitoring and management," and "digitally assisted nursing observations." In the English trial, the monitoring was used by nurses to take 15-minutely and hourly night-time "clinical observations" of patients in 6 individual bedrooms over a 4-month period (Barrera et al., 2020). The sensors used by researchers were wall-mounted video cameras along with "computer vision, signal processing, and AI software" that enabled nurses to track their patients' locations and movements ("physical monitoring") and to record their heart and respiratory rates ("physiological" or "vital sign monitoring"), all from a centralized nurses' station (Lloyd-Jukes et al., 2021). Physiological monitoring using the system allows nurses to access "real-time spot measurements of pulse rate and breathing rate without them having to enter the room" (Lloyd-Jukes et al., 2021). The software reportedly generates long-term information in the form of "a timeline summarising the patient's location (in bed, elsewhere in their room, etc) for a day or a week . . . to help characterise the patient's behaviour during that time interval" (Lloyd-Jukes et al., 2021). The use of these systems is reportedly expanding, with the company that produces them reporting that they are "relied on by one in three English mental health trusts as well as acute hospitals, care homes, skilled nursing facilities, prisons and police forces in the UK and Europe" (Oxehealth, 2021).

Other forms of biometric sensing go "beneath the skin," where ingestible sensors have been integrated with psychopharmaceutical pills (Flore, 2021). For example, in 2017, the US Food and Drug Administration ("FDA") approved a so-called digital pill (FDA, 2017). "Abilify MyCite," as it is commercially named, integrates a pill with an electronic sensor. The sensor is activated upon contact with a person's stomach fluid. Information concerning the nature and timing of ingestion is then transmitted via a patch worn on the skin to a linked device, such as a smartphone. Family members, clinicians, and other third parties can attain the information generated about the ingestion, with the person's consent, through a web-based portal. The smartphone/tablet app can also track "self-reported measures of rest and mood," though the pills are advertised primarily as “targeting the problem of medication adherence” (Klugman et al., 2018). According to the FDA, “Abilify MyCite” is aimed at “the treatment of schizophrenia, acute treatment of manic and mixed episodes associated with bipolar I disorder and for use as an add-on treatment for depression in adults” (FDA, 2017). Digital pills have also been approved for use by regulatory bodies in China and the European Union.

Proponents of such technologies view biometric monitoring with therapeutic aims as a novel method for real-time clinical monitoring that, for some people, may improve therapeutic outcomes for people with mental health conditions and psychosocial disability. This enthusiasm is typically accompanied by acknowledgement that some patients will not want to use nor gain from such measures, as well as occasional acknowledgements that the practice gives rise to unresolved ethical issues (see Gooding & Kariotis, 2021).

Troublingly, the practice has been proposed in highly prejudicial forms of state intrusion into the lives of people with mental health conditions and psychosocial disability. Senior members of the former Trump administration, for example, including then President Donald Trump and Vice President Mike Pence, were briefed on a proposal, “SAFEHOME – Stopping Aberrant Fatal Events by Helping Overcome Mental Extremes,” that would involve experimentation into whether “technology including phones and smartwatches can be used to detect when mentally ill people are about to turn violent” (Wan, 2019). The proposed new research would sit within a proposed new US department of health division, the “Health Advanced Research Projects Agency,” to be modelled after the Defense Advanced Research Projects Agency (or DARPA).

Although SAFEHOME was not adopted during the Trump presidency, it suggests that ideas about biometric monitoring lie in proximity to preventive policing policies and forms of algorithmic risk management. Other technological experiments have seen police and border authorities generate and process mental health-related data from disparate public and private systems. In 2018, for example, the Florida state legislature authorized the collection and digitization of certain types of student mental health data and its distribution through a statewide police database, intended to prevent gun violence (Travis, 2019). The same year, municipal police in Canada collated non-criminal information about individuals who had self-harmed or attempted suicide (Canada, 2017). The information – which it should be noted was *not* biometric data but rather typical police records – was then circulated to US border authorities, who used it to deny several Canadians’ entry into the USA (Canada, 2017). These examples, too, highlight the growing potential for profiling technologies and mental health-related databases to be used in prejudicial targeting by state authorities.

Power and Justice in the Biometric and Digital Turn

Given the above, serious concerns can be raised about the rise of profiling technologies that generate and rely on biometric data in mental healthcare. One obvious point is that even where good faith efforts are made to develop biometric monitoring techniques that individuals want to use, and even if those efforts manifestly benefit them as individuals, there is the potential for these same techniques to have extremely deleterious effects on broader populations. Consider the following comment by Neguine Rezaii:

> [w]hen I published my paper on predicting schizophrenia, the publishers wanted the code to be openly accessible, and I said fine because I was into liberal and free stuff. But then what if someone uses that to build an app and predict things on weird teenagers? That's risky. [. . .] [Open science advocates] have been advocating free publication of the algorithms. [My prediction tool] has been downloaded 1,060 times so far. I do not know for what purpose. . .. (Adam, 2020)

It is uncontroversial to say that biometric monitoring, as an exploratory technique in mental health sciences, has a highly limited evidence base demonstrating its real-world benefits, even if control conditions might suggest positive outcomes. Yet, the potential for it to be used in unexpected and harmful ways under current conditions suggests serious caution is needed, particularly given mental health-related data appears to very poorly governed and protected in the information economy writ large (see Bossewitch et al., 2022).

A key set of concerns hinge on contested claims about what "digital markers" of behavior can reveal about a person (see, e.g., Fisher & Appelbaum, 2017; Friesen, 2020). These concerns tend to fall into well-worn debates in the mental health context about behaviorism (which, crudely put, tends to prioritize the external behavior of individuals and view external stimuli as the primary locus of behavior) versus psychoanalytic approaches (which prioritize the mind and the subjective search for meaning and view the unconscious as potentially motivating behavior) (Pasquale, 2021). A behaviorist perspective, for example, might suggest that biometric monitoring offers a *more* reliable measure than existing approaches in mental healthcare that are based on the subjective reports of individuals or the subjective observation of mental health practitioners. Data that serves as a proxy for a person's behavior, from this view, could serve as "objective parameters that correlate with mental health status" (Resnick & Appelbaum, 2019). A more psychoanalytic viewpoint would seemingly balk at the way such a view undermines the "reliable narrator" in this picture – that is, the person themselves and their evolving perception of their inner lifeworld in the social context in which they live. The tension between these viewpoints echoes throughout the literature, as the remaining discussion will show.

Terminology is unsurprisingly contested. David Mohr and colleagues criticize the very term "digital phenotyping" for failing to convey the reality that the practice constitutes surveillance over intimate aspects of a person's life (Mohr et al., 2020). They suggest that the term "does not convey to the average person that we are engaging in a sensitive form of surveillance: collecting large amounts of data, and using those data to understand deeply personal things, such as how they sleep, where they go, how and when they communicate with others, or whether they may be experiencing a mental health condition" (Mohr et al., 2020). The authors ultimately endorse the practice itself but call for language that is more transparent about its intent, arguing the term "personal sensing" is more appropriate (though one might query whether "personal sensing" offers a clearer explanation).

Others reject the practice as inherently harmful, at least under current social conditions, drawing attention to issues of justice and power that come with persistent observation and surveillance (Harris, 2019). Leah Harris warns of biometric technologies being used in forms of social control over marginalized individuals, not just in mental health settings but also in prisons and other sites of carceral control, including in people's homes and communities (Harris, 2019, 2021). Harris draws on Michel Foucault's theorization of the panopticon, discussing the power gained by "both the ability to observe others and the knowledge obtained through that observation" (Harris, 2019). As is well covered elsewhere, the panopticon was originally an architectural system developed in the eighteenth century by Jeremy Bentham designed to continuously observe prisoners in confinement. For Foucault, *panopticism* refers to a metaphor or analytical tool to describe the surveillance mechanism used to exert disciplinary power throughout society by professionals, bureaucracies, government agencies, market actors, and so on by allowing for an "absolute and constant visibility surrounding the bodies of individuals" (Foucault, 2006).

Toward the end of his life, Foucault conceptualized a shift in Western societies away from the dominance of disciplinary environments, such as largescale psychiatric institutions, to systems of constant external surveillance. He wrote that "[o]ne also sees the spread of disciplinary procedures, not in the form of enclosed institutions, but as centres of observation disseminated throughout society" (Foucault, 1995). Foucault charts these societal shifts toward forms of control that are less costly and complex to manage than large asylums (Paradis-Gagné & Holmes, 2022). For Harris, biometric monitoring in the mental health context constitutes panopticism by virtue of the power asymmetries between the "'omnipresent' and 'invisible' watchers and their 'permanently visible' subjects," which Harris argues is an extension of the historic role of psychiatry as a science in governing "troublesome" populations (Harris, 2019).

It may be that these power asymmetries can be addressed through careful consent processes at the individual level, but others raise concerns about the collective harm that result from automating mental health classification in this way. For Jonah Bossewitch (2019) and others, these harms are particularly likely under the current economic conditions variously characterized as surveillance capitalism, platform capitalism, and so on. (see eg, Zuboff, 2019, Jeff Nagy, 2022), for example, suggests that disability has been transformed in the past two decades "into a rhetorical, conceptual, and material resource for the expansion of surveillance capitalism." For Nagy:

> This history has also underwritten a larger reconceptualization of emotional data, from a neglected variable in human-computer interaction to an exploitable corporate asset, a transformation that has allowed platform users' emotional lives to be mined for new forms of knowledge, value, and power. (Nagy, 2022)

Likewise, Lisa Cosgrove and colleagues suggest that "mental health apps that use digital phenotyping and other surveillance technologies position people as unwitting profit-makers . . . [by taking] individuals at their most vulnerable and make them part of a hidden supply chain for the marketplace" (Cosgrove et al., 2020b).

Tying these concerns to longstanding critique of the professional power of psychiatry, Bossewitch (2017) has warned of the "arrival of surveillance psychiatry." He queries the role of biometric profiling in the growing information economy, whereby "huge pools of data are being used to train algorithms to identify signs of mental illness" (Bossewitch, 2017). It remains to be seen how extensive such profiling will become and how it will be governed under the new era of data protection laws such as the GDPR. As an example of the kind of limitations the GDPR imposes, Article 22 of the GDPR states that "the data subject shall have the right not to be subject to a decision based solely on automated processing, including profiling, which produces legal effects concerning him or her or similarly significantly affects him or her." Bernadette McSherry has noted that predicting aspects of a person's mental health appears likely to fall within the ambit of this article, offering the potential for protection (McSherry, 2018).

Beyond legal remedy to prevent data-driven and automated systems of diagnosis or proxy diagnosis, commentators often premise their concerns about profiling technologies with a broader challenge to computational ways of knowing, which ties to critiques of behaviorism noted earlier. Arguably, there is a commonly held view that computational monitoring, measurement, and evaluation of people *necessarily* afford access to knowledge about individuals, including their inner state. However, computational technology may well *get in the way* of understanding people, including the unique experience of each new person in crisis or distress who deserves to be heard fully. Research by Victoria Hollis and others, for example, suggests that people who use algorithmic interpretations of data concerning emotions can be misled about the extent to which such systems can "capture" the reality of emotional experiences (Hollis et al., 2018). Hollis and colleagues surveyed 188 people who showed strong interest in automatic stress and emotion "tracking," with the results indicating that "many respondents expected these systems to provide objective measurements for their emotional experiences" despite this simply not being possible (Hollis et al., 2018).

This framing effect (which is often exaggerated by vendors of technologies who are trying to sell their product) can even change the way people construe their own emotions. In a second study, Hollis examined how algorithmic sensor feedback influences people's emotional self-judgments, in a mixed-methods study with 64 participants (Hollis et al., 2018). "Despite users reporting strategies to test system outputs," according to Hollis and colleagues, "users still deferred to feedback and their perceived emotions were significantly influenced by feedback frames" (Hollis et al., 2018). Some users even "overrode personal judgments, believing the system had access to privileged information about their emotions" (Hollis et al., 2018). Similarly, Lisa Parker and colleagues surveyed the messaging of mental health apps and argued that prominent apps tend to over-medicalize states of distress and may over-emphasize "individual responsibility for mental well-being" (Parker et al., 2018).

As a broad comment, persons with psychosocial disability and the user/survivor/ex-patient movement have – to various degrees – advanced reasons to de-medicalize approaches to supporting people in distress. This reasoning would seemingly extend to caution about framing personal mental crises as medical problems *amenable to digital technological solutions* (see, e.g., Mills & Hilberg, 2020). Nev Jones (2012), for example, has examined the impact of other ways of scientifically framing mental distress, including genetic and neurobiological causal attributions of psychiatric disorder, which she warns is an unduly positivist and can undercut the agency of people in distress, including the nuances of individual experiences. Likewise, the framing effects of biometric monitoring often go unremarked, but the studies noted previously suggest the effects can alienate people from their own self-perceptions. For their part, Hollis and colleagues argue that these framing effects should be acknowledged and, because they are unavoidable, they should be brought out into the open and applied transparently to help individuals more actively construe their personal experiences (Hollis et al., 2018).

Suggesting people can be "alienated from their own self-perceptions" is a risky proposition. Portraying individuals who seek digital forms of support as – crudely put – unreflective dupes very easily perpetuates a view of system "users" as passive and uncritical. Several studies indicate the opposite is true: that people are exerting more agency and critical engagement than may be presumed. Jacinthe Flore's interviews with 14 young adults who used digital mental health apps and wearable devices, for example, suggested that data-driven and automated systems "are not passively experienced" (Flore, 2022). Instead, members of her study group used apps and wearables strategically in ways that suited their individual purposes and in ways not particularly intended by app designers. Similarly, commentators from fields of anthropology and media studies have described the potential for care "to take unexpected forms through technologies, enabling distanced intimacy and social change that transcends the psychology of the individual," to use Hannah Zeavin's terms (Zeavin, 2021). Likewise, Claudia Lang describes the potential for technologies such as chatbots and mental health apps to "weave together code and poetry, emotions and programming, despair and reconciliation, isolation and relatedness in human-techno worlds" (Lang, 2021). Dismissing chatbots as an alienating simulacrum that necessarily deceive their users, or rejecting biometric monitoring techniques as uniformly harmful ways to make humans more amenable to surveillance, control, and exploitation, is clearly going to be simplistic and reductive.

Nevertheless, it seems hard to avoid acknowledging that profiling technologies using biometric data discussed throughout this chapter show quite clear signs of functioning to encourage "the people who are the object of this constant gaze... [to] come to internalize ways of doing things (the government of self), and thereby govern their own conduct" (Paradis-Gagné & Holmes, 2022). This is at least the case regarding the *design aim* of such practices, which are starting to appear in responses to mental health in major governing institutions in society, like education, employment, insurance, and the military (Gooding, 2019). Even if the function of profiling technology in "internalized subjectification" (Stewart & Roy, 2014) is set aside, there is growing evidence to suggest biometric or surveillance technologies, however framed, are disproportionately harming disabled people in precisely these sectors (Brown et al., 2022). Hence, the previously noted concerns raised by Harris, Bossewitch, and others cannot be easily dismissed, particularly as the list of "data harms" in the mental health context grows longer (Bossewitch et al., 2022).

The concern of this group of critics moves beyond questions of how to make particular technologies like biometric monitoring more equitable or ethical (e.g., by ensuring the datasets adequately cover diverse communities that accommodate distinct ways of being and self-presenting). Instead, critics' questions relate to law and political economy, questioning whether technologies are creating a market for surveillance in the mental health context that perpetuates and even extends the worst power imbalances, inequities, and harms of current mental health practices and disability-based rights violations and other objectionable social changes (Harris, 2019; Pasquale, 2019; 2021). Kaitlin Costello and Diana Floegel, for example, argue that the "link between the carceral state and mental healthcare in the United States is alarming" and that biometric monitoring technologies "are poised to only further strengthen that link, despite calls to the contrary" (Costello & Floegel, 2020). More fundamentally, this new ensemble of profiling technology and mental healthcare may well change how it is people can best know the world and the people in it (McQuillan, 2018), including the very nature of what it is to be considered well or unwell.

Moving the Frame from "What Does the Technology Do?" to "Who Is Benefiting and Who Is Not?"

One strategy to avoid the perils of biometric profiling is to place the emphasis away from the technology itself and toward questions of who is benefiting from the push for its adoption and – perhaps more importantly – who is losing (Kak, 2021). This framing challenges the common presentation of computational monitoring and evaluation, particularly in the disability context, as naturally being in people's interests on the basis that "the more we know the more we can help." Such "techno-optimism" or "techno-utopianism" can dovetail easily with widely held understandings about the legitimacy and unquestioned benefit of monitoring disabled people. As Sharon Snyder and David Mitchell have argued, "[o]ne of the primary oppressions experienced by disabled people is that they are marked as perpetually available for all kinds of intrusions, public and private" (Snyder & Mitchell, 2006).

Unsurprisingly, critical reflection has turned to financial incentives and business models associated with biometric data. One such business model is to target individuals with disability-related characteristics with advertising, such as for mental health apps or pharmaceutical drugs (see, e.g., ADHD Drugs 2022), a practice sometimes called "vulnerability-based marketing" (Marks, 2020a; Pasquale & Citron, 2014). In 2017, Facebook operations in Australia, for example, were reportedly targeting children and teenagers as young as 14 years old and helping advertisers to identify when children felt "worthless," "stressed," "anxious," and "insecure" (Levin, 2017). Legal mechanisms proffered to prevent these practices include the GDPR protection of sensitive personal information under Article 9(1), of which vulnerability-based marketing is likely to fall foul. Article 9(1) GDPR prohibits the processing of special categories of personal information, which include health and disability-related data, regardless of its source. The enforceability of such prohibitions remains a problem (Privacy International, 2021), and again, the success or otherwise of these legal approaches remains to be seen.

Beyond businesses trying to sell products, a deeper concern can be raised about the range of beneficiaries who are seeking to promote and entrench the very *explanatory power* of computational ways of knowing the world and the people in it. Jake Goldenfein describes a "particular group of actors that benefits from the idea that measuring and computationally analyzing the world affords access to knowledge – and those actors also have the power to enact and legitimize their knowledge claims" (2020). These epistemological concerns have great significance in the disability context and tie to concerns discussed earlier about both the dominance of certain expert groups in governing responses to disability and the potential intrinsic harms of processes of computational observation and measurement.

Just as the idea of the "medical gaze" (to draw on another Foucauldian term) has helped critique the biomedical and individualistic framing of mental health and disability, and its disciplinary power, the concept of the "data gaze" might be used similarly. The Americans Civil Liberties Union, for example, describes a potential "nightmare scenario" whereby a "data gaze" extends to omnipresent AI-powered monitoring and surveillance:

> the consistent tracking of our every conscious and unconscious behavior that, combined with our innate social self-consciousness, turns us into quivering, neurotic beings living in a psychologically oppressive world in which we're constantly aware that our every smallest move is being charted, measured, and evaluated against the like actions of millions of other people – and then used to judge us in unpredictable ways. (Stanley, 2019)

These concerns were not raised about the mental health or disability context but have clear resonance for this discussion.

Subtle harms can be caused by the way technological surveillance leads to an abstraction of the human body that is then reassembled through a series of data flows (Haggerty & Ericson, 2000; Smith, 2019). Jathan Sadowski has argued that datafication, in which information about the person is commodified, is itself a form of violence (Sadowski, 2020). Jackie Leach Scully and Georgia Van Toorn consider this possibility in the disability context and argue that increasing datafication of the human body, whether in commercial, medical, or governmental contexts, will delineate increasingly rigid boundaries between normality and disability (Scully & Van Toorn, 2021). This impulse to quantify and distinguish embodied difference, they argue, "diverts attention from the realities of disabled lives, at a time when disability scholars and activists are arguing for more rather than less attention to the lived experience of disability" (Scully & Van Toorn, 2021). Goldenfein (2020) proposes the term "computational empiricism" to characterize this impulse toward computational quantification, which is emerging as a knowledge system that presents profiling techniques with the premise that "nonvisible truths reside only in what can be sensed technologically and evaluated statistically."

One clear risk or even function of datafication and computational empiricism is to undermine the need to "act on the reliable narrator" – that is, listening to the person or populations affected and how they articulate their needs (James, 2020). Persons with psychosocial disabilities, mental health service users and survivors, and so on have long campaigned for an end to the type of "epistemic and hermeneutic injustice" that devalues their viewpoint and ways of knowing – individually and collectively – and instead elevates expert-based knowledge claims and systems (see, e.g., McQuillan, 2018; Roper, 2019; Russo & Beresford, 2015; Daya, 2022). Despite these efforts, dominant narratives about technology today often insist on new and alternative ways to undertake expert observation using automated and data-driven systems (Race Based Data 2020). In the mental health and disability context, this insistence creates a greater likelihood of diverting attention from the experienced reality of disabled lives (Scully & Van Toorn, 2021).

A clear step toward responsible governance of automated systems, therefore, is to elevate the often subjugated knowledge of people with disabilities. Deliberative input by affected populations aligns with calls from bioethicists in digital medicine for "interdisciplinary empirical research on the implications of these technologies that centers the experiences and knowledge of those who will be most affected" (Guta et al., 2018). It also aligns with human rights standards to actively involve persons with disabilities in decisions about matters that concern them (CRPD, Preamble 15). Although participatory development of technology in the mental health and disability context may seem axiomatic, it is far from the norm. In 2021, Timothy Kariotis and I reviewed applied studies involving algorithmic and data-driven technologies in "online mental health interventions" on multiple research databases (Gooding & Kariotis, 2021). Of the 132 papers in the survey, only 4 papers (or 3% of the examined field) appeared to involve in any substantive way people with personal experience of mental health services, whether in the design, evaluation, or implementation of the studies. The survey demonstrated "a near-complete exclusion of [mental health service users/patients/disabled people] in the conceptualisation or development of algorithmic and data-driven technologies" and their application to mental health services (Gooding & Kariotis, 2021). This pattern conforms with the longstanding marginalization of the perspectives of persons with experiences of mental health crises and psychosocial disability in academic research, policymaking, and service provision (Brown & Jones, 2012).

Disabled activists and researchers have hit back at exclusion from technological development. Melanie Yergeau's "criptastic hacking," for example, is advanced as a "disability-led movement" for technological tinkering, hacking, and programming that is designed in opposition to "a series of apps and patches and fixes designed by non-disabled people who cannot even be bothered to talk with disabled people" (Yergeau, 2014). Many people living with distress, addiction, disability, and so on have already crafted new technological arrangements (Bossewitch, 2019), pushing back against the treatment of disabled people as passive recipients rather than being treated as knowledge-makers, technologists, mechanics, researchers, and designers. The elevation of disabled perspectives cannot, in and of itself, prevent degrading forms of power or social harms generated by systems of automation and profiling, but it offers a starting point.

Conclusion

The use of technologies like AI to make assumptions and judgments about who we are and who we will become poses greater risks than just an invasion of privacy; it poses an existential threat to human autonomy and the ability to explore, develop, and express our identities. It has clear potential to normalize surveillance in a way that is reminiscent of nineteenth-century asylums as a state-authorized (and often privately run) site of control (Parry-Jones, 2006) but using twenty-first-century techniques of ubiquitous observation and monitoring. Beyond harms to "subject self-formation" and personhood, Salome Viljoen (2021) persuasively warns that attention is also needed to the way datafication materializes "unjust social relations" in ways that enact or amplify social and economic inequality. Discussion about the implications of profiling technologies in the disability context will need to grapple with these individual and collective concerns, for which the CRPD offers a potentially fruitful way to mediate these concerns in international law.

Those with an interest in disability studies, disability rights, and critical mental health scholarship have an important contribution to make to the growing field of research, practice, advocacy, activism, and law reform concerning biometric monitoring. In healthcare, the COVID-19 pandemic has accelerated the international adoption of forms of public health monitoring and security technologies, with similar techniques being adopted quite outside of the care context, including in education, the military, the insurance industry, and the criminal legal system (Kak, 2021). These latter sectors are societal institutions in which people with disabilities, and particularly those with mental health conditions and psychosocial disabilities, face heightened risk of harm. Issues of equality and non-discrimination are (rightly) forming part of the work that is needed to address these harms (see Human Rights Council, 2021). There are strong grounds for expanding this focus beyond ways that particular applications of technology are discriminatory to disabled people, to broader questions about the harmful expressions of power and destructive social and economic changes wrought by computational profiling techniques more generally.

To draw out benefits, and curtail harms, questions that could be explored include whether those deemed through biometric monitoring to be "cognitively impaired" or *likely to become* so will be informed that such attributions have been made. Will they be able to opt out of the monitoring process in the first place? Will they be able to contest such labels before data are transferred to others? Given the purported ease with which personal device data points can be used for automated profiling to determine cognitive impairment, are there sufficient safeguards to govern how this should occur, including whether it should occur in the first place? Will this data and its use be publicly governed as with traditional academic research or retained and governed in the private sector? Should moratoria apply to some forms of biometric monitoring and surveillance in the mental health and disability context on the basis that they are fundamentally harmful or inconsistent with legal instruments like the CRPD? What kind of politics is required for such decisions be made, including arbitrating between trade-offs between collective benefit and certain consequences to specific populations? What role is currently being played by psychiatric and psychological sciences in advancing profiling and biometric monitoring technologies and their regulatory regimes? What role *should* they play?

This is a critical moment to reflect on ways that current choices being made about automation, disability, and care will affect understandings of what it means to be human in the future.

The Exercise and Enjoyment of Sexual, Reproductive, and Non-reproductive Rights: Gender and Disability Intersectionality

69

Agustina Palacios and Iñaki Regueiro De Giacomi

Contents

Abstract

Based on the rights of autonomy and legal capacity, the article addresses the intersectionality between gender and disability. It includes a focus on both reproductive and non-reproductive rights; namely, the rights to have sex and access to sexual assistance. An overview of the main barriers in the exercise of these rights is also present, including serious human rights violations, such as forced sterilizations. Finally, the authors propose three specific tools under the Convention on the Rights of Persons with Disabilities to prevent infringements of rights: accessibility, accommodations, and support.

Disability rights · Sexual and reproductive rights, sterilization · Gender rights · Legal capacity · Right to autonomy · Right to have sex · Sexual assistance

Introduction

The International Convention on the Rights of Persons with Disabilities has introduced various standards of international human rights law in personal rights, gender. and disability, which promote and reinforce the values, principles, and freedoms enshrined in international standards.

International human rights law standards have become immensely necessary to address issues such as the “right to have rights” when these are sexual, reproductive, and non-reproductive rights. The case also becomes more complex when those who want to enjoy and exercise these rights are women and even more complicated when these women are women with disabilities (Minieri, 2017).

Discrimination against women with disabilities has a particularly significant impact on their right to sexual and reproductive health. Daily, multiple barriers impede access to information, communication, education, and knowledge, preventing persons with disabilities from fully exercising their sexual, reproductive, and non-reproductive rights. Lack of knowledge, prejudices, myths, and stereotypes often hinder access to contraception and adequate healthcare services. The stereotype of hypersexuality, or on the contrary, the idea that they are asexual and do not feel sexual desire, generally causes women with intellectual and psychosocial disabilities to be conceived as passive subjects referring to their sexuality (Profamilia Project, 2018). In particular, the collective faces innumerable barriers in access to contraceptive information, goods, and services. That, among other issues, prevents them from making autonomous decisions because their consent is based on erroneous or biased information due to stereotypes and prejudices (Minieri, 2017). It is also known that women with disabilities are subjected to forced surgical contraception and abortions without “their” consent – which must be free, informed, and sexuality participative.

Similarly, the loss of autonomy experienced by persons with disabilities not only restricts their ability to express their sexuality according to their sexual orientation but also hinders their recognition in terms of the gender identity that each person identifies with. Therefore, lesbian, gay, bisexual, trans, and intersex persons with disabilities see their rights violated twice, to the extent that any possible association with counter-hegemonic identities is wholly discouraged and made invisible.

Intersectionality as an analytical tool shows that situations of inequality are built from the interaction of various factors of oppression (Barrere Unzueta, 2010). In turn, intersectionality shows that the context and its critical analysis are necessary to understand the oppressed and discriminated against (Serra, 2017). The context comprises several factors of oppression that intersect simultaneously and whose analysis is crucial (CERMI Report, 2017).

Intersectionality as a paradigm works as an interpretative framework, recognizing that the systems of ethnicity, distribution of resources, gender, sexuality, nationality, disability, and age, among others, configure and shape the characteristics of social organizations, which at the same time shape the experiences of oppressed people. In the case of women and girls with disabilities, these characteristics are converted by the systems of power into ableist and sexist stereotypes, which become the two axes of oppression (CERMI Report, 2017).

The UN Committee on the Eradication of Discrimination against Women ("CEDAW Committee") expressed as early as 1991 its concern "...about the situation of disabled women, who suffer from a double discrimination linked to their special living conditions...." They added that "[h]aving considered more than 60 periodic reports of States parties, and having recognised that they provide scarce information on disabled women," their recommendation was "...that States parties provide information on disabled women in their periodic reports, and on measures taken to deal with their particular situation, including special measures to ensure that they have equal access to education and employment, health services and social security, and to ensure that they can participate in all areas of social and cultural life" (CEDAW GR-18, 2008).

Two years later, the UN General Assembly issued the Declaration on the Elimination of Violence against Women and specifically included the concern that "...some groups of women, such as women [...] in institutions or detention, [...and] women with disabilities, [...] are especially vulnerable to violence, ..." (A/RES/48/104, 1993).

In 1999, the CEDAW Committee issued General Recommendation No. 24 in the following terms: "Women with disabilities, of all ages, often have difficulty with physical access to health services. Women with mental disabilities are particularly vulnerable, while there is limited understanding, in general, of the broad range of risks to mental health to which women are disproportionately susceptible as a result of gender discrimination, violence, poverty, armed conflict, dislocation and other forms of social deprivation. States parties should take appropriate measures to ensure that health services are sensitive to the needs of women with disabilities and are respectful of their human rights and dignity" (CEDAW GR-24, 2008).

The CRPD is probably the most essential and representative human rights treaty related to disability rights, but not all human rights were equally considered in the drafting process. Marta Schaaf analyzed in an article how sexual rights were negotiated during the convention's drafting. Comparing the draft presented by the Committee Chair with the text of the Convention as adopted, it is clear that "protectionist measures were maintained and affirmations of sexual rights were eliminated. Discursive silences about disabled sexuality were enshrined in the most important official expression of global disability discourse." The author identifies the Holy See delegation as the main responsible for many of these changes. On the other hand, she concluded that the organizations of persons with disabilities lacked "vigorous advocacy for sexual rights," which probes that they "continue to be reluctant to engage sexuality" (Schaaf, 2011).

Despite this, the treaty includes some relevant provisions. It acknowledges in its article 25 – related to health – the right of persons with disabilities, "...with the same range, quality and standard of free or affordable health care and programs as provided to other persons, including in the area of sexual and reproductive health and population-based public health programmes." This specific right includes, for example, the right to receive information in accessible formats regarding available options in sexual support, contraception, and sexually transmitted diseases prevention.

The exercise of sexual, reproductive, and non-reproductive rights by women with disabilities undoubtedly requires a gender and disability perspective.

Although it has not been enough, the gender approach to sexual, reproductive, and non-reproductive rights has been years ahead of disability. It took a process to understand that the right to health, for example, had to include the right to reproductive and sexual health if it was going to protect and guarantee women's health (ICESCR, GC-22, 2016).[1]

However, if the approach starts from the field of disability, the advances are not significant enough. The focus continues today colonized by the medical or psychiatric diagnosis. That is not only a biased vision but also leads to and justifies the restriction, limitation, and/or violation of rights against a group that continues to be considered an object, not a subject (subject of law and, why not, subject of desire).

The social model and the International Convention on the Rights of Persons with Disabilities have provided a change of perspective on disability, to stop conceptualizing it as a limitation of the person. It directly challenges the exclusion of "others," legitimized in our societies through barriers – architectural, communicational, cultural, social, and legal – that prevent the exercise of rights under equal conditions for persons with disabilities (Brogna, 2009).

The exercise of sexual, reproductive, and non-reproductive rights by women with disabilities cannot be addressed if the gender perspective is not included. However, the disability focus should also be included, with a view *from and toward* human rights. The social model from the theoretical framework and the CRPD from the regulatory framework must intersect with the gender perspective based on the principles and values that sustain human rights.

The separation of these two fields (disability and gender) is not innocuous: the consequences can be dramatic and affect mainly the individuals residing in that intersection, such as women with disabilities. In 1988, bioethicists Adrianne Asch[2]

---

[1] General Comment 22 on the right to sexual and reproductive health of the Committee on Economic, Social and Cultural Rights establishes that the right to sexual and reproductive health is an integral part of the right to health enshrined in article 12 of the International Covenant on Economic, Social and Cultural Rights (2016).

[2] Adrienne Asch was a scholar who wrote about the intersection of the fields of Bioethics and Disability. She was also a disability studies scholar and a person with a disability. It is important to mention this because sometimes the voices of important experts in the field of disability are considered merely testimonial because of their personal experiences as persons with disabilities and their academic inputs are therefore undervalued. Disability, then, instead of being a necessary

and Michelle Fine used the term “double oppression” to describe the discrimination that women with disabilities suffer twice over (Bergstresser, 2014).

Moreover – and from a political perspective – the sum of both agendas strengthens and enriches each. The forces that push to maintain the current oppression of women and LGBTI people have a lot in common with the ones that subjugate persons with disabilities.

Right to Autonomy

The CRPD provides special protection for autonomy, which is not only protected as a right but also as a guiding principle. Article 3. a refers specifically to “Respect for inherent dignity, individual autonomy including the freedom to make one’s own choices, and independence of persons; (...).”

The treaty is based on the idea that autonomy is not so much a starting point as an arrival point, which means recognizing that every person has diversities and limitations. And it is precisely in cases where functional autonomy may be restricted where the role of the right should be highlighted in terms of guaranteeing the full development of the existing degree of autonomy, however minimal it may be.

The CRPD requires ensuring development and promoting autonomy through different guarantees. One of them is the support system established through art. 12. Due to the tremendous philosophical change that this implies, it is the precept that contains the most innovative provision of the Convention, especially concerning certain people who are in a situation of special vulnerability and discrimination when making their own decisions, such as women with intellectual and/or psychosocial disabilities.

Based on recognizing persons with disabilities as moral subjects, another side of autonomy is found in the well-known slogan “nothing about persons with disabilities without persons with disabilities.” This motto is the embodiment of one of the basic principles of the struggle of this movement and the ideology inherent to the social model. This important principle has been forged with a greater focus on the public life of persons with disabilities. This was to prevent decisions regarding policies to be designed and implemented from being taken without the stakeholders’ participation. But also, this principle includes the sphere of private life and the crucial decisions involved in it.

---

condition for political legitimacy, becomes some sort of bias of radicalism in the eyes of some individuals without disabilities. Experts with disabilities must be academically valued as experts and politically valued as persons with disabilities. None of these credentials should be conflicting, but appreciated as a whole. “*It was a persistent frustration to Asch that many of her admirers classified her first and foremost as a pioneering voice in clarifying disability rights and tended to overlook or diminish her identity as a Bioethicist. They often based their prioritization on her lifelong blindness, thereby seeming to overlook her training and production in the philosophical analytic basis for work in Bioethics.*”

Legal Capacity

The CRPD replaces the “substitution model in decision-making” with the “support model in decision-making” regarding legal capacity. It imposes the equality clause in legal capacity, guaranteeing the necessary support in situations where people require assistance for decision-making.

This implies prior recognition of legal personality and has significant consequences for the enjoyment and exercise of all rights by persons with disabilities.

Paragraph 2 of article 12 establishes that “persons with disabilities enjoy legal capacity on an equal basis with others in all aspects of life.” All aspects of life include, obviously, the exercise of sexuality.

This rule, which requires recognizing legal capacity under conditions of equality among persons (men and women, with and without disabilities) in all aspects of life, implies a transcendental change in human rights.[3] Article 12, in particular, generated a Copernican shift in all national civil capacity regulations, which in many countries included a differentiation between the right to hold rights and the right to exercise them.

Both the International Convention for the Elimination of All Forms of Discrimination against Women (Art. 15) and the Convention on the Rights of Persons with Disabilities (Art. 12) thus provide a double anti-discriminatory guarantee, which prevents restricting and/or violating the recognition of the legal personality or the exercise of legal capacity because of gender or disability.

Arlene Kanter describes the change introduced by Article 12 in the following terms: “Instead of paternalistic guardianship laws which substitute a guardian’s decision for the decision of the individual, the CRPD’s supported-decision making model recognises first, that all people have the right to make decisions and choices about their own lives” (Kanter, 2009).

Accordingly, the CRPD Committee interpreted the treaty as requiring all governments to remove the old guardianship system and replace it with supported-decision-making systems (according to article 12.3 CRPD).

Given the implication of legal capacity as a gateway to the enjoyment and exercise of rights, this represented – among many other transcendental issues – the possibility of recognizing and respecting the right to identity, the right to choose with whom to live, where to live, how to live, with whom to build our relationships – among them the right to form a family – the possibility of citizen and democratic participation, and a long etcetera that includes different conditions necessary for the construction of a personal and unique life project (Palacios, 2012). And without a doubt, it provides for the exercise of very personal rights that make up our essence as human beings.

Once the first obligation has been established, which is to recognize that people (women and men) with disabilities have legal capacity on an equal footing with

---

[3] The guarantee of equality in legal capacity refers to both the capacity to enjoy or have rights and the capacity to act or exercise them.

others, the second is foreseen, which takes the form of providing measures or support systems for their exercise. Thus, paragraph 3 establishes that *"States Parties shall take appropriate measures to provide access by persons with disabilities to the support they may require in exercising their legal capacity."*

In this way, the CRPD no longer allows asking *if the person with a disability has* the capacity to exercise their legal capacity but redirects the question to elucidate the person with disabilities' *requirements to exercise their legal capacity.* The response should inquire about accessibility conditions, the adoption of reasonable accommodations, and the provision of a support system. Indeed, all support systems must be tailored to the needs of the person and designed for each case, considering the specific requirements according to their condition and situation.

Recognizing the right on an equal basis with others means that the exercise of legal capacity cannot be limited or restricted due to gender or disability. In other words, to ensure non-discrimination based on gender and/or disability in the exercise of legal capacity, universal accessibility and reasonable accommodation must be guaranteed. This is where the support system comes into play, as part of universal accessibility (if they can be foreseen in advance) and reasonable accommodations if they could not have been expected.

Hand in hand with the abovementioned obligation, paragraph 4 of article 12 establishes the obligation to establish a system of safeguards to prevent abuse in relation to the measures that could be adopted within the support framework. This is vital in the lives of women with disabilities, who suffer abuse and violence to a greater extent than men, and these acts are often committed by those who are supposed to provide support.[4]

Legal capacity is often considered as "the right to have rights" because when a person is deprived of legal capacity (e.g., if she is declared incapacitated), she will not be able to exercise most rights such as voting, getting married, exercising parental responsibility, property management, and so on.

We will refer to the two main obstacles mentioned above from a legal capacity perspective.

Forced interventions: The right to give informed consent to sterilization, contraceptive treatments, and abortion is not legally recognized by people declared incapable or deprived of support systems. A guardian may make this delicate decision by substituting the person's will.

Implicit obstacles to having sex: People declared incapacitated, but also people deprived of support systems or basic levels of autonomy, are generally unaware of

---

[4] Paragraph 4 establishes that: "*States Parties shall ensure that all measures that relate to the exercise of legal capacity provide for appropriate and effective safeguards to prevent abuse in accordance with international human rights law. Such safeguards shall ensure that measures relating to the exercise of legal capacity respect the rights, will and preferences of the person, are free of conflict of interest and undue influence, are proportional and tailored to the person's circumstances, apply for the shortest time possible and are subject to regular review by a competent, independent and impartial authority or judicial body. The safeguards shall be proportional to the degree to which such measures affect the person's rights and interests.*"

their rights and live in highly restricted or even closed and incarcerated settings, away from any practical possibility of having intimacy or even social exchanges in general. Therefore, deprivation of sexual life comes from the belief that a person "can't" do anything by herself, which includes having sex, and the person "can't" decide to put into practice her desire, which includes choosing to have consented sexual intercourse. In summary, the legal incapacity framework currently in place in many countries contributes to retaining persons with disabilities without any positivity of sexual exploration or intercourse.

Sexual, Reproductive, and Non-reproductive Rights

Within the personal rights field, the CRPD provides special protection for the right to personal integrity and sexual, reproductive, and non-reproductive rights**.**

Sexual, reproductive, and non-reproductive rights could be defined as "the rights that guarantee free decision on the way of living one's own body in the sexual and reproductive spheres, which implies the right of every person to decide with whom, when and how they have sexual relations or descendants" (Pelaez Narvaez, 2012). Although we know that its scope is much broader, it includes the following (Quan Chang, 2014):

- The right to sexual freedom
- The right to sexual autonomy, integrity, and security
- The right to privacy in sexual matters
- The right to sexual pleasure
- The right to emotional and sexual expression
- The right to gender equality
- The right to make decisions on matters of reproduction
- The right to comprehensive sexuality education
- The right to information based on scientific knowledge
- The right to health in sexual health

Article 25 of the CRPD expressly states that persons with disabilities shall have access to the "same range, quality and standard of free or affordable health care and programmes as provided to other persons, including in the area of sexual and reproductive health and population-based public health programmes."

And more specifically, article 23 establishes the guarantee that "*Persons with disabilities, including children, retain their fertility on an equal basis with others.*"

This aspect of the rights of persons with disabilities has been tabooed and systematically denied throughout history and has a clear gender component. That is, it mainly affects women and girls with disabilities. In this sense, this rule is straightforward. It establishes that non-discrimination based on disability in surgical contraception is genuinely respected, that the person's disability cannot justify this practice, and that it must have the same guarantees as those provided to people without disabilities. This includes the adoption of reasonable accommodations and voluntary support systems.

It is common to require the express and formal consent of the person to exercise personal rights, but an exception is introduced for persons with disabilities. In that case, the consent is substituted by the family, the legal representative, or a judge. Even within the child's rights framework, most current legal systems do not allow legal representatives (mothers/fathers or guardians) to consent to this practice, except in situations of specific and imminent risk to the child's life. However, this is generally allowed for persons with disabilities without the need to demonstrate any risk. These provisions clearly violate the CRPD and the Convention on the Rights of the Child (Fernández, 2016).

A clear illustration of this situation has been the decision of the Colombian Constitutional Court that endorsed in 2014 the sterilization of girls with disabilities without their consent.[5] In this case, the resolution violated the CRPD and the Convention on the Rights of the Child. The Constitutional Court understood that "if the minor does not understand, nor is there the possibility that in the future, he or she will understand the implications of the procedure and the meaning of maternity or paternity, this means that there is a severe or profound level of disability that prevents him from making decisions in this regard and, therefore, he will not be able to exercise his sexual and reproductive rights freely. Therefore, in this case, the request and consent will be signed by the respective legal representative, who must have the interdisciplinary medical certificate confirming the deep and severe degree of disability that prevents the future consent of the minor. The judge will evaluate the preceding in each case and make the decision that best optimises the rights of the minor."[6] It is possible to clarify that sometime later, the same Court modified its position incorporating the standards of international human rights law.[7]

It should also be noted that the CRPD includes essential provisions to guarantee equality in exercising the right to human reproduction. Article 23(1)(b) states that State Parties must ensure that "*the rights of persons with disabilities to decide freely and responsibly on the number and spacing of their children and to have access to age-appropriate information, reproductive and family planning education are recognised, and the means necessary to enable them to exercise these rights are provided*."

Finally, the Convention expresses through art. 17 that "Every person with disabilities has a right to respect for their physical and mental integrity on an equal basis with others."

In other words, some specific rights are the following:

- Access to programs for sexual health, reproductive health, and family planning.
- To be free of forced sterilizations and forced contraception.

[6] Constitutional Court Colombia, C-131/2014, no. 6.4.4., para. 2 and 3.

[7] Colombian Constitutional Court, ST-665, Oct. 30/17.

- To have "relationships" broadly (including sexual intercourse).
- To decide if, when, and how often to have children and in which conditions. Similarly, article 16 of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) establishes that men and women have "[t]he same rights to decide freely and responsibly on the number and spacing of their children and to have access to the information, education and means to enable them to exercise these rights."

Right to Have Sex

The very concept of recreational sex dismantles the traditional association between sexual and reproductive rights. In general, they are viewed as an indivisible pairing. But considering sex only as a means of reproduction is problematic in many aspects. First, it encloses a particular moral judgment regarding which uses of sex are permissible or even proper for public or legal debate (e.g., heterosexual coitus of penis and vagina). Also, this association may send a disapproving message to people that cannot or do not want to reproduce. This can significantly affect women, who carry the biologic-centered and deterministic burden of reproduction and childbearing in our society.

In the words of a former UN Special Rapporteur on Violence against Women: "Social pressures, combined with the threat of domestic violence, may result in restrictions on a woman's ability to exercise reproductive and sexual autonomy. A woman's ability to bear children is linked to the continuity of families, clans and social groups. As such, it has been regulated by families, religious institutions and governmental authorities. The importance of procreation to a particular community can pressure women to bear children" (E/CN.4/1999/68/Add.4, 1999).

They are focusing on recreational sex to establish a foundation for freedom. When that right is granted and exercised, many other vital options, such as reproduction, relationships, and love, become available. But without sexual freedom, the range of possibilities shrinks.

Recreational sex is a topic present in the media, literature, and films. Therefore, there is no reason the legal and public debate should exclude it when the subjects belong to a particular group. There is also a longstanding tradition of legal and political concern for forced abortions and sterilizations in the disability agenda, but no such interest in sex as a leisure activity.

It is clear that in some national and international contexts, it is still controversial to mention these issues. That explains their lack of presence in laws, court decisions, and even academia.

For persons with disabilities, the sexual arena is sometimes depicted as a frightening place of rape, abuse, and unwanted pregnancy.

Regarding the CRPD drafting process, Marta Schaaf reflects on this tendency: "Sexuality was mentioned in documents emanating from initial regional consultations almost exclusively in the context of sexual abuse and forced sterilisation; indeed, the sexual vulnerability was presented as a principal area for increased protections" (Schaaf, 2011).

It is rare to find other references to sex rather than abuse in its different forms – no place for mutual consent, no place for pleasure, no place for love. As soon as we change the focus from caregivers' fears to expectations and the right of individuals to engage in sexual activities on an equal basis with others, the situation will change.

To be clear, we are not underestimating the heightened vulnerability of, for example, women with intellectual disabilities to be victims of sexual crimes and sexual exploitation. But the prevention of crimes cannot be the justification of an across-the-board restriction of the fundamental rights of the potential victims.

As stated before, sexual rights are difficult to find, but some milestones exist in international law. For example, the UN Report of the International Conference on Population and Development of Cairo of 1994 defines reproductive health as: "…a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity, in all matters relating to the reproductive system and its functions and processes. Reproductive health, therefore, implies that people can have a satisfying and safe sex life and that they can reproduce and the freedom to decide if, when and how often to do so. Implicit in this last condition are the right of men and women to be informed and to have access to safe, effective, affordable and acceptable methods of family planning of their choice, as well as other methods of birth control which are not against the law, and the right of access to appropriate health-care services that will enable women to go safely through pregnancy and childbirth and provide couples with the best chance of having a healthy infant" (A/CONF.171/13/Rev.1, 1994).

It is essential to highlight, in particular, the concept of a "satisfying and safe sex life" as groundbreaking. It was also interesting – and logical – that the document established sexual freedom as a prerequisite for reproductive health. This definition was almost reproduced in the UN Platform for Action of the United Nations Fourth World Conference on Women of Beijing, 1995 (A/CONF.177/20/Rev.1, 1995).

In 1996, Radhika Coomaraswamy, the former United Nations Special Rapporteur on Violence Against Women, wrote in an article about the existence of a movement that was "generating new rights": "The most controversial is the issue of sexual rights, which generally refers to a woman's control over her sexuality and her access to primary and secondary health care and reproductive technologies. It concerns the international recognition of women's rights over their bodies and their sexuality." She described the world conferences of Cairo and Beijing as "a major landmark in this field" (Coomaraswamy, 1996).

Even when the term "sexual rights" was erased from the final version of the Platform of Action, she highlights the sexual autonomy and freedom of choice components (Coomaraswamy, 1996).[8] Coomaraswamy had the opportunity to

---

[8] "Though the term 'sexual rights' was included in the draft Platform of Action, it was omitted from the final version, an omission indicating the controversial nature of this suggestion. It must also be noted that the formulation falls short of the right to abortion and sexual preference, an important demand of women's groups and the gay movement. Nonetheless, the inclusion of the paragraph even in this truncated form, and its accompanying vision of sexual autonomy and freedom of choice, are important developments in international human rights discourse."

mention these advancements in her 1999 official UN Report: "[m]any forms of violence against women result in violations of women's reproductive rights because such violence often imperils their reproductive capacities and/or prevents them from exercising reproductive and sexual choices" (E/CN.4/1999/68/Add.4, 1999). We would also like to underline and use the concept of "sexual choices" and "sexual autonomy" cited before.

In sum, we assert that the level of respect for the sexual rights of people with disabilities is minimal. And a cause for this might be social pressures, but not to reproduce. On the contrary, the mandate is to avoid any sexual contact.

Sexual Assistance

Support is a crosscutting concept in the CRPD. It is mentioned regarding legal capacity, employment, education, and so on. The full enjoyment of many rights for persons with disabilities includes the provision by the state of appropriate support tailored to the person's needs. Is sex another field where support should be granted?

Marta Schaaf identifies Tepper and Shuttleworth as authors who consider "the experience of pleasure" as "an accessibility issue" (Schaaf, 2011) for persons with disabilities. But what happens when a third person is involved? Can we still refer to accessibility?

In 2011 the Argentinean disabled persons organization REDI published a report (REDI, 2011) called "El derecho a la autonomía de las personas con discapacidad como instrumento para la participación social" ("People with Disabilities' Right to Autonomy as an instrument of social participation") that analyzes in depth CRPD's Article 19 (Living independently and being included in the community) and its application to the Argentinean context.

The first remarkable point of this publication, and valuable for our analysis, is that sexual accessibility arises when dealing with the right to independent living. Under the section "Los servicios para la vida autónoma" (Services for an Autonomous Life), there is a brief description of the figure of the "sexual assistant":

> Sexual assistance is implemented in some European countries, such as Germany and the Netherlands, with different objectives and scope. It was created to break with the cultural barriers that restrict a full sexual life by persons with a certain disability or with disfigurement. Originally provided by female prostitutes, sexual assistance triggered a strong social debate that found its balance with deepening the debate and establishing certain rules that would allow sexual climax without recurring to practices commonly associated with sex. In other circumstances, where the sexual climax caused by the sexual assistant is prohibited, he or she acts as a facilitator of the sexual meeting between two persons that, because of their disabilities, are limited to making it by their means. The debate surrounding sexual assistance is still open but advances firmly towards guaranteeing sexual practice as a human right. (REDI, 2011)

Another remarkable concept is naming a sexual practice as a human right. The text suggests that the service could be provided as a facilitator for consented sex between two adults and as a sexual service.

It would be important that future research focuses on the perspective of women with disabilities and LGBTI persons with disabilities as recipients of sexual assistance and its gender implications.

Many countries already have sex subrogate services (sometimes called "Medical sex workers"), including the Netherlands, Japan, Denmark, the United Kingdom, and Australia. In some cases, the service is funded by the state.

Independent living seems to be one answer for this and many other disability issues. A satisfying sexual life in incarcerated settings (where privacy is scarce) is challenging to achieve. Likewise, a very protective family environment also seems to be an obstacle because social and sexual lives are generally intertwined.

Another structural obstacle for this and other types of social interactions is, of course, ableism. The last frontier will be surpassed when prejudice against the "disabled" body and mind is replaced by desire.

Barriers

Women with disabilities are subject to different types of discrimination in exercising their personal rights, such as denial of their sexuality, infantilization, humiliation or rejection of their bodies, among other forms of stigmatization of their sexuality or their maternity wishes. This exposes them to various health risks through factors such as the absence of sexual and reproductive health services, the lack of information and accessible sexual education, defective care in pregnancy, childbirth and puerperium, the prevalence of sexually transmitted infections and HIV, and especially, situations of sexual violence (Profamilia Project, 2018).

Undoubtedly, the most significant difficulties that women with disabilities must face to exercise their legal capacity in accordance with the provisions of art. 12 of the CRPD are communication barriers – which could be summarized as the absence of accessibility in the communication process when it comes to expressing desires, needs, and preferences. Other challenges are *attitudinal barriers*, which include, in some cases, legal barriers as a consequence of prejudices and stereotypes; court rulings with legal interpretations based on prejudices and stereotypes; and lack of support and gender perspective, among many others.

Although women with disabilities must face these barriers to exercise their legal capacity, there are two clear areas where international regulations have placed greater emphasis.

The first is property rights. Decades ago, the Convention for the Elimination of all forms of discrimination against Women emphasized anti-discriminatory protection as a consequence of the violations of rights suffered by women in this sphere.[9] This

---

[9] As mentioned, the International Convention for the Elimination of all forms of Discrimination against Women has emphasized the protection of the exercise of the legal capacity of women in the field of property rights. The CEDAW recognizes that in civil matters, women have a legal capacity identical to that of men and the same opportunities to exercise that capacity. In particular, states are obliged to grant women equal rights to sign contracts and manage assets and to provide equal treatment at all stages of the proceedings in courts of law and tribunals.

makes sense given its historical context: This is justified given its historical context, as women had their capacity to exercise their rights to manage their property legally restricted.

But CRPD imposes the obligation to adopt all relevant and effective measures to guarantee the right of persons with disabilities, on an equal basis with others, to own and inherit property, control their economic affairs and have access to equal conditions for bank loans, mortgages, and other forms of financial credit, and to ensure that persons with disabilities are not arbitrarily deprived of their property.

In the case of women with disabilities, disability is often considered negatively to justify the impossibility of exercising these rights. This leads to the fact that today women with disabilities continue to be discriminated against "for reasons of disability" in the exercise of their maternity, in self-referential decisions that involve reproduction, in the exercise of their sexuality, in the conformation of their identity, in the right to privacy, and a long etcetera.

Considering the situation above of discrimination, the International Convention on the Rights of Persons with Disabilities has emphasized guaranteeing certain personal rights. Among others, the right to dignity, the right to preservation of identity (art. 3), the right to image (art. 8), and the right to freedom – which includes the right not to suffer exploitation, violence, or abuse (art. 16), the right to physical and mental integrity (art. 17), the right to identity (art. 18), the right to privacy (art. 22), the right to form a family, to exercise their maternity, to maintain their fertility (art. 23), and the right to sexual and reproductive health (art. 25).

But these rights will be mere utopias if the gender and intersectional perspectives are not included, nor is there the exercise of legal capacity and the necessary support measures.

Meanwhile, women with disabilities face legal barriers in those countries where the Law allows them to be substituted in decision-making involving their right to start a family. As well as the Law itself will enable them to be deprived of their liberty without their free and informed consent (reaching that of their representatives). Or they are subjected to medical treatments without their informed consent (resembling that of their representative). Or the Law allows them to be subjected to forced sterilizations (without their free and informed consent, only that of their legal representative is sufficient).[10]

The need for a legislative reform that guarantees non-discrimination against women with disabilities in matters of sexual and reproductive rights has been supported by the United Nations Committee on the Rights of Persons with Disabilities in various Concluding Observations and General Comments.

The Committee on the Rights of Persons with Disabilities addressed this issue at a general level. The General Comment regarding women with disabilities mentioned sexual and reproductive rights, including respect for the home and family (articles 25 and 23 of the CRPD, respectively). It establishes that the lack of accessibility to

---

[10] The Recommendations and General Observations of the Committee on the Rights of Persons with Disabilities have systematically emphasized this reality.

information, services, attitudinal barriers, and substitutive systems will contribute to sexual violence against women with intellectual and sensory impairments. It also leads to forced contraception, sterilization, and the denial of parental responsibility for their children (CRPD GC-3, 2016).

It is also worth mentioning the report of the former Special Rapporteur on violence against women. It addresses the absence of sexual information as a violation of women's reproductive health: "Inadequate levels of knowledge about human sexuality and inappropriate or inadequate reproductive health information and services, culturally-imbedded discrimination against women and girls, and limits on women's control over their sexual and reproductive lives all contribute to violations of women's reproductive health." We would also argue that seeing women with disabilities as asexual is culturally embedded discrimination in the words of the Rapporteur.

According to CEDAW's General Recommendation 24, "States parties should also, in particular: [...] (e) Require all health services to be consistent with the human rights of women, including the rights to autonomy, privacy, confidentiality, informed consent and choice"(CEDAW GR-24, 2008). The inclusion of consent and autonomy applied to women with disabilities reinforces the prohibition on forced abortions, forced pregnancies, and forced sterilizations.

The Rapporteur also indicates that "The right to reproductive health implicates the right to sexuality and sexual autonomy. While sexual and reproductive health rights are linked, they are not coterminus. Underscoring the recognition in the Cairo Programme of Action of the right to have a satisfying and safe sex life, paragraph 96 of the Beijing Platform for Action states that, "the human rights of women include the right to have control over and decide freely and responsibly on matters related to their sexuality, including sexual and reproductive health, free of coercion, discrimination and violence." Sexual rights include the right to information, based upon which one can make informed decisions about sexuality; the rights to dignity, to privacy and to physical, mental and moral integrity in realizing a sexual choice; and the right to the highest standard of sexual health. / Yasmin Tambiah, "Sexuality and human rights," in Margaret Schuler, From Basic Needs to Basic Rights, 1995, p. 37./". UN doc E/CN.4/1999/68/Add.4 Report of the Special Rapporteur on violence against women, its causes and consequences, Ms. Radhika Coomaraswamy, in accordance with Commission on Human Rights resolution 1997/44 Addendum https://documents-dds-ny.un.org/doc/UNDOC/GEN/G99/103/26/PDF/G9910326.pdf? OpenElement.

In other words, sexual freedom does not imply a reproductive intention, but a reproductive intention implies sexual freedom.

A milestone for sexual liberation was the invention of the contraceptive pill. From then on, sexual activities and reproduction go separate ways for many societies. Reproduction is not seen any more as an inevitable destiny but as the result of a decision. And this is true mainly for women because their bodies are necessarily involved. But reproductive decisions need, as a prerequisite, the person can fully exercise their sexual liberty to have the information and practical opportunities. Without freedom, reproduction is mandatory.

Forced Sterilizations

Involuntary sterilization is a two-fold ableist action. On the one hand, it implies the policy of exterminating future generations of persons with disability, also known as eugenics. The U.S. Supreme Court bluntly put it in 1927: "[t]hree generations of imbeciles are enough."[11] On the other hand, sterilizations are a form of regulating the sexuality of women with disabilities. We will refer to the latter.

In the 2011–2014 period, the CRPD Committee reviewed the reports of 13 state parties. Only in four opportunities (30.77%) there is no recommendation in the final official document regarding forced sterilizations. We are dealing with a global policy against persons with disabilities, even when article 23 of the CRPD prohibits it.

The sterilization of persons with disabilities is not only addressed from the framework of the rights mentioned above but also in another area such as the general framework of protection against torture. This has been stated by the UN Rapporteur against Torture when pointing out that "forced sterilisation is an act of violence, a form of social control and a violation of the right not to be subjected to torture and other cruel, inhuman or degrading" (A/HRC/22/53, 2013). But when these practices are carried out on women with disabilities, they usually go unnoticed or are justified and are not considered a form of torture or other cruel, inhuman, or degrading treatment or punishment (A/63/175, 2008). Along the same lines, the former Special Rapporteur on violence against women, its causes, and consequences pointed out that "there is a long history of forced and non-consensual sterilisations of women with disabilities that are socially and even legally accepted" (A/67/227, 2012).

In the inter-American system, the Inter-American Court of Human Rights recognized that "sterilisations disproportionately affect women because they are women and based on the perception of their primary reproductive role and that they are not capable of making responsible decisions about their health." Given the prevalence of the stereotypes mentioned in the previous paragraph, "sterilisation without consent... has had a greater impact on women who are part of groups with greater vulnerability to suffering this violation of human rights,... because of their... disability." (Case IV vs. Bolivia, 2016).

Among several, it is worth highlighting the recommendations of the Committee on Spain. It pointed out its "concern over the fact that persons with disabilities whose legal status is not recognised may be subjected to sterilisation without their consent, freely given and knowingly" (CRPD/C/ESP/CO/1, 2011).

Accordingly, in its Observation on Peru, the Committee expresses its concern "that Technical Standard for family planning No. 536/2005 – MINSA of July 26, 2005, allows, as a contraceptive method, to sterilize 'mentally incompetent' people without their free and informed consent" (CRPD/C/PER/CO/1, 2012).

The same argument was reiterated about China, noting its concern "that both the State party's legislation and its society accept the practice of subjecting women with disabilities to forced sterilisation and abortion without their free and informed consent" (CRPD/C/CHN/CO/1, 2012).

---

[11] Buck v. Bell, 274 U.S. at 207.

Jurisprudence: In Re Eve

The Supreme Court of Canada decided in 1986 a leading case regarding a person that requested judicial authorization to perform non-therapeutic and irreversible sterilization over her 24 years old daughter with an intellectual disability (E. Mrs. v. Eve, 1986 2 S.C.R. 388. Can.). One of the purposes of the sterilization was to relieve Eve's mother "... of anxiety about the possibility of Eve's becoming pregnant and of having to care for any child Eve might bear."

Even when the Court assumed that "Eve" was unable to give consent to the procedure, it stated the following: "The grave intrusion on a person's rights and the certain physical damage that ensues from non-therapeutic sterilisation without consent, when compared to the highly questionable advantages that can result from it, have persuaded me that it can never safely be determined that such a procedure is for the benefit of that person. Accordingly, the procedure should never be authorised for non-therapeutic purposes under the parents' patriae jurisdiction."

Between two rights – the right to reproduce and the "fundamental right to choose not to have children" – the Court refused, "at the behest of a third party, to make a choice." It is also remarkable that they set up a standard regarding the burden of proof and the right to independent representation.

The ruling includes references to a report of the Law Reform Commission of Canada that discovered that "there is considerable evidence that non-consensual sterilisation has a significant negative psychological impact on the mentally handicapped." They added that "[i]n a study by Sabagh and Edgerton, it was found that sterilised mentally retarded persons tend to perceive sterilisation as a symbol of reduced or degraded status." ("Sterilization, Working Paper 24 (1979)").

Also, the Court expressly refused to accept the substituted judgment test.[12] On the other hand, the ruling makes it clear that the mother's decision was based at least partially on the fact that she disapproved that Eve had sexual encounters. As the Court points out: "She was attracted, and attractive to men, and Mrs E. feared she might quite possibly and innocently become pregnant." The Court mentions two other precedents where these parents' concerns were equally involved.[13] As mentioned before, the regulation of sexuality is present.

However, the Court declines the authorization because "...there are human rights considerations that should make a court extremely hesitant about attempting to solve a social problem like this by this means." They considered that "our social history [of forced sterilisations of persons with disabilities] clouds our vision and

---

[12] "...it is obviously fiction to suggest that a decision so made is that of the mental incompetent, however much the court may try to put itself in her place. What the incompetent would do if she or he could make the choice is simply a matter of speculation."

[13] First case: "In *Matter of Sallmaier*, 378 N.Y.S.2d 989 (1976), the court, basing itself on expert testimony concerning the likelihood of a psychotic reaction to pregnancy, other evidence of psychological and hygienic difficulties, and the patient's proclivity for sexual encounters with men, authorized the sterilization of a severely retarded adult woman."

encourages many to perceive the mentally handicapped as somewhat less than human. This attitude has been aided and abetted by now discredited eugenic theories whose influence was felt in this country and the United States."

Ashley X

In 2006 a United States case identified as "Ashley's treatment" and "Pillow Angel" gained attention in the media after a publication in the Archives of Pediatrics & Adolescent Medicine titled "Attenuating Growth in Children With Profound Developmental Disability. A New Approach to an Old Dilemma" (Gunther & Diekema, 2006)· Ashley is a girl with cerebral palsy subjected to hormone treatment and surgical interventions. The objective of her parents was to avoid her growth to facilitate the caregiving task. The several procedures were authorized by the Ethics Committee of the prestigious Seattle Children's Hospital. In their article, the physicians state that the intervention is "medically feasible and ethically defensible."

But voices of disapproval appeared among scholars (Kittay, 2011) and within the medical community (Bersani et al., 2007). For example, Carole Marcus, MBBCh, from the Children's Hospital of Philadelphia, published in the section "pediatric forum" of a later edition of the journal a reply titled "Only Half the Story." She argues that the article in the journal was misleading by only referring to the hormone treatment, but that in media articles, it was disclosed that the treatment included the removal of breast buds and hysterectomy. She identifies, therefore, an intention in the treatment to "infantilise her and remove any evidence of puberty and maturation." The original authors later replied, "[t]he exclusion of breast bud removal from our discussion should make clear that we do not consider that procedure necessary or routine part of growth attenuation therapy." Dr. Marcus's question lingers in the air: Why was it performed?

One answer may arise when browsing the parent's webpage,[14] where they encourage other parents to access the treatment and share experiences (even when the procedure was later considered illegal). According to the page, one reason for the mastectomy was that "[l]arge breasts could 'sexualise' Ashley towards her caregiver, especially when they are touched while she is being moved or handled." Also, "[a] dditional and incidental benefits to hysterectomy include avoiding any possibility of pregnancy, which to our astonishment does occur to disabled women who are abused." The argument for the elimination of sexual and reproductive elements in her body then resides in the prevention of abuse but also "sexualization."

Other voices of disapproval came from the disability movement. Anne McDonald is also a person with cerebral palsy. She lives in Australia, where she had to file a habeas corpus to be de-institutionalized. But that was possible because she had support and could overcome the communication barrier. In a newspaper article published in Seattle, she affirms that "[t]o equate intelligence with motor skills is as absurd as equating it with height" and asks that "[n]o child should be presumed to

---

[14] http://www.pillowangel.org

be profoundly retarded because she can't talk. All children who can't talk should be given access to communication therapy before any judgments are made about their intelligence." She firmly opposes the treatment as "the roster set by the state and accepted by the medical profession."[15]

Also, a disability rights advocacy organization from the State of Washington called Disability Rights Washington (DRW)[16] prepared a document that recommended the following: "Courts also have limited parental authority to consent to other types of medical interventions that are highly invasive and/or irreversible, particularly when the interest of the parent may not be identical to the interest of the child. Thus, the other aspects of the 'Ashley Treatment' – surgical breast bud removal and hormone treatments – should also require independent court evaluation and sanction before being performed on any person with a developmental disability."

The intervention of the judiciary seems to be an adequate safeguard for DRW to prevent this type of case from occurring.

DRW also prepared and posted a brief video regarding this case on the Internet that includes several opinions from persons with disabilities. For example, Joelle Brouner expresses her concern: "I'm not here to say that parents don't have the right to make decisions. But parents don't have the right to do anything they want for their children. Children are their own human selves. They are not just the property of their parents. They are not just extensions of their parents."

On the other hand, Corinna Fale makes the following dramatic statement: "I was furious when I heard this come out on the news. I was extremely angry not only that it happened, but I was angry at the hospital. After this happened, I had a conversation with my mom, that said, if I had known about this when you were younger, I might have thought about doing it to you."

Tools: Accessibility, Accommodations, and Supports

The barriers that persons with disabilities face when exercising their rights are the consequence of a society planned only for a hegemonic person (usually characterized as a male without disabilities). To eliminate these barriers, the CRPD offers some strategies which require incorporating a broad view of human diversity.

---

[15] http://www.seattlepi.com/local/opinion/article/The-other-story-from-a-Pillow-Angel-1240555.php

[16] Disability Rights Washington (DRW) *"is a private, non-profit organization that protects the rights of people with disabilities statewide." "A substantial portion of the DRW budget is federally funded."* http://www.disabilityrightswa.org. They carry out innovative and extremely interesting legal activism, for example, "TR v. Quigley" class action lawsuit for intensive in-home mental health services based in the community to avoid criminal and psychiatric institutionalization. DRW is P&A of the State of Washington. "*The Protection and Advocacy (P&A) System and Client Assistance Program (CAP) comprise the nationwide network of congressionally mandated, legally based disability rights agencies. A P&A/CAP agency exists in every U.S. state and territory. There is also a Native American P&A in the four corners region of the Southwest.*" http://www.ndrn.org/about/paacap-network.html. The federal law is called Protection and Advocacy for Individuals with Developmental Disabilities (PADD) 42 USC §§ 15041–15045.

The primary strategy is universal accessibility, which is the condition that guarantees that all people can access and participate. It is a condition for the exercise of every right (Asís Roig et al., 2007).

To achieve this condition of accessibility, there are two complementary strategies: universal design (for all people) and reasonable accommodations.

Universal design consists of conceiving environments, processes, goods, products, services, objects, instruments, devices, or tools from the beginning in such a way that they can be used by all people, with or without disabilities. Through the technique of universal design, the goal is to achieve universal accessibility. It is a means, an instrument, an activity aimed at achieving that end (CRPD, Art. 2).

Reasonable accommodations are those measures designed to adapt the environment to the specific needs of certain people who, for different reasons, find themselves in a special situation that could not have been foreseen through universal design. These measures tend to facilitate participation on equal terms (CRPD, Art. 2).

Taking the above into account, we could say that accessibility would be the situation to which one aspires; universal design is a strategy at a general and prior level to achieve it; and reasonable accommodations is a subsequent strategy at an individual level when universal design is not enough to ensure architectural and communicational accessibility.

The exercise of legal capacity in sexual, reproductive, and non-reproductive rights requires a third strategy to achieve universal accessibility: support systems.

The support model stipulated in the CRPD is based on the premise that the person does not need a "protective" measure that deprives them of exercising their legal capacity. On the contrary, the solution consists of measures aimed at providing the necessary support to enhance legal capacity. This implies creating and/or adapting tools that guarantee accessibility to the exercise of legal capacity, that is, to make decisions on their behalf with the necessary support by their specific needs (i.e., "a tailored suit") (Bulit Goñi, 2008).[17]

These measures, which can be very diverse, can be accepted without being expressly covered in civil legislation. They could also be contemplated in social policies, as well as in sanitary regulations.

Although support systems consist of different arrangements (advice, interpretation, accompaniment, etc.), the critical element of the support model lies in its underlying philosophy, which materializes in the protected legal interests of autonomy and the exercise of the rights of the person. In this way, the judge can establish that for the celebration of certain legal acts, it is required that the support person

---

[17] It is also necessary to differentiate between different types of "support." This differentiation must be established firstly in relation to the type of act and secondly in relation to the type of appropriate support figure. In relation to the first, it is necessary to differentiate between transcendental acts for life (marriage, exercise of maternity, surgical operations, sale or purchase of a house, donation) and ordinary acts of common life (daily purchases, going on a trip, subscribe to a sports club). In relation to the second, it is necessary to make different types of support figures available to the person, which adapt to their particular situation.

expresses having assisted the person in understanding the consequences or implications of the act for their life. For other types of acts, it can be determined that the support assists the person in the manifestation of their will or intention based on the use of alternative communication formats and all other information necessary for the conclusion of the legal act.

Independently of its different modalities, all these dimensions must be developed in judicial and administrative processes such as the sanitary setting. In this case, the support becomes part of the universal accessibility that guarantees exercising the right. That is part of the essential content of the right itself.

The Path Forward

Historically, women's consent has been undervalued. For example, when their legal capacity was not even recognized or when the requirement of consent was overlooked in rape cases. In other words, consent is presumed when women are victims of violence. Still, it is disregarded when women want to decide about their lives (legal capacity) and bodies (contraception, abortion, and sex).

An inclusive and substantive equality model requires bearing in mind factual situations of structural inequality, such as those faced daily and in all spheres by persons with disabilities. In terms of sexual and reproductive rights – as in so many other rights – their reality is far from the legal standard. In this matter, the violation of rights often occurs due to preconceptions and stereotypes that sustain the impossibility of exercising sexual rights by persons with disabilities. This results in the substitution of their will or even the lack of exercise of autonomy, which leads to not knowing one's preferences or desires. Since freedom is a learning process, many persons with disabilities are at a clear disadvantage compared to others.

The paradigm shift initiated by the CRPD recognizes, reinforces, and enhances the autonomy of people who, due to their intellectual or psychosocial condition, have historically been deprived of their right to decide on sexual, reproductive, and non-reproductive issues (Iglesias & Palacios, 2019). And this, at the same time, requires the guarantee of a series of preconditions: reasonable accommodations and supports that are essential to the same right. Simply put, if they are not fulfilled, they annul the existence of the right. In these cases, an intersectional perspective requires that the decision-making process in the sanitary field guarantees conditions of accessibility, adoption of reasonable accommodations, and support measures (Iglesias & Palacios, 2019).

To achieve this, it is essential to deepen and strengthen the awareness of those who are part of the health system and have to guarantee this right through dignified treatment and respect for the autonomy of persons with disabilities. This awareness must include – in light of international law standards – the topic of disability from a human rights perspective; as well as specific content on the management and implementation of public policies with a disability perspective from a universal, transversal, and intersectional design; and guaranteeing non-discrimination, autonomy, and participation of persons with disabilities.

Secondly, it is fundamental to develop a genuinely Comprehensive Sexual Education, establishing active policies to promote and strengthen the sexual and reproductive health of the entire population. This also requires training on gender perspective and sexual diversity for teachers and health staff to provide adequate care, support, and follow-up to women who request assistance exercising their rights.

In this training and implementation, awareness must be strengthened once again, so we can achieve a "comprehensive sexual education with a disability perspective," which also includes persons with disabilities as recipients. In other words, a comprehensive, inclusive, broad, and equitable sexual education, from an open and responsible sexual pedagogy involving non-hegemonic human realities (Peirano, 2014).

Finally, the state must work on developing instruments and/or protocols with tools to provide dignified treatment and guarantee the exercise of rights. However, if such instruments do not yet exist – in the meantime and immediately, without practical obstacles or judicialization – every public official has to create and/or adapt tools that guarantee accessibility in decision-making with the necessary supports according to the individual and specific needs. That would represent the suit tailored to needs and potentialities.

Implementing Policy and Law from a Rights Perspective

Implementing Policy and Law from a Rights Perspective: Introduction

70

Roberto Lattanzio

Abstract

The Convention on the Rights of Persons with Disabilities (CRPD) offers critical and fundamental guidance to understanding and interpreting international human rights through a disability rights lens. The CRPD is a foundational tool for lawmakers and advocacy groups in advancing disability rights agendas, and in guiding the understanding of rights in a manner meaningful to persons with disabilities. This introduction provides a brief overview of the objectives of this section and of each of the chapters found within it. In this section, we aim to emphasize the foundational role that the CRPD should have in lawmaking and policymaking and in advancing needed reforms. Grounded in examples from various jurisdictions, the chapters in this section aim to offer approaches to advancing disability rights agendas that draw from the CRPD and further the realization of inclusion and equality for persons with disabilities.

The adoption of the *Convention on the Rights of Persons with Disabilities* (CRPD) signaled a global awakening to the recognition of persons with disabilities as rights holders. The CRPD introduced much-needed critical guidance on how international human rights are to be interpreted in order for those rights to be meaningful to persons with disabilities. Developed through a critical disability rights lens, the CRPD is a foundational tool for advancing disability rights agendas for lawmakers and advocacy groups alike. Notwithstanding the importance of the CRPD, its impact on advancing disability rights domestically is the subject of ongoing development and debate, and is particular to each state party that has ratified it. John Peters Humphrey opined that a great challenge for the United Nations “is to devise effective

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_90

machinery for the implementation and enforcement of the human rights which have now been internationally defined and proclaimed" (Humphrey, 1970).

The CRPD requires that states parties report periodically to the Committee on the Rights of Persons with Disabilities on its domestic implementation, and the Optional Protocol to the CRPD offers individual and group-initiated processes to seek redress for rights violations. Nevertheless, for states that have ratified the CRPD, it has had varying degrees of impact and influence on reshaping domestic legislative frameworks. Unquestionably, the full potential of the CRPD to achieve equality and inclusion for persons with disabilities remains unrealized at the domestic level.

Each chapter in this section explores how the CRPD's principles and substantive rights can be implemented effectively in particular domestic contexts. The chapters rely on examples to illustrate the importance of thoroughly understanding and addressing the exclusion and invisibility in law that persons with disabilities have experienced. The history of persons with disabilities as an equity-seeking group of diverse communities is one of persistent exclusion, ableism, and denial of fundamental rights. Laws have too often failed to address these inequalities, harmed rather than benefited disability communities, or ignored persons with disabilities altogether. Thus, the CRPD offers fundamental and significant guidance in addressing this legacy of exclusion, and in furthering a rights-based approach. Through a legal lens, this section explores some key elements of the CRPD's framework and underlying principles that should form the basis of any domestic legislative and policy development, reform, and implementation.

The section begins with a chapter that explores how the fundamental rationale for the CRPD must always be central in any legislative review or drafting exercise. Since persons with disabilities have been, and continue to be, excluded from legislative development and have not benefited from it, future legal reform must involve persons with disabilities and must meaningfully take into account their histories and experiences of exclusion. While there is a complexity that is specific to each domestic legislative framework, the particular history of persons with disabilities in that context must be understood. Using examples from Canada, the chapter demonstrates how attempts to reform law and policy to comply with the CRPD at times fail to create truly inclusive and beneficial change because they do not address the underlying impacts of exclusion and the fundamental guiding principles that frame the CRPD.

The next chapter in the section explores how historically human rights instruments fail to address intersectionality in a meaningful way, and how the CRPD can be an effective instrument to advance the human rights of individuals beyond siloed approaches. The CRPD assists with establishing a responsive approach to the inequality experienced due to intersecting identities and by multiply marginalized individuals. Grounded in Article 6 of the Convention – "Women with disabilities" (CRPD, 2006) – the chapter explores themes of intersectionality and the role of the CRPD in advancing social advocacy movements. The abortion rights campaign in Ireland is provided as a case study.

Institutionalization is a clear example of a discriminatory practice that exemplifies the invisibility of persons with disabilities. Institutionalization deprives people with disabilities of their fundamental rights, and by design completely excludes them from society. With a focus on Article 19 – “Living independently and being included in the community” (CRPD, 2006) – the third chapter in the section offers an analysis of laws that regulate housing, disability services, and supports within the Canadian context. The chapter unpacks the ways in which these legislative schemes miss the mark on accessibility, inclusion, adequacy, and quality of services needed to make independent inclusive living a reality for persons with disabilities.

Lastly, the final chapter in this section explores how the CRPD can provide important legal guidance to reduce vulnerability and address discrimination in disaster response and management. Relying on the CRPD’s principles and Article 11 – “Situations of risk and humanitarian emergencies” (CRPD, 2006) – the chapter offers a critical analysis of disaster theory and disaster management. It examines how the CRPD’s disability rights framework and intersectional approach can be applied to disaster and humanitarian response.

As every legal practitioner can attest, the law is not, and never can be, static. Human rights law in particular has significantly developed and evolved since the adoption of the *Universal Declaration of Human Rights* seventy-five years ago. The CRPD’s influence on disability rights can be just as significant, as it offers the much needed critical lens to make human rights meaningful for disabled people.

Law and policymakers, adjudicators, and advocacy groups all have important roles to play in ensuring the realization of the CRPD’s promise. Strategies to achieve this change will be diverse, as differences in approaches to treaty ratification and differing legal traditions, for example, will dictate particular challenges and barriers to CRPD implementation into domestic law. The great challenge ahead is for each ratifying state to effectively implement CRPD rights in its particular domestic context in a meaningful way. While each state is unique, there is important cross-jurisdictional learning from one another’s experiences. Relying on the CRPD as a compass for change, the intent of the chapters in this section is ultimately to offer approaches and considerations that may have relevance and can be adapted, notwithstanding the differences among domestic legal systems, to further the realization of inclusion and equality for persons with disabilities.

Abstract

The *Convention on the Rights of Persons with Disabilities* (CRPD) is a fundamental instrument for interpreting international human rights within a disability context, and an important tool for advancing disability rights agendas. Among states that have ratified the CRPD, it has had varying degrees of impact and influence in advancing and shaping legislative, regulatory and policy frameworks. This chapter explores foundational elements found within the CRPD, which, the authors argue, must guide and shape the review and development of legislation, regulations and policies by States Parties. The Chapter relies on illustrative examples from the Canadian context.

Introduction

The United Nations *Convention on the Rights of Persons with Disabilities* (CRPD) represents a seismic shift in how international human rights are understood within the context of disability. The CRPD offers a disability-specific rights framework aimed at achieving substantive equality and full inclusion for persons with disabilities. The CRPD is a blueprint of sorts. It invites States Parties to accelerate domestic legislative and policy reforms, and it enables disability communities to advocate for rights-based approaches to laws and policies that affect them. Durham and Quinn explain that, “[t]he Convention radically re-frames disability and accentuates the moral agency of the person, situating people with disabilities not as objects to be managed or pitied, but subjects with equal human rights. States Parties are expected to take proactive measures to sensitize general laws and policies to the situation of persons with disabilities, and these latter are envisaged as partners and co-producers in the process of change” (Durham & Quinn, 2022).

Thus, the CRPD is undoubtedly the most significant international human rights treaty from a disability rights perspective. It provides an understanding of civil, political, economic, social and cultural rights for persons with disabilities and establishes obligations that states must fulfill in order to ensure the full and equal enjoyment of these rights. While new rights per se are not enshrined in the CRPD, the treaty’s disability-specific interpretation of many well-established rights requires significant reform by States Parties in order for those rights to be realized by persons with disabilities.

Fundamental Objectives of the CRPD

Quinn and Degener explain that a driving factor motivating the need for the CRPD was the invisibility of persons with disabilities within existing international human rights frameworks (Quinn & Degener, 2002a, b). While seminal international human rights treaties, such as the *Universal Declaration of Human Rights*, the *International Covenant on Economic, Social and Cultural Rights,* and the *International Covenant on Civil and Political Rights* have always applied to persons with disabilities, these treaties do not articulate core human rights within a critical disability framework. Moreover, in practice, states were not implementing these core human rights in a manner that benefitted persons with disabilities, and the emancipation of persons with disabilities was not treated as a critical human rights issue within the international community (Quinn & Degener, 2002a). Over time, a consensus emerged that a disability-specific human rights convention was needed.

The CRPD aims to “promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities, and to promote respect for their inherent dignity” (CRPD, 2006). Each of the substantive articles of the CRPD articulates a particular right or freedom and the corresponding state obligations with a disability perspective. The CRPD articulates the rights and freedoms of existing human rights treaties within the circumstances of disability, "in such a way as to clear a path into the mainstream and create genuinely inclusive and equal societies" (Quinn & Degener, 2002b).

Among the central animating features of the CRPD is the remedying of the ongoing impacts of long-standing, deep-rooted exclusion of persons with disabilities from all aspects of daily life. Quinn and Degener explain that it is the positive spotlight on difference that human rights frameworks seek to uncover. Eugenics is a prime example of how differences in the human condition can be used to devalue and depreciate the exercise of rights based on disability. The authors attribute this compounding and layered depreciation of rights as the product of the "relative" and "absolute invisibility of persons with disabilities." It is thus, the fundamental intent and purpose of the CRPD to address the "invisibility" of persons with disabilities (Quinn & Degener, 2002a).

The spotlighting and remedying of such exclusion by a human rights framework is deeply complex. It requires a deep and meaningful understanding of the unique exclusion experienced by persons with disabilities and intersecting identities. It requires an understanding of the particular experiences of persons with disabilities in the state's context, and the ways in which disability communities have been marginalized, excluded, and made invisible. States must attend to establishing this knowledge. This knowledge must play an important role in the development and the reform of laws, policies and processes aimed at creating just societies that are truly inclusive of persons with disabilities.

Role of the CRPD in Legislative and Policy Development

While there are different approaches by signatory and ratifying States Parties to implementing international treaties such as the CRPD, ratification requires that existing and new legislation and policies align with treaty obligations. Article 4 of the CRPD outlines the general obligations of ratifying governments to ensure that their laws, policies, customs, and practices are reviewed, amended, abolished, and adopted toward the full realization of CRPD rights and freedoms (CRPD, 2006). The CRPD and its Optional Protocol offer numerous processes and mechanisms to monitor and report on this alignment or lack thereof.

These undertakings of States Parties to advance the substantive and fundamental rights in the CRPD are guided by foundational principles enshrined at article 3. Under article 3, legislation and policy must respect the "inherent dignity, individual autonomy including the freedom to make one's own choices, and independence of persons"; must ensure non-discrimination, full inclusion, a disability-specific understanding and acceptance of difference, substantive equality, accessibility, and respect for the evolving capacities of children with disabilities (CRPD, 2006). The CRPD's substantive articles must be interpreted in a manner that advances these principles. The principles and substantive rights in the CRPD are not to be read in isolation, but rather as inter-connected with one another. As a result, the CRPD must be interpreted and implemented within an intersectional lens, and through cross-disability and multiple disability approaches.

Ensuring that laws and policies comply with the rights and obligations laid out in the CRPD requires States Parties to consider its fundamental objectives. Addressing the deep-rooted exclusion and persistent invisibility of persons with disabilities requires more than just compliance with the letters of each article, but rather a conscious and targeted approach motivated with this intent. Thus, when reviewing and drafting laws and policies, a mere checklist does not suffice. Rather, a careful and meaningful understanding of the unique injustices experienced by persons with disabilities within specific and particular contexts is required. States Parties must deeply reflect on, and understand histories of exclusion, marginalization and eugenics, and the impacts of those legacies, on how persons with disabilities engage with legal rights and obligations within public and private contexts. The CRPD demands a deep understanding and acknowledgement of the core problems at issue, alongside disability communities, in order to identify legislative and policy solutions.

The CRPD is at once both a set of legal obligations that states must abide by, and a broader tool to guide states to actively consider and act to create truly inclusive societies. As a broader tool, the CRPD, its General Comments, and normative works can provide lawmakers and policymakers with a deeper understanding of the impact of exclusion and invisibility experienced by persons with disabilities. This understanding is a critical starting point when developing new legislation and policy; understanding how and why disabled people have been dehumanized, excluded, and made invisible is necessary in order to craft policies and laws that address these experiences. The CRPD, its General Comments, and normative works are also a rich source of legal principles for lawmakers and policymakers to draw upon to develop innovative and truly inclusive policies and laws.

Fundamental Objectives of the CRPD as Critical Guidance in Legislative and Policy Development: Examples from Canada

Canada ratified the CRPD in 2010 and acceded to the CRPD's Optional Protocol in 2018. Even so, people with disabilities in Canada continue to experience discrimination and face a myriad of barriers in most areas of life. In Canada, much work remains to be done to implement the rights and freedoms contained in the CRPD. In each of the examples described below, we consider legislation and policies designed to respond to particular disability-related issues in the Canadian context. We describe some of the ways in which these laws and policies have failed to realize the fundamental objectives of the CRPD. We argue that what is needed is an approach to legislative and policy development grounded in understanding disability communities' experiences of invisibility in a particular context. This understanding is an important starting point for creating laws and policies that comply with the letter and spirit of the CRPD.

Deinstitutionalization and the Unrealized Promise of Article 19 in Ontario

In Canada, the treatment of people labelled with intellectual and developmental disabilities is a stark example of the experiences of invisibility that the CRPD seeks to remedy.

Since at least the 1800s, persons labelled with intellectual or developmental disabilities have been housed, warehoused, and imprisoned in publicly funded large institutions in Canada. In the Canadian province of Ontario, the first large institution for people with intellectual or developmental disabilities opened in 1876 (Brown & Radford, 2015). Institutions were believed to be places where persons with disabilities could go to have their disability "treated," an approach wholly informed by the medical model of disability. Paternalistically, they were thought of as places where disabled people would be protected and well-cared for (Brown & Radford, 2015). In reality, however, institutions were places of systematic control, abuse, cruelty, and degradation (Spagnuolo & Earle, 2017; People First of Canada, 2008). Many people died in institutions, many were abused, and many were forcibly sterilized without their consent (Inclusion Canada et al., 2021; Dolmage v Ontario, 2010).

The public policies, social programs and laws that governed institutions reflected the dominant approach of the era (Whitehead & Hughey, 2004): one where persons labelled with intellectual and developmental disabilities were viewed as different from others, and incapable or not deserving of living in communities or determining the course of their own lives. The presence of large, purpose-built institutions also reflected the sinister view, held by eugenicists, that it was necessary to confine people labelled with intellectual or developmental disabilities in institutions to remove them from society. This served to eliminate the supposed "threat" they posed of contributing to social unrest, deviance, or societal contamination (Brown & Radford, 2015).

In Ontario, the last large, purpose-built institution for people with developmental disabilities closed on March 31, 2009. However, to this day, large, purpose-built institutions continue to operate in other Canadian provinces (Linton & David, 2022; Manitoba 2022; Spagnuolo & Earle, 2017). In addition, in many parts of Canada, people with intellectual or developmental disabilities continue to live or be warehoused in institutional settings such as hospitals, long-term care facilities, psychiatric facilities, and prisons (Linton & David, 2022; Disability Rights Coalition v Nova Scotia (Attorney General), 2021).

From a disability rights perspective, institutionalization is a violation of several core human rights. The UN Committee on the Rights of Persons with Disabilities has explained that institutionalization:

> is a discriminatory practice against persons with disabilities, contrary to article 5 of the Convention. It involves de facto denial of the legal capacity of persons with disabilities, in breach of article 12. It constitutes detention and deprivation of liberty based on impairment, contrary to article 14. States parties should recognize institutionalization as a form of

> violence against persons with disabilities. It exposes persons with disabilities to forced medical intervention with psychotropic medications, such as sedatives, mood stabilizers, electro-convulsive treatment, and conversion therapy, infringing articles 15, 16 and 17. It exposes persons with disabilities to the administration of drugs and other interventions without their free, prior and informed consent, in violation of articles 15 and 25 (Committee on the Rights of Persons with Disabilities, 2022).

In addition, institutionalization violates article 19 of the CRPD, the right of persons with disabilities to live independently and be included in the community (CRPD, 2006).

Animating all of these articles are the human rights principles espoused in article 3 of the CRPD: respect for inherent dignity, autonomy and independence; equality; the freedom to make one's own choices; and full and effective participation and inclusion in society (CRPD, 2006). Indeed, these general principles are the foundation of the right to live independently and be included in the community (Committee on the Rights of Persons with Disabilities, 2017).

Recognizing some of the harms caused by decades of institutionalization, governments have introduced legislative and policy alternatives. For example, in the 1970s, Ontario introduced a framework for the funding and operation of community-based services for people labelled with developmental disabilities (Developmental Services Act, 1990). In 2008, Ontario passed legislation entitled the *Services and Supports to Promote the Social Inclusion of Persons with Developmental Disabilities Act* (2008). This legislation was part of a public policy shift away from large, segregating purpose-built institutions and toward a system of services and supports intended to enable people with developmental disabilities to live and participate fully in communities of their choosing. The government responsible for the legislation promised that it would build a modern, fair and sustainable public developmental services system. This system was intended to give people with developmental disabilities and their families more independence, choice and foster their full inclusion in society (Legislative Assembly of Ontario, 2008).

Since the adoption of the 2008 legislation, there have been some positive changes to Ontario's public developmental services system, such as the elimination of large, purpose-built institutions and the funding of person-directed planning to support people with disabilities to create life-plans. With the legislative changes came expanded funding for some people with disabilities and their families to hire their own supports, thereby exercising more choice and control over the services they receive.

However, despite the improvements brought on by legislative reform, many aspects of Ontario's developmental services system continue to be characterized by paternalism, segregation and a charitable approach. For example, the variety of group homes and community-based living arrangements available under the 2008 legislation, may nonetheless perpetuate the hallmarks of large, purpose-built institutions including: their use of physical and chemical restraints; insufficient measures to prevent abuse; isolation from family and community supports; rigid daily routines set by staff regardless of residents' will and preferences; lack of choice or control over day-to-day life decisions; and obligatory sharing of assistants with other residents (Committee on the Rights of Persons with Disabilities, 2017; Ontario Ombudsman, 2016).

Further, the 2008 legislation does not enshrine any rights for people with developmental disabilities when they receive developmental services and supports. The law does require each developmental service provider to create its own rights statement, but does not specify what rights shall be included (Quality Assurance Measures). Without this legal guidance, the practical reality is that the substantive service rights in question vary from one service provider to another. People living in one group home may have fewer or different rights than those living in a group home in another geographic location within the same province. Moreover, some service providers have not created any rights statements at all.

When problems arise in the provision of developmental services, people who receive these services, their families and supporters are often reluctant to complain about rights violations for fear of losing their services, being evicted from their group home, or suffering reprisal for having made a complaint. Losing services or being evicted from a group home is a grave concern as waitlists for alternate placements in group homes, developmental services, and direct funding are incredibly long, often stretching to years (Leroux v Ontario, 2022).

For those who do decide to seek redress, the only way to make a complaint or raise a concern is to the staff or management of the agency or service provider (Services and Supports to Promote the Social Inclusion of Persons with Developmental Disabilities Act, 2008). There is no independent legal or administrative process for people with disabilities to seek a remedy or access justice when they experience problems related to their developmental services or funding. The government department responsible for administering developmental services does offer a hotline (Ontario, 2022). However, the hotline is limited to receiving reports of abuse and does not receive or act upon other complaints of rights violations (see Appendix, 1.1).

This absence of an independent, accessible accountability mechanism is another example of the paternalism and charitable approach that characterizes Ontario's public developmental services system. Without proper accountability mechanisms, people labelled with intellectual or developmental disabilities who receive developmental services remain passive recipients of government largesse, rather than rights-holders who utilize services and supports that are accountable to them.

Foundational Principles as Critical Guidance in Legislative and Policy Development

The passage of Ontario's 2008 developmental services legislation marked an attempt by law-makers and policy-makers to rectify the injustices of institutionalization, and respond to the needs of persons labelled with developmental disabilities and their families by creating a modern system of community services and supports. This modern system emphasized new funding streams, supports, and administrative mechanisms to determine eligibility for services. Without doubt, more funding, more material supports, and better administration are urgently needed to meet the demand for community-based housing, developmental services, supports, and direct funding. However, more funding and better administration are not the *only* needs. What is also needed is the creation of a system of economic and social supports grounded in the human rights principles of dignity, equality, the freedom to make one's own choices, and full and effective participation and inclusion in society, as articulated in article 3 of the CRPD and underscored as the foundation of article 19, the right to live independently and be included in the community.

An important starting point for creating such a system is to understand the deep-rooted exclusion and persistent invisibility experienced by persons labelled with intellectual and developmental disabilities in Canada. With this understanding, law-makers and policy-makers can then derive laws and policies that respond to the injustices of the past, and create economic and social services and supports aimed at liberating people with intellectual and developmental disabilities so that they can live with dignity in communities of their choosing, guided by the CRPD's principles, and in compliance with article 19 of the CRPD. For example, one of the ways that institutionalization renders people with disabilities invisible is by exerting control over residents' daily life and removing residents' opportunities to make their own decisions. Remedying this invisibility requires systems and supports that recognize the right of persons with disabilities to exercise legal capacity on an equal basis as others; that include the supports necessary for people to exercise this right; and that create opportunities for people to exercise the right by making decisions about where they live, with whom, what daily activities they engage in, and from who they receive supports. As explained by the CRPD Committee, the right to exercise legal capacity is an essential component of the right to live with dignity in the community (Committee on the Rights of Persons with Disabilities, 2017). This approach is very different from an approach focused on administration of funding and service delivery; it includes much broader considerations and requires new, innovative supports to be developed.

Advancing Inclusive Education Within an Exclusionary Framework

The right to education is a core human right, and is central to numerous international instruments including the *Universal Declaration of Human Rights* (art. 26) (Universal Declaration, 1948), the *International Covenant on Economic, Social and Cultural Rights* (art. 13) (ICESCR, 1966), and the *Convention on the Rights of the Child* (Convention on the Rights of the Child, 1989). The *International Covenant on Economic, Social and Cultural Rights* identified the right to education as foundational in ensuring that all people, "participate effectively in a free society, promote understanding, tolerance and friendship among all nations and all racial, ethnic or religious groups, and further the activities of the United Nations for the maintenance of peace." (ICESCR, 1966, art. 13.1).

The CRPD is the first treaty that offers a deeper understanding of what the right to education must entail to advance substantive equality and full citizenship for students with disabilities. Inclusive education, as articulated in article 24 of the CRPD, is the unequivocal expression of the right to education within the context of disability.

In Canada, education law and policy fall under provincial authority. Canada has not developed a national strategy on the implementation of article 24. The province of Ontario's *Education Act* (Education Act, 1990) is a comprehensive statute with many regulatory frameworks in place. Together, the Act and its regulations establish the delivery of public primary and secondary education in Ontario.

In 1980, the Act was amended to address the exclusion of students with disabilities, who did not have a right to a public education (Education Amendment Act, 1980). The framework designed at that time was intended to "integrate" the previously excluded students with disabilities into the public education system. The approach adopted was largely premised on the identification of students with disabilities within a set category of labels and the placement of those students within a range of options from a fully segregated classroom to an integrated placement in a regular classroom. Despite these legislative changes, students with disabilities remained without the right to an inclusive education. In 1997, a seminal decision of the Supreme Court of Canada styled *Eaton v. Brant County Board of Education* found that a student with cerebral palsy did not have a right to a regular class placement in her neighborhood school. While over a quarter of a century has passed since that decision, during which time the CRPD was ratified by Canada, the legal framework in practice remains essentially the same.

Article 24 of the CRPD states unequivocally that students with disabilities have the right to be included in all educational settings. In contrast, Ontario's *Education Act* fails to establish a right to inclusion for students with disabilities. Moreover, there is an evident absence of human rights principles within the *Education Act*'s legislative and regulatory frameworks and practices, as they relate to students with disabilities. Ontario's non-discrimination legislation, the *Human Rights Code* (Human Rights Code, 1990), applies to the delivery of primary and secondary education to students with disabilities. It offers direction and clarity on the procedural and substantive obligations of school authorities to accommodate students with disabilities.

A critical component of the right to inclusive education is the identification and delivery of appropriate, individualized accommodations to students with disabilities within inclusive education settings. The *Education Act* does not wholly incorporate these human rights principles; instead, it relies on its own jargon and approach, emphasizing the identification and labelling of students with disabilities, rather than the provision of individualized disability accommodations.

Under the *Education* Act, much attention is placed, or rather misplaced, on maintaining an artificial separation between "placement" and "services." The Act establishes a clear process for identifying students with particular disabilities and placing them in particular classrooms. It includes a corresponding legal avenue for appealing those decisions in the form of an administrative tribunal dedicated to adjudicating these appeals (Reid et al., 2020). However, the Act does not offer a similar process to determine and deliver the actual accommodations and supports that students with disabilities need in order to ensure that they have equal and meaningful access to education. Rather, the legislative scheme creates an artificial distinction and is essentially silent on the process and substance of disability accommodations and appropriateness of educational programs and services. It is equally silent on conflict resolution and due process regarding these matters. Thus, while a decision to place a student in a particular classroom setting can be challenged through a process that includes an appeal to an administrative tribunal, the nature of the supports or accommodations provided or denied cannot be directly challenged in any formalized process pursuant to the *Education Act* (*Education Act*, s. 57, and see Identification and Placement of Exceptional Pupils). The legislation's failure to offer any structural accountability mechanisms or complaints processes when disability accommodations are insufficient, inappropriate, or non-existent underscores its artificial emphasis on classroom placement, rather than ensuring that students have the supports they need.

As a result of this fractured approach, parents continue to report failures by the education system to appropriately support and accommodate their children. Moreover, parents report that some schools refuse to offer disability-related accommodations until after their student has gone through the process of identification and placement under the *Education Ac*t. This fractured approach fails to consider students as rights holders. It gives education administrators authority to create processes that do not guarantee meaningful and effective participation of students with disabilities (see Appendix, 1.2–1.4).

Moreover, while there are many students with disabilities who are in "fully integrated" educational placements throughout Ontario, inclusive education may be just as elusive for them as it is for students in segregated placements (see Appendix, 1.2).

The issue of equal access to school is a long-standing one among disability communities. Children with disabilities have long been excluded from educational institutions and even now, this remains a pervasive concern (Reid, 2017). In Ontario, the exclusion of students with disabilities from regular classrooms takes many different forms. One example is students with disabilities being removed from school via the use or threat of a particular provision of the *Education Act*, section 265 1(m). This provision allows for a principal to remove a person from school if that person is thought to be "detrimental to the physical or mental well-being of the pupils." The legislation directs an appeal but with no detail, which wholly divests the development of procedure, timelines and other due process rights onto the education providers. Education providers are also responsible for adjudicating such appeals. There is no government oversight or requirement for data gathering regarding the use of this provision. In practice, this provision is used to exclude or threaten to exclude students with disabilities, often on the basis of their disability or disability-related behavior (Reid, 2017) (see Appendix, 1.4). This is a form of segregation and a practice that is utterly irreconcilable with article 24 of the CRPD and its goal of achieving inclusion in education. Rather than excluding students with disabilities, the primary focus of any inclusive education framework is to ensure that supports remain appropriate, and that learning environments meet the needs of all students.

There is no one reason that accounts for the many ways in which students with disabilities are excluded from the benefits of the regular education system in Ontario. Multiple and layered factors including legal, policy, and funding frameworks fail to respond to the needs of students with disabilities. The common denominator is that inclusion is not the stated objective. In its Concluding Observations to Canada's initial report on the implementation of the CRPD, the Committee on the Rights of Persons with Disabilities signaled serious concerns regarding the "persistence of segregated special education environments" for students with high-level support needs, achievement gaps by students with disabilities, and women and girls with disabilities, as well as isolation in particular of "hard-of-hearing and deaf children" (UN Committee on the Rights of Persons with Disabilities, Concluding Observations).

Decades after the initial promise of inclusion into the public education system, Ontario's legislative structure still prioritizes an approach that is designed to fit all students into an old system, rather than placing greater importance on developing a system that provides appropriate and meaningful education to students of all abilities within an inclusive framework.

Foundational Principles as Critical Guidance in Legislative and Policy Development

It is the deeper rooted causes, realities, and impacts of ongoing exclusion in its many forms that inclusive education aims to address. The right to education is the doorway to realizing substantive equality, inclusion and full citizenship for persons with disabilities. Inclusive education can contribute to dismantling barriers that people with disabilities face in accessing housing, entering and remaining in the labor market, attaining social capital, earning income, and gaining appropriate social supports. Article 24 of the CRPD is grounded in the foundational understanding that, "only inclusive education can provide both quality education and social development for persons with disabilities, and a guarantee of universality and non-discrimination in the right to education" (Comment no. 4 at para 2, referencing A/HRC/25/29 and Corr.1, paras. 3 and 68).

Culture shifts, normative and structural, legal and policy changes are all required to bring Ontario's education system into compliance with article 24 of the CRPD. The underlying questions to be asked include what elements of education will lift individuals with disabilities out of poverty, out of unemployment or into labor markets, what are meaningful transitionary practices, what will offer the best possible ways for students to achieve their fullest potential, and ultimately best realize fully inclusive societies.

Article 24 unequivocally articulates inclusive education as the primary mode of education service delivery. It frames students with disabilities as rights holders to be afforded substantive equality in pursuit of achieving their "fullest potential" within all aspects of education. Read in conjunction with the other substantive CRPD articles, article 24 is prescriptive and comprehensive, and is fully understood when interpreted through the prism of the CRPD's article 3 principles. The article 3 principles of substantive equality and non-discrimination, "full and effective participation and inclusion in society," respect for inherent dignity, autonomy and independence, and respect for difference and the evolving capacities of children with disabilities and, "the right of children with disabilities to preserve their identities," take on a very particular meaning when applied to education. These principles inform the need for particular attention to ensure that students with disabilities can participate meaningfully, that they receive individualized disability accommodations, and that school cultures are inclusive. The design of a responsive and appropriate dispute resolution mechanism and due process rights must take into consideration the need for timely resolution and the entirety of the context, needs, strengths and potential of a student.

The *Education Act's* failure to meaningfully address the impacts of segregation and exclusion is also evidenced by the limited and mostly absent opportunities for students to engage directly in identifying the most appropriate supports for them, and the lack of legislative guidance in accommodation planning and implementation.

With its emphasis on identifying students' disabilities and then placing students into a range of educational settings, Ontario's *Education Act* is still in many ways predicated on a "medical model" of disability, which runs counter to the human rights approach and social model understanding of disability espoused in the CRPD. Achieving inclusion is something altogether different from creating processes to determine educational placements, or creating processes to fit students with disabilities into existing structures designed to serve able-bodied paradigms. As the CRPD Committee explains:

> [i]nclusion involves a process of systemic reform embodying changes and modifications in content, teaching methods, approaches, structures and strategies in education to overcome barriers with a vision serving to provide all students of the relevant age range with an equitable and participatory learning experience and the environment that best corresponds to their requirements and preferences. (Committee on the Rights of Persons with Disabilities, 2016 at para 11.)

A responsive approach that is aligned with the CRPD's foundational principles would ensure a legislative and policy framework that centers as its primary objectives each student as a whole, in recognizing their inherent dignity and potential, and corresponding individualized strengths and needs, and a supported inclusive environment to realize those goals.

Ultimately, the CRPD's principles offer needed guidance but also a litmus test of sorts: the way to achieve a fully inclusionary education system is by explicitly rejecting educational philosophies, such as Ontario's, which in one way or another prize segregation over inclusion. Instead, education systems must be designed with inclusion as one of their core objectives.

Accessibility Legislation: An Opportunity for Meaningful Participation in Law-Making

In 2019, the first federal accessibility legislation in Canada, the *Accessible Canada Act*, became law. The purpose of this law is to achieve a barrier-free Canada by 2040 (Accessible Canada Act, 2019). To accomplish this goal, the *Accessible Canada Act* creates a framework for the identification, removal and prevention of barriers to accessibility in specific areas of life that fall within Canada's federal jurisdiction. This includes travel on airlines and railways, broadcasting and telecommunications, federal government employment, programs and services, federal courts and tribunals, Canada's Parliament, and other areas. Organizations, businesses and government departments that fall within federal jurisdiction are required to create plans to identify, remove and prevent barriers in employment; the built environment; information and communication technologies; communication; the procurement of goods, services and facilities; and the design and delivery of programs and services (Accessible Canada Act, 2019). In addition, new accessibility standards will be created, and federal organizations, businesses and government departments are encouraged to follow those standards.

The preamble to the *Accessible Canada Act* recognizes that this legislation is intended to further the "economic, social and civic participation of all persons in Canada, regardless of their disabilities," complementing the rights of persons with disabilities articulated in both domestic and international law (Accessible Canada Act, 2019). In addition, the preamble acknowledges that the legislation plays a crucial role in implementing those parts of the CRPD that require states "to take appropriate measures respecting accessibility and to develop and monitor minimum accessibility standards" (Accessible Canada Act, 2019).

When the *Accessible Canada Act* first became law, there was much excitement and enthusiasm within disability communities across Canada. The legislation created new opportunities to raise awareness about the importance of accessibility and gain meaningful improvements toward more inclusive work, transportation, employment, services and communications in Canada's federal sphere.

Another opportunity engendered by the passage of the new legislation was a chance to create more meaningful and accessible ways for persons with disabilities to participate in the development of new legislation and regulations. Indeed, one of the principles of the *Accessible Canada Act* itself is that "persons with disabilities must be involved in the development and design of laws, policies, programs, services and structures" (Accessible Canada Act, 2019). This is consistent with the core principles of the CRPD, which include full and effective participation of persons with disabilities in society (CRPD, 2006). It is also consistent with the general obligations of States Parties to the CRPD to closely consult and actively involve persons with disabilities (CRPD, 2006).

The Committee on the Rights of Persons with Disabilities has recognized that often persons with disabilities are not consulted about matters affecting their lives, and that decisions continue to be made on their behalf. The Committee has stated that, "Persons with disabilities still face significant attitudinal, physical, legal, economic, social and communication barriers to participate in public life" (Committee on the Rights of Persons with Disabilities, 2018). In response to this experience of invisibility in public life, disability rights movements have demanded not only recognition of their human rights, but also an active role in determining those rights.

Meaningful participation of people with disabilities in the development of laws, policies and programs is critically important for achieving full inclusion. Creating opportunities for such participation is an important way in which states can address the experience of invisibility in public life that has impacted many disability communities. Participating in the development of laws, policies and programs allows persons with disabilities to frame policy issues, to challenge discriminatory and inaccurate assumptions, and to develop an empowering relationship with the law (Löve et al., 2017a, b). It facilitates the building of capacity within disability communities to share their experiences of disability-related barriers and to engage in public issues that affect them (Committee on the Rights of Persons with Disabilities, 2018). Participating in the development of laws, policies, and programs is consistent with a human rights-based approach to public decision-making and helps to ensure good governance and social accountability (Committee on the Rights of Persons with Disabilities, 2018).

In Canada, existing processes to develop new legislation and regulations require governments to consult with the public, including persons with disabilities (Treasury Board of Canada Secretariat, 2018). However, these consultation processes contain many barriers that prevent disabled people from participating. For example, many consultations are held online only and participants are required to submit their input in writing within fairly short deadlines. People with disabilities encounter barriers because online information is in inaccessible electronic formats, because they don't have access to computers or high-speed internet, because they cannot meet the imposed deadlines, or because background information about the consultation is in inaccessible technical terms (ARCH Disability Law Centre, 2021). People with disabilities report being reluctant to participate in legislative and regulatory consultations because their concerns are not listened to, or their input does not have any impact on the final legislation or regulation that the government develops (ARCH Disability Law Centre, 2021). Consultation processes that are inaccessible or not meaningful serve to perpetuate the exclusion of persons with disabilities from participation in public life.

Foundational Principles as Critical Guidance in Legislative and Policy Development

Reforming Canada's existing legislative and regulatory development processes to allow for people with disabilities to participate equally and meaningfully is one important way in which Canada can realize the objectives of the *Accessible Canada Act* and the CRPD. The *Accessible Canada Act*'s principle that "persons with disabilities must be involved in the development and design of laws, policies, programs, services and structures" must be interpreted in accordance with the principles in the CRPD.

Two of the CRPD's article 3 principles, accessibility and full and effective participation in society, are particularly relevant to consider when deciding what reforms to undertake. Applying the principle of accessibility requires that legislative and regulatory consultation processes must be designed to be fully accessible from the outset. This includes, for example, holding consultations at accessible physical and online venues; ensuring that sign language interpreters, communication intermediaries, support persons, attendants and others are provided at consultation meetings; providing participants with background and follow up information in accessible formats and accessible languages; and building in flexibility so that deadlines can be extended as needed (ARCH Disability Law Centre, 2021). Applying the principle of full and effective participation in society requires that consultation processes are not one-time events that have no impact on the outcome of the legislation or regulation. Instead, consultations must allow for meaningful participation. This includes, for example, an ongoing, transparent dialogue between disability communities and governments. Governments must engage people with disabilities early in the legislative or regulatory development process, and there must be opportunities for consultations to have a real impact on the final legislation or regulation (ARCH Disability Law Centre, 2021).

Reforming existing legislative and policy development processes to make them more participatory, accessible and meaningful for persons with disabilities is a significant step that governments can take to respond to disability communities' collective experiences of invisibility in public life. The CRPD's foundational principles and normative works (for example, General Comment No. 7 (2018) on the participation of persons with disabilities, including children with disabilities, through their representative organizations, in the implementation and monitoring of the Convention) are resources that states can draw upon to guide such reform. In Canada, such reform is not only mandated by Canada's ratification of the CRPD, but also by domestic legislation.

Conclusion

Degener and Quinn posit that one of the fundamental objectives of the *Convention* is to address the "invisibility" of persons with disabilities. In this chapter, we have argued that addressing the deep-rooted exclusion and persistent invisibility of persons with disabilities requires more than just compliance with the strict requirements of each of the CRPD's substantive articles. Rather, when states develop or review laws, regulations, policies, and programs, these processes must include a careful and meaningful understanding of the unique experiences of persons with disabilities within specific and particular contexts. Understanding how persons with disabilities have been excluded from society is an important starting point for developing laws and policies that respond to these injustices and that realize the fundamental objectives of the CRPD.

The general principles of the CRPD, set out at article 3, provide a critical starting point when developing or reviewing laws and policies. The Canadian examples presented in this chapter illustrate the important role that these general principles can play in legislative and policy development. We have argued, for example, that reforming public services for people labelled with intellectual disabilities requires more than additional funding and administrative improvements; it requires designing a system of economic and social supports grounded in the CRPD's human rights principles of dignity, equality, the freedom to make one's own choices, and to achieve full and effective participation and inclusion in society. Similarly, creating inclusive education services requires designing a system that is inclusive from the outset, guided by the CRPD's principles of respect for difference, equality, dignity, and accessibility. The final example, Canada's accessibility legislation, illustrates how the CRPD principles provide both general impetus and pragmatic direction for reforming legislative and regulatory development processes to make them more accessible, inclusive, and meaningful for disabled people.

While the examples cross different areas of life, common to them are the complex interactions that persons with disabilities continue to have with legislative and policy frameworks that fail to respond to their collective experiences of exclusion and invisibility. The CRPD's principles, foundational objectives, and substantive rights provide tools to guide and shape the review and development of legislation, regulations, and policies by States Parties, offering the promise of addressing the legacies of invisibility.

Appendix

1.1	It is important to note that Canada, and all its provinces and territories, including Ontario, have anti-discrimination laws which protect against discrimination on the basis of disability. If a person believes they have been discriminated against when they receive developmental services, they can initiate a human rights complaint at an independent tribunal charged with adjudicating discrimination complaints. However, in law and in practice anti-discrimination laws do not address the particular legal issues or rights violations commonly experienced by people who receive developmental services. Therefore, the availability of human rights complaint mechanisms does not alleviate the need for an independent, accessible process to adjudicate complaints related to the provision of developmental services and supports.
1.2	Research conducted in Ontario which included results of a survey and interviews, noted that 68% of parents of students with disabilities reported that schools were meeting half or less than half of their child's academic needs, 53% reported improper academic accommodations; 67% reported not receiving the appropriate curriculum; and 61% reported their child was excluded from extra-curricular activities. (Reid et al., 2018)
1.3	Students with disabilities who are racialized and/or identify within a lower socio-economic status experience much higher rates of segregation than other students. A report released by Canada's largest school board stated that "[s]tudents who self-identified as Black were over-represented in congregated Special Education. . .[and] notably under-represented in Gifted, IB, AP, Elite Athlete, and slightly under-represented in French Immersion" (see Toronto District School Board, "Facts, Selected In-School Programs: An Overview," Issue 8, December 2013 (TDSB) at 3).
1.4	Approximately 45% of respondent parents stated that they needed to keep their child home from school as a result of a lack of supports or services. Moreover, more than half of parents reported that their child's day had been shortened, often for reasons not related to the student's needs, such as staffing shortages and transportation scheduling issues. On average, these students lost 3.86 h out of a 6 h school day.(Reid et al., 2018)

Article 6: How Human Rights Instruments Can Support Movements and Build Bridges

72

Maria Ni Fhlatharta

Contents

Abstract

One of the pressing questions of current times is how international human rights instruments can achieve true equality for groups who are multiply marginalized.

The majority of disabled people experience at least one additional form of marginalization – be that based on sexual orientation, gender identity, sexual characteristics; based on race, ethnicity, or migration status; or based on class, economic status, age, or other factors. Meeting the needs of these populations can be challenging, particularly given that human rights instruments are often siloed and focused on a specific issue or group. Some treaties have inserted provisions in

---

The term organizations of women with disabilities is used throughout this chapter and is used in a broad way to describe organizations of persons with disabilities that have feminist goals

recognition of specific forms of multiple marginalization, in order that rights of specific groups are not overlooked.

One example is that of Article 6 of United Nations *Convention on the Rights of Persons with Disabilities*, which acknowledges the rights of women and girls with disabilities, alongside the convention including gender equality as a guiding principle in order to ensure the rights of women and girls with disabilities are not overlooked. This was fought for and pushed through by feminist disability rights activists during the negotiation of the convention. While this is only one group of multiply marginalized persons, it does provide a template for how human rights instruments can meet the needs of specific groups.

Beyond the question of how rights instruments can address these intersections, is how these rights can be realized for specific groups. For much of the world, a state committing to and ratifying a convention in and of itself does not guarantee the full realization of rights. The domestic implementation of these rights relies on advocacy within the state, and the development and proliferation of social movements in order to achieve change.

While rights instruments struggle to meet the needs of populations, the social movements which advocate for the rights of specific groups or on specific issues are often similarly siloed. This is true of feminist advocacy and disability advocacy. The CRPD Article 6, and related provisions, provides a common language with which to build a bridge between these movements. It also provides a framework to address what are often seen to be conflicts between the disability rights movement and the feminist movement.

We also see the expansion of feminist organizations of persons with disabilities such as Article Six in Poland, Disabled Women Ireland on the island of Ireland, the Indonesian, sisters of Frieda in England, network of women with the development and expansion of these groups, is a significant shift in the disability rights movement.

This chapter will examine how the acknowledgment of intersecting forms of marginalization can support social change movements with a specific focus on UN CRPD.

Introduction

One of the pressing questions of current times is how international human rights instruments can achieve true equality for groups who are multiply marginalized. The majority of disabled people experience at least one additional form of marginalization – be that based on sexual orientation, gender identity, sexual characteristics, based on race, ethnicity or migration status, or based on class, economic status, age or other factors. One in eight people in the world are disabled women – disabled women may also be a racial minority, pregnant, of divergent sexual expression or gender identity, be older, be younger, practice a non-dominant religion, be a migrant, a refugee, or be seeking asylum. Their experiences of marginalization are often not captured through disability-specific concepts of rights. These forms of multiple discrimination present a challenge for human rights law and the disability rights movement.

What Is Intersectionality?

Multiple marginalization refers to a person experiencing marginalization based on more than a single characteristic or ground; intersectional discrimination refers to a situation where several grounds interact with each other at the same and are unextractable. Grounds include age, disability, ethnic, indigenous, national or social origin, gender identity, political or other opinion, race, refugee, migrant or asylum seeker status, religion, sex and sexual orientation, which interact with each other and overlap.

The concept of multiple marginalization or intersectional discrimination can be traced back through generations of black women activists, including during the anti-slavery movement, the civil rights movement, and the early feminist movement (Atrey, 2019). Academically, it was Crenshaw who first used "intersectionality," a term to address how the inequalities faced by black women were poorly recognized and ill served by both feminist and anti-racist movements (Crenshaw, 1989). Crenshaw argued the intersection of gender and race, which needed to be considered to grasp with the complex experience of black women.

At a domestic level, the idea of intersectionality presents a direct challenge to normative constructions of anti-discrimination law – this is well established and illustrated through the cases examined by Crenshaw herself – Crenshaw focused on a number of cases where, while black women were treated unfairly, the courts failed to recognize the discrimination faced.

DeGraffenreid v. General Motors, for example, involved the claim of five black women who had been let go due to a seniority policy. The company had failed to hire black women prior to 1964, which resulted in all of the black women hired by the company in that time being let go during a round of redundancies. Although only black women had experienced disadvantage, the court did not accept this, as to allow for the case to succeed would allow for a special class to be created. Crenshaw used this example, along with other court cases to show how normative concepts of discrimination failed black women.

Intersectionality is the product of the work of black women activists and academics specifically on the struggle faced by black women – but it has been taken to heart by movements of multiply marginalized people the world over – as Atrey notes from #RhodesMustFall to #MeToo – intersectionality is a dominant theme in global justice movements. Intersectionality originally developed by a legal theorist has transcended the walls of the university and beyond in the community it was initially to serve to become a framework through which marginalized persons everywhere could understand and seek to change these systems of oppression (Atrey & Dunne, 2020).

Multiple Marginalization and International Human Rights Law

While discrimination law at a domestic level has often been the focus of discussions on intersectionality, less attention has been given to international human rights law (Atrey & Dunne, 2020).

Human rights have often developed in silos, the early core human rights instruments focused on broad declarations of rights (e.g., The Universal Declaration of Human Rights, International Covenant on Civil and Political Rights, International Covenant on Economic, Social, and Cultural Rights), followed by a specific focus on groups who traditionally experience more rights violations including racial minorities, women and girls, children, migrant workers (International Convention on the Elimination of All Forms of Racial Discrimination, Convention on the Elimination of All Forms of Discrimination Against Women, Convention on the Rights of the Child, International Convention on the Protection of the Rights of Migrant Workers and Members of Their Families). There are also conventions on specific issues such as torture, and enforced disappearances (Convention Against Torture and Other Cruel, Inhumane or Degrading Treatment and Punishment, International Convention for the Protection of All Persons From Enforced Disappearances).

To paraphrase the UN Committee on the Rights of Persons with Disabilities member Sir Robert Martin, we required more human rights instruments because we had a very narrow idea of who was human – we needed to make sure that women and LGBT people, disabled people, Indigenous people, and a lot of different other people all got to enjoy the same rights as everyone else. Human rights are considered rights possessed by all human beings simply in virtue of their humanity. As Atrey notes, rights are guaranteed not just to all human beings but to all human beings equally.

Disability in International Human Rights Law

The *Convention on the Rights of Persons with Disabilities* (Convention and CRPD) disability convention is often said to have come from the invisibility of disabled people. In the 1970s, the United Nations adopted "declarations" on the rights of "mentally retarded persons" and "disabled persons" (1975), but they were limited in scope, non-binding, and adhered to traditional medical model idea of disability. From before the turn of the last century, there were consistent and growing calls for the development of an international disability treaty. In 1999, the Organization of American States adopted the Inter-American Convention on the Elimination of All Forms of Discrimination against Persons with Disabilities, which was the first international treaty on disability discrimination. This was a turning point in the disability rights movement – a stand-alone international treaty on disability rights.

Further challenges remained in order to negotiate a global treaty on disability.

Nothing about Us Without us – the credo for the movement in negotiating the Convention – but it is also quite clear who was at the table when it came to the negotiation. In many respects, the Convention was the most inclusive convention ever developed. The inclusion of the disability community in the development of the treaty is considered a landmark in the history of human rights.

The extent to which other oppressed groups had been involved in the negotiation of their own convention is limited – conventions traditionally being drafted for a group does not include that group. As Series notes, those who experienced the violations of human rights that lead to the early human rights conventions were not for the most part involved in its drafting. It is well noted by actors within the UN system and academics that the CRPD displayed the greatest involvement of civil society in any treaty negotiation, which was unique. It does raise, however, the question about who was not at the table, and of those who were, what voices were loudest.

Recognition of Multiple Marginalization in UNCRPD

For the most part, CRPD follows the form of previous convention attempts at recognizing multiple marginalization. Within the Convention, most forms of multiple marginalization are referenced only within the preamble which states;

"*Concerned* about the difficult conditions faced by persons with disabilities who are subject to multiple or aggravated forms of discrimination on the basis of race, color, sex, language, religion, political or other opinion, national, ethnic, indigenous or social origin, property, birth, age or other status." While attempts to expand and strengthen these protections are found within the jurisprudence of the committee, this is a rather flippant acknowledgment. The preamble of the Convention is the longest preamble in any international human rights law treaty, making up about a third of the entire document (Kayess & French, 2008). It is instrumental in establishing the purpose and philosophy as well as capturing the intent of the drafters of the convention. It is by no means to diminish the importance of the preamble to suggest that this acknowledgement belongs somewhere else as well. The preamble is either within the guiding principles or through provisions within the operative provisions of the convention. The invisibility of disability in human rights called out by the disability community in the lead up to the development of the convention is echoed in the invisibility of those whose rights are not fully acknowledged in the convention.

The CRPD is often cited as a challenge to the siloed construction of rights, as it engages with multiple marginalization.

While attempts have been made to ensure that the Convention recognizes multiple marginalization for those from SOGISEC communities, the protections here are arguably insufficient for racial minorities, Indigenous communities, economically deprived, or from linguistic minorities (other than sign language).

The success of recognizing multiple marginalization is most pronounced in terms of gender and disability, where there is both a specific and mainstream recognition.

Youth remains its own distinct challenge, and in particular, how decision-making rights of children can be recognized.

The Convention acknowledges the rights of women and girls with disabilities, alongside gender equality as a guiding principle in order to ensure the rights of women and girls with disabilities are not overlooked. This was fought for and pushed through by feminist disability rights activists during the negotiation of the Convention.

This intersectional interpretation of the Convention has also been emphasized by the committee, most notably in the general comments on Article 5 and Article 6, which take a nuanced approach (Atrey & Dunne, 2020).

The concept of intersectional discrimination recognizes that individuals do not experience discrimination as members of a homogenous group but, rather, as individuals with multidimensional layers of identities, statuses, and life circumstances. It acknowledges the lived realities and experiences of heightened disadvantage of individuals caused by multiple and intersecting forms of discrimination, which requires targeted measures to be taken with respect to disaggregated data collection, consultation, policymaking, the enforceability of non-discrimination policies, and the provision of effective remedies.

Reproductive Rights Within the CRPD

The issue of reproductive rights is one that disproportionately impacts communities which experience multiple forms of marginalization in particular women and gender minorities who have the capacity to become pregnant. Separate from the broad gender provisions laid out under the CRPD, existing two specific provisions focused on reproductive rights. This is in addition to the non-discrimination protections under Article 5, which would apply to the area of reproductive health.

Article 23 states:

> b) The rights of persons with disabilities to decide freely and responsibly on the number and spacing of their children and to have access to age-appropriate information, reproductive and family planning education are recognized, and the means necessary to enable them to exercise these rights are provided.
>
> c) Persons with disabilities, including children, retain their fertility on an equal basis with others.

Article 25 states that States Parties must "[p]rovide persons with disabilities with the same range, quality and standard of free or affordable health care and programmed as provided to other persons, including in the area of sexual and reproductive health and population-based public health programmed."

During the ninth session on the committee on the convention on the rights of persons with disabilities, the committee held 1/2 day of general discussion focused on women and girls with disabilities with a range of topics discussed in terms of human, sexual, and reproductive health rights were identified as the main three issues of concern for this group (Mykitiuk & Chadha, 2018).

A note must be made here on the conflict of rights. In many respects, conflicts within human rights are often false paradigms that are artificially created in a response to a broad restriction of rights. This is often raised in relation to abortion where eugenics is conflated with the right to bodily autonomy. In the concluding observations for the United Kingdom of Great Britain and Northern Ireland, the CRPD committee noted that the state needed to amend its laws to end the discriminatory provisions, which existed in relation to disability, but did not call for restricting reproductive rights further.

We must be clear that reproductive rights are as disability rights issues, and this is clearly articulated in the text of the convention, but also in its interpretation by the committee through general comments, the reporting process, and engagement with the convention on the elimination of discrimination against women.

> Access to safe and legal abortion, as well as related services and information are essential aspects of women's reproductive health and a prerequisite for safeguarding their human rights to life, health, equality before the law and equal protection of the law, non-discrimination, information, privacy, bodily integrity and freedom from torture and ill treatment.

How Does International Human Rights Law Support Social Movements

As conversations about disability justice and reproductive justice evolve, questions arise over to what extent, if any, rights serve disabled people. States purport to take their obligations under international law seriously, and to respect it, but an analysis of reporting to treaty oversight bodies shows that states rarely meet their treaty obligations.

As noted by Hathaway, states which ratify conventions do not actually translate to practice on the ground. Repeated studies have shown that the ratification of human rights treaties does not directly improve respect for human rights at the domestic level. The ratification of such treaties does present a unique opportunity to advance human rights goals. Earlier in this chapter, I described the importance and influence of civil society and disabled persons organizations in the development and the UN signing of the CRPD. While this was groundbreaking, it may describe the secondary role of civil society and "disabled peoples organizations" within international human rights. I would argue that, as if not more vitally, human rights require civil society to engage at a domestic level. While ratification alone does not create social change, research shows the potential for civil society to leverage human rights obligations, and the language of state commitments in order to pressure governments to take action. Social movements themselves have been seen to be de facto enforcement of mechanisms and lead to improved local practices.

For much of the world, a state committing to and ratifying a convention in and of itself does not guarantee the full realization of rights. The domestic implementation of these rights relies on advocacy within the state, and the development and proliferation of social movements in order to achieve change.

International human rights law allows local movements to focus their goals as part of a global struggle. Article describes how framing it as part of a global struggle allows for social movements to gain supporters and material resources. The enforcement itself requires documentation of human rights abuses, which are useful at both international courts and treaty oversight mechanisms, and to issue formal complaints against the states in which they exist.

This symbiotic relationship where local organizations support the development and implementation of international human rights law and international human rights mechanisms provide frameworks legitimacy and guidance to those working on a domestic level, which is crucial to the success of human rights.

While rights instruments struggle to meet the needs of populations, the social movements which advocate for the rights of specific groups or on specific issues are often similarly siloed. This is true of feminist advocacy and disability advocacy. The CRPD Article 6, and related provisions, provides a common language with which to build a bridge between these movements. It also provides a framework to address what are often seen to be conflicts between the disability rights movement and the feminist movement.

An interesting case study on this intersection is that of the abortion referendum in Ireland in 2018. This impacts in turn the use of the Convention by activists campaigning for human rights on the ground. Activism is often fleeting and lacks records, but the use of online space by disabled activists within the Irish Abortion Rights Campaign allows us to track and examine the conversations that were happening within the disability community and beyond.

Abortion Campaign

The Irish Abortion rights campaign spans several decades, but the modern campaign to repeal the eighth amendment is probably best positioned at the 2012 March for Choice, which was the first national march for abortion rights in many years. Several months later, activists were galvanized by the death of Savita Hallapananver, who died due to a failure to provide medical care while she was experiencing a miscarriage. This is often cited as the turning point that led to the repeal of Ireland's constitutional protection of the unborn and strict prohibition on abortion in 2018. From early on in the campaign, disability was used by anti-abortion activists in an attempt to discredit and reject any attempts at reform. This is partially as the constitutional prohibition had been challenged a number of times in occasions where their fetus had been diagnosed with a fatal fetal abnormality. These are instances where the fetus would not survive outside the womb and the pregnancy was non-viable. This was then conflated with disability selective abortion in an attempt to avoid even the most marginal abortion law reform.

The position of disabled people in the campaign was an interesting one. From the outset, disabled people were defined by their absence rather than their presence, but the response to this from disabled women and non-binary feminists was such as to deepen the disability rights movement in Ireland.

Ireland has a long and interesting history of disability rights activism, but feminist disability activism has mostly focused around small collectives and specific activists. At the outset of the modern campaign to reform Ireland's abortion law, no specific feminist disabled persons organization existed at the outset of the campaign, nor were there many disabled persons organizations in existence at the time.[1]

Many disabled feminist activists spoke loudly from the outset of the modern era of the abortion movement in Ireland about the need to include. Noted disabled feminist and academic Rosaleen McDonagh wrote in an opinion piece in 2013, a year after the first modern March for Choice; "Anti-abortion pontificators, using disability as a calling card for their agenda, is disturbing and frightening. Patronizing ideologies about people with disabilities are harmful. As are their negative controlling views about women's bodies. Anti-abortion commentators do not hold the mantle of defining human rights for people with disabilities and our families. Their contribution to the debate on reproductive rights while using the lens of disability is exploitative and confusing. Their emotive language and imagery are not supportive or helpful for people with disabilities."

The use of disability at this time was striking. The law in Ireland was such that disability selective abortions were an impossibility. The criminalization of abortion in all circumstances predated the creation of the Irish state. This had been reaffirmed by a constitutional referendum in 1983 that guaranteed the right to life of the unborn. Legislative discussions at the time were focused on ensuring access to abortion where the life of the pregnant person is at risk.

In spite of this, the conversation continued to focus around disability. With disability being exclusively a characteristic of the fetus, no one could therefore unexpectedly find themselves in a crisis pregnancy.

Disability activists responded to this however, in many respects connecting through the isolation to respond to the campaign.

Many of these conversations were being held in private forums, but much was also made public. The use of technology by disabled activists has long been documented. While technology and the internet has a specific use in connecting communities, this[2] has been particularly transformative for the disability community who face barriers to political involvement.

For many people to whom the community center, the rally or the meeting room was inaccessible, the internet was an accessible alternative.

Two groups of disabled people formed specifically in the run up to the vote on abortion reform.

Disabled People for Choice was formed by a disability activist Evie Nevin in order to amplify the voices of disabled people in the campaign. She used social

---

[2] Not all disabled people can use technology, and addressing barriers to access to the internet.

media to share the stories of disabled people during the referendum and highlight issues of concern to disabled people.

"Reproductive Rights are Disability Rights" was formed by a group of disabled activists who had joined an online group chat to discuss some of the disability rights issues that were at play during the referendum. The group existed as an online forum for persons to share their experiences and concerns and difficulties with the campaign. They began advising other organizations on language and policies around disability, speaking at events, and hosting online Twitter chats where they held open conversations about disability rights and abortion.

During the final phase of the referendum campaign, both groups joined to form Together For Yes Campaign.

The formation of "Reproductive Rights are Disability Rights" ultimately evolved into Disabled Women Ireland, the national representative organization for disabled women and non-binary people, which continue to advocate for the realization of disability rights on the island of Ireland. We will discuss organizations of women with disabilities at a later point in this chapter.

Globally abortion rights are both expanding and facing unprecedented pushback and how disabled people belong to the struggle for global reproductive rights can often be under question. Bridging the gap between siloed social movements is a challenging task.

Use of International Human Rights Law by Abortion Rights Campaign

Alongside the pushback to anti-choice activists using disability as a justification for restricting abortion rights, disabled reproductive rights activists built a positive disability rights case for abortion law reform. While Ireland only ratified the UN Convention on the rights of persons with disabilities in the months immediately prior to the abortion law referendum, it is clear how the language of Human Rights influenced these arguments.

We described the path to both legal and illegal abortion prior to 2018 in Ireland earlier in this article where activists focused significantly on the access barriers facing disabled women.

Much of the focus of disability rights activists used the language of rights. The right to health (Article 25) featured significantly within the discussions that occurred online and in person. The previous abortion law did not allow for terminations when someone's health, but not life, was in danger, and people were not empowered to make decisions as to what was an acceptable risk to their own health in pregnancy. There was also significant focus on the impact of a crisis pregnancy on someone's mental health, and how ableism and disability-specific barriers could worsen that. The second method by which Irish people accessed abortion was through the importation of illegal abortion pills and self-managing abortion. Disabled feminists also made clear the difficulties this created for them – using the language of rights.

There was also a significant focus on the socioeconomic inequalities and how that impacted disabled people accessing abortion. In Ireland, the rate of poverty was and still is significantly higher among disabled people. Disabled people were less likely to be able to bear the cost of travel and abortion, alongside being less able to afford the specific supports or accommodations they may need.

One strategy pushed by disability activists while working with birthrights and abortion access was to highlight the commonalities between the two movements. Decision-making rights was one element that was consistently raised by disability rights activists. We can see an impact of gender-based discussions on legal capacity and how that impacted discussion between birth rights activists and disability rights activists.

Decision-making rights or legal capacity feature as both a guiding principle and a specific article of the Convention. The values underpinning this right closely overlap the rights that underpin reproductive rights, in particular autonomy and self-determination. During the campaign, activists pushed to recognize this particular intersection, relying heavily on the language of the CRPD (Burns, 2018).

Violations of legal capacity also have a significant gender dynamic and disproportionally impact disabled women. It was noted by the CRPD committee that, “women with disabilities are subjected to high rates of forced sterilization and are often denied control of their reproductive health and decision-making, the assumption being that they are not capable of consenting to sex. Certain jurisdictions also have higher rates of imposing substitute decision-makers on women than on men. Therefore, it is particularly important to reaffirm that the legal capacity of women with disabilities should be recognized on an equal basis with others.”

The national campaign coordinating organization Together For Yes, tweeted a sign from Inclusion Ireland, an advocacy organization for people with intellectual disabilities which campaigned on the referendum. The sign was on the right to make our own decisions and was left over from a march to end guardianship in Ireland.

The birth rights organization AIMS also featured a piece on consent, disability, and pregnancy. This allowed for discussion of decision-making rights beyond the groups that were explicitly concerned with disability and reproductive rights. The piece outlined the overlapping concerns of disability communities.

“Pregnant people all over the country are sharing their stories now. Stories of being demeaned, coerced, and ignored during their pregnancy and birth. Something which is part of the course for many disabled people during medical treatment. The silence around these issues can be crushing. They join the voices of disabled people, who have faced this form of coercion and duress since for decades.”

In spite of these marginal successes, it was noted by Burns (2019) that this failed to bring non-disabled feminist activists to the fight for legal capacity, and while the campaign was ongoing, many decisions were made about the bodies and lives of disabled people. She described an Irish Wardship case that occurred during the campaign. In that case, a disabled woman was ordered to undergo a mastectomy without her consent. Burns asks, “will we wear a badge for her” (Burns, 2019).

While this generated greater understanding between the campaigns, and may impact wider calls, there is no direct link between this campaign and greater solidarity for the disability rights movement.

International Law Building Bridges: Conflict of Rights

Shortly after the abortion campaign, the Committee on the Rights of Persons with Disabilities (CRPD) and the Committee on the Elimination of All Forms of Discrimination against Women (CEDAW) released a joint statement; "Guaranteeing sexual and reproductive health and rights for all women, in particular women with disabilities" – which specifically looked at women with disabilities reproductive rights and affirmed that:

> gender equality and disability rights are mutually reinforcing concepts and States parties should guarantee the human rights of all women, including women with disabilities. As such, States parties have an obligation to respect, protect and fulfil the rights of women, including women with disabilities, in relation to their sexual and reproductive health and rights. States must ensure the enjoyment of their sexual and reproductive health and rights without any form of discrimination. Access to safe and legal abortion, as well as related services and information are essential aspects of women's reproductive health and a prerequisite for safeguarding their human rights to life, health, equality before the law and equal protection of the law, non-discrimination, information, privacy, bodily integrity and freedom from torture and ill treatment. (2018)

This was also followed by the development of the initial draft of the Nairobi Principles by a civil society coalition, which set out a broader framework for addressing the perceived conflict, and once again affirmed that reproductive rights are disability rights, while:

> We recognize that ableism is widespread and that persons with disabilities face diverse forms of discrimination in many aspects of their lives, which are rooted in disability stigma and harmful stereotypes that perpetuate ideas that the lives of persons with disabilities are less valued or that they lack agency to decide on their lives and futures. We will advocate for laws, policies, and practices related to SRHR that do not perpetuate stigma and discrimination against persons with disabilities, and we will consciously avoid using stigmatizing language in our advocacy. (2019)

In 2020, the Special Rapporteur on the rights of persons with disabilities presented a thematic study on the impact of ableism in medical and scientific practice to the Human Rights Council as part of her 2019 report.

The Special Rapporteur stated, "while the issue of disability-selective abortion requires greater attention, solutions must not compromise the right of all women, including women with disabilities, to decide whether or not they want to continue with a pregnancy. As interventions against sex-selective abortions have shown, abortion bans and restrictions on the use of technologies are not only detrimental to women's rights but also ineffective" (2020).

Given the impact of disability selective abortion as an argument to restrict abortion law reforms in Ireland, laying a clear foundation for a human rights focused solution is vital.

Feminist Organizations of Persons with Disabilities

Social movements and international human rights are imperfect tools, complicated systems, which draw often arbitrary, and complicatedly constructed lines. The more nuanced types of oppression experienced by people who don't neatly fit into a single category are rarely addressed.

As noted throughout this chapter, more needs to be done within international human rights law to address these cracks, or to build a new foundation that better serves all people. For disabled women, however, the Convention presents a significant opportunity to forward and advance their rights at a domestic level. While this in part can be attributed to a greater state awareness of this specific type of multiple marginalization or intersectional discrimination, the CRPD presents a framework through which movements can understand each other, establish shared calls for specific rights, and embrace those marginalized within other movements as full, valid, and equal partners who must be heard.

Beyond cross movement organizing, we see the expansion of feminist organizations of persons with disabilities. There is a long history of feminist disabled organizations globally: Women With Disabilities Australia dates back to the International Year of the Disabled Persons, and its first formal construction was in 1985 as a response to the exclusion of women within the domestic and global movement; DAWN in Canada (https://www.dawncanada.net/about/about/) established in 1985; Himpunan Wanita Disabilitas Indonesia (HWDI) (https://www.hwdi.org/), an organization of women with disabilities in Indonesia was established in 1997; the Nepal Disabled Women Association (NDWA) was established in 1998 (https://wwda.org.au/about/our-history/ and https://ndwa.org.np/who-we-are/); National Union of Women with Disabilities of Uganda (NUWODU) established in 1999 (https://nuwoduganda.org/); and the Network of African Women with Disabilities (NAWWD) established in 2004 (http://nawwd.org/category/about/). These organizations developed alongside disability rights within international human rights law and ensured that the treaty clearly articulated the rights of disabled women.

Since the foundation of the CRPD, we have seen an expansion of organization of women with disabilities. Malawi Human Rights for Women and Girls with Disabilities established in 2008, CERMI Mujeres Foundation established in 2014, Disabled Women Ireland on the island of Ireland established in 2018, Artykul 6 in Poland takes its name from the convention, and held its first national congress in 2019, Círculo Emancipador de Mujeres y Niñas Con Discapacidad de Chile – CIMUNIDIS in Chile. This is by no means an exhaustive list of feminist organizing in this area, but it is the continued development and expansion of these groups that is a significant shift in the disability rights movement. This creates space to counter the dominant narrative within the disability rights movement on the feminist movement and allow issues to be discussed and developed.

Conclusion

As well as the creation of new organizations of women with disabilities that are rights focused, the CRPD emboldened organizations of women with disabilities to leverage the language of the Convention to legitimize their claims. The language of Article 6 appears on websites, within policy documents, and within campaigns. Those feminist organizations which had contributed to the development of the CRPD can now rely on it to develop and further their own causes.

The CRPD provides a framework to address feminist and ableist oppression – the focus maps complicated interlocking and overlapping forms of oppression. It is clear from the above analysis, that this complicated framework which is both expansive and well thought out does indeed provide space to address intersecting forms of marginalization both at a global level in the international human rights sphere, and at a local level within domestic civil society. We must recall, however, the single note in the preamble that addresses other intersecting forms of marginalization. Human rights, if it is to succeed, must establish mechanisms to deal with this whether by following the example of the CRPD or by developing new mechanisms to ensure that those in need of rights protections don’t fall through the many cracks within our systems.

Article 19: Deinstitutionalization and Full Inclusion in Community

73

Luke Reid and Roberto Lattanzio

Contents

Abstract

One of the fundamental requirements for the successful deinstitutionalization of persons with disabilities (PwD) is a robust and well-resourced strategy to support their inclusion and independence in the community. A crucial element of this strategy involves the removal of legal barriers that limit their autonomy and independence. However, in many of the jurisdictions where deinstitutionalization has begun, it has

become clear that government efforts to remove these barriers have fallen woefully short. This chapter will provide illustrative examples of some of the ongoing legal barriers to the inclusion and independence of PwD in Canada, as well as some of the advocacy efforts being made to remove these barriers. Some of the issues this chapter will briefly cover include: (a) accessibility in housing; (b) gaps in the right to security of tenure for PwD; (c) problems associated with complaint mechanisms around the quality of services and support PwD receive; and (d) some of the common forms of discrimination persons with disabilities experience in the area of housing and independent living. In covering these issues, this chapter will use Article 19 of the CRPD to both critique these barriers and to illustrate what the CRPD requires of States Parties when it comes to promoting the independence and inclusion of PwD in the community.

Introduction

Historically, one of the most pervasive rights violations experienced by persons with disabilities has been the denial of the right to live independently in the community. Persons with disabilities have consistently and pervasively labeled in a variety of pejorative medicalized ways throughout history (e.g., “mentally retarded,” “mentally handicapped,” etc.). As a direct result, persons with disabilities have been forced to live, work, and learn in a variety of institutional settings excluded from their communities (e.g., in “mental asylums,” residential institutions, psychiatric hospitals, segregated schools, sheltered workshops, etc.) where almost every aspect of their lives was heavily regulated and controlled. In these environments, their freedom of action and choice was circumscribed to the point where many were largely passive observers to their own lives rather than active participants. This continues to be the case for many persons with disabilities, as many still live in institutional (or institution-like) environments.

This unique history of marginalization was front and center during the drafting of the *Convention on the Rights of Persons with Disabilities* (“*CRPD*”), a convention which heavily prioritizes promoting the right of persons with disabilities to live independently in their chosen community. This right is most directly addressed in Article 19 of the *CRPD*:

> States Parties to the present Convention recognize the equal right of all persons with disabilities to live in the community, with choices equal to others, and shall take effective and appropriate measures to facilitate full enjoyment by persons with disabilities of this right and their full inclusion and participation in the community, including by ensuring that:
>
> (a) Persons with disabilities have the opportunity to **choose their place of residence** and where and with whom they live on an equal basis with others and are not obliged to live in a particular living arrangement;

(b) Persons with disabilities have access to a range of in-home, residential and other **community support services**, including personal assistance necessary to support living and inclusion in the community, and to prevent isolation or segregation from the community;

(c) Community services and facilities for the general population are **available on an equal basis to persons with disabilities** and are responsive to their needs.

Article 19 essentially protects two separate and interrelated rights: a) the right to independent living and b) the right to be included in the community (UN Committee on the Rights of Persons with Disabilities, 2017). Both of these rights are extremely complex – largely because their realization requires the fulfillment of a wide range of civil, political, economic, and cultural rights. The General Comment on Article 19 explicitly recognizes this by designating Article 19 as one of the "most intersectional articles of the Convention" (UN Committee on the Rights of Persons with Disabilities, 2017 at para 6).

This means that States Parties to the *CRPD* cannot realize the full promise of Article 19 without first ensuring that a variety of other important rights are respected, protected, and fulfilled. This is evident in the text of Article 19 itself, which enumerates some of the specific rights that persons with disabilities must have access to if they are to live independently in an inclusive community. These include the right to choose a place of residence, a right to access supportive community services, and a right to access community services and facilities on an equal basis with others.

However, despite the promise of Article 19, independent living in the community remains out of reach for many persons with disabilities. This is often because many of these subsidiary rights remain unfulfilled – a situation which is itself caused by the fact that many of the strategies deployed by governments to support independent living in the community have fallen radically short. In the wake of deinstitutionalization, many persons with disabilities continue to experience a wide range of barriers that make independence and inclusion in the community all but impossible.

One of the most significant barriers is often the law itself. In many countries, a wide range of regressive laws and regulations often remain in place which effectively hinder independent living in the community. This is recognized by the United Nations' recently published guidelines on deinstitutionalization, which emphasize the central role that barrier-laden legislative and regulatory frameworks play in impeding the transition from institutional living to independent living in the community (UN Committee on the Rights of Persons with Disabilities, 2022 at para 60–62). The guidelines suggest that only by systematically reviewing "primary, secondary [and] regulatory. . .sources of law" can we fully identify and remediate the legal barriers that inhibit the full realization of Article 19 (UN Committee on the Rights of Persons with Disabilities, 2022 at para 61).

The purpose of this chapter is essentially to help with this process by identifying some of the legal barriers that operate in Canada to deprive persons with disabilities of their rights under Article 19. In undertaking this analysis, the author hopes to demonstrate how the *CRPD* itself can be used as a tool to critically assess legislation with a disability rights lens. Using Article 19 as a framework, this chapter will highlight some of the distinct obligations that this article places on Canada and some areas where Canada's legal regime falls short. In particular, this chapter will cover some of the legal barriers that (a) prevent persons with disabilities from choosing their place of residence; (b) prevent them from accessing high-quality community supports; and (c) prevent them from accessing many of the community services available to the general public that are required for independent living.

Article 19(a): Choice of Residence and Accessibility

At the heart of Article 19 is a fundamental respect for choice and autonomy, particularly as it relates to ensuring that persons with disabilities can choose where and how they live. As General Comment No. 5 states "[t]o choose and decide how, where and with whom to live is. . .central [to the] right to live independently and be included in the community" (para 24). However, persons with disabilities often cannot choose where to live because of a distinct lack of options when it comes to their living arrangements.

While this absence of choice has *many* different causes, one of the main drivers is inaccessibility in the built environment – a fact which the General Comment recognizes (UN Committee on the Rights of Persons with Disabilities, 2017). Indeed, several cases brought to the Committee on the Rights of Persons with Disabilities raising Article 19 violations pursuant to the Optional Protocol have centered on barriers to accessibility, and the role that local building codes and building regulations play in limiting the options persons with disabilities have regarding their living arrangements (see: *H.M. v. Sweden*, No. 3/2011, CRPD/C/7/D/2011 para 8.9; *Bacher v. Austria*, No. 26/2014, CRPD/C/19/D /26/2014 para 2.1–2.11.) . As a general rule, Article 19 requires States Parties to ensure that new residential construction is barrier free and that existing residential structures are retrofitted to promote accessibility (UN Committee on the Rights of Persons with Disabilities, 2017; Article 9(1)(a) of the *CRPD*).

Unfortunately, Canada is not yet meeting this obligation. Indeed, accessibility barriers in Canada's stock of residential housing represents a significant source of housing instability for persons with disabilities, a fact that has wide-ranging social, economic, and health consequences (Wiesel, 2020). Canada's shortage of accessible housing means that persons with disabilities must often either live in inaccessible housing or face institutionalization. Being forced to live in an inaccessible environment has been linked to significantly greater risk of injury from falls (Burns et al., 2021; Close et al., 1999; Public Health Agency of Canada, 2005; Wiesel, 2020), something which represents one of the leading causes of hospitalization and loss of function among older adults. This in turn often leads to greater unwanted institutionalization (e.g., long-term care), as those who have injured themselves find it difficult to transition back home (Lantz & Fenn, 2017; Scuffham et al., 2003).

Conversely, those who are lucky enough to live in accessible environments enjoy a range of benefits. For instance, some studies have found associations between increased accessibility in the home and reduced need for paid/unpaid support (Carnemolla & Bridge, 2016), increased independence and privacy (Lau et al., 2018), and more freedom when it comes to choosing when and how people carry out their daily activities (Aplin et al., 2015). In addition, improvements in accessibility also facilitate an increased ability to engage in social activities (Aplin et al., 2015). For example, one study found that after ramp installation there was a 60% increase in trips out of the home (White et al., 1995) – while others have found that increased accessibility improved family relations by allowing persons with disabilities to take on caregiving roles (e.g., cooking for their children) (Aplin et al., 2015).

Despite these benefits, accessible housing in Canada remains scarce. Although there are few official estimates of this scarcity, approximately half of all households (49%) were built before 1980 (Canadian Commission on Building and Fire Codes, 2020), a time when there were essentially no accessibility standards incorporated into building regulations (Canadian Commission on Building and Fire Codes, 2021). Even since that time, mandatory accessibility standards for housing remain extremely limited, something which has perpetuated what the OECD calls an accessibility crisis in housing (Plouin et al., 2021). Numerous disability groups have persistently highlighted the shortage of accessible housing as one of the primary problems that many persons with disabilities face when trying to live independently in the community (Alzheimer Society of Canada et al., 2017).

The Legal Regulation of Accessible Housing in Canada

While inaccessibility is very much a problem rooted in our physical environment, it is also important to remember that it is a legal problem as well. Laws play an outsized role in structuring the built environment and also have significant potential to shape it in positive ways.

Broadly speaking, the built environment in Canada is regulated by two types of legislation/ regulation. The first, and most important, are building codes, which exist at both the national and provincial level in Canada. However, these codes are also supplemented, in part, by human rights legislation, which imposes certain additional obligations on building owners when it comes to accessibility. This chapter will briefly describe each of these frameworks, and some of the problems associated with them when it comes to promoting greater accessibility.

(a) *The National Building and Provincial Building Codes.*

Canada's *Constitution Act* gives jurisdiction over the design and construction of buildings to the provinces (see: *Oshawa (City) v. 536,813 Ontario Limited*, 2016 ONCJ 287 (CanLII) at para 71; *Mississauga (City) v. Greater Toronto Airports Authority*, 2000 CanLII 16948 (ON CA) at para 38.). Despite this, for a majority of Canada's history the provinces generally refused to exercise this jurisdiction. As J.W. Archer puts it:

> The wealthy citizens of the new provinces – those who could afford to have buildings designed and built – were not inclined to encourage government to put limitations on what they could do with their property (Archer, 2003).

However, as Canada's cities grew, the problems associated with large cities increased (e.g., fire, typhoid fever, small pox, etc.) and the wealthier elements began to realize that these problems did not distinguish between the poor and the rich. As such, political momentum began to build toward a new arrangement which would give municipalities the ability to write and enforce building codes to counter these problems. This power had generally been granted to municipalities (at least in the largest provinces) by 1900. Unfortunately, this new arrangement resulted in a chaotic patchwork of local municipal building regulations across the country, many of which were of suspect quality (Archer, 2003).

In 1941, the Government of Canada responded to this problem by creating the *National Building Code (NBC)*, a "model" building code that was designed to be suitable for adoption "in toto" by municipalities (Archer, 2003; National Housing Administration & Research Council, 1941). Although the *NBC* was not legally binding, the fact that it was developed using the extensive resources of the federal government meant that by the 1970s most jurisdictions in Canada had adopted some form of it.

Since that time, the provinces have become far more active when it comes to developing and implementing their own building codes. However, the *NBC* has continued to play a very significant role when it comes to setting basic building standards across the country. Nine out of thirteen provinces and territories (New Brunswick, Nova Scotia, Manitoba, Saskatchewan, Newfoundland and Labrador, Northwest Territories, Nunavut, Yukon, and Prince Edward Island) have generally foregone the development of their own building standards and have simply implemented the *NBC* within their own jurisdiction (with some limited modifications in certain circumstances) (National Researcher Council, 2020). Of the remaining four provinces, which create and publish their own codes, three of them substantially mirror the *NBC* in terms of its content (Quebec, Alberta, British Columbia) – a fact which speaks to its enduring influence.

Accessibility Problems in the National Building Code

Unfortunately, when the federal government first developed the *NBC*, accessibility for persons with disabilities was not a design consideration. The original building code contained no provisions designed to promote accessibility. Although it has since been modified to promote a measure of accessibility, significant problems remain – particularly in relation to housing. For example, sections 2.1.1.2.(5), 3.1.1.2.(3), and 3.8.2.1(1) all specifically exempt "detached houses, semi-detached houses, houses with a secondary suite, duplexes, triplexes, townhouses, row houses and boarding houses" from having to comply with any of the accessibility standards currently in the *NBC*. This exemption effectively renders a large part of Canada's housing stock inaccessible to persons with physical disabilities – as including accessibility features into these buildings is effectively voluntary.

Even in larger residential buildings, there are few mandatory accessibility requirements in the *NBC.* Section 3.8.2.3(2) states that barrier-free paths of travel are not mandated in larger buildings unless an "authority having jurisdiction" has designated it as a building which is to "be accessible for use by persons with disabilities." This section essentially means that local municipalities must actively designate a building as being "for" persons with disabilities – as opposed to having accessibility requirements that automatically apply. The intent of these exemptions, as it is described in the *National Building Code of Canada's 2015 – Intent Statements,* is to exempt "certain areas of buildings. . . on the basis that it is impractical or onerous to provide barrier-free access" (see: ss.3.8.2.3(2)).[1]

However, there is little to suggest that providing higher levels of accessibility in these areas is "impractical or onerous." This is evident based on the fact that several provincial jurisdictions within Canada have attempted to improve upon the accessibility standards contained in the *NBC.* That is, even while they have broadly adopted the *NBC* as a whole, they have specifically abrogated or altered some of the sections described above. For example, under s. 3.8.2.1(5) of Ontario's *Building Code*, 15% of all units in apartment buildings ("Group C major occupancy apartment building") are required to have a barrier-free path of travel within them (as compared with only those that have been designated by a municipality). This automatically ensures that all large buildings automatically contain at least a subset of relatively accessible units.

Furthermore, Nova Scotia, despite the fact that it has broadly adopted the *NBC*, has also made several modifications to improve accessibility. It has replaced the exemption for detached homes and townhouses (etc.) with several additional accessibility requirements (adaptable housing requirements – see: 3.8.4.1 of *Nova Scotia Building Code Regulations* N.S. Reg. 26/2017).[2] Other foreign jurisdictions have gone even further. *The Building Regulations* (Britain 2015) in the UK have long required that new dwellings of this type meet minimum visitability standards. All of this is to say that even by the conservative standards of many provinces/foreign jurisdictions, significant improvements in the *NBC* are certainly possible – and would almost definitely lead to improved accessibility requirements across Canada.

---

[1] These obviously represent just two problems among many in the *National Building Code.* A number of other notable problems exist. For example, one critique of the current standards is that only a portion of persons with disabilities are addressed by the current standards, as these requirements are primarily based on the dimensions required for people who use manual wheelchairs.

[2] Adaptable housing is housing that can be easily renovated to improve accessibility at minimal cost. As noted above, one of the primary housing challenges many persons with physical disabilities experience is related to the evolution of their disability, and the potential that they will experienced increased accessibility needs. In many cases, they may be in housing which is either expensive or impossible to renovate. Adaptable housing is designed to address this issue by including structural features within the housing that minimizes the cost of renovation and maximizes the type of accessibility-related features that could be implemented.

(b) *Antidiscrimination Law in Canada*

In addition to building codes, antidiscrimination law in Canada plays an important role in helping to regulate the built environment. This primarily occurs through the enforcement of human rights legislation (*Council of Canadians with Disabilities v.* VIA *Rail Canada Inc.,* [2007] 1 S.C.R. 650, 2007 SCC 15), which imposes an obligation to accommodate persons with disabilities on housing providers. Housing providers have incurred significant liability in a number of cases as a result of their failure to properly accommodate tenants by providing physically accessible housing (see: *Jacobsen v. Strata Plan SP1773 (No. 2)*, 2020 BCHRT 170 (CanLII); *Devoe v. Haran*, 2012 HRTO 1507 (CanLII); *Manning v. Stoykovich*, 2021 HRTO 5 (CanLII); *DiSalvo v. Halton Condominium Corporation No. 186*, 2009 HRTO 2120 (CanLII); *Di Marco v. Fabcic*, 2003 HRTO 4 (CanLII); *Biggings obo Walsh v. Pink and others*, 2018 BCHRT 174 (CanLII)). However, despite the potential for liability, these laws have proven to be uniquely ill-suited to dealing with accessibility issues.

One of the primary reasons for this is the reactive nature of many of the obligations contained in human rights legislation across Canada – particularly when it comes to issues of disability (Chipeur, 2021). Numerous commentators, as well as some human rights tribunals, have all confirmed that human rights legislation is generally "retrospective and remedial" (*Shuparski v. Toronto (City)* 2010 HRTO 726 (CanLII) at para 37), meaning that accessibility barriers often have to be challenged after they have been erected and even then these barriers can generally only be challenged one by one, on a piecemeal basis (Lepofsky, 2004; Mosoff, 2000). As the Honorable David C. Only (Onley, 2019) reported, in his review of the *Accessibility for Ontarians with Disabilities Act, 2005,* S.O. 2005, c. 11 (the "*AODA*"):

> Rights under …[Ontario's *Human Rights Code*] are enforced on a case-by-case basis… [and] legal proceedings of this type… have proven very cumbersome, costly and time consuming… Removing barriers one at a time has been extremely frustrating for those seeking wider and faster systemic change.

This trend is vividly demonstrated in the limited human rights case law addressing accessibility problems in provincial building codes. In both *Shuparski v. Toronto (City)* and *Malkowski v. Ontario Human Rights Commission* 2006 CanLII 43415 (ON SCDC)*,* two individual applicants attempted to challenge Ontario's *Building Code* O. Reg. 332/12 on the basis that it failed to incorporate sufficiently rigorous accessibility standards into its guidelines, and, as a result, effectively authorized discriminatory conduct by others on a widespread basis (i.e., the construction of inaccessible buildings). In dismissing these complaints, both the tribunal and the Divisional court stated that the enactment of legislation was not a service within the meaning of section 1 of the *Code* and was in any event a policy exercise that was protected by legislative privilege (see: *Shuparski v. Toronto (City)* at para 26). In doing so, these adjudicative bodies radically limited the potential of human rights legislation when it comes to challenging widespread accessibility barriers in residential housing (at least in Ontario).[3]

Unfortunately, at the moment, these cases represent the totality of the jurisprudence on the compliance of building codes with antidiscrimination law in Canada. No constitutional litigation has been initiated, although there is every reason to believe that ss. 7 and 15 of the *Charter of Rights and Freedoms* may have significant relevance for the accessibility provisions in the building code. However, the complexity of litigation of this nature may have discouraged claimants thus far.

Improving Accessibility in Canada

The above discussion suggests that Canada has a long way to go in order to meet its obligation to create an accessible and barrier-free physical environment, particularly as it relates to housing. Article 19 of the *CRPD* requires States Parties who are signatories to the convention to implement building codes that include barrier-free requirements in residential construction. It does so in recognition of the fact that independent and inclusive living in the community is impossible without an accessible built environment. The sections in the *NBC* highlighted above clearly violate these requirements. In order for Canada to comply with its obligations under the *CRPD,* or indeed for any country to comply, sections like these must be revised to ensure that barrier-free construction is the norm, not the exception.

Article 19(b): Access to Community and In-Home Supports

Independent living in the community is not always possible without appropriate supports. This is recognized by Article 19(b) of the *CRPD*, which highlights the fact that parties to the convention have a legal obligation to provide access to high-quality individualized support services that are designed to promote independence and inclusion in the community (UN Committee on the Rights of Persons with Disabilities, 2017 para 28). The General Comment emphasizes that this includes the right to choose both the *type* of services and the service *providers* who deliver them. It also stresses that these services "should be flexible enough to adapt to the requirements of the "users" . . . not the other way around" (UN Committee on the Rights of Persons with Disabilities, 2017 para 28) and that these services must extend to all spheres of life including employment, education, and political/social participation (UN Committee on the Rights of Persons with Disabilities, 2017 para 29–30).

---

[3] It is worth emphasizing here that the same is unlikely to be true of the *Charter* in this circumstance. Indeed, the author has previously done work which suggests that a *Charter* challenge on the basis of s. 7 and s. 15 has the potential to broadly challenge some of the accessibility barriers currently embedded in the *NBC.*

Despite the central importance of this obligation, the development of community support services in Canada lags far behind what is needed (Aubry et al., 2014). For instance, as the Select Committee on Developmental Services in Ontario has pointed out:

> . . .individuals and families who need developmental services and supports are in crisis. We heard that after struggling to obtain services and enduring waitlists for years, many families feel pushed to the brink of disaster (Legislative Assembly of Ontario, 2014, p. 3)

Ontario is by no means unique in this respect. The process of deinstitutionalization and the development of community-based supports in Nova Scotia is proceeding at such a slow pace that the province was recently rebuked by the Nova Scotia Court of Appeal, which found that the situation amounted to a violation of the province's *Human Rights Act*, RSNS 1989, c 214 (see: *Disability Rights Coalition v. Nova Scotia (Attorney General),* 2021 NSCA 70). In that case, the Court of Appeal found that the province's persistent failure to provide appropriate supports to persons with disabilities, as compared to those without disabilities, represented systemic discrimination. The court also found that the absence of support had effectively forced many persons with disabilities (including the individual claimants) into institutionalized settings (e.g., locked psychiatric units) while they endured yearslong waits for appropriate community services.

This case clearly demonstrates that Canada has a long way to go when it comes to providing the appropriate **quantity** of services as required by Article 19(b) of the *CRPD*. However, even those who *do* receive appropriate levels of support often experience a number of other problems which inhibit their ability to live independently in the community. The problems are largely associated with the **quality** of the services they receive, a problem which often has its roots in some of the unique legal standards that surround service delivery.

Problems with the Quality of Supports

Persons with disabilities often experience a variety of issues when it comes to the quality of the support they are able to access. For instance, for those who have a physical disability and require attendant care services in their homes, one survey conducted by ARCH Disability Law Centre (2020) highlighted a number of chronic problems embedded in Ontario's home care system. These included difficulties when it came to scheduling support services at reasonable times, problems associated with attendants not showing up, a lack of adequate training for attendants, negative attitudes toward attendants by service recipients, and in some of the more extreme cases abuse was a significant problem.

In the developmental service sector, those with intellectual/developmental disabilities often face their own unique set of problems when it comes to accessing supportive services. One of the primary barriers is related to the failure of supporters/service providers to respect their right to make their own decisions (see: Article 12 of the *CRPD*). While persons with intellectual disabilities often know they have the right to make their own decisions about their own lives, service providers (or other individuals in their lives) frequently prevent them from exercising this right, particularly as it relates to how, when, and where services are provided. A report for the Law Commission of Ontario makes this explicit:

> Instead of having choice over what to eat, some people with disabilities are forced to eat whatever is cooked for them or the same meal every day for years. Instead of having choice over where to go on outings, some people with disabilities are not permitted to go anywhere unsupervised because it is considered unsafe. Instead of choosing how to spend their free time, some people with disabilities are forced to participate in day programs they dislike because it is more convenient for staff to have everyone in the same place. And instead of choosing a support worker with whom they feel comfortable and safe, collective agreements and organizational bureaucracy force many people with disabilities to be supported by a worker who is assigned to them (Joffe, 2010, p. 28)

The problems described above often have their roots in the law. They result, in part, from either a failure of the existing regulatory frameworks to provide persons with disabilities with sufficient enforceable rights (e.g., an enforceable right to quality support) or a failure by service providers to recognize existing rights (e.g., the right to make one's own decisions). Each of these issues will be described in further detail below.

The Absence of Appropriate Quality Control Mechanisms in Attendant Care Services

Given the number of jurisdictions in Canada, and the range of regulatory frameworks dealing with service delivery within each jurisdiction, Canada-wide analyses of quality control mechanisms in attendant care service delivery are quite difficult. However, one of the striking things about many of these statutory frameworks is the absence of enforceable quality assurance standards. That is, persons with disabilities in many of these jurisdictions often have no guarantees when it comes to the quality of service they receive.

Several good examples of this can be found in British Columbia (BC). In BC, support services for persons with intellectual disabilities are often provided by Community Living British Columbia (CLBC), a crown corporation that operates under the auspices of the *Community Living Authority Act,* SBC 2004, c 60. Although this organization has an extensive (some would argue arduous) complaints process, including an "External Review" process which deals with quality-of-service issues, generally the process does not provide complainants with specific and enforceable quality of service rights – in large measure because CLBC retains sole discretion over quality-of-service decisions. While persons with disabilities may use the third-party External Review process to challenge these decisions, the third party can only make *recommendations* about how CLBC should alter the services they provide.

For those who require access to "assisted living residences" (ASRs) in BC, similar problems exist. The province's *Assisted Living Regulation*, BC Reg. 189/2019, made under the *Community Care and Assisted Living Act,* SBC 202, c 75 – contains limited specific requirements about quality of care beyond mandating that service providers create their own policies and procedures to ensure that the services they provide are of sufficient quality. Furthermore, the only complaints mechanism available to residents in ASRs, outside of the service providers themselves, lies with Assisted Living BC – an organization that firmly limits their involvement to "complaints related to health and/or safety" – a limitation which seemingly excludes a range of quality-of-care issues.

Similar patterns can be seen in other provinces as well. For example, in Ontario, many services for persons with disabilities are provided under the *Services and Supports to Promote the Social Inclusion of Persons with Developmental Disabilities Act*, 2008, S.O. 2008, c. 14. A regulation issued under this Act, titled *Quality Assurance Measures* O. Reg. 299/10, purports to regulate the quality of care provided by many service providers but does so only by requiring service providers to enact their own policies about quality-of-service issues, while providing vague and generally toothless statements about the rights of residents. Furthermore, it sets up no clear independent mechanisms to resolve quality-of-care complaints. Ultimately, this leaves service recipients with few specific, enforceable rights and few places to complain about quality-of-service issues.

These examples are representative of a broader issue across Canada – namely that persons with disabilities in this type of service setting often do not have: (a) sufficient legal guarantees related to the quality of the service they receive, or (b) access to appropriate enforcement mechanisms for quality-of-care issues. This often leaves persons with disabilities in these settings dependent on the good will of service providers to ensure that they enact appropriate policies guaranteeing quality of service and that after doing so, that said policies are implemented in the actual delivery of quality services.

As the reader might guess, the absence of these legal guarantees and legal enforcement mechanisms directly impairs Canada's ability to meet its obligations under Article 19 of the *CRPD.* This article mandates both a right to high-quality service and access to appropriate dispute resolution mechanisms that "ensure that all decisions concerning independent living in the community can be appealed" (UN Committee on the Rights of Persons with Disabilities, 2017 at para 81). Without these rights, there is often little that many persons with disabilities can do to ensure that they get the support they need to live independently in the community.

Problems Related to Legal Capacity

Persons with disabilities are often prevented by many service providers and/or supporters from making their own choices, and, as a result, much about the basic ordering of their lives is often left to the discretion (and convenience) of others. This situation often arises because of paternalistic attitudes toward persons with disabilities, which manifest in the form of assumptions about their capacity to make their own decisions. These assumptions of incapacity often result in service providers effectively usurping decision-making authority from the individual (Joffe, 2010).

This often happens in a manner that is contrary to existing law. For example, as in most common law jurisdictions, Canadians benefit from a "presumption of capacity," which is a legal concept that states that, unless there is compelling evidence to the contrary, all people over a certain age (typically 18 years) should be presumed to be capable of making their own decisions (see, for example: *Substitute Decisions Act*, 1992, S.O. 1992, c. 30 at s. 2; *Adult Guardianship Act* [RSBC 1996] c 6 at s. 3; *The Mental Health Act* C.C.S.M. c. M110 at s. 2; Peisah et al., 2017). This principle is often ignored in practice in many developmental service settings, where the rhythms of daily life are set by service providers, regardless of whether they have any compelling evidence to doubt the capacity of service users (Joffe, 2010). In practice, as noted above, what they eat, where they go, and what they do are often decided by others.

This is just one example of a common issue in this type of setting – namely that the existing law on legal capacity is often ignored or improperly applied to persons with disabilities in ways that limit their independence and autonomy. However, this is not to say that there are not inadequacies in the law itself. For example, Canada's long-time emphasis on the use of substitute decision-making, on behalf of individual's deemed incapable (i.e., the use of guardians), represents an approach that has long been labeled as discriminatory by many disability advocates (Stanton, 2016). These advocates have emphasized that alternate approaches like supported decision-making represent a more rights compliant approach to dealing with questions of legal capacity. This is largely because substitute decision-making generally involves removing an individual's right to make important decisions about their own life (based on disability/perceived ability), whereas supported decision-making is generally directed toward providing persons with disabilities with the resources, support, and accommodations they need to ensure that they can continue to make decisions about their own lives.

While it is beyond the scope of this paper to delve deeply into the nuances of supported decision-making, it is sufficient to say that in many provinces in Canada, the existing legal architecture does not recognize supported decision-making and that this creates a number of barriers to its implementation (Stanton, 2016). In provinces like Ontario (see: *Substitute Decisions Act, 1992*), where supported decision-making is not recognized, those faced with decisional capacity issues are often confronted with only one formal option to deal with the situation – namely the removal of their legal ability to make decisions and the appointment of a guardian (Law Commission of Ontario, 2017, p. 74). In the context of service delivery, this means that those individuals with guardians have limited input into how, when, and where services are delivered – a situation which significantly limits their autonomy and control over their lives.

This is contrary to both Article 19 and 12 of the *CRPD,* which taken together emphasize that persons with disabilities have the right to make their own choices, particularly as it relates to service delivery (UN Committee on the Rights of Persons with Disabilities, 2014 para 44; UN Committee on the Rights of Persons with Disabilities, 2017 at para 28). These articles both endorse supported decision-making and the recognition that everyone has the legal right to make decisions about important matters that affect their lives. In order to better comply with its obligations under Articles 19 and 12, Canada must implement reforms designed to better protect this fundamental right.

Article 19(c): Access to Services/Facilities Available to General Population

Persons with disabilities need more than disability-related support services to achieve independence and inclusion in the community. They also need to be able to access the same services, facilities, and rights that are typically available to the general public. This is recognized by Article 19(c) of the *CRPD* which emphasizes that community services and facilities that are available to the general population must also be made available to persons with disabilities on an equal basis as everyone else.

General Comment No. 5 states that this encompasses "a wide range of services, such as housing, public libraries, hospitals, schools, transport, shops, markets, museums, the Internet, social media, and similar facilities and services" (para 32). Notably, it also includes access to the type of rights necessary to thrive in the community (e.g., the right to accessible education, employment, health care, etc.) (para 33). In sum, Article 19(c) requires States Parties to create an environment, outside of institutions, that is accessible, inclusive, and nondiscriminatory.

However, despite these obligations significant barriers to community services/facilities remain, many of which derive from legal sources. The full range of such obstacles is too great to cover comprehensively, so this chapter will limit itself to a brief discussion of one or two of these barriers, with the understanding that they represent just a small part of the overall problem.

Access to the Security of Tenure and the Means to Enforce It

One of the key rights that persons with disabilities must access to ensure that they can live independently in the community is the right to security of tenure, a right which provides legal protection against harassment, forced eviction, and other threats. Among housing and disability advocates, this right is viewed as one of the foundations of the right to adequate housing (see: Committee on Economic, Social, and Cultural Rights, 1991). Without this right, it can be difficult to maintain a residence, let alone to thrive in the community.

Beyond having access to the right itself, persons with disabilities also need to be able to access the means to enforce it as well. This typically occurs through provincial tribunals that are charged with enforcing local residential tenancies legislation (e.g., see Part V – Security of Tenure and Termination of Tenancies in the *Residential Tenancies Act*, 2006, S.O. 2006, c. 17). At these tribunals, people facing harassment, forced evictions, or a wide range of other issues can theoretically challenge problematic landlord behaviors. However, numerous problems in Canada often operate to deprive persons with disabilities of both the right to security of tenure and the means to enforce this right at the appropriate tribunal. Each of these problems will be discussed in greater detail below.

Gaps in the Right to Security of Tenure

By virtue of their unique circumstances, many persons with disabilities often live within a wide range of "alternative residential arrangements" in the community. These arrangements include supported living residences, group homes, supported independent living arrangements, assisted living, intensive support residences, transitional housing, and care homes just to name a few. These different types of residences span a continuum between those that offer higher levels of care, support, and treatment to those that offer minimal levels.

While there is little in the way of common terminology to describe these different types of residences (often making cross-jurisdictional comparisons difficult), what is clear is that in many provinces a large portion of these residential arrangements are not covered under residential tenancies legislation. For instance, in the case of "assisted living residences" for older adults, a 2013 report by the British Columbia Law Institute noted that:

> A review of the legislation of other Canadian provinces reveals that only Ontario and Quebec extend their residential tenancy legislation to equivalents of assisted living. In other provinces, residential arrangements similar to British Columbia assisted living facilities either fall outside of the scope of residential tenancies legislation, or exist in a grey area of uncertainty as to whether residential tenancies law applies to them. (British Columbia Law Institute et al., 2013, p. 23)[4]

A review of current residential tenancy legislation across Canada broadly confirms this point, and suggests that a large number of other residential arrangements, often used by persons with disabilities, are excluded from the application of this legislation (see: *Residential Tenancies Act*, SA 2004, c R-17.1, s. 2(1); *Residential Tenancy Act* [SBC 2002] c. 78, s. 4(f), (g); *The Residential Tenancies Act*, CCSM c R119 s. 3(1); *Residential Tenancies Act*, S.N.B. 1975, c. R-10.2, s. 1(1)(b)(xiii); *Residential Tenancies Act*, 2000, SNL 2000, c R-14.1, s 3(4); *Residential Tenancies Act*, RSNS 1989, c 401; *The Residential Tenancies Act*, CCSM c R119 s. 3(1); *Residential Tenancies Act*, RSNWT (Nu) 1988, c R-5; *Residential Tenancies Act*,

---

[4] It should be emphasized that this statement also applies to British Columbia as well. While the report emphasizes that the relationship in assisted living is a landlord-tenant relationship, assisted living arrangements "are not currently governed by the *Residential Tenancy Act*, which governs most rentals of living accommodations in British Columbia." (p. 23)

2006, S.O. 2006, c. 17 ss. 5. (k) & 5.1; PEI Reg EC10/89 s. 1; *Civil Code of Québec*, CQLR c CCQ-1991 at s. 1892; *Residential Tenancies Act*, 2006, SS 2006, c R-22.0001 s. 5(c)-(d); *Residential Landlord and Tenant Act,* SY 2012, c 20). Section 3(1)(d) of *The Residential Tenancies Act* of the Northwest Territories provides a typical example, stating that:

> 3.(1) This Act **does not apply** to
>
> . . .
>
> (d) living accommodation occupied by a person for penal or correctional purposes or for the **purpose of receiving in-patient or resident-based therapeutic or rehabilitative care**;
>
> (e) living accommodation established to temporarily shelter persons in need;

While the language of this section may seem limited to hospital-like settings, subsequent cases in various jurisdictions have indicated that a variety of service/housing providers have invoked similar provisions to escape their legal obligations under various residential tenancies acts. Ontario provides an apt example of this phenomenon. In Ontario, while various interpretations of what constitutes a "therapeutic" and "rehabilitative" place of residence have been put forth, one line of cases has found that these exempted residences are not limited to those offering traditional health care services, but that it also includes residences providing "conditions of support" and that the services offered need not be specifically "rehabilitative" but can include other types of supportive services (see: *Smith v. Youthlink Youth Services*, 2020 ONSC 7624 (CanLII) at para 37).[5]

A variety of different housing providers have taken advantage of these exemptions to residential tenancies legislation (Ministry of Housing, 2006; see also: *Smith v. Youthlink Youth Services*, 2020 ONSC 7624 (CanLII); *TET-58815-15 (Re)*, 2015 CanLII 94893 (ON LTB); *TST-01778 (Re)*, 2010 CanLII 67970 (ON LTB); *SOL-45003-14 (Re)*, 2014 CanLII 52441 (ON LTB); *Murray v Salvation Army Bailey House*, 2011 CanLII 94390 (NWT RO); *Grenadier (Tenants of) v. We-Care Retirement Homes of Canada Ltd.*, [1993] O.J. No. 1550; *YWCA NWT v Hashi*, 2021 NWTSC 15 (CanLII); *NOT-18915-15-RV (Re)*, 2015 CanLII 35176 (ON LTB); *CET-70982-17 (Re)*, 2018 CanLII 41842 (ON LTB); *PHS Community Services Society v Swait*, 2018 BCSC 824 (CanLII); Decision No. 1696 RTB (BC) (2012); Decision No. 6472 RTB (BC) 2015; Decision No. 2161 RTB (BC) (2011)). This has led to a situation where many persons with disabilities are deprived of their right to protection under residential tenancies legislation which typically includes the right to security of tenure (e.g., quiet enjoyment of the premises and restrictions on evictions) and the right to access the various landlord tenant

---

[5] In practice, it can be quite difficult to determine which housing/service providers actually qualify for this exemption as this is typically seen as a factual issue that must be decided on a case-by-case basis. See: *Smith v. Youthlink Youth Services*, 2020 ONSC 7624 (CanLII) at para 47; YWCA NWT v Hashi, 2021 NWTSC 15 (CanLII).

enforcement systems in Canada. This deprivation has led to a number of problematic practices on the part of certain landlords (both public and private), like the imposition of overly restrictive rules, programmatic requirements as a condition of tenancy (*PHS Community Services Society v Swait*, 2018 BCSC 824 (CanLII); Decision No. 6472 RTB (BC) 2015), or situations where a person with a disability is ejected from their housing because their needs have been summarily "assessed" as being too high for a particular housing provider (what some might consider a defacto eviction that's characterized as a "discharge" instead) (Carter, 2010; Spagnuolo, 2016; Mahoney, 1997).[6]

Many housing providers argue that these exemptions are necessary because the programming they offer is incompatible with various security of tenure rights. For example, transitional housing providers have stated that their programs require tenants to abide by rules related to curfews, chores, guests, substance use, and behavior/safety requirements – all of which they allege is incompatible with a right to reasonable enjoyment of their premises or the right to privacy. Others note that they must be able to unilaterally end tenancies to promote compliance with program objectives (Ministry of Housing, 2016). The degree to which this is true is debatable and highly dependent on the particular program. Indeed, similar arguments were raised regarding "care homes" in Ontario in the 1990s and they have gone on since to be successfully regulated under the *Residential Tenancy Act* (Lightman, 1990).

More importantly though, these arguments sidestep the most important disadvantage that these exemptions impose on many persons with disabilities, namely the fact that they can no longer access an independent forum through which they can raise complaints about their landlord. In absence of landlord-tenant tribunals, there are very few expeditious places that persons with disabilities can go when it comes to dealing with problems with their landlord.

With this in mind, it is difficult to say that Canada's system of rights and enforcement around residential tenancies is equally accessible to all persons with disabilities and that Canada as a whole is meeting its obligations under Article 19 (c) in this respect. In order to fulfill its promise to make rights, services, and facilities equally available to everyone in the community, exemptions like the ones contained in the residential tenancies' acts described above need to be narrowed or eliminated.

Other Barriers to Accessing Residential Tenancy Tribunals

These exemptions are not the only problems facing persons with disabilities when it comes to accessing residential tenancy tribunals. A review of case law suggests that

---

[6] At times, this type of eviction may result not in an individual becoming homeless, but instead in greater institutionalization. Persons with disabilities may be "discharged" from a more inclusive community-based setting to a more institutional setting based on their perceived level of need (e.g., a nursing home).

even those individuals who formally have a right to access these tribunals (because their housing is not exempt) face significant difficulties at these tribunals. These difficulties largely center around two specific issues:

A. A failure by residential tenancy tribunals to apply human rights guarantees to their decision-making
B. A failure by residential tenancy tribunals to properly accommodate persons with disabilities during the tribunal process

Failure to Apply Human Rights Guarantees

Tenants with disabilities, and their advocates, have long complained about the fact that landlords rarely attempt to provide them with reasonable accommodation and that landlords, faced with a disability-related problem, often try eviction before accommodation (Carter, 2010). One of the most common manifestations of this problem usually involves a failure to inquire about accommodation needs prior to eviction and/or a failure to properly engage in the accommodation process itself.[7] That is, landlords are often quick to prioritize their rights, as well as those of other tenants (e.g., reasonable enjoyment of the premises), over those of a tenant with a disability instead of attempting to reconcile these rights through a proper accommodation process.

TEL-81015-17-RV (Re), 2018 CanLII 111,868 (ON LTB) provides a typical example. In that case, a landlord attempted to evict a tenant with multiple disabilities, including fetal alcohol syndrome and sleep apnea, as a result of noise disturbances caused by the tenant staying up late at night playing online games. In describing the situation, the tribunal noted that:

> The evidence does not support the conclusion that the Tenant is deliberately causing excessive noise. Rather, the evidence indicates that a symptom of the Tenant's disability is a loud voice which he is often unaware of. Because playing interactive games online can involve speaking into a microphone to other players, the Tenant's voice can become louder than normal.

The LTB denied the landlord's eviction application, specifically noting that "the Landlord did not meet with or talk to the Tenant about other steps that might help

---

[7] For example, see: *SOL-94702-18-RV (Re),* 2018 CanLII 141,507 (ON LTB) (Failure to inquire about accommodation needs prior to applying for eviction); *Erika v. David*, 2003 HRTO 13 (CanLII) (Imposition of extra conditions on tenancy because of disability); *Devoe v. Haran*, 2012 HRTO 1507 (CanLII) (failure to properly engage in accommodation process); *Cityviews Village Inc. v. [tenant]*, RTB (BC) Decision No. 6020 (2021) (Landlord pressuring tenant with disability to move out); *TEL-92935-18 (Re),* 2019 CanLII 86,868 (ON LTB) (Landlord not engaging in accommodation process); TEL-81015-17-RV (Re), 2018 CanLII 111,868 (ON LTB) (Landlord failed to inquire about accommodation needs prior to applying for eviction); SOL-66034-15-SA (Re), 2016 CanLII 44,564 (ON LTB) (Landlord failure to provide accommodation to the point of undue hardship); *SWT-97811-16 (Re)*, 2017 CanLII 48,795 (ON LTB) (Landlord failed to inquire about accommodation needs).

[resolve the noise issue]" and therefore had not discharged their duty to properly accommodate the tenant. This failure to engage in the accommodation process is extremely common among landlords and is perhaps a key reason why many eviction applications are brought against persons with disabilities.

Unfortunately, not all residential tenancy tribunals respond to these applications like the adjudicator above did. Many residential tenancy adjudicators across Canada often forget to heed legal antidiscrimination protections and, as a result, these tribunals have an inconsistent record of properly attending to these issues.

Historically, this appears to have been (at least in part) because it was legally unclear whether these administrative tribunals could even apply antidiscrimination guarantees under local human rights legislation. However, the Supreme Court of Canada clarified this issue in 2005, making it clear that these tribunals could indeed apply antidiscrimination protections (see: *Tranchemontagne v. Ontario (Director, Disability Support Program*) [2006] 1 S.C.R. 513, 2006 SCC 14). Despite this clarification, the ability to apply these guarantees is still often ignored or improperly exercised in this context. Indeed, the case law is rife with examples where landlord-tenant tribunals have failed to either properly apply human rights legislation or have ignored it entirely.[8]

SOL-51322-14 (Re), 2014 CanLII 57894 (ON LTB) illustrates this issue well. In that case, a tenant with clear disability-related needs was evicted from their home – with seemingly little to no inquiry into whether accommodations would have been possible. The tribunal, in evicting the tenant, made no reference to the Code, or the landlord's duty to inquire about disability-related needs (*Lane v. ADGA Group Consultants Inc.*, 2007 HRTO 34 (CanLII)).

Accommodation at Residential Tenancy Tribunals

For many persons with disabilities, access to justice hinges on their ability to obtain appropriate accommodations during the administrative tribunal context. In the last 2 years, this issue has taken on increasing importance in the pandemic, when most

Supportive Housing in Peel*, 2005 CanLII 12858 (ON SCDC) (LTB decision did not consider *Code* obligations in eviction hearing); *Bronson v. Kingston and Frontenac Housing Corporation*, 2014 HRTO 619 (CanLII) (LTB did not consider accommodation issue regarding a rental subsidy in eviction hearing); *Walmer Developments v.* Wolch, 2003 CanLII 42163 (ON SCDC) (LTB failed to consider landlords obligation to accommodate in eviction hearing); *Ramadhin v. Chavali*, 2014 HRTO 866 (CanLII) (LTB mediator advised applicant he could not raise human rights issues at LTB eviction hearing); *N.K. v. The Owners, Strata Plan LMS YYYY*, 2018 BCCRT 108 (CanLII) (refusal to allow occupant to keep support animal – failure to apply test for discrimination); *Sharp v. The Owners, Strata Plan* BCS 435, 2020 BCCRT 1142 (CanLII) (Failure to properly apply test for discrimination and burden of proof); *Metro Vancouver Housing Corporation v. [tenant]*, RTB (BC) Decision No. 6022 (2020) (No human rights analysis – tenants evicted because of noise from child with a disability); *TST-32086-12-RV (Re)*, 2015 CanLII 71788 (ON LTB) (Failure of LTB to consider *Code* related issues at eviction hearing); *SWL-13871-18 (Re*), 2018 CanLII 42924 (ON LTB) (Failure to consider code related obligations in LTB eviction decision); *TSL-67255-15-RV2 (Re)*, 2016 CanLII 39865 (ON LTB) (Failure to reference *Code* obligations for procedural accommodations).

administrative tribunals shifted to an all-digital format. With respect to landlord and tenant tribunals specifically, numerous organizations have raised significant concerns regarding the degree to which this process is accessible to tenants with disabilities. For instance, a recent report by the Advocacy Center for Tenants Ontario (ACTO) has highlighted a number of significant accessibility challenges persons with disabilities currently face before Ontario's Landlord and Tenant Board. These included problems with existing accommodations, such as lapses in ASL translation and inaccessible or complicated technologies.

The report further noted that participation by persons with mental health disabilities was almost nonexistent in the tribunal hearing processes (ACTO, 2021). In its conclusions, the report specifically questioned the accessibility of Ontario's landlord-tenant processes and noted that in cases where tenants did not show up, adjudicators inquired about their absence in only 30.5% of cases. This is extremely problematic given the numerous challenges that many tenants may face when attempting to participate in a hearing (e.g., the absence of proper notice *SOL-94702-18-RV (Re)*, 2018 CanLII 141507 (ON LTB) at para 3–6, difficulty arranging access to technology, etc.).

Limitations of Current Processes

These barriers to the right to access justice are contrary to the requirements of Article 19. In its guidelines on deinstitutionalization, the Committee on the Rights of Persons with Disabilities states that these obligations require States Parties to remove all of the "environmental, attitudinal, legal, communicational, and procedural barriers" that prevent persons with disabilities from pursuing legitimate claims through courts and tribunals. They state that States Parties must ensure that persons with disabilities are properly accommodated in the legal system and that they have the appropriate legal standing necessary to pursue these claims (UN Committee on the Rights of Persons with Disabilities, 2022). These obligations dovetail with the ones imposed by Article 13, which requires States Parties to "ensure effective access to justice for persons with disabilities on an equal basis with others… in all legal proceedings…".

Canada has clearly not yet met these obligations. Persons with disabilities still struggle to access vitally important security of tenure rights, as well as the right to an independent hearing as it relates to housing issues. Many persons with disabilities do not have access to landlord tenant tribunal processes (because of exemptions for housing providers) or because tribunals fail to properly accommodate their needs – impairing their ability to participate in the tribunal process. In other cases, even when they are able to participate, tribunals fail to recognize many of the fundamental antidiscrimination rights that persons with disabilities are entitled to benefit from.

Ultimately, all of these make them increasingly vulnerable to eviction, harassment, and other housing-related rights abuses, and significantly impair their ability to live independently in the community. As a result, when persons with disabilities encounter challenges in Canada's housing system, the legal system is not always there to help them.

Conclusion

The purpose of this chapter was, in part, to demonstrate how the rights enshrined in the *CRPD* could be used as a tool to critically assess legislation with a disability rights lens. Using Article 19 as a framework, this chapter has highlighted a number of Canada's obligations as a signatory to the *CRPD* and some of the areas where it falls short in their realization. This included a wide range of legal barriers running the gamut from inaccessible building codes to inadequate or nonexistent quality control mechanisms for service delivery. All of these individual problems, while significant on their own, frequently coalesce into a situation where independent living becomes all but impossible for many persons with disabilities.

The compounding nature of these problems highlights the intersectional character of Article 19. This chapter has identified a number of different areas where Article 19 rights intersect with and are dependent on the fulfillment of other articles in the convention. This point deserves special emphasis, because if the right to inclusive and independent living is ever to be realized, a systematic revision of many of Canada's legal structures is necessary – one geared toward filling gaps in Canadian law that perpetuate dependency and exclusion among persons with disabilities. In short, if Article 19 of the *CRPD* is to be fully realized, *all* of the rights in the Convention must be fulfilled.

While the discussion above has been specific to Canada, it is unlikely that many of these barriers are unique to Canadian jurisdictions. Experience has shown that persons with disabilities in different countries often cope with many of the same challenges and problems when it comes to achieving independence and inclusion. With this in mind, it is the author's hope that this chapter will inspire similar critiques of legal barriers in other jurisdictions, so that the promise of the *CRPD* and the right to live independently in an inclusive community will be realized sooner rather than later.

The Case of the UNCRPD: Fostering a Human Rights-Based Approach to Disaster Risk Reduction and Implementation Monitoring

74

Eleonora Guzzi

Contents

Abstract

International Human Rights Law (IHRL) does not explicitly affirm a right to protection and relief from disaster; however, it is implied in the positive obligations that the right to life places upon States. By recognizing that climate change-driven disasters have a disproportionate impact on the population, thus exacerbating preexisting vulnerabilities in the society and preventing the full enjoyment of human rights, in particular for the most marginalized, the UN Human Rights system has consolidated its focus on the topic, developing a jurisprudence of Human Rights obligations in the context of climate change. UN Human Rights mechanisms continuously stress the relevance of human rights in both Disaster Management and Climate Change Adaptation and Mitigation, promoting the application of a human rights-based approach. UN Treaty Bodies frequently highlight the links between human rights, disaster risk reduction, the United Nations Framework Convention on Climate Change (UNFCCC), and the

Sustainable Development Goals (SDGs), as well as their common goal of enhancing community resilience through the reduction of vulnerabilities, despite the fact that these frameworks still work in silos.

Considering the parallelism between the evolution of both "disaster theory" and IHRL, the chapter focuses on the need for a human rights approach to Disaster Risk Reduction and Climate Change Adaptation, underlining those principles which makes human rights the basis for an effective people-centered disaster risk reduction. To this end, it looks at the UN Convention on the Rights of Persons with Disabilities (CRPD) as a case study, given that the CRPD contains the only binding provision in IHRL citing "natural disasters" as a situation in which a State Party must ensure the protection of persons with disabilities. For this and other reasons, including the strong paradigm shift entailed in the Convention, as well as its explicit social development dimension enshrined in a standalone provision on international cooperation (Article 32), the CRPD has a huge potential in fostering the implementation of soft law instruments regulating Disaster Risk Reduction, in compensating the current absence of a flagship treaty on the protection of persons in the event of disasters, and in potentially paving the way for the adoption of such treaty.

Introduction

Building on the assumption that human rights are the connecting dots between climate change, disaster management, and sustainable development, this chapter makes the case for the potential of the Convention on the Rights of Persons with Disabilities (CRPD) and its human rights-based perspective on disability to foster the connection between disaster risk reduction (DRR)-related objectives of the various international agendas and the jurisprudence on states' obligations in the context of climate change, compensating the current absence of a flagship treaty on the protection of persons in the event of disasters.

Considering the parallelism between the evolution of both "disaster theory" and international human rights law, and of the concept of protection, this chapter highlights the need for a human rights-based approach to DRR and climate change adaptation (CCA) measures, comparing it with the traditional humanitarian "needs based approach," and underlining those principles which make human rights the basis for an effective people-centered governance of disaster risk reduction.

The chapter then analyzes three aspects of the CRPD. First, the reflection in the CRPD of the broader international human rights law shift from a paternalistic approach to a vulnerability paradigm, which goes from viewing persons with disabilities as "objects" of charity, medical treatment, and social protection toward considering them as "subjects" with rights. Second, the social development dimension of the CRPD, whose main principles reflect and complement those of a people-centered approach to DRR/CCA, thus constituting a point of reference for further mainstreaming human rights into disaster management. Finally, article 11 of the CRPD is the only binding international provision so far explicitly mentioning "natural disasters" within the situations in which a State party is required to "ensure protection and safety of persons with disabilities."

Drawing upon these reasons and considering that disaster management is currently regulated only by soft law instruments, such as the Sendai Framework for Disaster Risk Reduction 2015–2030, the chapter analyzes the International Law Commission's Draft Articles on the protection of persons in the event of disasters and its understanding of the current jurisprudence, as well as the role that UN Treaty Bodies, in particular of the CRPD Committee, play in fostering the implementation of human rights-based DRR/CCA measures.

Human Rights: The Normative Nexus Between Climate Change, Disasters, and Development

Disaster management and climate change action have historically been perceived as highly technical disciplines, and the relevance and the utility of human rights has been neglected or, at least, scarcely considered until recently. A human rights framework offers an understanding of the different requirements and vulnerabilities of disaster- and climate change-affected persons, as well as their empowerment as rights-holders rather than victims or mere recipients of humanitarian action and relief. Human rights thus contributes to the strengthening of the whole community resilience [intended as a process in which a hazard-exposed system, community, or society is able to adapt, by resisting or changing, in order to keep an acceptable level of functioning. Resilience is a function both of the degree of self-organization and of the community's capacity, based on lessons learned, to adopt measures that concretely contribute to risk reduction] and enhances the accountability of duty-bearers vis-à-vis rights-holders (Kälin, 2011).

International human rights law (IHRL) does not explicitly affirm a right to protection and relief from disaster; however, according to relevant jurisprudence of the European Court of Human Rights (see: ECtHR, ÖNERYILDIZ v. TURKEY, 2008), it is implied in the positive obligations that the right to life places upon States. These obligations on States include the duty to prevent and to mitigate the consequences of foreseeable disasters by adopting, for example, appropriate laws and the necessary institutional and administrative arrangements, by adequately informing the population, and by ensuring liability and accountability of duty-bearers (Kälin & Dale, 2008).

UN Treaty bodies (UNTBs), charged with the monitoring of the implementation of UN human rights legal instruments, unceasingly stress the relevance of human rights in both Disaster Management and in Climate Change Action (CCA), contributing to shape States' behaviors and promoting the application of a human rights-based approach. For instance, UNTBs have been quite active in acknowledging the disproportionate impacts of climate change-driven events on groups in vulnerable situations, such as rural women, children, persons with disabilities, and Indigenous people (see CEDAW Concluding Observations on Bahamas, 2018), stressing the need to take their views into account in a free, informed, and participatory decision-making process.

UNTBs have also frequently highlighted the links between human rights and the international legal and soft law instruments related to human and environmental protection, disaster risk reduction, and climate change (UN Committee on the Elimination of Every Form of Discrimination Against Women (CEDAW), 2018) (such as the Sendai Framework on Disaster Risk Reduction (2015–2030); the United Nations Framework Convention on Climate Change (UNFCCC); and the 2030 Agenda, and the 2016 World Humanitarian Summit), in line with the recent attempts to connect these heterogeneous fields through the main principles of the promotion and protection of human rights and a further acknowledgment of the need for a more consistent human rights-based approach in these areas.

It appears that human rights are the connecting dots between climate change, disaster management, and sustainable development at the UN level, somehow overcoming the integration issues at the international policy and institutional level. Nevertheless, if drawing the link between disaster risk reduction (DRR), CCA, and sustainable development is conceptually easy – they all share the common goals of reducing vulnerabilities and making communities resilient – there is a tendency to consider CCA as separated from DRR, resulting in poor integration and in ineffective strategies and action plans. The different legal status of these international instruments raises integration issues as well, especially considering that, technically speaking, CCA measures (which are regulated by a binding tool) can be considered a subset of DRR (regulated by a nonbinding framework). Placing both CCA and DRR under the umbrella of sustainable development (also regulated by a nonbinding instrument) raise some questions concerning the legal status of a possible new international regime as States would not easily accept to place sustainability goals under a legally binding instrument such as the UNFCCC, considering the widespread climate-related political dissent (Buffet & Revet, 2017). One of the major issues regarding these varied international frameworks is their synergetic implementation on the ground, in particular at the local level.

To achieve this, the need of an integration between those fields and human rights must be acknowledged first at the international level, to spread to the regional, national, and subnational levels. In fact, the mere existence of a national legislation covering DRR has been proved to be not as effective to protect individuals in disaster scenarios as one incorporating human rights (da Costa & Pospieszna, 2015). When human rights are respected and fulfilled, communities present higher level of resilience, intended as the ability of a system exposed to hazards to resist, absorb, accommodate, and recover from its effect in an efficient and timely manner (Bizzarri, 2012).

The Need for a Human Rights-Based Approach to DRR and CCA

To demonstrate the enhanced effectiveness of Human Rights-based DRR and CCA, it is useful to recall the similarities in the evolution of both disaster theory and IHRL. The conception of "disaster" has gradually shifted from inevitable "Acts of God" – predicated on fate which cannot be controlled; thus, nothing could be done in advance with no human responsibility to be claimed (Sun, 2016) – to disasters as

“Acts of Nature” with the 1775 Lisbon earthquake, when the State accepted the responsibility to mobilize the emergency response and to implement reconstruction efforts (Dynes, 1999).

Toward the mid-1970s, the human dimension became part of the disaster equation, conceiving catastrophes as the result of intersection between unaddressed social needs and structural vulnerabilities. Under this perspective, the affected population is no more a victim of the disaster itself but of those in power who have contributed to create (by action or inaction) the conditions leading to their vulnerability. The unequal exposure to risk is due to the dysfunctionalities of the social system that makes some groups of persons more vulnerable to hazards. Disaster risk is socially distributed and follows the pattern of preexisting inequalities, making marginalized groups more prone to death, injury, economic loss, and physical and psychological impairment (Peek & Stough, 2010a). This recognition is conducive to the moral and legal responsibility of who should bear the costs of all phases of disaster management and paves the way for solutions addressing the root causes of social injustice and human vulnerabilities to hazards (Lauta, 2016).

Similarly, IHRL has moved from a paternalistic approach to a vulnerability paradigm that allows to consider the latter not as an intrinsic characteristic of the individual but as the lack of effective legal protection in the enjoyment of rights provided by the public authority. This change of paradigm can be traced in the Convention on the Rights of the Child (CRC), whose cornerstone principle is “the best interest of the child” that must be upheld as the primary consideration in all actions regarding children (CRC, article 3). It perfectly reflects the shift from a “traditional welfare or paternalistic approach” (Crock, 2016) to the right of children to be regarded as active agents. The Committee on Economic, Social and Cultural Rights (CESCR) developed a consistent vulnerability paradigm with regard to the right to housing and adequate standard of living. Although still unclear, the conceptualization of vulnerability of the CESCR Committee is built upon the lack of full and equal enjoyment of the right to adequate housing, suggesting that the discrimination comes from factors such as age, disability, and socioeconomic conditions. According to this construction, disaster-affected persons are a marginalized group as they do not have full access to the right to house and adequate standards of living: Their vulnerability is already existing when the disaster strikes, and it is not to be ascribed to innate characteristics (Nifosi-Sutton, 2018a). Hence, this “new” paradigm recognizes disaster-affected people as victims of the public authority’s negligence in tackling the dysfunctions of the society that are responsible for creating vulnerability, by acknowledging the centrality of the respect for human dignity in protection frameworks. Indeed, in doing so, IHRL has become a core component of protection norms, forming a reliable framework for individuals’ protection during disasters.

Thus, it is evident that human rights play a fundamental role in disaster management and DRR as they provide a legal source of obligations for States in a field so far comprehensively regulated only by soft law instruments. In this way, IHRL represents a legal source of obligation for States in the field of disaster management, imposing procedural, substantive, and specific duties that impact vulnerable groups

(Nifosi-Sutton, 2018b). The recognition that IHRL is relevant not only in the aftermath of disasters but also in the mitigation phase highlights that, when governments are unable or unwilling to minimize the risks and damages of hazards leading to disasters, they violate human rights and must be held responsible for that (Ferris, 2014). Thus, framing DRR measures as human rights issues, other than contributing in reducing vulnerabilities, improves accountability in case of negligence of disaster management actors and empowers individuals and their participation in related decision-making. DRR measures have been defined as an "enabler of human rights" (Sossai, 2018a), referring exactly to the empowerment of individuals and communities vis-à-vis disasters through enhanced participation in political life and consultation in decision-making processes. DRR measures are, per se, a reminder of the necessity to pay attention to human rights standards in policy formulation: In fact, rights-based policies and programs focus on tackling the root causes of vulnerability through the eradication of poverty and by fostering social justice and meaningful participation and consultation, and by addressing multiple forms of discrimination. Moreover, a human rights-based approach considers not only State behavior but also those of nonstate actors, thanks to the consistent IHRL interpretation in the sense that private sector activities shall not interfere with the enjoyment of human rights (OHCHR, 2011). Finally, IHRL is conducive to a people-centered approach, which is supposed to be more effective in adequately addressing the exposure to risks and the vulnerability of communities, compared to top-down, hierarchical approaches (Da Costa, 2014a). Such an approach is the natural consequence of incorporating human rights in DRR, leading to a better disaster governance based on a multistakeholder and a multi-duty-bearers approach, encompassing, as a minimum, the principles of accountability; accessibility of information; meaningful, active, and free participation; and nondiscrimination (Da Costa, 2014b).

The Disability Rights Perspective and the Convention on the Rights of Persons with Disabilities

The UN Convention on the Rights of Persons with Disabilities (CRPD) demonstrates that mainstreaming human rights standards makes the management of disasters, in particular DRR and CCA, more efficient and effective and that its principles and formulation provide a guidance on how to formulate and implement human rights-based DRR.

The CRPD, with its social and human rights-based approaches to disability, reflect the broader evolution of the IHRL paradigm, shifting from a disempowering and stigmatizing charitable view (OHCHR, 2014a), and a biomedical approach that represents "an ideological construction of disability through individualism and medicalization" (Degener, 2016a), to a clear recognition of the enjoyment of rights by persons with disabilities in identifying them as rights-holders, holding duty-bearers accountable.

The social model of disability enshrined in the CRPD sees disability as a social construct, resulting from the interaction between the individuals and an environment that fails to accommodate their difference. The inability of society to eliminate barriers is what creates inequality, rather than the individual's impairment. According to this approach, the public authority (the State) and society are the duty-bearers, accountable for accommodating the requirements of persons with disabilities. Clearly, the view on disability has started to drastically change with the introduction of this model: Disability is a layer of human diversity. This model is in direct opposition to the charity/medical model of disability. Moreover, a social model understanding of disability and a rights-based approach dictates that laws and policies should be designed with the involvement of persons with disability (OHCHR, 2014b).

The human rights approach to disability builds on the social model: It ensures the full and equal enjoyment of all human rights to people with disabilities and promotes the respect of their inherent rights. The foundations of this approach are the principles of the equality of opportunities, of nondiscrimination on the basis of disability, and of participation in all aspects of public life. Barriers constitute a significant source of discrimination, and the State is responsible for their removal, obliging the public authority to undertake actions to ensure the full inclusion in all social aspects (i.e., law enforcement, awareness raising policies, equal recognition before the law, and private sector regulation). This model defies the presumption that impairment might hinder the capacity of enjoying rights (Degener, 2016b). Driven by the core principles of human dignity, individual autonomy, freedom of choice, and independence, this model celebrates human diversity (OHCHR, 2014c) by providing, when needed, support to people with disabilities to exercise active agency in society (OHCHR, 2014d). The human rights model of disability codified by the CRPD is centered on a social model understanding of disability offering a road map for inclusive development and humanitarian aid by seeking to establish the necessary social and economic mechanism to support persons with disabilities to take full charge of their own lives.

Both disaster and disability theory end up recognizing the multifaceted social nature of both disaster and disability. Environmental, institutional, attitudinal, and social barriers are the main source of discrimination in both disability and disasters' modern constructions: Barriers (not the impairment or the person's characteristic) are the source of inequality and must be removed.

CRPD's General Principles and Relevance in Disaster Management

An analysis of the main principles of the CRPD (Article 3) shows full convergence with the principles at the basis of an effective people-centered approach to DRR.

For example, the respect for dignity and individual autonomy translates into the consideration of persons with disabilities not as mere recipients of humanitarian assistance but as active agents. In disaster situations, this principle emphasizes that persons with disabilities have the right to be involved, not only because they can improve Disaster Management with their specific knowledge and skills but also to avoid recurring violations of rights in future disasters (Njelesani et al., 2012a).

The strong nondiscrimination framework of the CRPD allows for the recognition of multiple and intersectional forms of discrimination that persons with disabilities might be subjected to in humanitarian emergencies and provides them with a higher level of protection. The Convention, in fact, moves from a mere proclamation of equality to substantive equality (OHCHR, 2014e).

The meaningful and active participation in decision-making and the inclusion of every diversity is an obligation and an objective of the Convention that oblige States to actively involve organizations of persons with disabilities (OPDs) in the development, implementation, and monitoring of emergency regulation. Mere consultation of persons with disabilities is not enough: Participation must include meaningful involvement in activities and decision-making processes, and the possibility to voice opinions and to correctly identify specific requirements, to influence, and to complain when participation is denied, in line with the disability movement's motto "nothing about us without us." The full and effective participation and inclusion of persons with disabilities in society is a two-way process that promotes the acceptance of persons with disabilities and their participation, and that encourages society to open up and be fully accessible to them.

Respect for difference and acceptance of persons with disabilities reflects the new approach to disability based on the enjoyment of human rights, viewing disability as a part of human diversity. This principle is at the base of Article 8 on awareness-raising, for which States parties are required to adopt measures with the aim "to combat stereotypes, prejudices and harmful practices" and to "promote awareness of the capabilities and contributions of persons with disabilities." It implicates that social programs shall accommodate varying abilities, rather than expecting people to conform to a certain norm, benefitting a broader range of people, such as pregnant women, young children, and the elderly (Njelesani et al., 2012b).

The principle of accessibility is a vital precondition for the effective enjoyments of all human rights and a tool to remove barriers and to grant equality of opportunities (UN Committee on the Rights of Persons with Disabilities (CRPD), General comment No. 2, 2014a). In its General Comment No. 2 on Article 9, the CRPD Committee emphasizes that ensuring full access to the physical environment, transportation, information, and communication is vital for the effective enjoyment of human rights. Thus, in those situations covered by Article 11, emergency services must be accessible to persons with disabilities to save their life or to protect them. Other than stressing on the incorporation of accessibility in postdisaster reconstruction efforts, the Committee explicitly states that "*DRR must be accessible and disability-inclusive*" (UN Committee on the Rights of Persons with Disabilities (CRPD), General comment No. 2, 2014b).

The recognition of equality between women and men highlights the double vulnerability of women with disabilities in disaster settings and calls for States to ensure de facto equality in the access to information of relief projects, to accessibility of emergency equipment and evacuation plans. CRPD Article 6, other than reinforcing the nondiscriminatory approach of the treaty, strengthens this principle with regard to the protection of women and girls with disability from "multiple discrimination," after recognizing that individuals with "multidimensional layers of identities, status and life circumstances" might experience higher disadvantage caused by intersecting forms of discrimination (UN Committee on the Rights of Persons with Disabilities (CRPD), General comment No. 3, 2016).

In a similar way, children with disabilities, who are more exposed to disaster risk, both physically and psychologically, require a special form of protection due to their double status as minors and as having a disability, enshrined in Article 7. As the collapse of social infrastructures, the inequitable access to social services, and the loss of autonomy resulting in dependence increase their vulnerability and decrease their level of resilience (Peek & Stough, 2010b), the CRPD stresses their right to be actively involved in all decision affecting them, as well as the deeper vulnerability they might suffer in humanitarian emergencies.

CRPD: Vulnerability Paradigm, Social Development, and Good Governance

As mentioned above, International Disability Law fully mirrors this paradigm shift of general IHRL, developing its own vulnerability paradigm whose application with regard to legal protection is applicable in emergency situations in general and, as stated by CRPD Article 11, during "natural disasters." The combination of this paradigm with the social development dimension and good governance aspects of the CRPD are conducive to effective, inclusive, and people-centered DRR.

Legal Protection As recalled, the CRPD embraces and extends the ICESCR vulnerability paradigm, providing a higher level of protection due to its robust nondiscrimination framework: The legal protection of the Convention extends to all individuals discriminated on the basis of disability (including perceived disability and discrimination by association). The denial of reasonable accommodation is also considered a form of discrimination, a provision fundamental to achieve equality of opportunity and equality of results. To promote equality, States Parties "*shall take all appropriate steps to ensure that reasonable accommodation is provided*" (Article 5, para.3), and that "*any specific measures which are necessary to accelerate or achieve de facto equality of persons with disabilities shall not be considered discrimination*" (para. 4). The application of this right (and of the right to equality) is not confined to the rights contained in the CRPD because, as mentioned earlier, any form of discrimination based on disability is prohibited (Cera, 2017a). The provision on reasonable accommodations is a means to achieve one of the objectives of substantive equality: equality of opportunity. Nonetheless, the CRPD requires from States parties an additional commitment to reach equality of results, which addresses the underlining causes of the differentiated treatment. In other words, if equality of opportunities is achieved by providing a sign language interpreter to a deaf person, it does not automatically correspond to the achievement of "equality of results": In fact, societal changes, including the removal and the elimination of barriers, are needed to achieve it (Cera, 2017b). The Convention thus understands human rights from an accessibility perspective and advocates for "transformative equality" as a tool to redress systemic discrimination by undertaking positive actions targeting those social constructs which lead to the exclusion of persons with disabilities and to the denial of their rights. Examples of "transformative equality" are the obligation to provide accessibility, universal design, awareness-raising, and in general, reasonable accommodations to substantive rights. The endorsement to transformative equality is important to empower persons with disabilities and to foster their capabilities through social change. Reaching fundamental structural transformations through reasonable accommodation might result in advantages for third parties as well, for instance, adapting the physical arrangement of a workplace or purchasing new equipment may benefit other employees by making them more productive or by reducing their workload (Cera, 2017c). The concept of reasonable accommodation itself vehicles the idea that the universality of human rights fosters their enjoyment beyond the disability dimension, and the CRPD introduces in IHRL another concept reinforcing this idea: "universal design," defined in Article 2 as "*the design of products, environments, programmes and services to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design.*" It is evident that its aim is to allow the participation in all aspects of public life to the maximum number of people, having a disability or not.

The CRPD therefore expands the concepts of "equality of results" and of "transformative equality" to develop the model of "inclusive equality," composed of four dimensions: (1) redistributive, to fairly address socioeconomic disadvantages; (2) recognition of human dignity and intersectionality to combat stigma, stereotyping, prejudice, and violence; (3) participative and inclusive, to reaffirm the social nature of people as members of social groups; and (4) "accommodating, to find space for difference as a part of human dignity" (UN Committee on the Rights of Persons with Disabilities (CRPD), General comment No. 6, 2018). Such a construction of the notion of equality could contribute to shape measures to protect persons with disabilities in emergency scenarios, including DRR measures.
