This book is dedicated to the people who were pivotal in the disability movement and the organizations of persons with disabilities who changed how things were, what they are now, and where they will need to be. This book is also dedicated to all those who will continue to fight for human rights and social justice in the spirit of Marcia Rioux and Bengt Lindqvist.

Acknowledgments

First and most importantly, we want to thank Marcia Rioux whose idea this book was. In addition, she impacted every one of the co-editors, section editors, and contributors in many ways.

For some she was a partner; for others a teacher; for others a colleague; for others a role model; for others a visionary; for others an icon; for others an advocate; for others a friend. We want to thank our families for their patience and their belief in this project when we asked them to forego all the small and major family activities because we were writing and editing this book. Thank you Trevor and Seth Russell, Zoe Zucar, Liz Bucar, Alexis and Marcia Zubrow, Alanya, Carlos, Reuben and Lily Zuniga, Rosana Alancay and Helena Viera.

We also want to thank our dedicated section editors for their commitment to this Handbook. We thank you for your ongoing support, writing and curating the sections of this book. You not only helped find the numerous contributors, but your perceptions and editing skills made each chapter and section better. Furthermore, you were indomitable in collecting manuscripts and helping us focus on the central issues.

This Handbook is the result of the brilliant and diverse contributions of all the authors of the 92 chapters included herein. We thank you for sharing your critical thoughts, insights, and experiences with us and our readers. We deeply appreciate your openness and vulnerability in participating in this project, as well as your creative expressions. Many of you come from diverse cultural and national backgrounds. We thank you for your willingness to adapt to a single format and style.

The Handbook would not have been possible without the tremendous support of our publisher – Springer, in particular the efforts and responsiveness of Shobana Lenin and Juby George. We particularly wish to thank you for picking up the threads and reviving the project after a 2-year delay because of Marcia's death. We thank you for making the Meteor system accessible to our authors (even though the co-editors in chief were initially doubtful of the necessity for the Meteor system and agreed to do so only because you wanted us to). We soon came to realize that it actually is a wonderful tool and we could not have accomplished as much as we did in a relatively short time without it. You were always there to assist us with technical, administrative, and other important details needed to ensure the book was developed and completed.

There were numerous institutions that have been instrumental and supportive of this work: York University, where Marcia Rioux was a distinguished professor, and the School of Health Policy and Management as well as the Critical Disabilities Studies Program. We want to acknowledge and thank Marina Morrow – Professor and Chair of the School of Health Policy and Management at York – for her continuous support to DRPI and the programs that Marcia created over many years, not the least of which was this book. The University at Buffalo and its Anthropology Department provided office and laboratory support, and many contributors had institutional support from IDA. McMaster University and the Institute for Work and Health have provided financial support for Alexis' postdoctoral fellowship – of which the book is a part. Thank you to Emile Tompa for your ongoing postdoctoral guidance and mentorship throughout this project.

Next to Sukaina Dada and Tammy Bernasky, you were truly integral to the development of the Handbook alongside Marcia. The creation, design, structure, and development of the Handbook was indeed a result of your commitment and dedication to this project – especially in the midst of great challenges. Thank you for working closely with Springer to ensure the Meteor system was accessible to all our editors and authors. Thank you for your drafts and creative versions of the text to make it accessible to all. Thank you for your communication and amazing organizational skills.

We want to acknowledge that this Handbook was created because of our capacity to communicate online. Not only could we communicate all over the world easily and with the ability to see and share material, but we could connect virtually and accessibly with our editors and contributors. We are grateful for our digital access in Canada and recognize that this is not as freely and easily available throughout the world. We hope that the future will bring digital equity and accessibility to all people of the world. We acknowledge Zoom, Teams, Skype, and WhatsApp for making our worldwide communication better.

Finally, this book would not have been possible without the intellectual and advocacy visions of Bengt Lindqvist who together with Marcia Rioux changed the paradigm.

About the Editors

Marcia H. Rioux
School of Health Policy and Management, Faculty of Health
York University
Toronto, ON, Canada

Marcia H. Rioux was a Distinguished Research Professor and Professor Emerita in the School of Health Policy and Management at York University's Faculty of Health. Nationally and internationally, Professor Rioux was regarded as a leading legal scholar and pioneer in the field of human rights and equity. She held a PhD in jurisprudence and social policy from the University of California, Berkeley. In addition to being named a Distinguished Research Professor by York University, Professor Rioux was the Director at York University's Institute for Health Research. She was the Co-Founder and first Chair of the School of Health Policy and Management as well as the Critical Disabilities Studies program. She was a driving force in the promotion of disability rights and the enhancement of opportunities for marginalized people. She played a leadership role in the United Nations Convention on the Rights of Persons with Disabilities and published widely in the area of disability and human rights. She was a Co-Founder of Disability Rights Promotion International, which now monitors rights for people with disabilities in more than 62 countries. She was a Fellow of the Institutes of Advanced Studies in the UK and Australia. Professor Rioux was the recipient of the Lieutenant Governor's Community Volunteer Award in recognition of her contributions to Ontario communities. In 2014, she was invested into the Order of Canada for her scholarship in the field of social justice and for her advancement of the rights of persons with disabilities. Professor Rioux lectured throughout the Americas, Europe, Africa, and Asia. She was a visiting scholar and Professor at a number of international institutions, including the University of Zagreb in Croatia and LaTrobe University in Australia. She edited a number of collected volumes and more than 70 book chapters and articles on human rights. Marcia died in September 2021. Her most recent project was this Handbook.

Alexis Buettgen
Department of Economics and School of Rehabilitation Science
McMaster University
Hamilton, ON, Canada

Alexis Buettgen is a community-engaged scholar with an interdisciplinary academic background in community psychology and critical disability studies. Dr. Buettgen has over 15 years of experience in community-based participatory research and evaluation as a Senior Researcher at several community-based research organizations and organizations of people with disabilities (OPDs). Prior to this, Dr. Buettgen worked in a variety of community settings providing direct support to individuals with various experiences of oppression and marginalization, including people with various disabilities. These community experiences have informed her research program to critically examine issues of poverty, exclusion, and intersectional approaches to promote equity, and social and environmental justice. Dr. Buettgen holds academic appointments in the Department of Economics and School of Rehabilitation Science at McMaster University, and the Critical Disability Studies program at York University. Her scholarship aims to bridge the gap between academic knowledge and community action using a critical theoretical, human rights, and disability justice approach. She is dedicated to participatory and collaborative research examining the influence of economic and political environments on the progressive realization of disability inclusion. Her work connects the local with the global through fieldwork carried out at local, national, regional, and international levels. Her record of publications includes journal articles, invited book chapters, a monograph, and numerous reports commissioned by international, national, and local government agencies, OPDs, other disability organizations, and NGOs. Her scholarly publications have appeared in leading international peer-reviewed journals in the fields of disability studies, health sciences, human rights, and the social economy. Dr. Buettgen has been an invited speaker, guest lecturer, and course instructor on the topics of critical theory, human rights, global health, climate justice, intersectionality, and applied research for social justice at numerous universities and community organizations.

Ezra Zubrow
Department of Anthropology
University at Buffalo, State University of New York
NY, USA

Ezra Zubrow was educated at Harvard and the University of Arizona. He is an Anthropologist presently holding positions at the Universities of Cambridge, Buffalo, and Toronto as well as previously teaching at Stanford. He has been a fellow at various Institutes for Advanced Research in Europe and Australia. He has a broad range of interests focusing on the demographic, ecological, and spatial aspects of social and physical environments as well as disability. He has written or edited 10+ books, 150+ articles as well as received 20+ million dollars of grants. Among his writings are two co-written books – *The Atlas of Literacy and Disability* and *The Landscape of Literacy and Disability.*

Over the last two decades, he has been the Vice President and President of a labor union as well as the chair of a faculty senate. During these tenures, he actively made changes to promote human rights and he has served on various International Commissions on Law and Environment. An internationalist, he has done over 50 fieldwork expeditions in North America, South America, the Middle East, Europe, and Asia. Most recently, he is focusing on the circumpolar region.

José Viera
Advocacy Unit
International Disability Alliance
Geneva, Switzerland

José Viera has more than 18 years of experience working nationally and internationally in the field of human rights and inclusive development. As a person with a disability, Mr. Viera has a personal commitment to improving the lives of persons with disabilities and advocating for their human rights. Mr. Viera is the Advocacy Director of the International Disability Alliance and was the Chief Executive Officer for the World Blind Union (WBU), a global organization with a broad international membership of over 300 organizations at the sub-national and regional levels in over 196 countries. Mr. Viera is also the Global Disability Summit Secretariat Senior Manager. The Global Disability Summit is a world-leading and pioneering event that unites the global effort for momentum toward the inclusion of the world's poorest and most neglected people. In addition, Mr. Viera is the Permanent Representative of the UN Stakeholder Group of Persons with Disabilities for Sustainable Development, also an Independent Board Member of CBM Global Disability Inclusion, as well as the former President of the Federation of the Blind of Argentina. Before joining WBU, Mr. Viera was Director of the Latin American Regional Center for Disability Rights Promotion International, which is a global monitoring rights system where he led regional and global initiatives to promote the ratification and implementation of the UN CRPD and the Agenda 2030. In addition, Mr. Viera has more than 10 years of experience as Associate Professor at the International Studies Department of Siglo 21 University in Argentina, lecturing on issues related to sustainable development and international cooperation. Mr. Viera holds a bachelor's degree in International Studies and a master's degree in Management of Development. Mr. Viera has contributed to various publications and research projects on disability and development with a special focus on the Global South.

About the Associate Editors

Tammy Bernasky has a PhD in Critical Disability Studies from York University. Using an intersectional approach, her research is focused on understanding the impacts of oppression and developing pathways to empowerment. Centering story-telling in her research, Tammy specializes in addressing gender-based violence in the disability community.

Dr. Sukaina Dada has been working in the areas of children's health, social justice, and disability rights for over 15 years. She is a critical pediatric occupational therapist and the Founder and Executive Director of SMILE Canada – Support Services, a Canadian non-profit organization that supports racialized disabled children and youth and their families. Dr. Sukaina holds a PhD in Critical Disability Studies from the School of Health Policy and Management at York University. Her research is focused on the critical intersections of displacement and disablement, examining why disabled refugees are continuously left out of critical conversations on human rights, disability justice, and the social determinants of health and disability.

About the Section Editors

Francisco J. Bariffi
CONEX-PLUS Program
University Carlos III of Madrid
Madrid, Spain

Francisco J. Bariffi, an academic, lawyer, and advocate, is deeply dedicated to human rights and disability rights. Presently a Postdoctoral Researcher at University Carlos III of Madrid (UC3M), he boasts a PhD in International Human Rights from the same institution. His vast expertise includes teaching postgraduate courses in countries like South Africa, Italy, Spain, and Brazil, among others. Widely respected for his lectures and talks worldwide, he served as a legal attorney from 2008 to 2014, specializing in civil, administrative, and family law. Between 2014 and 2021, he was a judge's assistant at the National Appeal Chamber of Mar del Plata, Argentina, focusing on human rights and criminal law.

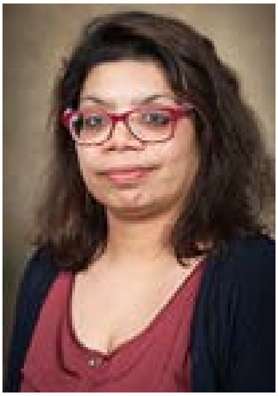
Internationally, Francisco advised the Spanish Government during the UN-CPRD negotiations in 2005–2006 and contributed to various UN and regional human rights bodies. He has collaborated with EU agencies and served on advisory boards in Spain and Argentina, influencing law reforms in several countries. Beyond academia, Bariffi actively engages in community outreach, legal consultancy, and reporting. Fluent in English, Spanish, and Italian, his advocacy for human rights remains unparalleled.

Serida L. Catalano
World Enabled
Berkeley, CA, USA

Dr. Serida L. Catalano is a renowned scholar in public policy, accessibility, and neurodiversity, with over a decade of managerial and research experience in non-profit and academic sectors. Her research has significantly contributed to social cohesion policies, especially concerning gender equality and inclusivity for marginalized demographics. Dr. Catalano has assisted government agencies in the UAE with implementing innovative educational methods and offered vital consultancy for aligning national laws with the UN Convention for the Rights of People with Disabilities (CRPD). Currently, as World Enabled's Program Director, she collaborates with cities and governments worldwide to promote inclusive urban development. Additionally, she is a Resident Research Fellow at the University of Berkeley, focusing on inclusive policies for neurodivergence.

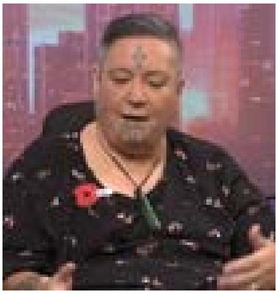
Mary Crock
Sydney Law School
The University of Sydney
Sydney, NSW, Australia

Mary Crock has worked in the area of immigration and refugee law since 1985. She is a Professor of Public Law at the University of Sydney's Law School. An Accredited Specialist in Immigration Law since 1994, she has served on a variety of national, state, and NGO bodies relating to immigration, refugees, disability, and child protection. Professor Crock has written extensively on issues related to immigration and refugee law, authoring 14 books, and over 80 book chapters, refereed articles, and reports. She has had a research focus on the laws, policies, and practices involving persons with disabilities in forced migration since 2010, building on a long-standing interest in children and other vulnerable migrants. Together with her husband Professor Emeritus Ron McCallum AO, her work with refugees with disabilities was recognized in December 2015 with the award of the inaugural NEDA Medal by the National Ethnic Disability Alliance and by invitations to present her research findings to global forums including the United Nations (2015 Conference of States Parties to the CRPD – DESA/DSPD Forum on Disability and Development; and 2018 Commission for Social Development, 56th Session, New York) and World Bank (2018, World Report 2023).



Nirmala Erevelles
Department of Educational Leadership, Technology, and Policy Studies
The University of Alabama
Tuscaloosa, AL, USA

Dr. Nirmala Erevelles is a Professor of Social and Cultural Studies in Education at the University of Alabama. Her teaching and research interests lie in the areas of disability studies, critical race theory, transnational feminism, sociology of education, and postcolonial studies. Specifically, her research focuses on the unruly, messy, unpredictable, and taboo body – a habitual outcast in educational (and social) contexts. Her book, *Disability and Difference in Global Contexts: Towards a Transformative Body Politic* was published by Palgrave in November 2012. She is currently working on a book-length manuscript tentatively entitled *Cripping Empire: Theorizing Intersectionality as if Black/Brown/Disabled Lives Matter.*



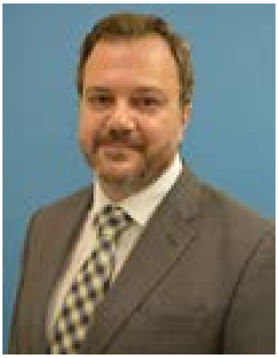
Huhana Hickey
Pukenga Consultancy Ltd.
Auckland, New Zealand

Huhana Hickey (PhD in Laws and kaupapa Māori) has a long-standing interest in the human rights of people from marginal backgrounds and the consequences of discrimination and social oppression. She is a scholar of disabilities research and legal theory and is noted for the breadth of her published cross-disciplinary research. One of Huhana's goals is to increase the knowledge of

Indigenous peoples with disabilities along with increasing their profile and inclusion in all levels of society. Dr. Huhana is a former Director on the HCNZ board (2018–2019), on the Human Rights Review Tribunal (2010–), was an Advisor to the welfare expert advisory group (2018), has her own consultancy (Pukenga Consultancy), is President of the Māori Women's Welfare league Te Hokinga Mai branch for Disabled Māori women, is a former Chair of the Medicinal Cannabis Awareness NZ Trust (2017–2019), and is a partner, Mum, Nana, and keen singer, writer, and poet.

Rados Keravica
School of Sociology and Social Policy
University of Leeds
Leeds, UK

Rados Keravica is a doctoral candidate at the University of Leeds, Centre for Disability Studies in the School of Sociology and Social Policy. He currently works as a Qualitative Researcher at the Bradford Institute for Health Research. He worked as an EU Marie Sklodowska-Curie Research Fellow within the Disability Advocacy Research in Europe (DARE) project at the University of Leeds between 2019 and 2022. His PhD research work focuses on disabled children's participation in healthcare decision-making. He worked previously for the UN Human Rights Team in Serbia as a Disability Specialist where he coordinated the joint UN project aiming to reform the legal capacity regime in Serbia and to support the rights of women and girls with disabilities and employment opportunities for persons with disabilities. He holds an MA degree in Human Rights Law from the Central European University, Budapest, as well as an MSc degree in International Economics from the University of Novi Sad, Serbia. In the period 2011–2016, he worked for Disability Rights Promotion International, a global collaborative project on disability rights monitoring as a Regional Officer for Europe. He serves as a Board Member of the European Network on Independent Living (ENIL).

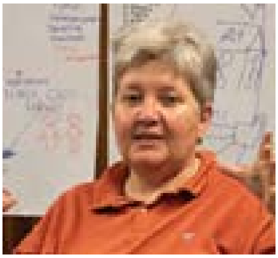


Roberto Lattanzio
ARCH Disability Law Centre
Toronto, ON, Canada

Roberto Lattanzio is the Executive Director of ARCH Disability Law Centre. Robert has been Executive Director since 2015, and first joined ARCH in 2003. He has acted as legal counsel in test case litigation at all levels of court, including the Supreme Court of Canada, and has made law reform submissions to various levels of government, committees, and administrative bodies. Robert has been appointed to numerous advisory committees and has written and guest-lectured on diverse topics including equality and human rights law, administrative law, education law, capacity and supported decision-making, disability rights, legislative reform, and social science evidence. Robert received his LLB and BCL law degrees with distinction from McGill University in 2003.

Anna Lawson
Centre for Disability Studies and Centre for Law and Social Justice
University of Leeds
Leeds, UK

Anna Lawson is a Professor of Law at the University of Leeds where she has just completed an 8-year term as Joint Director of the University's Centre for Disability Studies. Her work focuses on disability equality and human rights at international, national, and local levels. Herself disabled, Anna has played active roles in a range of disabled people's organizations and human rights organizations. She is a Fellow of the British Academy and the Academy of Social Sciences, patron of the National Association of Disabled Staff Networks, and an Honorary Master of the Bench at the Middle Temple Inns of Court, London.

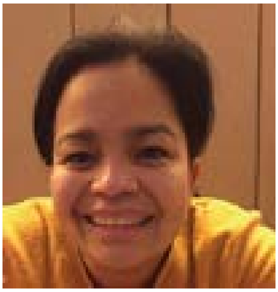


Theresa Lorenzo
Department of Health and Rehabilitation
Sciences, Division of Disability Studies
University of Cape Town
Cape Town, South Africa

Theresa Lorenzo is a Professor of Disability Studies and Occupational Therapy, and Co-Director of Inclusive Practices Africa, in the Department of Health and Rehabilitation Sciences, Faculty of Health Sciences, at the University of Cape Town, South Africa. She co-led the development of the first Disability Studies postgraduate program in Africa, in collaboration with Disabled People South Africa and the Centre for Disability Studies at the University of Leeds, which was launched in 2003. She has focused much of her work on collaborative research with non-government organizations and disabled people's organizations to develop reciprocal capacity of a community-based inclusive development workforce for monitoring disability inclusion in policy implementation and practice. One of her strengths is developing innovative research methodologies for data gathering with collectives and groups. She is active in the African Network for Evidence of Action on Disability (AfriNEAD), the CBR Africa Network, and the Occupational Therapy Africa Regional Group (OTARG).

Marina Morrow
School of Health Policy and Management, Faculty
of Health
York University
Toronto, ON, Canada

Marina Morrow is a Professor at the School of Health Policy and Management in the Faculty of Health at York University. In her work, Marina uses critical mental health and intersectional approaches to better understand the social, political, and institutional processes through which health and mental health policies and practices are developed and how social and health inequities are sustained or attenuated for different populations. Prof. Marina strongly supports public scholarship and the work and activism of the Mad movement and Mad scholars. Prof. Marina is the Lead Editor (with Dr. Halinka Malcoe) of *Critical Inquiries for Social Justice in Mental Health* (University of Toronto Press, 2017) and lead on the Realizing Human Rights and Social Justice in Mental Health project (www.socialjusticeinmentalhealth.org).



Silvia Margarita Baldiris Navarro
Faculty of Engineering
Fundación Universitaria Tecnológico Comfenalco, Sede C Barrio Zaragocilla
Cartagena de Indias, Colombia

Dr. Silvia Margarita Baldiris Navarro graduated from the Industrial University of Santander (UIS) in Colombia as a systems and industrial engineer. Later she completed master's studies in Computer Science and Industrial Automation at the University of Girona, a university where she also completed a doctorate in technology. She is currently an Advisor to the Government of Cartagena de Indias, and a Professor at the Fundación Universitaria Tecnológico Comfenalco, Colombia. Her research has always been focused on analyzing how information and communication technologies can facilitate the inclusion of all people in the educational system. She has recently coordinated the formulation of the public policy for Science, Technology and Innovation of Cartagena de Indias, in which she has promoted an inclusive approach, which has considered the participation of all the populations of the region. She has coordinated and participated in international projects and initiatives in Europe, North America, and also in Latin America.

Victor Santiago Pineda
Department of Cities and Regional Planning
University of Berkeley (CA) – Victor Pineda Foundation/World Enabled
Berkeley, CA, USA

Dr. Victor Santiago Pineda is a human rights expert, scholar, investor, and philanthropist. His work focuses on inclusive and accessible smart cities. A two-time presidential appointee on the US Access Board, a senior

Fellow at the Mohammed Bin Rashid School of Government in Dubai, and the Chairman of The Victor Pineda Foundation/World ENABLED. His foundation supports global non-profits and campaigns, promoting the rights of people with disabilities and older persons. Dr. Pineda's research and humanitarian works advance urban resilience, inclusion, and sustainability both at home and abroad. Dr. Pineda is an urban planner and a leading scholar on inclusive and accessible smart cities. He directs the Inclusive Cities Lab at the Institute for Urban and Regional Development, UC Berkeley. His teaching and research focus on urban equity, access, and inclusion in global urban governance.

Paula Campos Pinto
ODDH and CIEG/Institute for Social and Political Sciences, University of Lisbon
Lisbon, Portugal

Paula Campos Pinto holds a PhD in Sociology from York University, Toronto, Canada. She is an Associate Professor in the School for Social and Political Sciences at the University of Lisbon (ISCSP-ULisboa), where she also founded and coordinates the *Observatory on Disability and Human Rights* (OODH), a platform that brings together academics, disability organizations, and decision-makers to support disability research and advance disability rights in Portugal (http://oddh.iscsp.ulisboa.pt/index.php/en/). From December 2016 to March 2021, she was the Chair of the National Independent Mechanism for Monitoring the Implementation of the CRPD in Portugal.

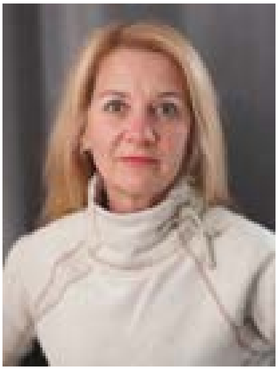
Prof. Pinto has been the principal investigator and researcher in numerous national and international projects related to disability, gender, social policy analyses, and the impact of policy on people's lives and has authored many national and international publications on these topics, including books, edited books, and articles in peer-reviewed journals as well as conference presentations, many of whom as invited keynote speaker.

Gerard Quinn
National University of Ireland
Galway, Ireland

Gerard Quinn was appointed the UN Special Rapporteur on the rights of persons with disabilities by the Human Rights Council at its 45th session, in October 2020. Gerard held two research chairs at the Raoul Wallenberg Institute on Human Rights in the University of Lund (Sweden) and Leeds University (UK). A graduate of Harvard Law School, the King's Inns (Dublin), and the National University of Ireland, he formerly held a chair at the National University of Ireland where he founded and directed the Centre on Disability Law and Policy. In Ireland, he served as a member of the Commission on the Status of People with Disabilities (1992–1996) which was composed of a majority of persons with disabilities. This Commission produced an early blueprint for change in Ireland based on equality. He was Director of Research at the Government's Law Reform Commission (1997–1998). He was a member of the Irish Government Taskforce on the individualization of budgets and services (2017–2018). He served two terms on Irelands' Human Rights Commission. At the invitation of the President of Ireland, he served on the Council of State (Ireland) from January 2012 to 2018. He is also currently a Professor Emeritus of law at the National University of Ireland (Galway).

Geoffrey Reaume
Critical Disability Studies
York University
Toronto, ON, Canada

Geoffrey Reaume is an Associate Professor in the Critical Disability Studies program at York University, Toronto, Canada, where he teaches a course on disability history. He established the first university credit course on Mad People's History beginning in 2000.



Vera Roberts
Inclusive Design Research Centre
OCAD University
Toronto, ON, Canada

Dr. Vera Roberts is a leading expert in inclusive design and participatory research, with 25 years of experience in the field. She is the Senior Manager Research, Consulting and Projects at the Inclusive Design Research Centre (IDRC) of OCAD University, where she also teaches research methods for graduate studies. She holds a PhD in Applied Cognitive Science from the Ontario Institute for Studies in Education at the University of Toronto. Dr. Roberts has been involved in numerous multi-partner inclusion projects that leverage inclusive technology and digital sharing platforms to create a culture of inclusion. Some of these projects include: Regulating the Digital Domain, Communication Access, *We Count, Future of Work and Disability*, *Equitable Digital Systems*, *Morphic, BIG IDeA,* and *Our Doors Are Open*. Dr. Roberts provides consulting and training on inclusion and diversity to various public and private sector organizations.

Sara Scalenghe
Department of History
Loyola University Maryland
Baltimore, MD, USA

Sara Scalenghe teaches at Loyola University Maryland in Baltimore, USA. Her research and teaching interests revolve around the global history of disability, especially in the Middle East and North Africa. She is the author of *Disability in the Ottoman Arab World, 1500–1800* (Cambridge University Press).

Jutta Treviranus
Inclusive Design Research Centre
OCAD University
Toronto, ON, Canada

Jutta Treviranus is the Director of the Inclusive Design Research Centre (IDRC) and a Professor in the Faculty of Design at OCAD University in Toronto (http://idrc.ocadu.ca). Dr. Treviranus established the IDRC in 1993 as the nexus of an open growing global community that proactively works to ensure that our digitally transformed and globally connected society is designed inclusively. She has emphasized the existential importance of including and valuing people who are currently excluded outliers and small minorities. Dr. Treviranus also founded an innovative graduate program in inclusive design at OCAD University. Dr. Treviranus is credited with developing an inclusive design methodology and inclusive co-design practice that has been adopted internationally.

Stefan Tromel
ILO
Geneva, Switzerland

Stefan Tromel Since August 2013, Mr. Tromel has been the Senior Disability Specialist at the International Labour Organization. Between 2008 and 2013, he was the Executive Director of the International Disability Alliance and between 1999 and 2004, the Director of the European Disability Forum (EDF). Mr Tromel was actively involved in the negotiation process of the UN Convention on the Rights of Persons with Disabilities from 2002–2006.

Margaret Wazakili
MagWaz Physiotherapy, Disability and
Wellness Services
Lilongwe, Malawi

Dr. Margaret Wazakili is a Holistic Physiotherapist, Disability Consultant, and Managing Director of the MagWaz Physiotherapy and Wellness Services. She obtained her PhD at the University of the Western Cape, South Africa, in 2008, focusing on Disability, Sexuality and HIV/AIDS among young people with physical disabilities. She undertook a 1-year Post-Doctoral Research Fellowship on knowledge and skills needed to combat HIV/AIDS in a workplace and then a 3-year Post-Doctoral Fellowship with Stellenbosch University, Centre for Rehabilitation Studies, working on the African Policy on Disability and Development project. She has taught Community-Based Rehabilitation nationally and internationally as well as supervised Master students in Disability and Rehabilitation studies. She is often asked to mark Master's and PhD dissertations on disability and rehabilitation.

Dr. Wazakili was the first International Joseph P. Kennedy Jr. Foundation Fellow in Africa, working on Disability and Public Policy, as it affects children and adults with intellectual disabilities. She has published her work in accredited journals and presented at a number of local and international conferences as well as carried out disability consultancies in the region.

As a private practitioner, she provides evidence-based interventions to her clients. She has followed a course on: Leadership for the 21st Century at Harvard University, Kennedy School of Government and Inclusive Education, as it applies to children with disabilities. Her skills as a Transformation Life Coach enable her to treat the whole person and not just the presenting symptoms.

Introduction, Prominent Figures, and Voices of Impact

Nothing Without Us: Disability, Critical Thought, and Social Change in a Globalizing World

1

Alexis Buettgen and Ezra Zubrow

Contents

Abstract

This introductory chapter has been titled: “Nothing Without Us” to reflect our shared belief that inclusion requires much more than changing people with disabilities. This motto has changed a little from the usual rallying cry of the disability movement. It is about shifting, rethinking, and adapting situations and environments to enable inclusion of people with disabilities. It is not enough to only worry about people with disabilities – the shift must be to remedy all societies that exclude people. This chapter provides an overview of the origins of the Handbook and ideas behind it; the evolution of critical disability advocacy,

scholarship and education programs; and suggestions on how to read and access the contents within the 92 chapters that comprise this volume.

> Disability is not measles. (Rioux, 1994)

> The primary goal of a human rights approach to disability is the achievement of individual autonomy to the greatest extent possible and creation of an inclusive society that respects the dignity and equality of each person. (Rioux, 2004)

> Inclusion: An unending set of processes in which disadvantaged children and adults have the opportunity to participate fully in all community activities available to people who do not have disabilities. (Rioux, 2006)

Introduction

The reason we have named this introduction "Nothing Without Us" is to reflect our shared belief that inclusion requires much more than changing people with disabilities.[1] This has changed a little from the usual rallying cry of the disability movement. It is about shifting, rethinking, and adapting situations and environments to enable inclusion of people with disabilities. It is not enough to only worry about people with disabilities – the shift must be to remedy all societies that exclude people. To make this happen there must be broad systemic changes to the structure of society itself. It is not just about disability but is about fairness and equality on the one hand, and inclusion and accessibility on the other. We need a new era.

This handbook maps the terrain of disability, the world over, by providing an overview of issues, concerns, and developments in various domains. They are advocacy, education, medicine, law, policy, research, disaster management, development, economics, employment, science, technology, history, culture, and society. Working from this interdisciplinary matrix, the book aims to:

- Present an overview of the field of global disability studies in a world-wide and transnational perspective
- Explore the evolution of the concept of disability over space and time
- Identify various approaches to disability and debility
- Highlight broad trends in research on disability across the world
- Identify new directions in practice
- Recognize the emergence of a global disability movement and its etiology

The target audience for this volume are students, scholars, medical, and paramedical professionals, activists and advocates, researchers, international development workers, and others. The editorial team are eminent disability scholars and advocates located across the globe who bring rich professional experiences and unique expertise to guide this work from its inception to completion.

---

[1] We use the terms "people with disabilities," "persons with disabilities," and "disabled persons" interchangeably as all terms are used by scholars and activists in the disability movement.

The Handbook contains original pieces on different dimensions of disability by researchers, activists, helping professionals, service providers, international development experts and organizations, professors in disability studies, and policymakers with a particular focus on the voices of the principal stakeholders, people with disabilities themselves.

Origin of the Book and Ideas Behind It. . .

This handbook began around the year 2000 when Bengt Lindqvist and Marcia Rioiux were sitting at Bengt's cottage along the sea watching the water sprites dance. Noting that water sprites were universal, breathing both water and air, they began talking about the need for a book that was equally comprehensive. It should be a discussion of not only the state of disability around the world but aspirational goals.

After Bengt's death in 2016, Marcia secured a book contract in 2017 to fulfill their vision. Marcia's idea for this book was to produce an encyclopedia of the evolution of the field of critical disability (studies). She invited prominent scholars, advocates, and activists from the Global South and North with the intention of presenting a balanced view on critical disability from across all regions of the world. The plan was to create sections led by these accomplished voices and encompassing chapters on substantive topics that highlight the lived experience of disability, the policy environments, and societal attitudes toward disability and people with disabilities. After her death in 2021, the new co-editors incorporated this vision and added emerging scholars in order to include new dynamic viewpoints and rapidly emerging issues in the field. This book is a legacy to both of them.

There were several challenges along the way to completing this project. First, we come from a range of perspectives and disciplines (anthropology, psychology, advocacy, international development, critical disability studies). Second was the death of Bengt, then the death of Marcia. The project was delayed until the new co-editors Alexis Buettgen, Jose Viera, and Ezra Zubrow reinvigorated it in late 2021. The original idea had to be modified because of the changing world conditions as well as logistical issues. However, the editors have tried to remain true to the vision as well as extend it.

Third, the COVID-19 pandemic presented unique challenges for authors and editors around the world – particularly those with disabilities and from the Global South. This presented us with some delays and new opportunities to re-imagine aspects of the book. We worked to provide as much accessibility and flexibility as possible in the development of the chapters and to support the writing process for all. Some authors were coping with the loss of family and friends, civil unrest, office closures, lockdowns, internet failures, as well as increased complications of everyday life under a pandemic. People with disabilities were especially vulnerable because of preexisting impairments, inequities in health care access, the highly contagious nature of the virus and their need for close contact with caregivers, as well as the compounding nature of other forms of social and economic disadvantage. These challenges highlighted the extent to which preparedness and response planning was exclusive and inaccessible to many people with disabilities. We acknowledge and aim to address these barriers.

The Handbook emphasizes calls for inter- and transdisciplinary approaches, alliances, and coalition building. The editors recognize the challenges of alliance building – including the power of non-disabled people, caregivers, and families, as well as the influence of fields outside disability studies.

There are topics that are not included in this book as originally proposed by Marcia. The original project had sections dedicated to quantitative research and disability across the life cycle. It was to have an equal balance of section editors from the Global South and North. We made strong efforts to realize this proposal; however, the challenges noted above in the book building process made this difficult to realize. Alexis, Ezra, and Jose alongside the sub editors worked together to reorganize several of the sections. The following original topics were interspersed throughout the book:

- Inclusive education and learning
- Disability, development, and inclusion in a globalizing world
- Science and culture
- Disability arts and literature
- Innovation and new ideas of inclusion

Other limitations that we recognize include issues regarding open access and language translation, and there may be accessibility issues caused by press limitations. We asked for the book to conform to the Marrakesh Treaty which makes the production and international transfer of adapted books for people with blindness or visual impairments easier. It does this by establishing a set of limitations and exceptions to traditional copyright law.

Further, much of the writing uses academic language and the orientation tends to be overly theoretical and methodologically verifiable rather than oriented to real-world implementation. However, all section editors have made significant efforts to invite and include authors from outside of academia including activists, artists, advocates, and community-based researchers.

This book is part of a rapidly growing body of knowledge and scholarly and gray literature on the topic of disability. This is exemplified by over 7000 serials on the subject, and over 170,000 books. These texts have presented a range of perspectives from various conceptual paradigms of thought and action on disability. An increasing number of these texts are from a disability studies perspective. Moreover, there is a rise in the profile of disability in the humanities. An escalation of multimedia such as disability blogs, creative productions, etc. has meant that the perspectives of people with disabilities have become more accessible to a wider global audience and embedded in various portrayals and mechanisms to continue to organize the movement for transformative social change. The result of this greater visibility is being seen everywhere including from Bollywood to Hollywood. Most recently Coda received three academy awards – namely, Best Picture, Best Supporting Actor, and Best Adapted Screenplay.

How did this rapid growth come about? It was through a long and gradual evolution of the concept of disability, the increase of advocacy, and new international, national, and community policies and laws.

Evolution of Critical Disability

Disability inclusion is evolving both conceptually and operationally in societies. One way to examine the historical change in both the thinking and activity regarding disability is through a set of paradigm shifts (Kuhn, 1970). Over the last century, disability has been understood through paradigms that have changed both thought and action. Each has been pervasive for certain times, locations, and cultures.

It is imperative to examine multiple understandings of a particular social phenomenon such as disability. This examination should include careful consideration of how constructs and measures systematically include and exclude certain understandings of disability to serve the political interests of some groups at the expense of others.

Being able to understand where we were, where we are, and where we need to be allows us to focus on change as a process, rather than a destination. The disability movement is one that has grown out of people who looked for solutions to what limited them in their own lives, and then taken that forward. The historical lack of free decision-making by people with disabilities motivated the need for people with disabilities to be leaders of the change they wanted to realize.

There are tensions within the movement because it is a social and political movement that reflects the diversity of disability. The movement includes different interests in money, power, political orientation, and reputation. This is particularly critical as we are living in turbulent times and facing social, economic, and environmental crises that will impact the lives of people with disabilities. This means that the movement is tasked with creating opportunities for inclusion, solidarity, and collaboration while ensuring that progress made is not lost.

Turning to the intellectual history of the movement, there are four paradigms that can be distinguished. Namely, the medical paradigm, the social paradigm, the human rights paradigm, and the disability justice paradigm.

Medical Paradigm

The first paradigm is defined by what has come to be called the “medical model” sometimes called the “individual model.” Underlying its general theory and methodology is the belief that disability can be corrected by diagnostic tools to identify pathology and develop medical and individualized interventions to cure or minimize it. The use of charity and rehabilitation approaches fall under this model.

Criticisms of the model are based on the failure of medical and other professionals to involve people with disabilities in a meaningful way except as passive objects of intervention, treatment, and rehabilitation. According to Michael Oliver (1990), under this model most research and the development of knowledge on disability has been exclusive and non-participatory. Thus, the medical model has had oppressive consequences for people with disabilities because it focuses on an individual's limitation(s), deficiencies, deviance from the norm, and overall challenges to fit into society. Solutions are focused on ways in which to "fix" an individual to better fit into society, rather than how society can better accommodate difference.

Historically, the social response to disability has been managed by separation, segregation, and incarceration of people with disabilities, particularly since the onset of industrial capitalism. This response is reflected in practices of special education, building of asylums, medical classifications, and sheltered employment. (One of the building blocks of current thinking on disability is based on the need to overcome such segregation through the enactment of human rights, as well as programs, policies, and laws that reflect the principles of inclusive education, affirmative action, reasonable accommodation, supported decision-making, and inclusive design. This current thinking is particularly prevalent in the area of employment and education where a business model influences employers and educators to see opportunities for the employment of disabled persons as assets rather than liabilities in many sectors of the neo-liberal economy.)

Given the development of major medical practices, pharmaceutical solutions, and medical equipment for people disabilities, there has been strong economic and financial reasons to continue this model. Medical institutions (broadly defined) have resisted intellectually, politically, and economically the change to another paradigm (Evans, 2004; Foucault, 2006; Oliver, 1990; Szasz, 1974).

Social Paradigm

The second paradigm is the "social model." The social model developed in response to the medicalization and individualization of disability in the preceding medical/individual models. Pioneered by British activists after its development by Oliver (1990), this critical Marxist approach to disability issues has become internationally influential. Most importantly it changed the way people with disabilities see themselves and organize for social change. According to the model, disability is a social construction, and the vast experiences of physical, mental, and sensory impairment are not reduced to medical diagnoses, pathologies, and diseases but are instead placed in the social and cultural contexts of their times.

In the social model, disability is defined by the lack of participation and access in society. The model differentiates "disability" from "impairment" whereby disability is a consequence of the way society is organized, rather than a person's impairment or bodily difference. The model begins with a definition of impairment as "lacking all or part of a limb, organism or mechanism of the body" (Oliver, 1996, p. 22), which also includes psycho-social, intellectual, and sensory impairments. Disability then is created by a society that limits and restricts the full participation of impaired people. The social model seeks to change society to accommodate and include people living with impairments. It does not seek to change people with impairments to accommodate or be included in society. This model changes the focus of the problem of disability away from the impaired individual and places it directly onto societal norms, practices, and structures. In comparison to the medical model, this approach focuses on the social, attitudinal, physical, and environmental barriers that restrict the life choices and participation of people with disabilities. In this way, all society needs to do is to accommodate and include people with disabilities.

Human Rights Paradigm

The third paradigm is the human rights paradigm. As the social model has developed over the past few decades, there has also been a rise in the profile of disability rights at the national, regional, and international levels. The human rights model defines disability in accordance with the United Nations Convention on the Rights of Persons with Disabilities (UN General Assembly, 2007) as, "long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder [an individual's] full and effective participation in society on an equal basis with others" (p. 4).

The CRPD was adopted in 2006 at the UN following decades of work to change attitudes and approaches to persons with disabilities. The Convention was negotiated by a committee of various state governments, relevant bodies and organizations of the UN system, as well as intergovernmental and nongovernmental organizations including individuals and organizations of persons with disabilities (OPDs). It was negotiated during eight sessions between 2002 and 2006, making it the fastest negotiated of all human rights treaties. Similarly, once established, the Convention became the most quickly supported human rights instrument in history. There were 160 States that signed the Convention on its opening day in 2007 and 126 more States ratified the Convention within the next 5 years. The reader should know that ratification of the Convention means that the signatory states accept legal obligations to enact the necessary legislation required by the CRPD.

The Convention marked a shift in views on disability from a social welfare to a human rights issue. It took the movement to new heights with a profound shift toward viewing persons with disabilities as holders of rights, "who are capable of claiming those rights and making decisions for their lives based on their free and informed consent as well as being active members of society."[2] People with disabilities should no longer be viewed as objects of charity and medical intervention.

The Convention is a human rights instrument with an explicit, social development dimension. It adopts a broad categorization of persons with disabilities and reaffirms that all persons with all types of disabilities must enjoy all human rights and fundamental freedoms. On the positive side, it clarifies and qualifies how all categories of rights such as employment and education apply to persons with disabilities. Furthermore, it identifies areas where adaptations have to be made for persons with disabilities to effectively

---

[2] https://social.desa.un.org/issues/disability/crpd/convention-on-the-rights-of-persons-with-disabilities-crpd

exercise their rights. On the negative side, it identifies areas where their rights have been violated, and where protection of rights must be reinforced.

The human rights model conceives people with disabilities as diverse rights-bearing citizens and embraces substantive and transformative conceptions of equality that address the physical, economic, institutional, and social barriers that undermine their rights and dignity (Degener, 2016). This model is inspired by the values of dignity; autonomy; participation, inclusion, and accessibility; non-discrimination and equality; and respect for difference. This perspective also considers the multiple identities that people with disabilities hold, and intersecting forms of oppression related to their sex, gender, age, race, or other characteristics. Finally, a disability rights perspective focuses on the barriers that people with disabilities face in society and the legal and policy solutions through which they can be dismantled.

According to Quinn & Degener (2002), the human rights paradigm for people with disabilities considers "Each individual is deemed to be of inestimable value and nobody is insignificant. People are to be valued not just because they are economically or otherwise useful but because of their inherent self-worth" (p. 14). This means that people with disabilities have a stake and claim on society regardless of considerations of economic or social utility. As we will see later, there are critiques regarding the over-individualization of some aspects of the human rights paradigm and lack of causation of the root causes of exclusion.

The UN from its origin has played a pivotal role in raising the issue of disability rights at the international level in terms of laws, aspirational policies, operational programs, and local interventions. For example, at the international level, the formulation of the CRPD and the explicit positioning of disability in several of the Sustainable Development Goals are critical frameworks that situate disability at the interstices of the global and the local. At the national and local levels, there is increased recognition of the need for inclusion of the voices of people with disabilities in the design and implementation of community-based rehabilitation programs and the International Labour Organization disability employment initiatives. Moreover, the World Report on Disability (World Health Organization & World Bank, 2011), and the International Classification of Functions, Disability and Health (ICF) – albeit imperfect – are standardized resources on disability and are used worldwide. In the human rights model, ultimately, the positioning of disability is not only a critical issue that situated disability at the interstices of the global and the local but it is positioned as an intrinsic aspect of every person with or without disabilities.

Disability Justice Paradigm

The fourth paradigm is the disability justice paradigm. This paradigm is the next and contemporary stage in the evolution of the disability movement. Originally envisioned in 2005 by disabled queers and activists of color (Sins Invalid, 2020), this developing framework is being created as this volume is being published. In contrast to the human rights model, this paradigm points out that human rights frequently are so generalized that they are not operational for specific issues or specific marginal groups. Disability justice is the framework of the social movement to end ableism in conjunction with ending other systems of oppression. Disability justice commits to collective access to “create and explore new ways of doing things that go beyond able-bodied/minded normativity” (Berne et al., 2018, p. 228) in various spaces and places and in social movements. As a theory it offers opportunities for movements to connect, this explicitly intersectional paradigm provides a framework for understanding social justice, racial justice, and disability justice. They are not separate but rather interconnected and at times the very same matter (Jampel, 2018).

The principles of disability justice begins with intersectionality promoted by leadership of those most impacted by systems of oppression and violence. It is informed by an anti-capitalist politic, a commitment to cross-movement organizing and cross-disability solidarity, interdependence, collective access, and liberation and a focus on sustainability of the movement.

Prior to the disability rights movement, if people with disabilities were mistreated, there were no legal repercussions. Most spaces and places were not accessible and it was expected that disabled people would not participate in society. For example, one may consider the famous case of the paraplegic Charles Lane who was forced to crawl up the stairs in Tennessee to reach a hearing on the second floor regarding denial of accessibility for people with disabilities in state courts. A disability justice framework understands that all bodies are unique and essential, have strengths and needs that must be met, are powerful because of their complexities and confined by ability, race, gender, sexuality, class, nation state, religion, etc. and we cannot separate them (Sins Invalid, 2020). It focuses on the causation of exclusion and marginalization rather than focusing on rectifying laws and policies.

We found that in the sense of the Kuhnian long run, these paradigms have partially replaced each other in a dialectic synthesizing the best of each as they change and evolve. However remnants of each continue to exist with what can best be described as a checkered pattern across the global north and south.

Disability Studies Programs

Disability has long been studied in universities and hospitals but primarily from a clinical, psychological, or sociological perspective that framed disability as deviance. The field of disability studies emerged from the activism of people with disabilities in the 1970s and became an independent academic field in the 1980s (Rawson, n.d.). The field emerged primarily in the USA, the UK, and Canada and has diffused now globally. It was inspired by the social model of disability such that, “Scholars and researchers began to think of disability as a social construction and a set of cultural products, and of disabled people as a group historically oppressed but politically recognized under the logic of civil rights” (Garland-Thomson, 2013, p. 916). The first disability studies program was developed in 1996 at Syracuse University (https://soe.syr.edu/disability-studies/) and by the end of the 1990s, it had become a widely recognized field of study in which aspiring academics could publish, conduct research, and teach in formally employed positions.

Currently, there are hundreds of disability studies degrees and courses around the world. In 2009 *Disability Studies Quarterly* published a multinational review of English-language disability studies degrees and courses. They found that the field is expanding at an exponential rate with three key dimensions of growth in independent disability studies departments, hybridization with applied disciplines, and integration within the liberal arts (Cushing & Smith, 2009).

Critical disability studies is a complex, interdisciplinary field of study. It is rooted in activism, radical hope, a commitment to critical theory and has its own fair share of internal debates. For example, because disability is a historically and culturally contingent and contested social category, it is surprisingly difficult to define. Definitions vary by country. Some states have disability laws and policies that include people with mental health labels, while others do not. Anti-psychiatry, ex-patient, and Mad movements have only recently been included in disability movements. Women and trans-people struggled for a long time to get people with chronic illness recognized as part of the disability community (Buettgen & Gorman, 2019). Disability justice activists have also struggled to make space for disabilities that are disproportionately experienced by Black, Indigenous, and people of color, including conditions related to environmental toxicity, war, and experiences of violence, exploitation, and racism.

Some argue that the term “disabled people” emphasizes that disability is an essential part of self-identity. Others argue that the term “people with disabilities” or “persons with disabilities” puts people and the individual first and that disability is only one aspect of overall identity. None of these terms are universally accepted, “but the very fact that this debate exists reflects the efforts of a long-marginalized community to assert how they should be defined on their own terms” (Reaume, 2014). Thus, the field is by, and not just about, people with disabilities and centers their interpretation of their place in the world based on a social and political definition rooted in societal power relations.

Critical disability studies considers how institutions and societies systematically “dis-able” people. This area of study involves both academics and activists representing multiple disciplines and perspectives. Frequently disability studies programs in universities or colleges are connected either within the department or within a semi-independent research institute. Only recently have they become departments in their own right. As in the case of many emerging fields there is no standardized curriculum and most departments are crafted from the viewpoints and faculty interests of the institution. This has several consequences. First, it means that a student who wishes to “do disability studies” will usually know who the faculty are and what type of curriculum they will encompass. Second, because it is not standardized it means that students with the same degree may have had very different training and interests. Third, it means that there are various career paths followed by graduates depending upon which institution one attends. In short, it is an exciting field of study but not a career path for the faint of heart.

Disability studies lends credibility to the social, human rights and disability justice model. It establishes these models as a legitimate field of study and profession. Although not all faculty and staff in disability studies are disabled, many of these programs and institutions provide an intellectually stimulating place to grow and learn from their own or others' lived experiences.

There is a wide spectrum of programs that reflect the evolution of the paradigms of disability. Some programs lean more toward the medical model, some lean toward the human rights model, and some are firmly embedded in the disability justice model. As in other fields, the friends, colleagues, and relationships that are developed in these programs frequently last lifetimes and entire careers. There are overlapping networks that originate in these programs that impact the formation of government policies, court cases, and even benefits in a way that would not have been 30 years ago.

In conclusion, the field of disability studies, although still emerging is relatively rare. There are too few programs in either the Global North or Global South given that people with disabilities are the largest minority group worldwide. Those few programs that exist are still sometimes marginalized but are beginning to take their place among other more established departments.

About the Handbook

The editorial policy of this book is to take a broad view of critical analysis – one that is broader than postmodernism, poststructuralism, psychoanalytic criticism, and Marxism. Here we focus on the pragmatics of critical theory and fundamental thinking about criticality and disability.

Critical theory is useful to the field of disability studies as an interdisciplinary school of thought striving toward emancipation. This theoretical perspective focuses on the possibilities for transformative change by exposing and challenging the institutions and mechanisms of domination and power. Critical theory provides a method for analysis of the many forms of domination that inhibit radical transformation and political movements.

This handbook highlights forms of domination that are often hidden and must be unmasked to develop alternative socio-political-economic systems that promote well-being rather than serve the interests of capital. It is intended to support work that unleashes the potentialities of all human beings, links theory, and practice and engagement in participatory processes. In this sense, critical theory is helpful to our understanding and re-conceptualization of disability. Critical theory is anti-oppressive, anti-positivist, and anti-capitalist which align with the values of many disability studies scholars. One needs to understand how socio-political-economic systems such as capitalism, colonialism, and fascism have uniquely *dis*abled people from full participation in society.

We follow in the footsteps of Marcia Rioux claiming that critical theory matters because the development of theory associated with disablement and equality impacts our collective understanding of the meaning of disability. Furthermore, it impacts the development of laws, policies and practices (Rioux & Valentine, 2006). A critical disability theory approach offers an important lens in unraveling the inherent complexities associated with disability and equality/inclusion. For example, one of the General Principles of the CRPD (developed by and for persons with disabilities around the world) includes respect for inherent dignity, individual autonomy, and the freedom to make one's own choices. The principles also emphasize respect for difference and acceptance of persons with disabilities as part of human diversity and humanity. These clearly are derived from the application of critical theory.

The disability rights movement and emerging discipline of disability studies have challenged the medical model that characterizes disability as a physical and mental defect that can be cured or managed at an individual level through medical interventions. But developments in science and biotechnology are re-igniting the medicalization debate or what is now being called the re-medicalization of disability. Genetic research, and particularly genetic selection, is posing dilemmas to the meaning of disability in society. This issue will be covered across several sections including the section on ethics.

Through the text, key concepts of accessibility, inclusion, and inclusive design will be described and debated. The concept of inclusive design considers the full range of human diversity with respect to ability, language, culture, gender, age, and other forms of human difference. It recognizes the interconnectedness of users and systems moving beyond the notion of separate, specialized, or segregated solutions. In this way, disability is framed as a mismatch between the needs of the individual and the design of a product, system, or service. With this framing, disability can be experienced by anyone excluded by design which, to overcome, requires the integration of inclusive design and generic design. While universal design has its origins in architecture and industry, it is now included in the digital realm – which requires flexibility, adaptability, and personalized approaches to inclusion. Chapter authors will examine these issues in a variety of contexts throughout the volume.

The introduction of new ideas about the meaning of inclusion, equality and equity, and the right to be different opens up new avenues for a perspective on disability. These new ideas move us to a better understanding of fundamental issues such as supported decision-making and labor market initiatives that go beyond policy, programs and thinking on disability. With the introduction of these new ideas in the various sections, we collectively (in collaboration with chapter authors and section editors) open up emerging, hitherto unimagined areas in which the disability paradigm is integrating and impacting many areas of social, economic, and political life.

The majority (80%) of persons with disabilities live in the Global South. This includes low- and middle-income countries. However, the bulk of the literature in the field of disability studies is from the Global North. We believe that this reflects an imbalance of power and access to knowledge. Thus, we have made a significant effort to include authors and editors from the Global South to raise the profile of the lived experiences, challenges, barriers, and opportunities facing people with disabilities around the world.

How to Read and Access the Book

This handbook does not need to be read in either chronological or spatial order. It is an encyclopedia of knowledge and resources intended to support the progressive realization of human rights and pursuit of social justice. Encourage people to reach out to us, the section editors and authors to connect, ask questions and dialogue, and share knowledge and resources.

Each section includes an introduction by each section editor to provide reflections on the past, present, and future of their respective areas of expertise and a summary of the chapters in their section. They also provide a context in which to place their chapters while the editors in chiefs' introduction and conclusion provide an overall context for the state of disability studies, advocacy, and movements worldwide.

The Handbook contains original pieces on different dimensions of disability by researchers, activists, helping professionals, service providers, international development experts and organizations, professors in disability studies, and policymakers with a particular focus on the voices of the principal stakeholders, disabled persons themselves. Section editors have been identified with dedicated effort to include editors from the global North and the global South.

The field of disability studies will be examined from a variety of perspectives as described in the overview of sections below. The Handbook also includes an index of terms for easy access to particular subjects and keywords.

Overview of Parts

Part I is a collection of prominent figures who have had voices of impact. These voices raise core issues that have influenced our understanding and approaches to disability over time. This section reflects on the twentieth and twenty-first centuries and offers some predictions about future directions. It segues into the history of disability rights.

Part II covers the history of the development of the disability rights movement as well as the history, ideas, and ideology of disability from different parts of the world. The section includes chapters from authors in different areas of the world and from different religious perspectives. In order to organize these diverse views the next section coalesces these into paradigms.

Part III addresses disability paradigm shifts, describing current models, perspectives, and philosophical orientations that drive and determine the responses to disability globally and locally. It explores models/perspectives that emanate from presumptions of individual pathology in contrast to those that emanate from presumptions of socio-political factors. These paradigm shifts are inextricably linked to the evolution of the field of critical disability studies as described the next section.

Part IV looks at critical disability studies as a consolidating field. A form of knowledge production, "critical disability" deals with what is between, through, and beyond any discipline. It recognizes and accounts for complex theory in social disciplines. Specifically, this section outlines and problematizes the social determinants of disability, and ways of addressing those within an academic discipline. It takes a cross-section of work in the emerging discipline of disability studies to highlight the importance of understanding what each discipline brings to disability studies. One area where the cross sectional and transdisciplinarity discussed in this section is applied is in various approaches to the study of disability which is taken up in the next section.

Part V on research examines approaches to the study of disability including decolonizing methodologies, biological, survey, ethnographic, feminist, and post-modernist epistemologies and methodologies and will be grounded in the concept of emancipatory research to studying disability will be prevalent here. The next section explores these intersectional approaches further focusing on diverse disability identities.

Part VI on Intersectionality focuses on diverse disability identities located at the interstices of caste, class, gender, sexuality, and indigenous peoples. This section highlights the experiences of persons with disabilities within other marginal identities before moving into discussions of monitoring and indicators of disability in section seven.

Part VII, Monitoring and Indicators of Disability Rights, identifies recent work on indicators for the CRPD, for the SDGS, and for other international instruments. The section directly addresses the understanding of how evidence-based progressive realization can be measured and monitoring advances the implement of progressive realization within the framework of disability and other international instruments. The development of inclusive monitoring tools and indicators requires utilization of the principles of inclusive design and accessibility which is discussed in detail in the next section.

Part VIII is on Inclusive Design and Accessibility. Inclusive design considers the full range of human diversity with respect to ability, language, culture, gender, age, and other forms of human difference. It recognizes the interconnectedness of users and systems moving beyond the notion of separate, specialized, or segregated solutions. Rather than a personal characteristic or a binary state (disabled vs. non-disabled), disability is framed as: a mismatch between the needs of the individual and the design of the product, system, or service. Inclusive design includes digital accessibility and evolving technology. With this framing, disability can be experienced by anyone excluded by the design. The problematic of unequal distribution of inclusive design and inaccessibility can be seen in the experiences of socioeconomic poverty and exclusion of persons with disabilities as discussed in the next section.

Part IX focuses on Poverty and Economic Inclusion to look at the relationship of disability to poverty. There are many themes that poverty and economic inclusion of people with disabilities raise in the context of disability, including theories of poverty; why employment initiatives have failed to reduce poverty for people with disabilities despite the huge local, national, and international development grants that have been invested; local and global approaches to poverty reduction; and the role of the disability movement in poverty reduction and how has this been impacted by the charity perspective, the social model, and the disability rights movement. These issues raise concerns about ethics and the influence of law on the lives of people with disabilities.

Part X moves into Disability, Ethics, and Law. Important issues of trans-humanism, supported decision-making, living wills, euthanasia, dying with dignity, meaning of equality under the law; capacity to consent; right to life (Article 10 of CRPD); non-consensual sterilization; gender identity, sexuality and sexual expression, reproduction, and the future of mental health law are addressed. With these critical concerns in mind, the next section focuses on the implementation of law and policy.

Part XI looks at Implementing Policy and Law from a Rights Perspective to explore and unpack the meaning of human rights. The section includes analyses of the UNCRPD, illustrations of disability legislation post UNCRPD, anti-discrimination legislation, and different rights discourses to provide a context to disability rights. The chapter explores the scope and impact and potential of the CRPD. With the introduction of the CRPD and the SDGs, there is on-going work to develop evidence-based methods of monitoring that incorporate the voices of people with disabilities, a requirement of reporting by countries that have ratified the Convention. Effective implementation of laws and policies often relies on activism and advocacy from the disability movement which will be discussed in the next section.

Part XII focuses on various forms of disability activism from different places in the world that are popping up and taking root. This section includes discussions of self-advocacy and parent-led activism, bullying, oppression, and incarceration; as well as movements guided by psychosocial survivors of psychiatry; people with intellectual disabilities, physical disabilities and sensory disabilities.Activism and advocacy are also critical in the life and death experiences of people with disabilities in disasters and conflict.

Part XIII on Disaster, Conflict, and Environmental Conditions includes an analysis of the impact of natural and man-made disasters and climate change on persons with disabilities as well as disability as a result of war, road accidents, or firearms. The section also includes disaster relief measures designed for people with disabilities.

The concluding part offers insight on ways to move forward, critically engaging in where to go from here given our globalizing world.

It is our hope that this volume opens up an expanded range of issues, insights, and developments in the field of critical disability studies to debate and discuss. We approached this work with the intention that what is offered in the following sections is taken up by scholars, activists, international development works, researchers, and students alike seeking to achieve equality around issues affecting persons with disabilities the world over.

Marcia Rioux: A Voice for Impact

2

Ezra Zubrow and Alexis Buettgen

Contents

Abstract

This chapter spans the career of Marcia Rioux who was a profound voice for impact and change in the field of critical disability and human rights. Internationally and nationally, Marcia Hampton Rioux was regarded as a leading legal scholar and pioneer in the field of human rights and equity. She was a driving force in the promotion of disability rights and the enhancement of opportunities for marginalized people. She played a leadership role in the United Nations Convention on the Rights of Persons with Disabilities and published widely in the area of disability and human

rights. Editing a number of collected volumes, she wrote more than 70 book chapters and articles on human rights. Holding a Ph.D. in jurisprudence and social policy from the University of California, Berkeley, she was the director of the Roeher Institute in Toronto, Canada, whose purpose was to secure the inclusion, citizenship, human rights, and equality of people with disabilities. She was the director at York University's Institute for Health Research as well as the cofounder and first chair of the School of Health Policy and Management and the founder of the Critical Disabilities Studies Program. She was a co-founder of Disability Rights Promotion International, which now monitors rights for people with disabilities in more than 62 countries. She held the positions of Distinguished Research Professor and Professor Emerita in the School of Health Policy and Management in York University's Faculty of Health in Canada, and was a Fellow of the Institutes of Advanced Studies in the United Kingdom and Australia. Professor Rioux was the recipient of the Lieutenant Governor's Community Volunteer Award in recognition of her contributions to Ontario communities. In 2014, she was invested into the Order of Canada for her scholarship in the field of social justice and for her advancement of the rights of persons with disabilities.

Introduction

Internationally and nationally, Marcia Hampton Rioux was regarded as a leading legal scholar and pioneer in the field of human rights and equity. She was a driving force in the promotion of disability rights and the enhancement of opportunities for marginalized people. She played a leadership role in the United Nations Convention on the Rights of Persons with Disabilities and published widely in the area of disability and human rights. Editing a number of collected volumes, she wrote more than 70 book chapters and articles on human rights. Holding a Ph.D. in jurisprudence and social policy from the University of California, Berkeley, she was the director of the Roeher Institute in Toronto, Canada, whose purpose was to secure the inclusion, citizenship, human rights, and equality of people with disabilities. She was the director at York University's Institute for Health Research as well as the cofounder and first chair of the School of Health Policy and Management and the founder of the Critical Disabilities Studies Program. She was a cofounder of Disability Rights Promotion International, which now monitors rights for people with disabilities in more than 62 countries. She held the positions of Distinguished Research Professor and Professor Emerita in the School of Health Policy and Management in York University's Faculty of Health and was a Fellow of the Institutes of Advanced Studies in the United Kingdom and Australia.

Professor Rioux was the recipient of the Lieutenant Governor's Community Volunteer Award in recognition of her contributions to Ontario communities. In 2014, she was invested into the Order of Canada for her scholarship in the field of social justice and for her advancement of the rights of persons with disabilities. Professor Rioux lectured throughout the Americas, Europe, Africa, and Asia. She was a visiting scholar and professor at a number of international institutions, including the University of Zagreb, Croatia, and LaTrobe University in Australia. Marcia died in September 2021. Her last project was this handbook.

Early Years

Marcia was born on May 16, 1947, in Trail, British Columbia, Canada. She was the daughter of the late Edouard and Phyllis (née Gray) Gautschi and the youngest of three sisters. Her parents raised them to do service and help others. Her uncle was Hampton Gray – the last Canadian awarded the Victoria Cross. All three sisters earned Ph.D.'s in the health fields. Marcia Rioux spent her entire life working to fulfill those joint ambitions.

After graduating from Carleton University, Marcia began her career as a research assistant at the Royal Commission on the Status of Women in 1968. Six years later, she became the Director of Research at the Canadian Advisory Council on the Status of Women. In the year 1977, she joined the Law Reform Commission of Canada as a Policy Analyst. At that time, the commission was examining issues such as "sterilization of the mentally ill, and personality and behaviour control," as well as euthanasia and sexual offenses (Law Reform Commission of Canada, 1976). These critical issues and work experiences influenced Marcia's thinking about both the status of women and people with disabilities as constructed by laws and policies.

From 1979 to 1986, Marcia worked as a consultant for the Canadian Human Rights Commission; British Columbia Human Rights Branch; Royal Commission on Equality in Employment; National Council of Welfare; and others while completing her Ph.D. in Jurisprudence & Social Policy at Boalt Hall, University of California, Berkeley. Among her professors was Laura Nader who was famous for recognizing "studying up" – the role of impact of the marginalizer on the marginalized.

Marcia's dissertation titled "The Equality-Disability Nexus: The History and Law of Mental Handicap [sic] in Canada" reflected on the history of treatment and legal status of people with intellectual disabilities in Canada as a complex interaction of medical science, technology, economics, law, and politics. It challenged the logic of separation and difference that perpetuated the marginalized position of people with disabilities. She poignantly asked whether difference can form the basis for equality and explored the extension of citizenship rights to persons with intellectual disabilities. She wrote:

> ...[T]he manner in which differential treatment in law and policy of people with mental handicaps has been legitimated...raises the question of whether the nature and type of difference between those with mental handicaps and others justifies the continuing marginalization and denial of a claim to equality and rights. (p. 1)

Marcia proposed an equality of well-being model in which rights would be guaranteed independent of difference and that recognized the need for a range of social interventions to ensure equality. Looking first at history, she claimed:

> Tracing the history of exclusion reveals the social interests that have been served by limiting participation of this group, outlining three identifiable periods of legal and social action.

> . . .[First] in the English Poor Law, aimed to protect society from the differences of those with mental handicaps through policies of confinement, strict state control and a eugenic imperative . . . (second) . . . social attitudes and legal norms based on charity and benevolence. . . (third). . .with the control exercised primarily through medical decision-making and local authorities. (pp. 1–2)

She explicated her model such that:

> The eradication of discrimination against those with mental handicaps [sic] thus requires a more fundamental alteration of the existing legal and social order than does the elimination of race or gender discrimination and even sex discrimination. . . An encompassing model of equality must confront intellectual differences, not ignore them. For this it is not a matter of irrational prejudice focused on superficial differences but the elimination of assumptions about the basis of legitimate claims of people whose salient differences will not diminish. (p. 232)
>
> To achieve this form of equality would require the redistribution of state resources to actualize equality of well-being. Mental handicap would no longer be a negative concept, but would denote something positive to which a particular social status was attributed. The granting of entitlements could be attached purely by reason — of an individual's being - independent of their potential to compete. It refocuses the concept of equality, both legally and socially, from the negative notion of "discrimination" to a positive means of integration. . .Setting the equality standard as an outcome measure removes the need for each disadvantaged group to show the discrimination that it had faced and to establish that it can compete in the existing social and economic structure or to show why adaptation should be made so that they can compete. (pp. 234–235)

During and upon completion of her Ph.D., Marcia became a leading proponent of critical thought and inclusive research. Her work made national and international strides toward a paradigm shift in the way societies viewed and treated people with disabilities in order to move away from the medical model toward a rights-based approach.

Mid-Career: Becoming a Thought Leader

In 1987, Marcia became the Executive Director of the Roeher Institute and later became the President until 2000. She led the organization to become renowned in the development and exchange of ideas founded on a new way of understanding disability and society. The institute raised awareness about the barriers that affect people with disabilities and presented critical policy and program alternatives. Over the course of almost two decades, the Institute produced a large assortment of analytical publications, as well as education and training sessions to provide insight into the social policies, laws, and programs that act as barriers to the full participation of people with disabilities in Canada and internationally.

This work included the famously "infamous" book titled: "Disability Is Not Measles: New Research Paradigms in Disability" (Rioux & Bach, 1994). This coedited book critiqued the reification of disability entrenched through a positivist theory of knowledge and focused on the social, economic, political, and legal construction of disability. Returning to the history of research regarding the treatment of people with disabilities (dating back to the 1800s), she guided our collective understanding of why people with disabilities experience profound poverty, violence, marginalization, and exclusion in society.

Bringing the reader up to the present moment at the time, she strongly wrote:

> “What does the preponderance of research in the field look like now? It looks a great deal like the research into measles. The goal is prevention. Consequently, identifying the condition and its biological origins is still a preoccupation of much of the work. Cures are sought - now euphemistically called prevention - and divided between biological prevention and environmental prevention....with new research showing the relationship between such elements as workplace toxins, alcohol use, age of women at conception and rates of disability. (Rioux, 1994a, pp. 3–4)
>
> There is, however, another important policy agenda that must be addressed in the research of the 1990s on disability. The philosophical foundations of notions of citizenship and equality are important to the critique of traditional research in the field. The underlying assumption of the lack of status of persons with disabilities has promoted, or at a minimum left unquestioned, the funding and undertaking of research that would be ethically and legally unacceptable if it involves other groups.
>
> ...Disability is not measles. It is not a medical condition that needs to be eliminated from the population. It is a social status and the research agenda must take into account the political implications attached to that status. (Rioux, 1994a, pp. 6–7)

After the publication of *Disability is Not Measles*, Marcia presented a paper titled “Disability: The Place of Judgement in a World of Fact” at the 10th World Congress of the International Association for the Scientific Study of Intellectual Disabilities in Helsinki, Finland, July 1996 (Rioux, 1996). She critically addressed the impact of economic neoconservatism, the Washington Consensus, and Western utilitarianism as the underlying principles for policy as well as for research and professional practice to reject out of hand, a research culture driven by objectivity and positivism.

Marcia pushed the research community to recognize the forces that shaped the questions they asked and the criteria of validity they adopted in disability research. She wrote:

> Ways of viewing disability, of developing research questions, of interpreting research results, of justifying research methodology and of putting policies and programs in place are as much about ideology as they are about fact. (Rioux, 1996, p. 1)

Within a strong critique of positivist ideology, Marcia contended that:

> [T]he research community in the field of disability has created a world of “disability facts”, but has been relatively unconscious about the judgements it has made in doing so In creating the world of facts, we have assumed that the place of judgement belongs to the advocates, the policy-makers, the politicians, the courts. I think that we need to reconfigure the place of judgement in the world of facts we construct in the field of disability research. (Rioux, 1996, pp. 21–22)

In 1997, she was invited by Michael Oliver to be a fellow of the Institute of Advanced Study at Bristol University, United Kingdom, as the Benjamin Meeker Visiting Professor for 6 months. Although already well known in the field of disability, she was introduced to important policy makers outside of disability in the United Kingdom and Europe. These contacts later became very important in her efforts to reach powerful leaders outside the realm of disability who could influence the progressive realization of human rights. She recognized that they could help her harness the more general agendas of social, political, and economic inclusion and apply them to disability.

One year later, in 1998, Marcia and her colleagues at Roeher put together one of the first articulations of the cost of exclusion of people with disabilities. This work was presented at The World Bank in Washington D.C., March 5, 1998. In front of an audience of powerful international bankers and economists, Marcia presented a speech titled: "Enabling the Well-Being of Persons with Disabilities" (Rioux, 1998). In this speech, she argued that not only was disability internationally conceived expensive, but it was not sustainable. It was a hodge-podge of reactive "shreds and patches." After demonstrating her case, she suggested "a disability paradigms" to introduce coherence and sustainability into World Bank and other international financial initiatives. She argued that a disability framework does the following:

- Recognizes that disability is a result of the biological condition, functional capacity, and social status of the individual.
- Recognizes the broad set of social, economic, legal, and environmental factors which contribute to exclusion and inability to exercise human rights.
- Recognizes the well-being of everyone through a respect for diversity and differences.
- Recognizes that people must be enabled and supported to choose the way in which they want to live.
- Recognizes social justice and the sense of the citizens that they are being treated fairly (unlike the situation now where too many people for one reason or another feel that they are being treated unfairly because of conditions over which they have no control, such as race, sex, color, religion, disability, sexual orientation, and so on).

She believed that one of the great challenges for these institutions was to recognize that incremental reforms and project funding were not ends in themselves. They were simply part of a continuum of change, and while each country will make changes within its own cultural context and economic and social conditions, it is possible that the projects as a whole work together toward that set of broader objectives that ensure inclusion, human rights, and full citizenship.

By this time in the late 1990s, Marcia was increasingly present on the international scene. Marcia was working as a Consultant for the Interregional Seminar and Symposium on International Norms and Standards relating to Disability, organized by the Centre for Comparative and Public Law, Faculty of Law, University of Hong Kong, the Hong Kong Equal Opportunities Commission, and the United Nations Division for Social Policy and Development, Hong Kong. She was also the Principal Coordinator in Canada for the National Resource Centre for Inclusion (India) Project in Bombay, India; Policy Advisor for Inclusion International in Geneva, Switzerland; and Consultant for the Government of Victoria, Australia, Ten Year State Plan for Disability.

She was frequently collaborating with Bengt Lindqvist – a Swedish politician and strong advocate of persons with disabilities. She was a member of the Social Democratic Party and served as chairman of the Swedish Association of the Visually Impaired from 1975 to 1985, the rehabilitation committee of the World Council for the Welfare of the Blind from 1974 to 1985, and the Swedish Disability Association from 1977 to 1985. First elected as a Member of the Riksdag (MP) for Stockholm County in 1982, Lindqvist also served as a deputy minister for social security (responsible for family affairs, elderly care and disability) in the Palme II and Carlsson I Cabinet and was later named minister without portfolio in the Carlsson II Cabinet. He moved to the UN where from 1994 to 2002, he served as the United Nations Special Rapporteur on Disability of the Commission for Social Development. They had a special relationship and often met in Sweden and New York to reflect on the status of human rights among persons with disabilities conceiving an international holistic monitoring project on the rights of persons with disabilities and the creation of a disability studies programs around the world.

In 2000, Marcia worked with Bengt as Policy Advisor to the UN Special Rapporteur for an International Expert Meeting on human rights abuses, "Let the World Know," in Stockholm, Sweden. At this Expert Meeting, Bengt brought together 27 experts from all regions of the world to consider measures to strengthen the protection and monitoring of the human rights of people with disabilities. Among the seminar participants were representatives of all the major international disability organizations, representatives of the Office of the High Commissioner for Human Rights and the UN Secretariat, disability rights activists, and experts on human rights. The participants recommended the creation of an international system to monitor the human rights situation of people with disabilities. To fill this need, Disability Rights Promotion International (DRPI) was founded by Marcia and Bengt.

Establishing Critical Disability Studies and International Rights Monitoring

In 2001, Marcia left Roeher and joined York University in Toronto, Canada, as a Full Professor. Originally appointed to Atkinson College, she accepted this position on the condition that she could establish both a School of Health Policy and Management (SHPM) and a Program of Critical Disability Studies (CDS) at the university. The goal was to develop a cadre of people skilled and knowledgeable about disability from a critical perspective. The university administration agreed to establish the program in the Faculty of Health (despite Marcia's objections to such a faculty home given the challenges and harms caused by the medical model of disability). The CDS program was created with input and consultation with leading disability studies scholars and activists around the world including Michael Oliver, Colin Barnes, Bengt Lindqvist, Nora Groce, as well as colleagues at the York Centre for Vision Research, among others. Saul Joel, Susan Warwick, and Rob Webb at York played a critical role in getting the program accepted through the university and provincial administration.

The program was designed with three areas of concentration: (1) human rights and social justice, (2) social policy, and (3) critical theory. These three areas of concentration were intended to be complementary and comprehensive. Students received education and courses in all three areas and could focus on one area or more in their research programs.

Simultaneously and complementarily, Marcia began to bring external governmental and international projects and grants such as DRPI into the Financial Services Department of York University as part of her development plan for SHPM and CDS.

At the rock bottom level, Marcia had to fight to make the classes accessible for students and faculty with disabilities. This was an ongoing battle with facilities that was later taken up by other program faculty. Only one classroom on campus was made fully accessible. Accessibility was considered regarding the built environment, information and communications, and student and faculty services. Marcia saw this as an integral part of the educational structure of the program. She emphasized the right to accessibility as a means to inclusion. As part of making Disability Studies important at York, she helped organize an Honorary Doctorate for Bengt Lindquist which made national and international news.

She developed a model at York for what she thought a Critical Disability Program or Department should be. Rather than try to make it exclusive to York, she systematically lectured at universities on all the continents and advised their disability scholars, organizations, on how to create a Critical Disability Department and if not a critical one at least a Department of Disability Studies. It is and will be a long-term continuing legacy.

As the convention on the rights of persons with disabilities (CRPD) was being created in the early 2000s, Marcia saw this as a tremendous opportunity to identify, address, and remove the challenges and barriers facing people with disabilities. The CRPD solidified the rights of persons with disabilities in an international treaty. Marcia was among the first in the world to develop educational and research activities to promote and monitor the implementation of the CRPD. She worked closely with her colleagues at York University, across Canada, and internationally. She worked closely with the Canadian government and in particular with members of the "blue jean bureaucracy." She also had many connections in national politics. She was a friend of Carolyn Bennett who was a Member of Parliament for St. Paul's and Minister for Public Health (and set up the governments Public Health Agency and Public Health Network), and William Young, biographer of Paul Martin and Brian Mulrooney, and the parliamentary librarian where his portfolio included being deputy head of the government responsible for parliamentary administration as well as research, information, public outreach, and education.

Just prior to the adoption of the CRPD in 2006, Marcia published her reflections on equality and well-being – picking up on the work she started with her Ph.D. dissertation and continued to develop throughout the 1990s. These reflections were published in a journal article in 1994 (Rioux, 1994b) and reprinted as a book chapter in 2005 titled: "Towards a Concept of Equality of Well-Being: Overcoming the Social and Legal Construction of Inequality." She wrote:

> The ways in which a society provides for people who, for one reason or another, are more socially and economically dependent throws into sharp focus the problems of equality as a political construct. The basic dilemma of social dependency is that of reconciling the responsibility of the state to ensure equality with the rights and needs of those who are dependent. . . (p. 127)
>
> Traditional limits that have circumscribed political obligation to ensure equality become suspect when the meaning of equality incorporates the notion of well-being, with its implications for resource distribution. Entitlement is based on a comprehensive notion of citizenship (that is, the intrinsic worth of the individual and on some absolute notion of need) not on ones status as a member of the class of worthy poor, or on inequality of talent or social usefulness. (p. 144)

Conversely, she believed that discrimination was:

> . . . tied to traditional notions of worth, (and) merely changing conventional definitions of discrimination may not by itself result in substantive equality. Structural changes are likely to be necessary on the political and legal levels. If the right to participate is to be recognized, the notion would have to be jettisoned that people with intellectual disabilities are members of a class provided with goods and services because they are worthy of care rather than by right of citizenship. (p. 144)

Finally, she argued for an outcome-based equality of well-being that

> . . .starts not with an assimilationist view but with a pluralist perspective on how people with differences and similarities ought to see each other in a just society. It argues that formal barriers have placed groups in substantively different social positions, i.e., that differences have become sites of social disadvantage. Consequently, removing the barriers without also redressing associated disadvantage does not result in significant change. This model also assumes that systemic discrimination against groups is not a "mistake" but an integral part of policies fostering a dominant social agenda. As such, it provides an alternative context for examining legal and social equality. To enable equality that takes into account immutable differences, differences must be accommodated in order to neutralize their effect as barriers to personal achievement and to entitlement as fully participating members of society, that is, barriers to personhood dignity and self-determination. The emphasis is then on the means of reasonable accommodation, rather than affirmative action. (p. 144)
>
> The premises of this model of equality are that all persons of distinguishable groups have the same needs for equality; that the capacity to exercise a right is not a distinguishing characteristic for the purpose of recognizing or denying that right; and that equality is consequent on the equal value, benefit, and rights possessed in differences from the norm, not on overcoming natural characteristics and becoming as much like the norm as possible.
>
> To achieve this form of equality would require the redistribution of state resources to actualize equality of well-being. Inequality would no longer be embodied in the concept of intellectual disability nor would intellectual disability be the basis for denying citizenship. The granting of entitlements could be attached purely by reason of an individual's being, independent of their potential to compete. This would refocus the concept of equality, both legally and socially, from the negative notion of "discrimination," to a positive means of integration. Distributive justice based on this idea of equality would require that social transfers were made not just in financial terms but in the basis of other needs as well, including support to participate.
>
> Setting the equality standard as an outcome measure removes the need for each disadvantaged group to demonstrate discrimination. It replaces the capacity to compete as the basis for political obligation. It takes into account the social reality of the disabled and non-disabled as well as their biological differences. And it thus makes the achievement of

> social justice dependent on a recognition of those differences that must be accommodated to achieve equality of well-being. (p. 147)

After the adoption of the CRPD, Marcia delivered a keynote address titled: “Promises and Panaceas: The Idealism of Rights to the Exercise of Rights” to the World Congress of Rehabilitation International, in Québec City, August 2008 (Rioux, 2008). In this address, she presented examples and experience of monitoring rights from a holistic perspective, including media monitoring, systemic monitoring (of programs, policies, and laws) and monitoring of individual situations. The presentation used examples from research that DRPI had already carried out in the field since 2002, to underscore the limitations of monitoring that doesn’t measure the gap between government policies, programs, and constitutional guarantees and the reality for people with disabilities who continue to live without their rights. In this address, she said:

> After more than 30 years of lobbying and advocacy we have finally reached the plateau where human rights and disability have become firmly linked. With the first statements of Mary Robinson acknowledging that disability was a human rights issue (in the late 1990s) to the newly signed United Nations Convention on Disability, this connection has become entrenched in the UN rhetoric. It is also now found in national state rhetoric where governments are signing and ratifying the Convention.

This recognition of disability rights is a watershed but not by any means a panacea. The next steps are more difficult. How do we engage in enabling the exercise of those rights? Implementation in practice depends on some very important elements. These are:

1. The Convention itself and the way it is structured.
2. An on-going dialogue and buy-in by the public of disability rights as shared social values.
3. Building an awareness of disability rights values in government and the legal system across all sectors in each country.
4. Requirement of public authorities to take account of civil, political, economic, social, and cultural rights in policy making.
5. Putting in place a National Disability Strategy supporting rights that incorporates. . .principles of indivisibiltiy of rights and responsibilities. . .a rights assessment tool, logic mapping for prioritizing strategy, and careful and detailed monitoring of the strategy against the principles of the UN Convention.
6. Finally and of critical importance had to be real, sustainable and on-going holistic monitoring of the Convention and of other UN instruments that guarantee rights.

Marcia strongly spoke about how the importance of having these six elements cannot be exaggerated.

During this period of her life, she might work at York for a week, go to Ottawa for a few days, and then fly to London with Carolyn Bennett. There she would meet with Mithu Alur representing Indian Disability Societies and then go with Carolyn Bennett to the English House of Commons in order to have committee meetings on upcoming

UK disability legislation and the next day visit with Oliver and then Barnes about setting up a CDS program. There were visits with Nora Groce and staying at her place on Hampstead Heath. For anyone, it would have been a grueling schedule.

She had considerable outreach and was often interviewed on human rights, disability, women's rights, and social justice by the media. You would find her on CBC including discussions with CBC Morningside with Peter Gzowski, and subsequently Shelagh Rogers and Stuart McLean. There were similar interviews in the United Kingdom, France, Italy, Germany, and by Asian and African newspapers. All of this work was in one way or another linked to the promotion of disability rights internationally.

Disability Rights Promotion International (DRPI)

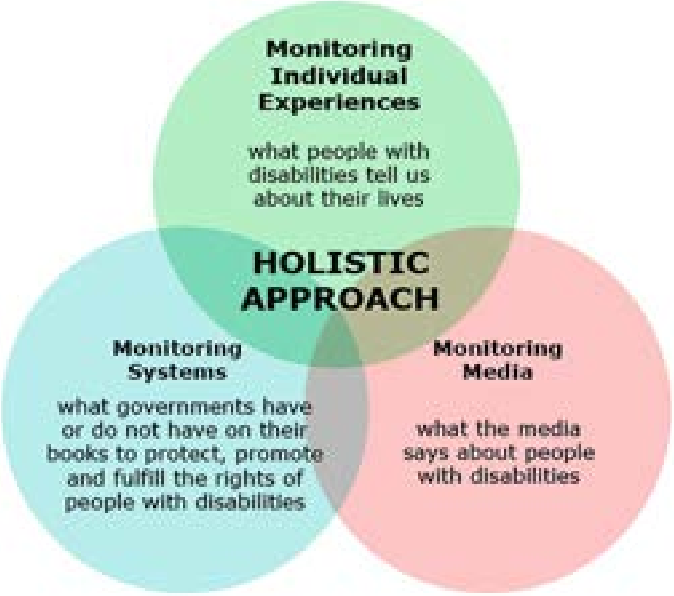
The first phase of DRPI was launched in 2002 with a research agenda that investigated opportunities for using international human rights instruments to enforce disability rights; types of monitoring tools used by human rights monitoring projects; and current training resources for human rights monitors and for more general human rights education. This research confirmed the need for increased disability rights monitoring activities and for disability-specific monitoring and training resources; identified existing expertise, models, and methodologies related to human rights monitoring in the five areas of focus; and highlighted opportunities for disability rights advocacy in the international human rights system.

In addition to research, the DRPI team reached out to many organizations to identify partnership opportunities. This exploration of partnerships continued as plans were developed to implement a monitoring system. One goal was to form effective working relationships with human rights and disability organizations to share expertise and develop field testing sites for monitoring (Disability Rights Promotion International, n.d.-a).

Seven years later, the DRPI initiative was officially implemented. By 2012, instruments and tools were being used in more than 20 countries, to foster permanence and sustainability of monitoring the implementation of the CRPD. The initiative was sustained through the establishment of continental regional centers in collaboration with organizations operated by and for persons with disabilities. These centers were regional focal points for disability rights monitoring activities. They worked together to create a sustainable and coherent structure that would continue over many years. DRPI reported to the UN Special Rapporteur and strengthened the international network of persons with disabilities and disability organizations to enhance their capacity with skills to manage, coordinate, and participate in disability rights monitoring projects. Existing collaborations continued and new partnerships were explored. By 2013, "a strong foundation was put in place for a comprehensive and sustainable global disability rights monitoring system, involving the networks and organizations of persons with disabilities needed to support the work" (Disability Rights Promotion International, n.d.-a).

The DRPI initiative has adopted three broad areas for monitoring: monitoring systems, monitoring individual experiences, and monitoring media. Human rights monitoring has been broken down into these areas to discover discrete pieces of knowledge and create a picture of the current situation faced by individuals with disabilities. Data collected during monitoring activities in all three areas are used as evidence for advocacy efforts and the improvement of government policies and laws.

The three broad areas for monitoring, monitoring systems, monitoring individual experiences, and monitoring media, are represented in the following Venn diagram.



The DRPI monitoring system is a powerful and empowering project because "it provides a voice to marginalized people, enhances public awareness by documenting abuses and violations reinforces a collective identity among persons with disabilities, and supports efforts to achieve social justice" (Disability Rights Promotion International, n.d.-b). DRPI remains active today. The knowledge and reports produced as well as the rights monitoring training are freely available online and accessible (Visit: https://drpi.research.yorku.ca/ and https://drpitraining.research.yorku.ca/drpihub/

Impacts and Achievements: An Illustrious Career

Marcia's collaborative work has had tremendous social and geographic reach and impact. Marcia supervised 85 students across various programs including critical disability studies, law, history, political science, education, computer science, and humanities. Since the beginning of DRPI, over 50 monitoring projects have been developed including people with disabilities from 49 different countries who participated in DRPI training. In addition, at least 24 universities across the world (e.g., India, South Africa, Germany, Portugal, Kenya, United States, Sweden, etc.) have collaborated with DRPI.

The accessibility of DRPI is a reflection of Marcia's drive and commitment to making knowledge accessible to everyone. She engaged in academic and public pedagogy with a strong focus on impact by enhancing the capacity of people with disabilities to advocate for their rights. An example of this effort is articulated in The People's Indicators: Evidence Based Participatory Indicators – Measuring Progressive Realization (Rioux, 2017) which provided an adequate and sufficient basis for groups around the world to determine their relative status regarding on the ground behavior by governmental and religious bodies. She was adamant about all projects being participatory.

The People's Indicators were drawn from over a decade of work under the DRPI initiative. The indicators were derived from hundreds of individual and group interviews with persons with disabilities around the world who spoke and communicated about their rights within the context of monitoring the implementation of the CRPD.

From 2017 onward, the work of DRPI evolved into article/issue-specific areas such as employment (Rioux et al., 2019) with an explicit focus on gender and women with disabilities, and indigenous issues (Gillespie et al., 2016). The emphasis here was to increase awareness of the human rights experiences of diverse people with disabilities.

As the second decade of the twenty-first century ended, Marcia's interest turned to disability and indigenous communities. She always had an interest, and she frequently interacted with indigenous groups in the various countries in which she worked. This included indigenous European groups such as the Sami and Roma, African tribal groups, Middle Eastern Beduions, and a variety of groups from India and Granada. However, she began to focus on the Cree, Mohawks, Inuit, and Athapaskan groups as well as the Northwestern tribes. She started to lecture at many of their conferences and to tribal organizations.

Before her retirement, Marcia created an endowment of knowledge and legacy of open-access resources (e.g., DRPI online training, reports, data collection tools), books, and an established credible disability studies program and community-based education resource for people with disabilities around the world. We have listed many of these publications and resources below. It is an extensive and broad list.

Sometimes, the monitoring reports from DRPI and Marcia's many other publications, teaching, and presentations were listened to by governments, and policy changed, and sometimes not. One of Marcia's greatest achievements was her cocreative efforts that resulted in people with disabilities in numerous countries becoming aware of their rights and how their rights should be guaranteed by their governments, as well as the discontinuity between what should be and what was. This knowledge created action. People with disabilities were empowered to advocate for their rights. They began to see themselves as equal citizens with rights and freedoms, responsibilities and entitlements, and as autonomous dignified individuals connected to a global community of people with shared lived experiences. Marcia was brave, and she was willing to be very uncomfortable in order to do what was necessary to move knowledge to action.

Over the course of her career, Marcia received 17 honors and awards for her contributions to scholarship, research, practice, and advocacy. These honors and awards ranged from early career scholarships and fellowships, visiting professorships and distinguished fellowships, professional recognition awards and all the way up to the receipt of a Queen Elizabeth II Diamond Jubilee Medal, Governor General of Canada as well as the Order of Canada. However, she would say that her greatest reward was the look in people's eyes when they realized that they had rights that could not be taken away.

Lifetime Summary of Publications

Books and Monographs

2017 DRPI People's Indicators: A Participatory, Holistic and Community Based Monitoring System (M.H. Rioux, Principle Author and Editor, J. Viera, P. Pinto, Rados, Keravica, D. Wakene, R. Rathuri, P. Hearne). On-line publication.

2015 Disability, Rights Monitoring and Social Change: Building Power out of Evidence (Eds. M.H. Rioux, P.Pinto, G. Parekh) Toronto, Canada: Canadian Scholars Press.

2011 Critical Perspectives on Human Rights and Disability Law, (Eds. M. H. Rioux, L. Basser, M. Jones). The Hague: Martinus Nijhoff.

2010 Staying Alive: Critical Perspectives on Health, Illness and Health Care, 2nd Edition. (Eds. T. Bryant, D. Raphael, M. H. Rioux). Toronto: Canadian Scholars' Press Inc.

2009 Landscape of Literacy and Disability, (Eds. E. Zubrow, M. H. Rioux, M. Dinca-Panaitescu, C. Spielman, A. Marsolais). Toronto, Canadian Abilities Foundation.

2006 Staying Alive: Critical Perspectives on Health, Illness and Health Care, (Eds. D. Raphael, T. Bryant, M. H. Rioux). Toronto: Canadian Scholars' Press Inc.

2003 Atlas of Literacy and Disability, (M. H. Rioux. E. Zubrow, M. Stutt Bunch, and W. Miller). Toronto: Canadian Abilities Foundation.

2002–2009 Book series. Inclusive Education: Cross Cultural Perspectives, (Eds. L. Barton, M. H. Rioux). The Netherlands: Kluwer Academic Publishers. (5 books published).

1996 Reflections on the Canada Health and Social Transfer, (An Occasional Paper) (Eds. M. H. Rioux, M. Bach). North York: The Roeher Institute.

1994 Disability is not Measles: New Research Paradigms in Disability, (Eds. M. H. Rioux, M. Bach). Toronto: The Roeher Institute.

1994 Canadian Disability Resource Program. (Eds. M. H. Rioux, C. Crawford) North York: The Roeher Institute.

Chapters in Books

2019 Rioux, M, Pinto, P. Wakene, D. “Reinventing Activism: Evidence-based participatory monitoring as a tool for social change” Berghs, M., Chataika, T., El-Lahib, Y. & Dub, A.K. (Eds.) 2019. The Routledge Handbook of Disability Activism. London and New York: Routledge.

2017 “International Human Rights and Intellectual Disability” (Pinto, P., Rioux, M.H., Lindqvist, B. & Carbert, A.) In I. Brown and M. Percy A Comprehensive Guide to Intellectual and Developmental Disabilities (2nd Edition): Brookes Publishing Company.

2016 “Disability Research in the context of the Global South: Building Southern Sustainability through an Emancipatory, Evidence-based and Locally Initiated Approach” (Rioux, M.H., Pinto, P., Viera, J., and Keravica, R). In S. Grech and K. Soldatic (Eds.), Disability in the Global South: The Critical Handbook. US: Springer.

2015 “Employment, Poverty, Disability and Gender: A Rights Approach for Women with Disabilities in India, Nepal and Bangladesh” (Buettgen, A., Gorman, R., Rioux, M., Das, K., Vinayan, S.) In Khanlou N & Pilkington B. (Eds). Women’s Mental Health: Resistance and Resilience in Community and Society, Advances in Mental Health and Addiction (Series Editor: Masood Zangeneh). New York: Springer.

2014 “Employment Equity and Disability: Moving Forward to Achieve Employment Integration and Fulfill Promises of Inclusion and Participation” (Rioux, M.) In M. S. Lynk, J. Craig, C. Agocs (eds) Employment Equity in Canada. Toronto: University of Toronto Press.

2014 “Human Rights in Context: Making Rights Count” (Rioux, M. & Bonita Heath) in Swain, J., French, S., Barnes, C. And Thomas, C. (eds.) (2014) Disabling Barriers; Enabling Environments (3rd edition), London: Sage.

2014 “Disability Rights In Education” (Rioux, M.) In L. Florian (ed), Sage Handbook of Special Education (2nd Edition), England: Sage Books.

New Politics of Disablement

The Contribution of Mike Oliver

3

Ravi Malhotra

Contents

Abstract

Michael Oliver (3 February 1945 to 2 March 2019) was a British academic, author, and disability rights activist. He was Emeritus Professor of Disability Studies at the University of Greenwich. His research focused on the social model of disability, and his activism centered on overcoming the systemic barriers disabled people confront in their daily lives. We present below a memoir of his contribution to building disability studies and a movement demanding inclusion and equality for disabled people.

Introduction

Mike Oliver, Emeritus Professor of Disability Studies at the University of Greenwich in England, has died at the age of 74 after a short illness. A long-time wheelchair user since the age of 17, a sociologist by training and author of many books including his

landmark texts, *Social Work with Disabled People* (1983) and the *Politics of Disablement* (1990) and (with Colin Barnes) *The New Politics of Disablement* (2012). Oliver played a pioneering role in developing, with others such as Vic Finkelstein, what has come to be known as the social model of disability. The model builds from the proposition that it is structural barriers, such as a lack of wheelchair ramps or a failure to provide sign language interpreters, which impede disabled people rather than the impairments themselves. In other words, systemic barriers constitute an ableist society that immobilizes disabled people and keeps them largely unemployed and in poverty. In every advanced capitalist country, disabled people face tremendous barriers in housing, transportation, and employment. These barriers are so widespread and comprehensive that most individuals do not give them a second thought.

The Social Model of Disablement

By establishing and popularizing what has become known as the impairment-disability distinction, Oliver convinced disabled people to view the discrimination that they face daily as a matter of rights rather than a personal tragedy or medical problem. In other words, the fact that Jill has broken her leg means that she has an impairment, but she cannot get to class because the school does not have a functioning elevator. The inaccessible school is a disabling barrier that has to be remedied. It is difficult to convey how revolutionary the social model of disability was in crystallizing the consciousness of disabled people. Individuals who had spent years regarding their daily difficulties as a matter of personal failure and were socialized by an array of physiotherapists, occupational therapists, and physicians to focus on rehabilitation were suddenly politicized as they came to realize that disability was indeed a political issue. Sometimes this has been misinterpreted as an attack on the medical profession. However, Oliver is very clear that the social model is not anti-medicine where medical intervention is required. Rather he is against "medical imperialism," a mode of thought that regards disabled people as irremediably broken.

Activists chose to prioritize different strategies. Many disabled people, more influenced by postmodern theories of language and the body, have tended to focus on cultural studies and the representation of disabled people in cinema, dance, and sports. Others have chosen to engage in law reform strategies such as advocacy for human rights legislation and test case litigation, with all its promise and perils, to seek social transformation. Still others have focused more directly on grassroots mobilization to challenge the austerity agenda of neoliberal governments – an anti-capitalist route. Certainly, all have merits and, indeed, some have chosen to combine them, but it is the last road that most closely corresponds to Oliver's prescient vision of transforming the lives of disabled people for a better future.

Class Politics and Institutionalization

Oliver was deeply influenced by class politics and laid the basis for the still unfinished product of a materialist theory of disablement. He very much believed that the rise of capitalism and the factory system created disability. The requirements of wage labor as the dominant mode of production entailed the segregation and exclusion of disabled workers who could not maintain efficient production standards in an industrial society. As many scholars have noted, the very notion of time functioned differently in agrarian rural societies. Those who failed to conform and work at a pace set by Fordist factories were consigned to “workhouses, asylums, impairment-specific colonies and special schools and out of the mainstream of economic and social life” (Oliver and Barnes, 2012, p. 55). Social Darwinism and eugenics provided an ideological justification for the exclusion of those individuals who could not conform to the requirements of industrial capitalism.

As many scholars of “mad studies” have noted, the actual impairments were often irrelevant. People incarcerated in psychiatric institutions notoriously did not necessarily have a formal diagnosis. As Geoffrey Reaume has shown in his book, *Remembrance of Patients Past* (2000), some were simply housewives who refused to conform to gender norms or even individuals who were misdiagnosed because they had acted in an unusual manner and spoke foreign languages that authorities could not understand. By associating ability with productivity, the workhouses and asylums served as a warning to the able-bodied population and stigmatized those who fall outside the boundaries of normality. Theories of eugenics of course entailed both stigmatization of disability and racial classifications that sought to exclude immigrants who were a danger to society. At its nadir, this culminated in the eugenics policies of Nazi Germany where hundreds of thousands of disabled people were exterminated in accordance with instructions from Hitler in 1939, but it is often forgotten that early twentieth-century social democratic politicians around the world were enthusiasts of eugenics measures.

In the twentieth century, Oliver showed how the state engaged in a neoliberal “decarceration strategy” that saw the closure of many institutional settings in Western countries. However, this was done in the context of inadequate services that did not allow disabled people to flourish. What remains to this day are massive and inflexible bureaucratic requirements for eligibility for social assistance. It is not uncommon for individuals to entail significant difficulty and repeated rejection in navigating a process that is designed to exclude as many people as possible.

The Role of Professionals

Oliver also played an important role in identifying the role of professionals who work with disabled people and build a career providing services that do little to empower them. He was particularly pointed in criticizing middle-class professionals whom he felt exploited disabled people, created a culture of dependency, and systematically ignored their life experience, hence the slogan of the disability rights movement: “nothing about us without us.” He also developed interesting insights on the need for disabled people to acquire a consciousness around disability politics. Unusually for an academic, he combined grassroots activism with his scholarly work and was influenced by the work of militant disability organizations such as the Union of the Physically Impaired Against Segregation (UPIAS), which was founded in 1974. Their 1976 manifesto, *Fundamental Principles of Disability*, articulated many of the distinctions between impairment and disability that Oliver would go on to develop. He fittingly became the first professor of disability studies in Britain.

Disability Rights Activism and the Left

His powerful ideas have influenced an entire generation of disabled people, particularly in the Commonwealth countries, despite the fact that the socialist Left has all too frequently ignored disability rights activism. I was privileged to hear him speak around 1994 at Carleton University in Ottawa in which he spoke about disability rights and referenced Gramsci. This is hardly surprising as Oliver has written eloquently on the ideological construct of individualism. In the disability context, this is manifested through medicalization, the requirements of normality and eugenics (Oliver and Barnes, 2012 p. 79). While many have since questioned whether the social model adequately integrated identities such as race and gender and whether it adequately encapsulates the experience of those with chronic conditions that involve significant physical pain, the debates still relate back to Oliver’s pioneering work. There is no doubt that there were elements of pessimism in his later work. Oliver thought that the transformation of capitalism was not on the immediate agenda in the face of widespread neoliberal cuts.

That understandable pessimism does not diminish the immense value of his transformative model and his legacy. All the writing I have done since then, including my anthology in honor of the late American disability rights advocate Marta Russell, *Disability Politics in a Global Economy* (2016), and other topics, are predicated on the epistemic foundation established by Oliver. Marta Russell’s landmark book, *Beyond Ramps* (1998), has undoubtedly been better received in Britain and other countries than in Canada and the United States in part because Oliver’s materialist conception of disablement has wider currency. At the same time, few scholars have developed a full-fledged historical materialist theory of disablement as postmodernism dominates current disability studies departments, despite significant contributions by Marta Russell, Sunny Taylor (2004), Jim Charlton (1998), and others.

Today disability rights advocates continue to play an important role in challenging austerity including vigorous protests in the American Congress against Republican attempts to repeal the *Affordable Health Care Act*. In 2019, the Canadian Parliament passed the very limited and largely toothless *Accessible Canada Act* (see the critique of the Council of Canadians with Disabilities), some 30 years after the passage of the more robust *Americans with Disabilities Act* in the United States. Disability rights advocates around the world owe an enormous debt of gratitude to Mike Oliver.

Abstract

This chapter presents highlights of the career and perspectives of Bengt Lindqvist – a prominent voice for disability rights internationally. Bengt Olof Lennart Lindqvist was born in Helsingborg Sweden on June 3, 1936, and died on December 3, 2016. Bengt was a dedicated career politician. He was an expert at using the leverages of political power to help people with disabilities. A lifelong member of the Social Democratic Party, he was first elected as a Member of the Swedish Parliament representing Stockholm County from 1982 and continued to serve for 12 years to 1995. From 1994 to 2002, Bengt Lindqvist served as the United Nations Special Rapporteur on Disability of the Commission for Social Development. In addition, he served as chairman of the Swedish Association of

the Visually Impaired from 1975 to 1985, the rehabilitation committee of the World Council for the Welfare of the Blind from 1974 to 1985, and the Swedish Disability Association from 1977 to 1985. Together with Marcia Rioux, he created Disability Rights Promotion International and was its codirector until his death. During his lifetime, he received a wide variety of awards including honorary doctorates. He traveled the world and the seven seas looking for everything to use, looking for something, to keep moving on, and advance the rights of people with disabilities.

Short Biography and Introduction to Bengt

Bengt Olof Lennart Lindqvist was born in Helsingborg Sweden on June 3, 1936, and died on December 3, 2016. For most of his life, he was completely blind. He was a long-term personal friend of Marcia Rioux, and together, they developed many of the ideas that became central to the Human Rights and justice paradigm – including the development of Disability Rights Promotion International (DRPI). Unlike Marcia, Bengt was a dedicated career politician. He was an expert at using the leverages of political power to help people with disabilities. A lifelong member of the Social Democratic Party, he was first elected as a Member of the Swedish Parliament representing Stockholm County from 1982 and continued to serve for 12 years to 1995. He held important political and administrative positions in the Swedish government serving as a deputy minister for social security (responsible for family affairs, elderly care, and disability) in the Palme II and Carlsson I Cabinet and was later named minister without portfolio with the same responsibilities in the Carlsson II Cabinet.[1]

From 1994 to 2002, Bengt Lindqvist served as the United Nations Special Rapporteur on Disability of the Commission for Social Development. In addition, he served as chairman of the Swedish Association of the Visually Impaired from 1975 to 1985, the rehabilitation committee of the World Council for the Welfare of the Blind from 1974 to 1985, and the Swedish Disability Association from 1977 to 1985. Together with Marcia Rioux, he created Disability Rights Promotion International and was its codirector until his death During his lifetime, he received a wide variety of awards including honorary doctorates. He traveled the world and the seven seas looking for everything to use, looking for something, to keep moving on, and advance the rights of people with disabilities.

This chapter begins with Marcia Rioux's remembrance of Bengt posted on the DRPI site shortly after his death. Next is a welcome message Bengt shared in 2011 with the community of DRPI participants who took part in both the online and in-person trainings. The chapter concludes with excerpts from one of Bengt's last writings – a 2015 book chapter on disability rights monitoring and social change. These excerpts capture his key reflections on how to progressively realize human rights for all.

Marcia Rioux's Remembrance of Bengt

Bengt had a singular influence on disability of the 20th and well into the 21st century. His contribution is profound. Not because he had a disability but because he understood social justice in a way that he was able to put it in practice in all the many different lives he had – as a teacher, as a politician, an as an advocate, as a UN Special Rapporteur on Disability, as a father, as a husband, and as a jazz musician. He recognized so clearly and unfailingly that the voices of people with disabilities were the voices we needed to hear and what was said by those voices had to be the only agenda in addressing the denial of rights, and exclusion. He never bent in his resolve to make those voices heard.

His influence is legendary and recognized by both the famous and the average person who he met on his journey. He had an impact on every person he met.

By profession, Mr. Lindqvist trained and practiced as a language teacher. His interest in equality and disability led him to advocate and work on issues of disability policy in the 1960s. In 1982, his passions for politics led to him becoming a Member in Parliament in Sweden, serving as the Minister of Social Service and Family Affairs between 1985 and 1991. Between 1994 and 2003 Mr. Lindqvist served as the United Nations Special Rapporteur on Disability, where he led the implementation of the Standard Rules on the Equalization of Opportunities for Persons with Disabilities, the framework that promoted participation and equality for people with disabilities. Before anyone was thinking of monitoring and the CRPD was not even yet on the political agenda, Bengt held a conference in Almosa, Sweden, in which the 28 participants, including representatives of all the international disability organizations as well as the UN, heralded jurists and others detailed a way to monitor the rights of persons with disabilities. It stands to this day as the model for participatory, holistic monitoring rights – through the voices of persons with disabilities. And the oak tree he planted at that meeting as a symbol for the work that was beginning still grows in the gardens of Almosa getting stronger and bigger each year. Bengt said it was the symbol of what we could achieve and it is. In partnership with me, he co-founded, after that meeting, Disability Rights Promotion International (DRPI), in 2003 in an effort to design a methodology for participatory disability rights monitoring internationally. Bengt has provided dedicated leadership as Co-Director of DRPI in the process of mapping the monitoring of the rights of people with disabilities internationally. His wisdom and knowledge and strength shine through that as they are found in all his struggles for justice

Bengt Lindqvist's achievements were recognized by many communities internationally, including receiving honorary doctorates from York University (2013), Stockholm University (1999), and Lund University (2002). (This message can also be found at: https://drpi.research.yorku.ca/remembering-bengt-lindqvist-co-director-of-drpi/)

Bengt's DRPI Welcome Message

Let me look back a little bit, you know I am an old man by now and I was involved in disability policy already in the late 1960s. A sociologist, Robert A. Scott, wrote a book with the title, The Making of Blind Men, where he showed how people with disabilities, like no other group in society, are in the hands of experts, of doctors, nurses, social workers, teachers and also by their family and relatives, and that though, the values that these people have, to a very large extent, form the lives of people with disabilities.

When awareness grew about this phenomenon, of course we ourselves said that we must catch more influence, we must build capacity to take our own destinies into our hands, and you can see in many of the international documents, a trend to emphasize more and more, the role of disabled people themselves in deciding on their own lives and what should be priorities, and what should be done in the disability field. You have it in the World

> Programme of Action, you have it in the Standard Rules, and you also have it in the new Convention, and in the Convention its quite unique that the influence of people with disabilities themselves is so clearly stipulated in the different provisions of this Convention, like no other UN convention actually.
>
> Well, so the voice of people with disabilities is the most important voice in creating initiatives and action to improve the living conditions of people with disabilities. When the breakthrough took place in the UN and the UN human rights establishment recognized finally that disability is human rights dimension which has to be taken into account by human rights organizations and by the UN human rights institutions, that was great event in the disability history of course and it also presented a real challenge. How are we going to catch all the different forms of exclusion and discrimination that disability creates throughout the world? Well, the best answer is ask the people with disabilities themselves. They can tell you, they know, and our intention has been all the time to develop two things. (Lindqvist DRPI Welcome Message: https://drpi.research.yorku.ca/drpi-resources/a-welcome-message-from-drpi-co-director-bengt-lindqvist/)

Excerpts from Bengt's Writings

Below are excerpts from a book chapter Bengt wrote in 2015 as a leader in the development of monitoring disability rights. The chapter encompasses some of his core ideas, values, and principles in how monitoring can promote the progressive realization of human rights for all.

The Development of Human Rights for People with Disabilities in the International Context

In 1976, the UN proclaimed 1981 as the International Year of Disabled Persons (IYDP) (UN, 1981). The proclamation generated mixed feelings within the disability community. While disability-related charity organizations saw an emerging opportunity for increased publicity and the potential for additional resources, people with disabilities themselves were less enthusiastic. Concerned that the IYDP would continue to envision disability within traditional conceptualizations, relegating people with disabilities to roles of needing care or as charity recipients, people with disabilities sought to establish new ideas about disability within the UN framework. Their position was supported by the UN's announcement that the theme of IYDP would be "full participation and equality" (UN, 1981).

By focusing on these concepts, the IYDP opened up a field where a new political approach could be applied to the understanding of disability. The old method of concentrating all efforts to improve the capacity of the disabled individual was simply not sufficient. A shift of focus took place. From then on, much more attention had to be directed toward the surrounding society and any shortcomings and obstacles that prevented participation by persons with disabilities. In this way, the issue of disability became a political issue, an issue of how to design and build a society for all.

For disabled persons' organizations (DPOs) in Scandinavian and some English-speaking countries, this was a natural extension of a movement to embrace a new conceptualization of disability, one that emphasized equality, participation, and independent living.

During the late 1970s, activist groups and individuals with disabilities undertook several initiatives to increase the influence of disabled people themselves in all matters concerning their lives. For example, steps were taken to merge the two competing international organizations for people who are blind, only one of which was controlled by blind people themselves.

The merger took place in 1984, when the World Blind Union was formed. The new organization "provided a forum where people who were blind or had low vision established the right to speak for themselves" and acknowledged that "the majority of national delegates must come from recognised movements of blind and low vision people themselves" (World Blind Union, n.d.).

Perhaps the most spectacular and the most politically important example of the changing role of people with disabilities within disability organizations took place in 1980. Rehabilitation International, a large and influential international disability organization, held its congress in Winnipeg, Manitoba, Canada. Several thousand participants were involved, most of them nondisabled people. In previous years, there had been discussion about the necessity of increasing the influence of persons with disabilities, bur at that point, little progress had been made toward that goal. At the 1980 Congress, the Swedish delegation proposed a constitutional change that would give national DPOs the majority in the national delegations of Rehabilitation International (Driedger, 1989). The proposal generated a long and even aggressive debate. Ultimately, the proposal was rejected, creating great frustration and anger among the DPO representatives (Driedger, 1989, p. 37). In a parallel action, the Coalition of Provincial Organizations of the Handicapped (COPOH, now the Council of Canadians with Disabilities, or CCD) had been preparing for a new initiative, a new international organization representing all types of disabilities. As a consequence, a number of organizations supporting the right of self-representation for persons with disabilities established a new cross-disability organization consisting exclusively of national DPOs. This new organization was Disabled Peoples' International (DPI), and it was formally established a year later in Singapore (1981). DPI adopted a political manifesto based on human rights and nondiscrimination (DPI, 2012). Many of its representatives became delegates to the UN Advisory Committee established to lead activities throughout the IYDP. These events are important to keep in mind when analyzing the outcome of the IYDP. Never before had representatives of DPOs played as prominent a role in the UN context as they did in all of the major decisions, both during the preparations for activities and in elaborating the final outcome of the IYDP.

In 1982, the General Assembly adopted a resolution known as the World Programme of Action Concerning Disabled Persons (hereafter the World Programme). The elements of the World Programme were to be implemented during the International Decade of Disabled Persons 1983–1992 (hereafter the International Decade) (UNEnable, n.d.-a).

The discussions of the Advisory Committee on the contents of the World Programme were very lively and constructive. Thanks to excellent chairmanship and a hard-working secretariat, a text was developed, which, for the first time in history, gave the world community a comprehensive and coherent policy concerning all aspects of disability matters. The overall goal was to give meaning and content to the IYDP's theme, which was "full participation and equality." One important contribution of the World Programme was the identification of three main areas for action: prevention, rehabilitation, and equalization of opportunities (UNEnable, 2006a, n.d.-b). The first two areas were already well known and established in disability rights communities, but the third area, that concerning equalization of opportunities, was innovative, bringing the shortcomings and barriers to participation in society into focus. In the World Programme, this area is defined as follows:

> Equalisation of Opportunities means the process through which the general system of society, such as the physical and cultural environment, housing and transportation, social and health services, education and work opportunities, cultural and social life, including sports and recreational facilities, are made accessible to all. (UNEnable, 2006a, para. 6)

During the sessions to establish the World Programme's Advisory Committee, the issue of disability and human rights was brought up several times. It was the Canadian delegation that took the lead in these discussions and presented draft texts in order to obtain recognition of the fact that disability is a human rights concern for the UN; however, the vast majority of delegations held the view that disability, first and foremost, is a social development issue and should be treated as such by the UN (UNEnable, 2006a, n.d.-b). With the support of a few other delegations, the Canadians finally succeeded in gaining approval to include a few paragraphs on the subject near the end of the document. This text later proved to be of great importance.

A Special Rapporteur on Disability and Human Rights Appointed

In 1984, based primarily on concerns arising from the World Programme, the UN Sub-Commission on Prevention of Discrimination and Protection of Minorities (currently the Sub-Commission on Prevention of Discrimination and Protection of Human Rights) appointed Leandro Despouy as Special Rapporteur to study and analyze the relationship between human rights and disability (Despouy, 1992). Despouy's final report, Human Rights and Disability, "chronicled wide-spread human rights abuses in the area of disability" (Rioux & Carbert, 2003, p. 3).

The Issue of a Special Convention About Disability

In the mid-1980s, many representatives of international disability organizations believed that the disability issue was losing momentum around the world. According to them, the World Programme was too vague in identifying the responsibility of governments and that more active monitoring from the UN was needed. In the International Decade's guidelines, a mid-term evaluation was required in 1987.

Collaborating with a few other delegations, the Swedes utilized the slightly different attitude among delegations in 1989 and suggested that a new type of policy document should be drafted. They found a model in the UN's recommendations concerning standards for conditions in prisons, a document entitled Standard Minimum Rules.

In 1990, the proposal to elaborate Standard Rules on the Equalization of Opportunities for Persons with Disabilities was accepted, and the Rules were adopted in 1993 (UN, 1993). The Rules were not legally binding, but they were developed within the context of individual rights for persons with disabilities.

In 22 different areas, including education, legislation, and rehabilitation, concrete measures were formulated. The role and responsibility of the State were strongly emphasized. A specific principle embraced throughout the document was the involvement of organizations representative of persons with disabilities in all matters concerning their lives.

One of the most important features of the Standard Rules was the establishment of an active and independent monitoring mechanism. This consisted of a special rapporteur and a panel of experts, the majority of which were to be selected from DPOs. Bengt Lindqvist, former Swedish Minister for Social Services and Family Affairs, was appointed in 1994 as the first special rapporteur and held this position until 2002. The panel was constituted by the six most influential international disability organizations. Their cooperation in the panel resulted in the formation of the International Disability Alliance (IDA) a few years later.

Several governments contributed funding in support of the monitoring activities. This meant that the special rapporteur could travel extensively and visit a number of countries each year. He also carried out three separate global surveys to find out more about the situation of people with disabilities around the world. In this way, information was collected in 130 countries in all parts of the world. The panel of experts met once a year to consult with the rapporteur. Over the next few years, a number of countries adopted new disability legislation and made other policy changes in harmony with the Rules. There is no doubt that the Standard Rules contributed to the recognition of disability as a human rights issue and strengthened the arguments for a future UN convention.

Two Other Important Steps Forward

In 1992, Leandro Despouy, the special rapporteur appointed some years earlier within the human rights system, delivered his final report, *Human Rights and Disabled Persons* (Despouy, 1992). He recommended that the UN should accept disability as a human rights concern and consider establishing either a Disability Ombudsman, which could bring forward violations of human rights caused by the existence of a disability to the appropriate monitoring committee, or a special convention on the rights of people with disabilities. His recommendations were of great importance for further development in the field.

Another very important step toward recognizing disability as a human rights concern for the UN was taken when, in 1994, the Committee on Economic, Social and Cultural Rights (CESCR) issued General Comment No. 5, which deals with disability from a human rights perspective (CESCR & OHCHR, 1994). This general comment can be seen as a response to the statements in the World Programme adopted more than ten years earlier.

After these events in the early 1990s – the Standard Rules, the report by Despouy, and the General Comment by CESCR – the issue of disability was brought to the full attention of the UN Commission on Human Rights, the highest UN body in the human rights field. In a series of resolutions issued from 1996 to 2002, the Commission decided that disability should be fully recognized as a human rights concern for the UN and all its human rights bodies. These resolutions constitute the final recognition that disability matters have an obvious human rights dimension and that the issue must be included in the UN human rights monitoring system.

A Special Convention

Representatives of DPOs were enthusiastic about this development, but at the same time, a discussion started about how this breakthrough would be best utilized. The Special Rapporteur on the Standard Rules took two initiatives in this context. He prepared a working document for the panel, in which he outlined a number of possible ways to act (Lindqvist, n.d.). In one of these suggestions, he asked the panel to consider the development of a special convention with an independent monitoring mechanism. Most of the panel members were in favor of this solution, as, in their opinion, it represented the most efficient way to get results. They brought this initiative back to their organizations and undertook activities to promote the idea.

One of the panel members, Maria Eugenia Antunez of Mexico, presented the idea to the Mexican President Vicente Fox. In September 2001, President Fox, in his main speech to the General Assembly, formally proposed a Comprehensive and Integral International Convention to Promote and Protect the Rights and Dignity of Persons with Disabilities. His proposal led to the creation of a working group to consider the proposal (Rioux & Carbert, 2003). The contributions by representatives of disability organizations were significant in the elaboration of the convention. The new UN Convention on the Rights of Persons with Disabilities (CRPD) was adopted by the General Assembly in December 2006 (UNEnable, 2006b).

The other initiative taken by the special rapporteur was to organize a seminar consisting of DPO representatives, human rights activists, and representatives from the UN. During one hectic week in November 2000, the participants discussed ways to utilize the CRPD in the struggle to improve living conditions for persons with disabilities.

In the final report of the seminar, entitled *Let the World Know* (Lindqvist, 2001), plans to make monitoring relevant, comprehensive, and efficient for the disability field were presented. The report recommended that monitoring should take place in three different areas: systemic monitoring, including government policy and legislation, case law, and service provision; monitoring individual experiences of discrimination and exclusion; and monitoring the depiction of disability in the media. It was strongly recommended that disabled persons themselves and their representative organizations play a leading role in all of these forms of monitoring. Capacity building among DPOs in the field of human rights was strongly recommended. These recommendations by the seminar constituted the basis of the Disability Rights

Promotion International (DRPI) project, the purpose of which is to develop monitoring and training tools in these areas. This project started in 2002 and continues today.

As mentioned before, in 2001, the Mexican government proposed that a special disability convention should be elaborated. This idea was accepted by the General Assembly, and a process to elaborate such a convention was immediately initiated. A drafting committee was formed by interested state parties, and civil society was permitted to attend and take part in the drafting to an extent that was unique for this kind of UN work. Representatives of international disability organizations actively participated in the drafting and had a significant impact on the content of the convention.

The drafting committee worked and completed a proposal for a Convention CRPD in 2006. The General Assembly adopted the CRPD the same year.

The CRPD contains two remarkable features that are not spelt out as clearly in any of the earlier UN core conventions. Both of these features concern the methodology of monitoring. Those who have worked in monitoring the implementation of human rights conventions over a long period know these conventions can lead to changes in the existing national legislation. For me as Special Rapporteur on Disability, it was important to make the phenomenon of disability visible within each country's legislation. This would offer a solid base of work in efforts to improve living conditions. However, such new laws do not automatically affect the living conditions of the people concerned. This is where different forms of monitoring progress are indispensable in providing evidence of the actual situation. The effects of new legislation and policies must be continuously analyzed and brought to the attention of governments and international monitoring mechanisms. The closer you can get to the "grassroots" in exploration and evidence-based knowledge, the better.

One unique feature of the CRPD is that every nation must establish a national monitoring mechanism in the field of disability to collect information and evidence of remaining problems (UNEnable, 2006b, art. 33). Unfortunately, many governments have not yet established a mechanism in harmony with the provisions of the CRPD, despite the fact that several years have passed since it came into force in 2008.

The other important feature of the CRPD is the emphasis on the involvement of disabled persons themselves and their representative organizations in the national monitoring process. Unfortunately, many governments have not yet established a structure that offers an active role for DPOs.

These new signals from the UN human rights system are important. They open a whole new field of methodological and structural development. They offer a challenge to all of us involved in the struggle for better living conditions for people with disabilities. (Lindqvist, 2015).

2020 Pandemic and Refugees with Disabilities

5

Ron C. McCallum AO

Contents

Abstract

The first 6 years of the work of the CRPD Committee forms the backdrop of this chapter. Its focus turns to the 2020 pandemic and refugees with disabilities. The pandemic showed that persons with disabilities were a vulnerable population. Article 11 of the CRPD applies to emergencies. The work of the UN Special Rapporteur on disability and of the Australian Government is noted. Refugees with disabilities are sometimes forgotten. The obligations in the CRPD extend to all persons resident in a country. Research is unpacked which shows that 15% of refugees have disabilities, and that protective measures are essential.

My premature birth took place in Melbourne, Australia, some 71 years ago. The use of pure oxygen to save my life caused me to be blind from birth. I suffer from retrolental fibroplasia, which is better known as retinopathy of prematurity (Brown, Establishing proof. Washington Post, 2005). My career was in legal academia, which culminated with my appointment in 1993 as Professor of Labor Law at the University of Sydney. This was the first occasion in which a totally blind person was appointed to a full professorship in any field at any Australian or New Zealand university. From 2002 to 2007, I undertook my 5-year term as Dean of Law at the University of Sydney (McCallum, Born at the right time: A memoire. Allen and Unwin, Sydney, 2019).

My work in the field of disability was largely concerned with the welfare of blind and vision impaired Australians. For example, in February 2006, I was appointed to the Board of Vision Australia which assists blind and vision impaired Australians. My term concluded in October 2015. However, after Australia ratified the United Nations Convention on the Rights of Persons with Disabilities (CRPD) on 17 July 2008, the Australian Government asked if I would stand as a candidate for election to the United Nations Committee on the Rights of Persons with Disabilities (CRPD Committee) which monitors the implementation of the CRPD. At the United Nations headquarters in New York on 3 November 2008, I was elected as an inaugural member of the CRPD Committee and served for 6 years until my mandate concluded on 31 December 2014. (I was initially elected for a 2-year term in accordance with article 34(7) of the CRPD and was subsequently elected for a further term of 4 years on 1 September 2010.) It was my honor to serve as the Chair of the CRPD Committee from February 2010 to April 2013. When my period as Chairperson concluded, I remained a Vice-Chairperson of the CRPD Committee until the end of my mandate. It was a further honor to be the Chairperson of the Committee of the Chairpersons of the United Nations Human Rights Committees from July 2011 to June 2012. The early years of the CRPD Committee gave me a broader perspective of the plight of persons with disabilities throughout the world. It was a privileged position because I was able to read reports and participate in constructive dialogues where the day-to-day difficulties confronting persons with disabilities in many countries were revealed and discussed. During my tenure as Chairperson, the first constructive dialogue with Tunisia took place in 2011 (CRPD, Committee on the Rights of Persons with Disabilities, Concluding observations on the initial report of Tunisia, fifth sess, UN Doc CRPD/C/TUN/CO/1, 2011), and in the following year, there was a fruitful constructive dialogue with the People's Republic of China (CRPD, The Committee on the Rights of Persons with Disabilities, Concluding observations on the initial report of China including Hong Kong and Macao, eighth sess, UN Doc CRPD/C/CHN/CO/1, 2012 (China)). Also, in 2012, the first complaint under the Optional Protocol to the CRPD was determined (MH v Sweden). The Optional Protocol to the CRPD entered into force for Australia on 20 September 2009.

In 2014, the CRPD Committee published its first two general comments on article 12 on equal recognition before the law (CRPD, GC No 1) and on article 9 concerning accessibility (CRPD, GC No 2).

The CRPD: A Game Changer

The CRPD is a game changer because it has placed the human rights and inherent dignity of persons with disabilities squarely within the human rights framework of the United Nations. One hundred and eighty-one countries have ratified or acceded to the CRPD, and 96 nations have ratified its Optional Protocol. As the 2011 World

Bank and World Health Organization *World Report on Disability* shows (WHO, 2011, Ch 2), persons with disabilities comprise 15% of the world's population. In other words, there are approximately one billion of us persons with disabilities. However, this World Health Organization and World Bank Report also makes it clear that disability is synonymous with poverty in most nations. This is because so many persons with disabilities lack education and opportunities for employment and are unable to access appropriate health and community services.

Having regard to the constructive dialogues of the CRPD Committee, it is apparent that whether nations are developed or developing, the same issues concerning people with disabilities arise. One notable issue is violence, including sexual violence, against women and girls with disabilities in institutional settings and/or the family home. Likewise, many persons with disabilities around the world are still unable to access quality inclusive education and the levels of unemployment are still too high in most countries. In many nations, guardianship and mental health laws still do not establish regimes of supported decision-making to assist persons with disabilities to make decisions in accordance with their will and preferences.

The COVID-19 pandemic and the plight of refugees with disabilities are topical issues at the time of writing and thus the role of the CRPD deserves brief comment.

The COVID-19 Pandemic and People with Disabilities

Article 11 of the CRPD requires governments to prepare and take "all necessary measures to protect and to keep safe persons with disabilities when humanitarian emergencies, natural disasters or armed conflicts occur." It is clear that in emergency situations, women, children, and persons with disabilities are especially vulnerable (Hart et al., 2014, p 148; Karr & Mitchell, 2014). By March 2020, the COVID-19 pandemic had begun to spread throughout the globe. Persons with disabilities, especially in institutions, are especially vulnerable due to the highly contagious nature of the virus and their need for close contact with carers. The United Nations Special Rapporteur on the Rights of Persons with Disabilities, Ms. Catalina Devandas-Aguilar, on 16 March 2020, released a statement requesting governments to assist persons with disabilities at this troubled time (UN Special Rapporteurs and Independent Experts, 2020).

In 2019, an inquiry was established by the Government of Australia to examine violence, abuse, neglect, and exploitation of people with disability. In Australia, these inquiries are known as royal commissions. The Disability Royal Commission was established on 4 April 2019 (DRC, 2019). On 26 March 2020, this very inquiry issued its own Statement of Concern about the impact of COVID-19 on persons with disabilities (DRC, 2020). The Australian Government (DRC Response, 2020) and other governments around the globe have put in place measures to assist persons with disabilities, and it is hoped that these measures assist the community to protect vulnerable groups including persons with disabilities throughout the duration of this pandemic.

The Plight of Refugees with Disabilities

There are 79.5 million people around the world who have been forced to leave their homes who are in need of protection. They include 26 million refugees, half of whom are under 18 years of age (UNHCR, 2020). It is clear that the rights and obligations contained in the CRPD are not limited to citizens or permanent residents of ratifying countries. The CRPD protects all persons with disabilities within the territory of countries which have signed up to the CRPD (Crock et al., 2012), 738–742). Therefore, all displaced persons are entitled to CRPD protections and cannot be discriminated against when on the territory of a ratifying nation. Of course, international human rights and refugee law prevents nations from returning persons to places where they risk being persecuted or tortured (Saul, 2010, pp. 63–104, p. 71 (citing UN Human Rights Committee (1989), General Comment No 18, 'Non-discrimination', 37th sess, UN Doc HRI/GEN/l/Rev.5 (29 May 2008)). Refugees with disabilities are a particularly vulnerable group to mistreatment. Together with my wife, Professor Mary Crock, and two colleagues, Dr. Laura Smith-Khan and Professor Ben Saul, we undertook research from 2011 to 2016 on refugees with disabilities in six countries: Malaysia, Indonesia, Pakistan, Uganda, Jordan, and Turkey. We concluded that within the refugee population, at least 15% of refugees are persons with disabilities (Crock et al., 2017, Ch 4). The difficulty in identifying refugees with disabilities and extending them appropriate care was apparent from our research (Crock & Smith-Khan, 2017, Ch 16, p. 305). Much more needs to be done to ensure that refugees with disabilities have access to services and to education, and are able to participate in resettlement programs.

In conclusion, the CRPD Committee performs its tasks remarkably in the international arena. However, it is essential for persons with disabilities, organizations, and national human rights institutions to remain vigilant and hold ratifying governments to the rights and obligations set forth in the CRPD.

Part II

History of Disability

Disability History: Introduction

6

Sara Scalenghe and Geoffrey Reaume

Abstract

This introduction offers a succinct overview of the five chapters contained in the History of Disability section of this handbook and highlights their contributions to the field of disability history. It also briefly addresses the Euro-American centrism of the field and the issue of the dearth of historical scholarship on disability from and about the "Global South," especially in the premodern period.

Introduction

Disability history has seen what historians Daniel Blackie and Alexia Moncrieff have recently described as "tremendous growth" during the early twenty-first century (Blackie & Moncrieff, 2022, 1). This developing area of study has evolved out of the field of Disability Studies and the activism of disabled people throughout the world as part of the wider civil rights struggles of marginalized communities (Rembis et al., 2018). Part of the way in which this struggle has been manifested is through the wider efforts of scholars and activists who have worked to ensure that the academy and broader public be aware of the diverse, complex histories of people who are now defined as disabled in various cultures throughout history. In doing so, historians are seeking to understand this topic from the perspectives of disabled people, and where this is not possible due to the absence of primary sources, from a critical disability historical perspective where the vast experiences of physical, mental, and sensory impairment are not reduced to contemporary medical

interpretations but are instead placed in the social and cultural contexts of their times. The articles contained in this section contribute to these efforts. The authors describe historiographical and methodological developments which have made disability history so very path-breaking in how people have come to understand and experience disablement in so many different ways down through the ages.

In his article covering the most distant period in this collection, "Prosthetics for Osiris: Evidence for Assistive Technology in Ancient Egypt," Jonathan White-Boonshoft describes how ancient Egyptians created assistive devices and prosthetics both for the living and for the dead on what was expected to be their journey to the afterworld. The images included in this essay contribute significantly to illustrating the archaeological remains that are described in the article and point toward an innovative way of understanding disability's ancient history. This is accomplished through the use of evidence uncovered and interpreted by archaeologists about what it was like to be physically disabled several thousand years ago. As White points out, prosthetic devices were meant for practical purposes as well as, in some cases, decorative design. From evidence such as walking sticks, prosthetic body parts, to artistic reliefs and hieroglyphic script, White uses a broad range of archeological sources to highlight a history that is as old, and even older, than the pyramids. In doing so, his study demonstrates that physically assisting or "correcting" an impairment was a common practice of varying degrees among both rich and poor, though obviously the quality of such devices and prosthetics varied greatly depending on social status.

In "European Medieval Disability History: An Overview," Ninon Dubourg provides a historiographical discussion of disability in medieval Europe, particularly during the period from the twelfth to fourteenth centuries. Dubourg's overview of recent scholarship shows the position of disabled people during this period as being more than scorned and harassed but also as integrated and more widely accepted as part of the fabric of the late Middle Ages than is often assumed. It is particularly important that her review outlines the increasing level of historical scholarship on medieval European disability history since 2005, which has enriched our knowledge of the complexity and diversity of this topic beyond the image of disabled people as primarily beggars who were cast out by society. Her discussion of the context of poverty in medieval Europe helps to explain this history further, particularly in regard to disabled people as the focus of miracle hagiography and subjects of charity. As with White's article on disability in Ancient Egypt, Dubourg includes images to illustrate the points made in her article, in this case about charity and hierarchy, mockery and inclusion, and assistive devices for a rich disabled person. Her discussion of how scholars have shown the ambiguity of disability during this period, wherein disabled people were both mocked and socially integrated, provides an essential contribution to the complexities of disablement and its depiction during medieval European history.

Historiographical developments are also the focus of "Disability in US History" by Caroline Lieffers. Her article emphasizes the burgeoning histories of disability in Indigenous, colonial, and African-American enslaved societies that, until recent years, had been neglected among disability scholars based in northern countries.

The growing field of studies on racialized people provides a more representative history of disability, as Lieffers indicates. She also describes disability histories focusing on the impact of industrialization and eugenics on disabled people, along with disability rights activism since the latter half of the twentieth century. Her article provides an overview of some of the most important new disability history work appearing in the United States, which has expanded the field beyond asylums and well-known individuals to include wider social dimensions of disablement.

Wei Yu Wayne Tan's "Disability History of Modern East Asia: An Overview" shifts the focus away from Europe and the United States. Blackie and Moncrieff have recently pointed out that much of the scholarship on disability history is now being published in languages other than English (Blackie & Moncrieff, 2022, 1). Although it is a welcome development, those languages are usually European, and the field is still overwhelmingly centered on Europe and North America. The dearth of scholarship about the rest of the world, and especially about and *from* the "Global South" (a problematic term, to be sure) remains the Achilles' heel of the field. This dearth of research is even more pronounced for the premodern period; to date, there exists only a handful of historical monographs on disability in the non-Western world before the nineteenth century (see, for example, Tan, 2022; Scalenghe, 2014). The overwhelming focus on Europe and North America is a problem when one considers that up to 80% of the world's disabled people *do not* live in Europe or North America. Thus, most of the historical scholarship currently available is about a small portion of the world's modern population and cannot give us an accurate picture of how disabilities have been lived by human beings throughout history. Rather, it is largely the experiences of (mostly white) Europeans and North Americans that are represented. Perhaps inevitably, then, it is (mostly white) European and North American scholars that are framing the agenda and priorities of the field. But even some of the debates about identity-first versus person-first language do not always translate or resonate in non-Western contexts.

Why is there less historical scholarship on disability about or from the "Global South," especially in the premodern period? The answer depends, of course, on the specific country or region – the Democratic Republic of the Congo, for example, is obviously very different from Bangladesh or from Syria – but there are some shared similarities. At the practical level, it can be challenging and time-consuming for historians to find, access, and process archival and other primary sources, which are often unpublished and uncatalogued. Even native speakers may require specialized language training. For scholars who are based in the "Global South," where institutions of higher education are often massively underfunded, there are additional obstacles, such as the lack of resources, and the lack of exposure if the scholarship is not written or translated in European languages. However, there are many other reasons why there are still few works centered explicitly on disabled people, including the dominance of the medical model of disability and the still widespread societal stigmatization of disabilities, especially congenital and intellectual or cognitive ones. On a more positive note, however, there is exciting new work in the pipeline. Tan's article in this collection is a good example of what non-Western disability history can contribute to this conversation. It provides a much-needed survey of disability history in China, Korea, and Japan since the nineteenth century with a succinct discussion of such a broad topic in three countries over a long period, covering science, medicine, law, activism, and popular culture. The brief summaries of wider political developments help to place this history into a broader national and international context. Tan's piece highlights how terminology and ideas about what is meant by disability are based on cultural influences and external factors. Underlining the distinctions, as well as similarities, between ancient cultures in all three countries, Tan discusses tensions between Chinese, Korean and Japanese ideas around what we now call disability with imported western practices in which medical model treatments often reflected anti-disability biases of practitioners.

Last but not least, in "Transnational History of Disability: Reflections," Gildas Brégain analyzes the strengths and problems with transnational history, as it applies to disability history. In particular, he underlines the need for Western (particularly Anglo-Saxon) historians to think far beyond national borders as defining what is original in activist and legislative developments to broaden the scope of disability history in regard to the "Global South." While discussing historiographical developments, Brégain addresses some of the methodological, language, and financial issues historians will encounter when undertaking transnational disability history. This includes the difficulty of doing social history from below through transnational history, as can be done through more localized histories. He also reflects on how few disability historians are engaged in transnational history and yet how many younger historians are under pressure to consider doing transnational history. Brégain's suggestion of possible solutions to this challenge are to engage in micro-history (rather than the more common macro approach) as being more practical, and for some a more affordable solution to this challenge of how to do transnational disability history.

Together, the articles included here reveal the extent to which disability history continues to re-shape our understanding of the experiences of impairment in ways that demonstrate both how much this history changes our understanding of the past as well as how much more there is to uncover and re-interpret from the perspectives of disabled people.

Prosthetics for Osiris: Evidence for Assistive Technology in Ancient Egypt

7

Contents

Abstract

Recently there has been an increasing trend to interpret disability as a part of personal identity rather than a condition or conditions to be suffered. Recognizing the diversity of approaches to indfigividual abilities and the variety of cultural viewpoints surrounding disability, it is time to examine how people with disabilities were perceived and how they perceived themselves in the ancient world. The large number of available remains, rich material culture, and existing written and visual records make Egypt an excellent case study for exploring individual and cultural perceptions of ability, disability, and accommodation in the past. This chapter reviews extant finds in order to critically examine material evidence for disability and accommodation among elites from various periods of Ancient Egypt. The material culture shows how people who might be recognized as having physical disabilities today were accommodated in Ancient Egypt. Accommodations range from simple canes to more complex walking devices. Perhaps most striking is the presence of some of the earliest prosthetic devices in Egyptian burials. These prostheses can be merely ornamental or fully functional and were clearly made to aid not only in life, but also in the afterlife. Together with

paleopathological evidence of disability during life provided by mummified human remains, these individuals and their burials offer a revealing glimpse into what it was like to live and die with a disability in the age of the Pharaohs

Introduction

Recently (that is, within the last 30 years) there has been an increasing trend to interpret disability as a part of personal identity rather than a condition or conditions to be suffered. Recognizing the diversity of approaches to individual abilities and the variety of cultural viewpoints surrounding disability, the field of critical disability studies developed in the 1980s to counter the then-prevalent medical model of disability (Mitchell & Snyder, 2004: 16–25, Linton, 2010: 149). Disability scholars argue that even though there is considerable overlap between medical conditions and disabilities, a medical model is inadequate for understanding disability on many levels (Davis, 1997: 1–5). Disability is also culturally and socially constructed, varying greatly from culture to culture and even social group to social group (Mitchell & Snyder, 2004: 5). It is this dichotomy – that disability is both tangible and intangible – that makes it both difficult and fascinating to examine in archaeology and history.

In keeping with the move away from the medical model, this chapter pivots away from bioarchaeology, paleopathology, and extensive textual analysis to put the focus on what material culture can tell us about disability, specifically disability in Ancient Egypt. Most of the material culture examined herein dates from the New Kingdom (c.1550–c.1077 BCE) and Third Intermediate Period (c. 1069–c.664 BCE). Art from the Old (c. 2700–c. 2200 BCE) and Middle Kingdoms (c. 2055–1650 BCE) will be examined as well. Accommodations range from simple canes to more complex walking devices. Perhaps most striking is the presence of some of the earliest prosthetic devices in Egyptian burials. These prostheses can be merely ornamental or fully functional and were clearly made to aid not only in life, but also in the afterlife. Together with paleopathological evidence of disability during life provided by mummified human remains, these individuals and their burials offer a revealing glimpse into what it was like to live and die with a disability in the age of the Pharaohs.

Definitions

Three terms need to be defined before proceeding: **disability**, **accommodation**, and **assistive technology**. A **disability** is defined by Merriam-Webster as “a physical, mental, cognitive, or developmental condition that impairs, interferes with, or limits a person’s ability to engage in certain tasks or actions or participate in typical daily activities and interactions.” The Oxford Dictionary offers the similar “physical or mental condition that limits a person’s movements, senses, or activities,” while also offering “a disadvantage or handicap, especially one imposed or recognized by the law" (Merriam-Webster.com *Dictionary*, s.v. "disability," accessed December 1, 2021, https://www.merriam-webster.com/dictionary/disability).These dictionary definitions are based primarily on a medical model of disability, that is, rooting the concept of disability in medical or biological conditions or states. Disability studies recognizes additional models and constructions of disability, namely those based around culture or society. In these models, disability is defined as much by what a culture perceives, or a social group determines is a disability. The limitations a person faces are therefore not automatic limitations posed by a medical condition but constructed limitation imposed by culture and/or society. For example, in most modern societies, myopia (near-sightedness) is not considered a disability, even though it is clearly a medical condition that impairs, interferes, and limits a person's ability to engage in certain tasks or actions. This is because, for a variety of reasons, myopia does not fit with these societies' cultural constructions of "disability." When attempting to examine disability archaeologically, the medical model provides a useful starting point for analysis, but it is the cultural constructions of disability that the archaeologist is more interested in.

An **accommodation** is a change or adjustment to a job, work environment, or the way things are done that would allow an individual with a disability to enjoy the same accessibility that a person without a disability would enjoy. To put it more simply, accommodations are the media through which accessibility is achieved. Generally, if something is universally designed, it will not require an accommodation to make it accessible. Examples of accommodations, in a general sense, range from extended time on exams to prosthetic limbs (Williamson, 2020: 3, 7, 9, 57, 6–66).

This brings us to the final term, **assistive technology**. In a broad sense, anything that is used to deliver an accommodation to a person with a disability is a form of assistive technology. The most obvious forms of assistive technology devices that are specifically designed for disability accommodation are cochlear implants, prosthetic limbs, and wheelchairs. However, technology that was originally designed for other purposes, such as text-to-speech software, voice activation ("hands-free") technology, tape recorders, and typewriters, can also be used as assistive technology (Guffey & Williamson, 2020: 7).

Mobility Aids as Assistive Technology

Mobility aids are simple or complex pieces of technology that assist in locomotion. They are arguably the most common and the most recognizable form of assistive technology. In modern times, the wheelchair is the most recognizable mobility aid, followed perhaps by the walker. Archaeological evidence for wheelchairs or any sort of wheeled furniture is sparse. In Classical (510–323 BCE) Greek vase paintings, the god Hephaistos and the demigod Triptolemus are occasionally shown in wheeled chairs or one-person chariots pulled by flying serpents (Anderson, 2013; Wheelchair Junkie, 2021), but these scenes are firmly mythological and there is no material or textual evidence to suggest that such conveyances were actually made by the Ancient Greeks. A tomb carving from Ancient China also seems to show a wheeled chair used for moving a person (Anderson, 2013). However, this carving seems to be referenced only in popular press and not any academic source. These popular sources cannot agree as to whether the carving dates from the sixth century BCE, which would place it at the height of the Spring and Autumn Period (771–476 BCE), or the sixth century CE, which would date it to the Northern and Southern Dynasties (420–589) or Sui Dynasty (581–618). Again, there are no contemporaneous texts mentioning wheelchairs, nor have the remains of any such conveyances been found. The earliest verifiable material and textual evidence for wheelchairs date to seventeenth-century Europe (Bellis, 2019; Nias, 2019). It is not surprising, therefore, that there is no evidence for wheelchairs in Ancient Egypt. However, material evidence for simpler mobility aids can be found in the archaeological and art historical records.

Sticks and Staves

The simplest form of mobility aid is a humble stick, and from the stick emerged the staff and the cane. Although some studies exist that purport to find the earliest evidence for canes in Egypt, they miss the point somewhat, as the use of a stick of some sort for mobility stability surely predates Ancient Egypt and probably goes back as far as behaviorally modern humans. The questions that should concern us regarding the use of canes are not simply “when?” and “where?”, but “why?” and “how?”

In modern times, most individuals who need to use canes might be considered “elderly” rather than “disabled,” and textual evidence for association between staves and old age is abundant in Ancient Egypt too. Hassan (1976: 114–199) describes two sticks of the New Kingdom that each bear an inscription wherein the deceased owner is addressing his staff saying, “Come my staff, I lean on you.” In one of them, “when I have grown old” is added. In his *Maxims*, the vizier Ptahhotep said, “May this servant be ordered to make a Staff of Old Age” (Loebl & Nunn, 1997; Lichtheim, 1973: 63). However, the underlying reason for the cane – a mobility problem – would be considered a disability in a younger person, at least by today’s standards. In the case of the elderly, the mobility problem is the disability, the cause of this disability is age, and the accommodation is a cane or staff. Therefore, the following discussion of sticks and staves in Ancient Egypt is divided into “artistic” and “practical,” and not “disabled” and “elderly.”

For the purposes of this discussion, a “staff” (pl. “staves”) is a stick that comes at least to the shoulder of its user, while the term “cane” will be used to describe a stick that only comes up to waist level.

Artistic Depictions of Canes and Staves

Within Egyptian art, obvious depictions of staves as mobility aides are rare. Egyptian art of most periods is highly stylized, with specific imperfections completely ignored. It is much more common to see staves used as symbols of authority. Nonetheless, there are a few artistic examples that hint at the reality behind the style.

The most familiar of all staves in Egyptian art is probably the *was* staff. This staff is held almost exclusively by divine figures – pharaohs and priests are the only humans shown using them. The *was* is a modification of the hieroglyph for "power" or "dominion," held in one hand while *ankh* ("life") is held in the other. For humans with more secular roles, the *medu* staff is much more common. Although the *medu* is occasionally shown as a walking stick, it was primarily an authority symbol, to the extent that it became a hieroglyphic determinative in the words for "official," "noble," and "courtier" (Fischer, 1978: 7–8; Loebl & Nunn, 1997: 450).

There is a tradition of showing the *medu* in a more complex way, however. In several images, the *medu* is held with both hands, one grasping the top, the other resting against it at the level of the thigh. One leg is in front, with the forward leg slightly bent at the knee with the heel clear of the ground (Fig. 1, left). Although this posture is usually referred to as a "posture of leisure," Loebl and Nunn (1997: 452) propose that it represents the stance an individual would have to assume to compensate for a painful condition of the hip, the knee, or even the heel, meaning that some depictions of the *medu* may represent mobility aids. Relatively early examples of this include images from the tombs of Ra-khaef-ankhu (Fig. 1, center) and Mer-ibi (Fig. 1, right), both officials who lived during Dynasty IV (c. 2550) and were buried in the Giza Necropolis. The stela of Intef, an "overseer," dated to Dynasty XII (c. 1991 BCE–c. 1802 BCE), shows a similar posture. Intef's stela seems to show signs of apparent wasting or heavy wrinkling in both legs (Loebl & Nunn, 1997: 451). Derry (2013: 436–58), assuming that the image is a portrait of Intef himself, suggested that the official specifically suffered from hydrocephalus due not only to the state of his legs but also the apparently enlarged head. Interestingly, the stela of another Intef, this one a military overseer and also dated to Dynasty XII, features a male figure with emaciated limbs, seemingly wrinkled skin, and a comparatively large head (Fig. 2). Although the man holds his *medu* more traditionally,

Fig. 2 A very thin man holding a *medu* and leading a cow. From the stela of Intef, Dynasty XII. Metropolitan Museum of Art 57.95. (Photo: Metropolitan Museum of Art, Open Access)

he is leading a cow with the other hand, suggesting that he may still need the staff for support. Epstein (1937: 304–313) also described an example of this posture from the tomb of Harkuf and wondered whether the flexed knee indicated an injury. However, Epstein mistook a crack in the surface of the relief for an axillary horizontal piece at the top of the staff and erroneously identified it as the earliest recorded crutch (Loebl & Nunn, 1997: 451).

Another nonstandard depiction of the *medu* occurs in the tomb of Menna, a scribe of Dynasty XVIII. In the image, an elderly balding haired man (Fig. 3) oversees some agricultural activity. It can be interpreted that this is an elderly farm laborer suffering from osteoarthritis promoted to overseer. The canons of proportion and style that governed funerary art might not have been so strictly implemented for a servant as they would have been for the tomb owner. Thus, this image may well be a realistic depiction of an elderly man with fixed flexion deformity of a lower limb joint (Loebl & Nunn, 1997: 452) (Fig. 4).

Of slightly later date is the funerary stele of Roma, a doorkeeper of Dynasty XVIII or XIX (Fig. 5). Roma's depiction features a withered right leg that is clearly and deliberately depicted as being thinner and shorter than the other. Roma is in an offering pose, with both his hands otherwise engaged, so his staff is nestled between his chest and his left arm, and thus the image doesn't show him using it to walk. Still, the image is a rare and striking depiction of physical difference and nestling a staff between the chest and an arm is certainly a natural way keeping the staff upright when one's hands must both be otherwise engaged (Loebl & Nunn, 1997: 454).

From roughly the same time, but at the other end of the social ladder, is a carved and painted limestone (Fig. 6) from the Amarna Period, said to be from Tell el-Amarna (Aldred, 1991: 287). The limestone depicts a pair of well-dressed Egyptians apparently at leisure. The woman wears a diaphanous gown and holds flowers in each hand, while the man wears a lavish kilt and leans on a long, thin stick, similar in size to a *medu*. His right arm is wrapped around it, awkward but clearly supportive. Contextually, it is not clear whether the male is leaning on the stick out of necessity or leisure, but the fact that he is shown with it in either context is

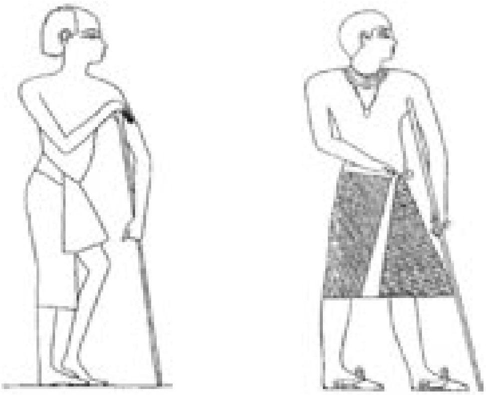

Fig. 3 Left: a servant, balding and apparently aged, overseeing agricultural activities while resting on his staff, from the tomb of Menna, (TT 69) at Sheikh Abd el-Qurna, Dynasty XVIII (c. 1400 BCE). Fig. 4 Roma, a doorkeeper of Dynasty XVIII or XIX, c. 1300 BCE. From his stela in the Carlsberg Glyptotek Museum, Copenhagen, AIN 134. (Photo: © Loebl and Nunn 1997, after Harpur 1987)

quite striking. Amarna Period art is generally accepted to focus on realistic or even truthful depictions of individuals, so this is often interpreted as being a literal image of an aristocrat using a cane. It has been suggested that the pair are Tutankhamun and Ankhesenamun due to their resemblance to the couple on Tutankhamun's famous throne. Furthermore, the slab closely resembles an ivory from his tomb (Fig. 6) that seems to show the couple in an almost identical physical arrangement – and in which Tutankhamun is holding what is more clearly recognizable as a *medu*.

Actual Canes and Staves

Tutankhamun, the famous "boy king," had over 130 canes and walking sticks entombed with him, most of them in the antechamber (Fig. 7). As he died in his late teens, they

Fig. 5 Limestone portrait thought to depict Tutankhamun and Ankhesenamun, Dynasty XVIII, c. 1330 BCE. Said to be from Tell el-Amarna. Neues Museum, Berlin. (Photo: © A. Praefcke, Wikicommons)

were clearly not needed to support an elderly man. Most of them are around a meter in length, and many of them are crooked on one end. If not for their ornamentation and provenance, they could be mistaken for modern canes. Since their discovery, debate has raged as to whether the young king had used them. Many of them are covered in gold leaf and various forms of precious inlay, and several feature handles carved in the shapes of non-Egyptian peoples (Fig. 8). Howard Carter remained baffled by them and suggested that Tutankhamun must have been an amateur collector of such things (Burzacott, 2016). Another suggestion was that the canes were used nonpractically, and the curved handles depicting non-Egyptian peoples were supposed to be placed on the ground and pressed into the dirt, symbolically stomping Egypt's enemies into the dust. This suggestion was found credible by the authors of the Tutankhamun's Sticks and Staves Project (TSS), who point out that the papyriform knobs at the blunt end of the canes bear the pharaoh's cartouche, and therefore would not have been suitable for putting on the ground (Veldmeijer & Ikram, 2020: 12). However, the anthropomorphic handles show few signs of wear and tear, and no evidence for such a practice has been found, either in Tutankhamun's tomb or elsewhere.

As for Carter's assumption, subsequent research has all but disproven it. Tutankhamun's mummy was examined many times, and modern paleopathology and imaging techniques confirmed that Tutankhamun had had a visible clubfoot (Hawass et al., 2010: 645). This means that he probably would have needed a walking stick when he was alive, which implies that the canes in the tomb were

Fig. 6 Ivory inlay portrait of Tutankhamun and Ankhesenamun on the lid of a coffer, Dynasty XVIII, c. 1330 BCE. From the tomb of Tutankhamun (KV62). The Grand Egyptian Museum, Cairo. (Photo: © Egyptian Museum, Cairo)

not curios or a rushed attempt to fill the tomb, but things he might have used. This, along with the ivory lid, makes it more likely that the painted relief from Tell el-Amarna discussed above does in fact depict him. The authors of the TSS project, however, disagree, as their detailed examination shows that even the simplest and sturdiest of Tutankhamun's canes have little evidence of hard use, even taking account the fact that he may have used them mostly indoors (Veldmeijer & Ikram, 2020: 12). However, I argue that the sheer number of walking sticks might explain the lack of use wear. Even if Tutankhamun used every stick in the tomb, he would still have only used each one three times a year. Another possibility, consistent with the findings of the TSS project, is that Tutankhamun's clubfoot was visible enough that he would receive canes as gifts or that his attendants kept some on hand for bad days, but that he did not need one every day.

Prostheses

To be defined as a prosthesis or prosthetic, a replacement limb must satisfy two major criteria. First it must be durable, made from a material that can withstand

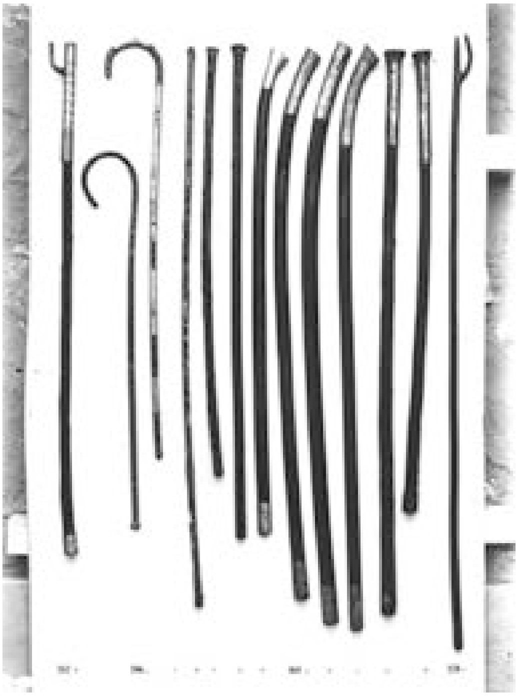

Fig. 7 An assortment of King Tut's sticks and staves. From the tomb of Tutankhamun (KV62). Grand Egyptian Museum, Cairo. (Photo: © H. Burton, Courtesy of the Griffith Institute Oxford)

Fig. 8 Stick 048b with a curved handle in the shape of a Nubian foe with his arms tied behind his back. From the tomb of Tutankhamun (KV62). Grand Egyptian Museum, Cairo. (Photo © A.J. Veldmeijer, E. Endenburg, courtesy of the Grand Egyptian Museum, Cairo)

bodily and external forces so that it does not snap or crack with use. Second, the device must be a functional and usable replacement for the missing limb, to the extent that the user can perform or even outperform all the tasks they would have used the limb for (Finch, 2011: 549). Because our purpose here is to investigate evidence for ancient assistive technology, rather than actually assess that technology, the term "prosthetic" will be used here to refer to any replacement limb regardless of effectiveness or appearance.

Although the term is modern, prostheses were – assuming Plutarch and Theodoros are to be trusted – enshrined in Egyptian mythology. As some versions of the story go, the vegetation god Osiris was vivisected by his brother Set and his body parts were scattered throughout the world. Isis, wife of Osiris and sister to both him and Set, went after them, recovering each piece and gradually reassembling him. She was unable to locate his penis, which was swallowed by a fish. Isis crafted a replacement and embalmed it with the other 16 pieces of Osiris to create the first mummy and resurrect him long enough to conceive his heir, Horus (Colazilli, 2012: 147). Since the replacement was fully functional – even if it needed the goddess of magic to make it so – we can consider it a prosthetic.

Prosthesis in Egypt took two forms: first, as in the mythical and modern sense, as a literal, functional replacement for a lost body part; and secondly, as an amulet or nonfunctional simulacrum intended to restore ritual wholeness (Colazilli, 2012: 148). Functional prostheses include toes and feet, while nonfunctional prostheses could be any sort of limb or body part. Finch and others suggest that prostheses of any sort are a natural outgrowth of the Egyptian belief that the physical body must be complete for the soul to progress to the afterlife. Embalmers had a well-documented practice of reaffirming body shapes with plaster, mud, sand, or extra linen, and stuffing sawdust beneath the skin to contour desiccated muscle and fill in empty eye sockets (Colazilli, 2012: 150). In this environment, replacement limbs are not a surprising development.

Functional Prostheses

What may be the earliest fully functional prosthetic device was reported from the Theban Necropolis in 2000. This prosthetic was an adducted hallux (big toe), found in situ still attached to its associated mummy (Nerlich et al., 2000: 2176). The mummy was identified as Tabaketenmut, the daughter of a priest who lived sometime between 950 and 710 BCE. Tabaketenmut may have had diabetes, which in turn caused the ischemic gangrene, resulting in the loss of the toe. She healed without stiches and apparently used this prosthetic toe to move around. Upon her death, it seems that it was embalmed with her so that her mummy would be complete (Nerlich et al., 2000: 2177).

The prosthetic itself was made in three sections: two of wood and third possibly of leather (Fig. 9). The main section was sculpted into the likeness of the missing toe, complete with articulated toenail, and with variation in texture on the ventral side that would aid in stability on the ground. A series of drilled holes supported a series of marlin hitches to secure the sections together. The pieces reveal that the carver (or designer) seemed to know anatomy and function of different parts of the foot (Finch, 2011: 549). Furthermore, the joints of the two wood sections seem to form an intentional hinge which mimics the flexion of the joints at the base of the toe. This suggests that the designers were knowledgeable of the mechanics of podiatric locomotion (Finch et al., 2012: 183).

Fig. 9 Prosthetic toe of Tabaketenmut, c. 950–710 BCE. From near Luxor. Grand Egyptian Museum, Cairo. (Photo: Finch et al. 2011, courtesy of the Egyptian Museum, Cairo)

A less complex prosthetic was acquired by the British Museum in 1881, now known as the Greville Chester great toe (Fig. 10). Its provenance is unclear but is probably also from Thebes. Scientific analyses in the late 1990s dated it to around 600 BCE, making it more recent than Tabaketenmut's toe (Finch et al., 2012: 182). The Greville Chester great toe is made from cartonnage, that is, linen soaked in animal glue and coated with plaster. It is also sculpted in the visual likeness of a big toe and once sported a false toenail. Holes on the medial signs show evidence of wear, possibly from laces, and plaster across the prosthetic shows evidence of wear in roughly the places a sandal would have been tied (Finch et al., 2012: 182).

Finch et al. constructed replicas of both the Greville Chester great toe and Tabaketenmut's toe for experimentation (Fig. 11). The replicas were tested with only two volunteers (finding volunteers with the correct pathology and no other health problems in the legs was noted to be particularly challenging), so the results were highly subjective (Finch et al., 2012: 184). Tabaketenmut's toe was deemed somewhat more effective than the Greville Chester great toe and wearing Egyptian-style sandals increased the effectiveness of both prostheses, despite the difficulties in having to keep both the prosthetic and the sandal in place. Finch et al. quip that the prostheses would be even more effective when encased in a sock and shoe (Finch et al., 2012: 189), neither of which the Egyptians are credited with inventing.

Nonfunctional Prostheses

Many prostheses were nonfunctional, and almost all of these are found with mummies to "complete" an incomplete body. Ritual wholeness was clearly very important and enshrined in mythology, for Osiris could not be resurrected without all his body parts accounted for or replaced. Rather than a simple instructional tale, the embalmers of Egypt seemed to take this story as a challenge: from the New Kingdom through to the Common Era, mummies were not simply prepared for the afterlife, they were gussied up for it. Embalmers stuffed sagging skin with sawdust, filled eye sockets with pebbles, applied makeup, buried the dead with reasonably fine wigs, and replaced any missing body part that should have been in the mummy and not a canopic jar (MacLeod & Cooney, 2019: 289).

Fig. 11 Experimental prostheses modeled after the prosthetic toe of Tabaketenmut and the Greville Chester great toe. (Photo © J. L. Finch 2012)

These replacement body parts range from tiny conventional amulets depicturing the missing body part to full size, yet still nonfunctional prostheses. They can usually be determined to be nonfunctional due to the lack of any features which would attach the prosthesis to the body during normal activity, or else were made of linen or similar nonfunctional material. For example, the Darlington Museum mummy, which dates to c. 250 BCE, appears to have been born without a left hand and forearm. A false hand and forearm were made of resin-soaked linen and fitted onto the stump. Clearly nonfunctional, the only use for this prosthetic was funereal (Colazilli, 2012: 151).

Mummy 1770 in the Manchester Museum had a linen penis and completely fake legs, the left one being a bundle of mud and reeds and the right one being wood (Fig. 12). The feet were made of mud, reed, and wooden pieces, and were adorned with painted slippers and gilded toenail covers. This extreme example probably lost his legs at the time of death, perhaps in an incident involving a large reptile or very large mammal. Interestingly, the wrappings date to around 380 BCE while the bones date to

Fig. 12 Prosthetic leg of mud and reeds. The Manchester Museum, Manchester UK. (Photo: Colazilli 2012, courtesy of The Manchester Museum, University of Manchester)

around 1000 BCE, suggesting that a Twenty-First-Dynasty mummy was refurbished in the Late Period (Colazilli, 2012: 151–153). That the linen penis is made of the same Late Period wrappings may indicate that the refurbishers were unsure of the mummy's sex, and therefore didn't commit to a plaster or stone replacement.

Another example is the mummy of Ankhefenmut, a priest from Thebes who lived during the Third Intermediate Period. The mummy now resides in the Albany Institute of History and Art. MRI scans undertaken in 2015 reveal the presence of a surprisingly dense false toe in the mummy (Fig. 13). Ankhefenmut's mummy has never been unwrapped, so the toe has not been examined physically, but the MRI reveals a crude piece of stone, roughly hewn into the general shape of a toe (Brier et al., 2015: 1047–1058). It seems, then, that this was a nonfunctional prosthetic as seen in the Darlington Museum mummy and Mummy 1770.

Another type of nonfunctional prosthetic is found in abundance. Amulets, it can be argued, are symbolic prostheses, particularly as they were used in Ancient Egypt. Embalmers who decided against faking limbs wrapped amulets in the shape of the missing limb into the wrappings, often close to their original location. Hands, arms, legs, and feet were the most common, but ears and noses have been found as well (Fig. 14).

But not all amulets can be considered prostheses. One amulet whose use as a prosthetic we cannot determine is the *wadjet* eye (Fig. 15). Recognizable and popular, *wadjet* eyes were symbols of protection and one of the most common tools of apotropaic magic in Ancient Egypt. As *wadjet* eyes were a common funerary amulet to include with the mummy anyway, there is little evidence that their presence indicates an injured or missing eye. Although they could logically have been appropriated for this purpose, eyes cannot be mummified and so eye injures can only be determined through osteological examination.

Another example of amuletic prostheses are golden tongues such as those found with the poorly preserved mummies at Alexandria's Taposiris Magna temple in February of 2021 (Fig. 15) and at Oxyrhynchus (El Bahnasa) in December the same year. These artifacts are interpreted to have been added to give the dead the ability to speak before Osiris, who since being mummied and fitted with his prosthesis, was now the god of death and rebirth (Davis-Marks, 2021). Such a

practice is not suggested in early mortuary contexts elsewhere – at least, not in Egypt, where a symbolic "Opening of the Mouth" ceremony was performed to give the dead the ability to speak.

Fig. 15 A golden tongue from a mummy, Ptolemaic Period, c. 280–100. From Taposiris Magna. (Photo: © Egyptian Ministry of Tourism and Antiquities)

The closest antecedent to the golden tongues is the Hellenistic practice of placing a coin under the tongue of deceased person to pay for the soul's journey across the River Styx. Famously referred to as "Charon's obols," these coins could have been of any denomination, composition, and shape (Brown, 2008), and are attested in both archaeological and historical sources from across the Hellenistic and Roman worlds (Stevens, 1991). The Taposiris Magna and Oxyrhynchus tongues, therefore, could perhaps be seen as an appropriation and adaptation of the Hellenic practice for Egyptian religious beliefs.

Discussion

The fact that much of the material examined here comes from funerary contexts is arguably a clear example of preservation bias, since it is funerary contexts which make up the bulk of the surviving archaeological material in Egypt. However, this doesn't change the fact that the prostheses discussed above were deliberately placed in, or even made specifically for, this context. Why? Is ritual completeness enough of an explanation? Or is it something more? *The Book of the Dead* and its antecedents, the *Coffin Texts*, and the *Pyramid Texts* indicate that it is not simply a complete body that allows the deceased to make the perilous journey through the Duat – the underworld or the night world – to stand before Osiris (Faulkner and Allen 2005: 11–20). The dead needed access to the spells and directions in the funerary texts to make the journey, not simply a complete body.

It can be argued that upon death, Egyptian souls entered a disabled state. In order to progress on their journey, they need to be provided with accommodations in the form of funerary texts and assistive technology in the form of replacement or even supplemental body parts. Just as with modern accommodations and assistive technology, the prostheses, amulets, and spells leveled the playing field and allowed all souls with access to them to reach Osiris. As with modern accommodations, some individuals had greater access to assistive technology depending on their socioeconomic status. And as with modern accommodations, these measures ensured access, not success – the final judgement of the soul came at the iconic Weighing of the Heart, where only the deeds of an individual in life could secure an audience with Osiris and gain admission to Aaru – the afterlife.

At first glance, this argument seems exist in opposition to the interpretation suggested by the Egyptian artistic canon, which favors stylization and idealization. In this interpretation, the dead must be made perfect though the repair and refurbishment of the body, as well as the bestowal of the spells and directions necessary to traverse the Duat. However, stylization and idealization do not necessarily imply a spiritual desire for perfection, particularly since all periods of Egyptian art contain permissible exceptions to the rules of the canon, even outside the Amarna Period. Old and infirm people are portrayed in art, non-Egyptians living in Egypt are portrayed with realistic skin tones, women sometimes allowed themselves to be depicted with distinctive hairstyles, and dwarfs of high rank are portrayed with realistic relative height throughout all periods.

Disability is as much a sociocultural construct as a medical construct and is usually measured from difference or deviation from a perceived norm. Death is the ultimate deviation from the norm, and therefore the ultimate disability. If perfection were the goal, why wasn’t Tutankhamun outfitted with some prosthetic or amulet to rectify his clubfoot, rather than simply be buried with his walking sticks? Perfection was not the goal, immortality was. Metaphysically, the Duat is a liminal space between life and the afterlife, but it was also a space that rendered all deceased inherently disabled. While some were fortunate enough to only need the accommodation of funerary texts, others needed prostheses to make the journey forth by day.

Conclusion

Through this examination, we have seen that the ancient Egyptians crafted assistive technology far more complex than walking sticks, devising prostheses that would be deemed functional and effective today. It seems then that in Ancient Egypt impairment, regardless of whether it was considered disability, was indeed accommodated. In addition, this examination has revealed that the Egyptians were masters of a unique form of accommodation: assistive technology for the dead. This practice is a logical outgrowth of the Egyptians’ concern for spiritual completeness manifesting as a concern for physical completeness, as least as far as mummies are concerned.

What this examination does not reveal is how the Egyptians viewed individuals with impairments, i.e., the *shared social perception* of individuals which in our society is summed up in the word “disability.” Similarly, material evidence alone offers only a glimpse into the *lived experience* of these individuals who were accommodated with assistive technology but does not provide a complete picture. We do not know if average Egyptians perceived Tutankhamun as less of a king or less of a person because of his clubfoot. We do not know if Tabaketenmut, despite her effective prosthetic, still had so much trouble moving about the temples where her father worked that she had to alter her patterns of worship. Analysis of material remains is but the first step to reconstructing this shared social perception of individuals with disabilities, which is arguably the goal of the archaeology of disability itself.

European Medieval Disability History: An Overview

8

Ninon Dubourg

Contents

Abstract

This chapter offers a targeted, macrolevel "need to know" overview of medieval disability scholarship and disability in the Middle Ages. History, art history, literature, and archaeology are all disciplines that count scholars working on issues linked to disability. The main argument I advance is that the common Christian culture operative in the Middle Ages supported the constitution of a pan-European identity, albeit with differences and nuances owing to local and national circumstances. In this context, disability was an intersectional node of identity that "sat beneath" the dominant identity category of Christian. We certainly encounter in the sources people with disabilities who faced numerous personal, daily challenges that sometimes impacted their ability to participate fully in medieval culture. Nevertheless, people with disabilities were not wholly excluded from their communities. In fact, people with disabilities were present in all spheres of medieval society, even playing leading roles, and thus were not inevitably marginalized. This chapter, then, aims to show that we find people with disabilities everywhere in the Middle Ages – if only we look for them.

Introduction

Can we really speak of disability in terms of marginality when disabled people were present at every rank of society and when disability was not an insurmountable obstacle to social integration? This question cuts to the heart of core issues in the field of European medieval disability history and acts as an invitation to contextualize disability within a broader frame. The modern, popular imagination tends to frame disability in the medieval era as an overwhelmingly bleak fate, perhaps worse than death. Yet disability was not necessarily perceived, or experienced, as an obstacle to community life in the Middle Ages. Non-normative states could be, and were, accepted and appropriately managed by societal adjustments. Of course, the inclusion of disabled people within the social fabric varied according to the specific contexts in which individuals were embedded – their temporal, sociocultural, and geographical locations and more. Similarly, different kinds of historical sources offer different, even contradictory, representations of the experience of disability in the period. These fundamental ambiguities explain why medievalists working on disability history have, over the years, focused on a range of issues, using a diverse set of methodologies.

This chapter, in a nutshell, offers a targeted, macrolevel "need to know" overview of medieval disability scholarship and disability in the Middle Ages. History, art history, literature, and archaeology are all disciplines that count scholars working on issues linked to disability. The main argument I advance is that the common Christian culture operative in the Middle Ages supported the constitution of a pan-European identity, albeit with differences and nuances owing to local and national circumstances. In this context, disability was an intersectional node of identity that "sat beneath" the dominant identity category of Christian. We certainly encounter in the sources people with disabilities who faced numerous personal, daily challenges that sometimes impacted their ability to participate fully in medieval culture. Nevertheless, people with disabilities were not wholly excluded from their communities. In fact, people with disabilities were present in all spheres of medieval society, even playing leading roles, and thus were not inevitably marginalized. This chapter, then, aims to show that we find people with disabilities everywhere in the Middle Ages – if only we look for them.

Historical Context(s)

The Middle Ages begins in the fifth century, with the period's "birth" marked by important shifts in global sociopolitical contexts: the decline and fall of the Western Roman Empire and the concomitant Migration Period, the ascendency of the Byzantine Empire, and, in the seventh century, the rise of Islam. The medieval period comes to a close during the long fifteenth century, demarcated by the so-called Renaissance against the backdrop of the Black Death, the developments of the Reformation, the invention of the printing press, the voyages of Christopher Colombus, and the Ottoman Empire's conquest of Constantinople in 1453, which marked the end of the Byzantine Empire. The terms “Dark Ages,” “Middle Ages,” and “medieval” continue to be interrogated, and their analytical utility was debated, because of the way in which they obscure the historical specificity and richness of medieval societies and cultures and serve to situate derogatorily the time to which they refer: an uninteresting pause somewhere between glorious “antiquity” and magisterial “modernity” (Arnold 2008). Debate as to the validity of the term “Dark Ages” is ever ongoing (Falk, 2020; Fouracre, 2015) as in the 2016 Twitter debates “bring back the dark ages” (Williams, 2016). However, it is now very clear that the medieval period – which lasted for over a millennium! – is profoundly rich and undoubtedly complex (Aberth, 2018).

Since the aim of this chapter is to provide a succinct, and thus necessarily simplified, overview of medieval disability history, I will focus exclusively on Europe. Crucially, although Christianity was an essential common denominator, medieval Europe was not a homogenous territory by any means. The Western Roman Empire functionally ended in 476, with its power shifting to the East; Europe was the Empire’s heir, coalescing in the Early Middle Ages (Bartlett, 2015). Christianity began to take hold among the European elites, who in turn sought to Christianize their populations through assimilation and/or conquest with various timelines: some European regions were much slower to adopt the religion than others. From the twelfth to the fourteenth century, Christianity was dominant in medieval Europe and reached its peak in terms of its geographic spread and the size of its pan-continental congregation (Bend, 2006). This chapter concentrates on the thirteenth and fourteenth centuries, i.e., the latter period of the Middle Ages. This is less of a deliberate choice than a scholarly necessity: there is a dearth of research on disability in the earlier part of the era, though this gap is slowly being filled (Jones, 2012; Skinner, 2017).

While it is possible, even necessary, to offer generalizations about medieval Europe, the principles upon which such generalizations depend are not universal and do not allow us to capture authentically the full complexity of medieval societies. For this reason, then, this chapter does not claim to cover all the spaces or periods of the Middle Ages, nor does it proffer any fixed, final “answers.” Rather, it provides an overview of disability in the Middle Ages and discusses some of the main questions that are being posed by medievalists about disability history, showcasing the latest research in the field.

Critical Context(s)

Historical work from medievalists prior to the 1970s tended to situate disabled people primarily as a sub-grouping of the poor, focusing on the analysis of hospitals, charity, poverty, infirmity, and/or assistance. Effectively, medievalists replicated an understanding of disability in terms of exclusion prevalent in their societies and applied it to premodern society (Haggard, 1932). These studies were especially prominent in French historiography (Geremek, 1980; Goglin, 1976; Mollat, 1978). The medical model upon which medievalists previously depended has, however, been roundly critiqued. Henri-Jacques Stiker pioneered the implementation of this kind of critical approach in a historical context with the publication of his seminal book *Corps infirmes et sociétés* (A History of Disability) in 1982 (Stiker 1982, 2009 in English). Stiker encouraged the production of a history of the representation of disabled people. He sought to understand the viewpoint of premodern individuals living with physical or mental incapacity, interrogating specifically medieval sources relating to beggars in the archives of now-defunct hospitals. The studies of medieval disability that followed tended to take legislative documents as a starting point for analyses, such as those related to the receipt of charity (Adam, 1982; Agrimi & Crisciani, 1980).

Researchers gradually began to expand their focus, considering disability mostly, if not exclusively, in terms of social exclusion by interrogating the social *inclusion* of disabled people. This development tied directly into political activism and the desire to significantly improve the lives of disabled people and gain more civil rights (Trexler, 1985). Hence, in the 1980s and thereafter, the articulation of the "cultural model" of disability, as a part of the broader "linguistic turn," initiated in the 1970s and 1980s by academics studying the intersections of culture, language, and discourse (Hughes, 2002). This model considers that a phenomenon such as disability is not limited to material conditions (i.e., social model), and, as such, disability is not a fixed category of experience. On the contrary, what is experienced and understood as disability changes according to the specifics of the period and culture in question (Snyder and Mitchell 2006). Medieval historians have, accordingly, excavated a cultural history of disability in the Middle Ages, interrogating how medieval society produced the disabled body by establishing norms from which it "diverges" (Campbell et al., 1992; Eyler, 2010; Fandrey, 1990). In this work, medievalists also frequently rely on the "minority-group model" of disability, a framework developed in the human sciences which supposes that disabled people belong either to a stigmatized group or to a subculture. This thesis, which stems from American multiculturalism, supposes that people with disabilities form cultural groups, because disability produces a particular identity, relative to normative "common" experiences of able-bodiedness (Hedlund, 2009). The Deaf Community is most often referred to in the literature as an example, given the existence of a common language and a cohesive, non-dominant culture (Brueggemann, 2005). Many, if not most, publications in this generation of research are segmented studies with a singular focus, bracketing off conditions according to the type of disability, with much attention paid to old age (Rosenthal, 1996; Shahar, 1997), blindness (Weygand, 2003), and mental illness (Katajala-Peltomaa & Niiranen, 2014; Metzler, 2016; Turner, 2010, 2013). Similarly, research in this mode is often organized according to a taxonomy of care, in terms of the institutional arrangements put in place to care for disabled individuals, support structures which differ according to the nature of disability. This is evidenced by the numerous research studies on leprosy and leprosaria (Brody, 1974; Ephraim, 2014; Touati, 1998).

Scholarship in the field of medieval disability history came into its own in the mid-2010s, with a marked increase in publications after 2005. At the same time, the "critical model" of disability emerged, created to synthesize the best that the social and cultural models have to offer. This analytical schema proposes a comprehensive approach to disability and infirmity as cultural phenomena. Researchers using this approach question power relations, seeking to shed light on the sociohistorical conditions of oppression that are geographically specific (Meekosha & Shuttleworth, 2009). However, unlike the cultural model, it is no longer sufficient to add the most marginalized categories to the syllabus, but they must be taken into account in order to change our understanding of society as a whole (Shildrick, 2012). In the field of colonial, postcolonial, or neo-colonial disability studies, the variation of the viewpoint is as much in space as in time (Sherry, 2007). Faced with these similar objects, many historians are inspired by the spatial approach to enrich their problems.

Medievalists have profited from the latest developments in the field of critical disability studies, publishing major synthetic studies that attempt to write the history of people with disabilities in medieval times (Metzler, 2006). However, by and large, such work is collective and collaborative, while book-length studies remain rare (Hsy et al., 2020). This reflects the novelty of this critical approach, and its limited application in historical disability studies (Collard & Samama, 2010; Nolte, 2009). Despite the fact that few historical publications currently adopt this interdisciplinary way of thinking – with disability interrogated as one of many intersecting components of identity in medieval society – the field is all but united in calling for the implementation of this kind of innovative methodology (Barschet et al. 2013; Turner & Butler, 2014; Krötzl et al., 2015; Turner & Lee, 2018). Medieval disability continues to develop as a field, with ever more publications analyzing ever more (kinds of) medieval sources (McNabb, 2020; Turner & Pearman, 2010)· Consequently, the most recent works use disability as a category of analysis that obliges us to rethink the principles of medieval society that have long been taken as fundamental and, in so doing, to engage with, even change the way we think about contemporary disability (Godden & Hsy, 2013; Waldschmidt, 2010).

With this in mind, I begin with a discussion of general representations of disability, drawn from the imaginary of medieval elites in which disabled people are conceived of as beggars. This portrayal, which served to maintain social hierarchies, provides the stereotypical image of disability in the Middle Ages, one that still prevailed in the literature until about a decade ago, in which disabled people are thought to be entirely excluded from the normative social fabric. The following section provides a more holistic picture and demonstrates that this contention offers only part of the story: disabled people were certainly subject to social exclusion in substantive ways yet were also able to participate dynamically in their society. In the third section, I rely on material from literary texts and miracle testimonies which give insight into the lived experience(s) of medieval disability and the possibility of maintaining high social status as a disabled individual. In this way, the focus of analysis is narrowed from the generalized, macrolevel to the microlevel of personal, quasi-biographic accounts of disability in the Middle Ages.

I. Disability, Poverty, and Charity

In the medieval public imagination, the *imago Christi* (the image of Christ) ruled as the stereotypical portrayal of disability. Disabled people were routinely depicted as vectors of salvation for the richest Christians, either in receipt of alms which demonstrated the piety of wealthy benefactors and for which recipients may “pay” with prayers on donors’ behalf or subject to miraculous healing which showed the glory of God Himself. In numerous ecclesiastical sources, the scribe and/or the illuminator chose to depict “cripples” as poor beggars, living off alms. As such, it seems that medieval disabled people relied for their survival, ideologically and literally, on an established system of charity, a transactional practice in which their role was primarily to offer spiritual “resources” to their able-bodied betters. These documents represent and reproduce perspectives from the top of the social hierarchy, the attitudes of the elite, for whom charitable donations to the disabled were not simply magnanimous. Rather, engaging in charitable acts by donating alms to disabled people served to reinforce the elite benefactors’ elevated social role, further ossifying the social hierarchy. This dynamic is witnessed in numerous medieval texts and pictures, as discussed below.

Before engaging in such analysis, however, it is crucial to understand the context in which such depictions operate. Medieval poverty is not the poverty we know today. Indeed, poverty in the Middle Ages has perhaps a broader meaning than today: the poor lacked the physical means to ensure their own subsistence and lived on the margins of society as its most vulnerable, low-status members. Nevertheless, they were endowed with a specific social role. In addition, “the poor” (*impotens* or *debilis*), as a category, traditionally comprised a wide swathe of people that included the elderly, infirm, sick, orphans, children, widows, and pregnant women. Irina Metzler examines the link between poverty and disability through the prism of charity in her landmark 2013 book (Metzler, 2013).

Metzler advocates that from the Merovingian period onward, bishops, abbots, and towns identified poor people with numbers in order to keep track of them. Long lists of precise criteria, preserved in legal sources, were utilized to “correctly” classify these poor citizens (Meier, 2005). This meticulous system facilitated the recording of individuals who were authorized to beg, alongside membership rolls of brotherhoods or guilds of beggars, groups that sometimes gathered a type of disabled people (leprous, blind, etc.). Such records were used by bishoprics and monasteries to verify which poor people were entitled to receive donations from Christians. In exchange, alms’ recipients had to save their rich donors’ souls through prayer. The charitable system was organized from the top down, with authority granted to rich donors, monastic communities, and bishoprics. These privileged groups decided what form and function their local hospitals should take, according to their personal aspirations, family ties, and/or the needs of their community (Sweetinburgh, 2004). The foundation of such charitable institutions demonstrated the eminent social status of those in charge; the larger the premises, the greater the number of poor people accepted within its walls, or the relative severity of the poor inhabitants’ needs, the more illustrious the benefactors appeared (Rubin, 2002).

Hospitals were part of the ecclesiastical infrastructure from the beginning of the medieval era. The figure of the bishop was central in their formation and running, as caring for the poor was absolutely fundamental to his role. Initially, hospitals were not (solely) medical institutions. They provided accommodation and food to the poor, operating as community hubs in which individuals' access to charity was determined, and alms were distributed to the "verifiably" needy (Lazard, 2001). For this reason, then, illness and poverty are confused in records relating to charitable assistance between the seventh and ninth centuries. From the ninth to the eleventh centuries, the generic term "pilgrim" is used in texts to refer to all those who received therapeutic treatment from monks (Montford, 2004; Yearl, 2007). The introduction of secular charity in the thirteenth century led to the gradual secularization of such institutions (Rawcliffe, 1995). This shift also led to institutional specialization, with a given hospital specializing in a specific type of infirmity, according to the funders' preference (Brodman, 2003). Consequently, charitable institutions incrementally acquired an explicitly medical function, transforming them into hospitals more closer to the modern sense of the term (Dumas, 2015). This suggests improved treatment for the poor, at least in medical terms. In the same time, cities and kingdoms began to regulate their poor citizenry as early as the thirteenth century. Restrictions on begging were introduced, ranging from increased scrutiny – mandatory examinations of beggars, the obligation for beggars to carry distinctive signs – to strict controls. In some cases, begging was functionally eliminated by the expulsion of anyone without employment from the city. The definition of the term "poor" narrowed and was now applicable only to individuals without the capacity to work and thereby support themselves. This prefigures, as Metzler notes, modern disability legislation that recognizes a person's disability in similar terms, based on their capacity.

To return to disabled people and/as the *imago Christi*, Livio Pestilli notes that disabled people were routinely depicted in two configurations in the Middle Ages: as petitioners for miraculous healing and as recipients of alms (Pestilli, 2016). The first representations of disabled people in manuscripts occur in the context of hagiography, books of saints' lives, in which they figure as prospective beneficiaries of saints' salvific cures. In their earliest form, such scenes were depicted in miniatures, though they are also found in margins during the thirteenth and fourteenth centuries. This amounts to an integration of disabled people in manuscript culture, which, as Pestilli points out, reflects the growing importance of the Christian precept of charity as part of the Gregorian Reform. Representations of disability which foreground charity serve as a mechanism for modeling laudable Christian behavior. At the same time, noble patrons instrumentalized manuscript illumination to enhance their own social and political prestige: by highlighting the importance of charity in such images, they drew attention to their own piety, as donors themselves, beyond the manuscripts' borders.

The *infirmi* (impaired people) played an important social role in the system of Christian charity. They were the archetypical poor, the best – the neediest and thus most worthy – recipient of alms. For this reason, they were mainly depicted as beggars in narrative vignettes contained in manuscripts. Such representations served to glorify the act of charity itself and, in so doing, functioned to maintain social hierarchy, the power imbalances between men and women, rich and poor. These manuscripts necessarily offer a skewed perspective, as they were made for the richest Christians. Nevertheless, the donation of alms is an oft-repeated subject in all kinds of texts and images, cropping up as a reminder to donate to the poor, or as a means to memorialize and celebrate past gifts. This is the case, for instance, in a marginal scene in the *Smithfield Decretals* (Fig. 1), an edition of Gregory IX's book of canon law that was illuminated in London during the mid-thirteenth century for an unknown owner (Taylor, 1996). This image offers a tableau of four individuals and portrays the interaction between rich charitable donors and the disabled recipients of their alms.

The two figures to the left of the scene are depicted with their hands held out, a visual indicator of begging. One sits on the floor with crutches placed nearby, suggesting a mobility impairment such as paralysis. The other figure is standing, appearing to limp toward the pair of figures to his right. While the limping figure is half-naked, the two individuals with whom he engages are richly decked out, one even wears a crown and seemingly has clothes to spare. The king proffers a coat and some cash to the two beggars, as his escort clutches the royal purse. This implicitly references the legend in which St Martin of Tours gives his coat to a beggar. The latter was sometimes figured in ecclesiastical images as able-bodied, though others depicted him a disabled (usually as a foot amputee). Then, this is an archetypical depiction of an act of charity and thus was likely immediately recognizable to contemporary viewers. The scene's players are unambiguously situated as the top and bottom of the social hierarchy: the donor is a king, the richest of the rich; the poor are disabled. Disabled people are fairly often represented in such images with crutches or similar assistive objects, signaling some form of paralysis or mobility impairment. Similarly, the king is identified as such by his crown, another visual marker that the artist used to distinguish their subject(s) from "normal" people (Godden, 2016). Clutches and other assistive devices allow for the depicted figures to be identified *as disabled*, thereby offering us insight into the variety of prostheses used by disabled people during the Middle Ages. What's more, the use of visual markers to denote disability serves to group disabled people together; they share the same symbolic attributes as markers of their distinct, shared social status, alongside their similar symbolic value within society. While disability is frequently depicted in

Fig. 1 London, British Library, Royal MS 10 E IV, f. 262: King offers coat and coins to a disabled beggar. (Copyright © CC-BY-NC 4.0)

terms of *imago Christi*, as in Fig. 1, the fact that disabled people figure in manuscript illumination so often ultimately shows the extent to which they were integrated within society more generally.

II. Ambivalence: Salvation and Sin, Inclusion and Exclusion

Disabled people in the Middle Ages were met with ambivalence. On the one hand, the transactional spiritual economy, as expressed in the system of Christian charity, depended upon disabled people as vectors of salvation, with care for the disabled a core component of what it meant to be a good Christian. At the same time, disabled people might be isolated, maybe ostracized by the able-bodied community, especially if they lived with leprosy. Like today, people with disabilities in the Middle Ages were subject to mockery, notably because they inverted expected standards. Attitudes toward disabled people, and the signification of disability itself, were equivocal. Disability could be a divine punishment for an individual's evil or their parents' immorality and could thus denote innate sinfulness. But disability, understood as a divine burden, could bring an individual closer to God and salvation: disabled people could be models of holiness.

Medieval society tended to physically group disabled people together in order to facilitate care, individually and/or collectively – much as is the case today. Receiving care necessitated social exclusion to some extent. Indeed, archaeological evidence testifies to cases of "care exclusion" in medieval communities. Frédérique Blaizot's study of 24 burials in the funerary complex of Beaume in Châteauneuf-sur-Isère (Drôme, France) is highly illustrative (Blaizot, 2009). These tombs, located at some distance from religious buildings, belonged to individuals with disabilities resulting from serious accidents, or illnesses related to their old age. The archaeological evidence establishes that these people were unable to take care of themselves and required daily care. Blaizot shows that the disabled people in these plots were buried according to standard funerary practices but, critically, that their tombs were placed outside the parish cemetery, the usual resting place for the area's deceased. The specificity of this burial site reveals some kind of exclusion to which the disabled were subject in their life as in their death. However, Beaume, a small hamlet, appears to have cared for its disabled populace with an arrangement based on community care, something akin to a retirement home, with residents technically sheltered within the community yet simultaneously separated, as a group, from its other inhabitants.

This dynamic of relative exclusion, linked to the specificity of care required, is even more prominent in cases of leprosy, and the institutions that were established to house and care for lepers. Leprosy is a progressive chronic disease that affects the peripheral nervous system, skin, and/or nasal mucous membranes, causing loss of sensation in the limbs, which can lead to amputation. In the Middle Ages, leprosy was incurable and thus might have provoked fear in the healthy population. The condition was also strongly associated with sin in some texts, like the sermons (Bériou & Touati, 1991). In the latter, the disease's effects of physical degradation were understood to be a reflection of the leper's moral corruption, with lepers subject to cruelty, ridicule, and social ostracism – but also as a test for the righteous. For such reasons, historians have long believed that lepers were almost entirely excluded from medieval society (Tabuteau, 2007). Research on the condition has traditionally focused on leper hospitals (*leprosaria*), monastic-like institutions in which lepers were typically cloistered, with such exclusion long explained by historians as a public health measure (Rawcliffe, 2006). Recent scholarship, however, challenges this notion, highlighting the fact that lepers in such institutions were living in new forms of community life and were not cut off from the world; *leprosaria* were part of the urban or rural fabric.

Elma Brenner's, 2015 monograph offers an interesting case study of leper houses in the French city of Rouen during the twelfth and thirteenth centuries (Brenner, 2015). Analyzing archival materials, Brenner demonstrates the way in which the link between leprosy, charity, and practices of piety enabled, even demanded, the inclusion of lepers in the diverse social fabric of medieval Rouen. The people who lived in Rouen's leper houses were considered to be patients, not inmates. The leprosarium, as an institution, permitted their social inclusion by remaining within their local community; as recipients of charity, lepers were integrated into Christian society. Some of Rouen's lepers – a group comprising both men and women, clerics and laypeople – were resident in the Augustinian priory of Mont-aux-Malades. Situated in a prestigious locale, at the entrance of the city, they received healthy visitors and participated in the city's life, for example, by organizing an annual fair. More generally, Rouen's lepers were the recipients of charity not just from the city's bourgeois but also from nobility and royalty. The king of England Henry II, for example, founded a community for women lepers in the twelfth century. Such donations allowed the leprosarium to amass significant economic assets, endowing its residents with considerable financial means. The situation was not equally favorable for all lepers, however. Brenner shows that lepers without the financial reserves to join a leprosarium remained marginalized in the community. Poor lepers in Rouen were, for example, compelled to beg, even in front of the gates of the cathedral. In sum, there are no clear-cut answers in the debate about the relative inclusion or exclusion of lepers in medieval society. Findings depend upon the specific context(s) under investigation and vary from segregation to integration (Dubourg, 2018; Spencer-Hall, 2015). Nevertheless, the latest research tends to highlight the ways in which lepers were valuable members of the medieval society, sketching the range of roles they could and did occupy (Brenner & Touati, 2020; Orlemanski, 2012)˙

Notwithstanding their relative social inclusion, disabled people, as personifications of the inversion of expected standards, were routinely subjected to cruel and ruthless ridicule. Such "timeless" mockery of disabled people – present even today – circulated in medieval texts and images and cannot be ignored. Perhaps the most famous, or at least the most studied, comic depiction of disability is found in the so-called "blind beating the pig" game (Richard, 2015). First documented in the thirteenth century, the "game" proved popular and was still being played at the end of the fifteenth century in at least 11 towns. The notionally sporting event consisted of a quasi-gladiatorial match between blind beggars and a pig, with the beggars earning the right to eat their porcine foe if they beat it to death with a cudgel. The entertainment factor lay in the likely eventuality of the beggars hitting each other, rather than their quarry. A painted miniature (Fig. 2) in a Flemish manuscript of the *Romance of Alexander*, illuminated by Jehan de Grise in 1338–1344, offers a snapshot of a typical match.

On the left, a little boy leads four blind beggars, equipped with sticks, into an arena; on the right, one beggar clubs his compatriot over the head, tripping over an unfussed pig, while the third beggar appears to be about to do the same to another unfortunate friend. Mocking depictions of disability were not only intended to generate laughter but also offered powerful moments of catharsis. Both were generated by the inversion of norms embodied by disabled people (Thomson, 1996). Richard asserts, for instance, that laughing at (the fear of) blindness and poverty helped medieval townspeople to accept disabled people in the urban context. The inclusion of blind beggars as "knights" in tournaments for comic effect, such as the "blind beating the pig" "game," functioned, ultimately, to improve the social inclusion of disabled people more generally. Comedic and parodic representations of disability also served constructive pious and didactic purposes, reminding audiences of the importance of engaging in charity, for example (Gurevitch 1990). Consideration of this aesthetic corpus allows us to better understand the conceptualization of marginality and alterity in the medieval imaginary (or at least the imaginary of artists and their rich clientele), including the ways in which normate subjects structured their own identity in relation to those deemed "other."

III. Integration of Disabled People Within the Social Fabric

While disabled people were subject to mockery in the Middle Ages, that did not preclude their broader social integration. Tantalizing glimpses of the diverse experiences of disability in the era are found in depictions of disabled people in the

Fig. 2 Oxford, Bodleian Library, Bodl. MS 264, f. 74v: Blind people hitting each other with sticks ("blind beating the pig" game). (Copyright © CC-BY-NC 4.0)

context of other facets of their intersectional identities. In manuscript's margins, a relatively limited, yet highly connotative, corpus of images, we find not just disabled beggars but disabled peasants, townspeople, prominent citizens, and even knights. The images provide an invaluable source to understand how disabled people navigated the sociocultural, physical, and mental effects of their conditions, especially in terms of strategies used to maintain their social status after the onset of disability. A miniature from the fourteenth-century *Romance of Alexander* (see Fig. 3) that shows how a servant could help their master manage a mobility impairment is again illustrative.

To the left of the image, a crowned figure reclines on a cart, pushed by his servant to the right of the frame. The king, pictured with only one leg, appears to be a lower-limb amputee, probably as the result of a war injury, as he is still dressed like a knight. The image testifies to the availability of assistive devices, and the usage thereof, by disabled people in the Middle Ages – or at least by members of the rich elite, like the pictured king.

The pervasive ambivalence toward disability in the Middle Ages cannot be ignored, however. This is especially the case in terms of the religious binary which oriented attitudes to disability: disability was either a sign of sin or of holiness, with reactions oscillating between compassion and rejection (Scarborough, 2018). The moral model posits a direct link between personal and/or parental fault and an individual's physical or mental disability, an interpretation that has been in circulation since antiquity (Breitwieser, 2012; Kristiansen et al., 2009). Physical or mental "imperfection" signifies a lack of virtue and is effectively a highly targeted "plague" wrought by a moral defect operative either in the disabled individual themselves or their progenitors (Gianfalla, 2010). By contrast, another model offered a more positive view of infirmity: disability was understood as a spiritual opportunity, a test initiated by God to enable the individual to prove their faith (Cusack, 1997).

Pious Christians should endure all the calamities that the Creator sends them without questioning his goodness. This explains the relatively high incidence of disability in stories of saints and holy men and women. While the connection between disability and holiness could certainly be affirmative, disabled saints were largely defined in relation to their body, with their disability a core aspect of their sanctity (Kuuliala, 2020). In effect, disabled saints were often reduced to their disability alone, with little attention paid to their subjecthood.

Conflicting attitudes toward disability were not mutually exclusive nor entirely fixed: different sources offer different, even contradictory, perspectives on the topic. The moral model foregrounds medieval society as fundamentally exclusionary, with disability stigmatized on theological grounds. Yet its counterpart, the "spiritual-opportunity" model, emphasizes that the challenges posed by disability can be a route to holiness, on the proviso that such difficulties are met with gracious forbearance. Inclusion of difference is presented as an important tenet of a truly pious medieval Christian society (Frohne and Horn 2013). In the end, such ambiguous conceptualizations reveal how prevalent disabled people were in medieval society, with their disability ascribed various significations and instrumentalized for a range of purposes. This is the case, for example, in the leveraging of disability for "narrative prosthesis," a phenomenon evident in many medieval texts, literary and otherwise (Bearden, 2019).

With the term "narrative prosthesis," David Mitchell and Sharon Snyder theorize the ways in which disability is conjured in a given text as a means to propel the narrative forward, triggering the intervention of characters in order to "fix," and thus erase, the disability at hand (Mitchell & Snyder, 2000). Tory Vandeventer Pearman, for example, analyzes the social category of knighthood in terms of its complex internal dynamics (Pearman, 2018). Knighthood rests upon the physical and mental capacity to fulfill chivalric functions, including fighting, military strategizing, and courtly etiquette. Yet the role bears with it a high risk of acquiring disability, through injury. Indeed, as Pearman demonstrates in a close reading of Sir Thomas Malory's *Morte d'Arthur*, a knight is *supposed* to suffer from bodily and mental injuries to prove his valor in combat and, subsequently, to reinforce his chivalric reputation. Contrary to what one might first think, disability did not always prevent knights' participation in battle, as various studies have shown (Metzler, 2013, Chap. 2). Rather, injuries functioned as tangible, bodily proof of a warrior's chivalric prestige and his associated social worth. Malory's knights are, thus, trapped in an endless cycle, healing from battlefield injuries only to return to combat, risking new harms from which they will seek to heal, starting the process anew. In so doing, they seek to heal not only their physical body but also the social body of chivalry itself, paradoxically achieved through battlefield wounds which demonstrate the prestige of knighthood. In this way, disability is utilized in the *Morte d'Arthur* in a mode of "narrative prosthesis," an essential artifact which catalyzes narrative progression, constantly (at threat of) being erased. Pearman also wrote on how "womanhood" and "disability" function in the same way to shape literary texts (Pearman, 2010).

"Narrative prosthesis," as a trope, is perhaps most pervasive in another genre of medieval literature: miracle collections (Spencer-Hall, 2020). These anthologies, collated for canonization trials, present tales of saints miraculously healing all manner of disabilities. Disability in these texts is emphatically a problem to which a solution is sought. Jenni Kuuliala, a pioneer in this area, analyzes testimonies offered in thirteenth- and fourteenth-century miracle collections to uncover the everyday experiences of disabled people which subtend the dominant discourse (Kuuliala, 2016). She notes that, unsurprisingly, individuals had to grapple with significant consequences linked to disability in their daily lives, and the social expectations to which they were subject, if their condition were congenital or if acquired before the age of 14. In other words, disability acquired later in life, when an individual's social status and identity were already established, was understood, and experienced, differently.

Kuuliala deconstructs the "narrative prosthesis" at play in the miracle tales by pinpointing their integral partiality. These accounts are necessarily biased by the hagiographic context in which they appear, not to mention the heightened emotionality of the curative interlude, and, often, the long gap between the date of the cure and its recounting for the canonization process itself. Interviewers seeking persuasive miracle stories for the saint's dossier used pro forma questionnaires to elicit desired responses; witnesses' answers were often summarized or translated from the vernacular into Latin. In other words, miracle collections' treatment of disability is impacted by the sources' demonstrable aims, including verifying the saints' holiness via spiritually impressive healings. The erasure of disability was not a simple "fact" of medieval culture. Kuuliala's work opens up new perspectives on the attitudes of communities and families toward disabled people in premodern times by highlighting the strong bonds of kinship, affection, and solidarity that anchored disabled people in their sociocultural contexts.

Pearman and Kuuliala's scholarship, and the issues raised therein, emblematizes a new wave of research on medieval disability. This research provides concrete evidence of the social integration of disabled people, not just in the elite social sphere but in all kinds of communities, families, and circles of affinity.

Conclusion

Medieval representations of disabled people reflect the integral diversity of experiences of disability in the Middle Ages, as today. They also highlight the complex signification(s)s ascribed to disability in the era. The frequency with which disabled people appear in all kinds of medieval sources reveals their broad social inclusion, even when portrayals of disability are negative, even cruel. Medieval people grappled with what disability meant and how it impacted lives – just as we do in the twenty-first century. The challenges we face today often resemble those faced by our ancestors. Similarly, disabled people across time were not reducible to their disability alone. They could be empowered in various ways and lead rich lives.

Medieval media incorporated, even foregrounded, disabled bodies in all kinds of works, visual, literary, architectural, and more. It is essential to acknowledge, however, that the medieval representations to which we have access are marked by the worldview of their creators and their privileged consumers. As such, they can only offer a partial, at best, view of the lived reality of some disabled people. Nevertheless, these sources transmit the attitudes of a range of cultural taste-makers – patrons, planners, artists, craftspeople, authors, notaries, scribes, and, to some extent, readers and viewers – toward disability. Close attention to a wide range of sources allows us to perceive the structural ambivalence in which disability, as a concept, was embedded. Disabled people were not solely catalysts of Christian devotion and/or subjects of mockery or fear but were also potent symbols of diversity in the medieval world. The disabled body signified sin, but it also embodied Christian ideals of charity, acceptance of one's divine lot, a path to salvation. Disability invited ridicule but also care, assistance, and solidarity from loved ones and the community. Disabled people experienced life in the shifting borderlands between (partial) exclusion and social integration. As in the twenty-first century, the experience of disability in the Middle Ages was anything but uniform.

Abstract

People with diverse bodies and minds have existed since the origins of human habitation in what is now the United States, but how that diversity has been understood has changed dramatically over time and across cultures. This chapter begins by surveying experiences and understandings of disability in Indigenous communities and colonial America, emphasizing how different cultures made sense of human variation in dramatically different ways. Indigenous peoples often interpreted bodies and minds through individuals' relationships with the larger community and the spiritual world, while early settlers established legal structures that sought ostensibly to protect but also effectively marginalized certain classes of people. This chapter then moves to examine disability's intersections with race and slavery, as well as the power and influence of industrial capitalism and medical authority. Attitudes toward disability shaped and were shaped by other forms of discrimination, as well as concerns about economic expediency, and medical experts and the state were increasingly inclined to intervene in the lives of people with disabilities in the late nineteenth and early twentieth centuries. But disability, importantly, has also been reconstituted and redefined through disabled people's efforts to claim what they have been denied or to build

alternative communities and futures for themselves, asserting rights and resisting ableism. Disability history is a powerful tool for illuminating structures and discourses of power, identity, and discrimination in US history writ large, and its ability to demonstrate contingency and change over time helpfully de-essentializes understandings of how people experience differences of mind, body, or senses.

Introduction

People with diverse bodies and minds have existed since the origins of human habitation in what is now the United States, but how that diversity has been understood has changed dramatically over time and across cultures. Over the past several decades, historians of American disability have done remarkable work in responding to Douglas Baynton's now famous comment that "[d]isability is everywhere in history, once you begin looking for it, but conspicuously absent in the histories we write" (2001, p. 52). Baynton reminded readers not only that "disabled people have a history, and a history worth studying" (p. 52) but also that concepts and categories of disability are socially and culturally mediated.

Scholars have examined numerous dimensions of disability in US history, considering the experiences of people with variations of mind, body, or senses, as well as the understandings of disability, ability, and capacity that have shaped their lives and American culture more broadly. In many cases, these understandings intersected with and even helped to define or reinforce other social and cultural dimensions and categories, including race, ethnicity, sexuality, gender, class, and stage of life. Disability history is thus a powerful tool for illuminating structures and discourses of power, identity, and discrimination in US history writ large, and its ability to demonstrate contingency and change over time helpfully de-essentializes understandings of how people experience differences of mind, body, or senses.

Central topics for US disability historians include the histories of institutions and institutionalization, war injuries, societal expectations of labor and laboring bodies, attempts to govern reproduction, and immigration restrictions, as well as identity and community formation, activism, and the struggle for disability rights. Across all of this diverse work, however, a key matter comes consistently to the forefront: categories and experiences of disability were frequently shaped by ableist exclusion that put certain people at – or entirely outside – the boundaries of citizenship and social and cultural belonging. To be sure, people with diverse minds, bodies, and senses have always existed in US history, and some found shared identities on the basis of similar characteristics or experiences. But disability's coherence and significance as an analytical category arguably emerge most clearly through attention to how this diversity was met with various forms of discrimination, including the denial of mobility, social participation and belonging, and the rights and privileges of liberal citizenship. Moreover, the denial of full inclusion and rights to people who either have disabilities or are perceived as disabled has often worked in close conjunction with efforts to enforce other norms, expectations, and prejudices, whether religious, economic, or racial (to name just a few). Disability is thus deeply political and inextricable from other vectors of marginalization.

This chapter examines these processes at work. It begins by surveying experiences and understandings of disability in Indigenous communities and colonial America, emphasizing how different cultures made sense of human variation in dramatically different ways. It then moves to interrogate disability's intersections with race and slavery, as well as the power and influence of industrial capitalism and medical authority. But disability, importantly, has also been reconstituted and redefined through disabled people's efforts to claim what they have been denied or to build alternative communities and futures for themselves, and this chapter ends with attention to these efforts to assert rights and resist ableism. Disability's ragged edges and shifting applications and definitions over time testify to its position at the intersection between human difference and the operation of political and social power.

Indigenous Cultures and Colonial America

Though it is often inappropriate to generalize across Indigenous cultures in North America, scholars have noted that many Indigenous communities in what is now the United States were characterized by systems of social belonging that did not exclude people with disabilities. While people certainly experienced injury, frailty, and sensory or cognitive differences, for example, they continued to participate fully in the life of their communities, share wisdom and experience, and maintain strong relationships. The Umo^{n}ho^{n} (Omaha) Nation in what is now Nebraska, for instance, took human difference and need as matters of course. When a child reached the age of 3 or 4 and could go in whatever direction they pleased, they would undergo the ceremony of "turning the child," indicating that they were ready to be recognized as an individual and inducted fully into the community. But the ceremony also included an acknowledgement of the day when they would reach old age and "be bowed over" (Fletcher & La Flesche, 1911, p. 118). Independence and dependence wove in and out of one another.

Among the Umo^{n}ho^{n}, weak or sick people also played an integral role in the body politic. Washna, a tender part of the buffalo intestine, for example, was reserved for old people who had but few teeth; young people learned that if they ate it for themselves, dogs would bark at them during their hunting excursions (Fletcher & La Flesche, 1911). Similarly, those who were too elderly or infirm to participate in the annual hunts, which could last for weeks or months, were known as he'begthi^{n}, "those who sit half-way" (Fletcher & La Flesche, 1911, p. 99). They were provided with ample provisions and would monitor the corn fields until the rest of the community returned. Many Indigenous communities also made abundant use of signed languages, which allowed Deaf people to communicate with few barriers. Though disabled people might take on unique roles in Indigenous societies, systemic discrimination was uncommon.

That said, what we might now recognize as disability could sometimes be understood as an appropriate consequence for a transgression against the community or the natural order. An over-eager Umo^{n}ho^{n} hunter who rushed a buffalo herd, for example, was “crippled for life” when his horse fell on him, an incident “regarded as a supernatural punishment of his irreverent action in interrupting the prescribed order of procedure” (Fletcher & La Flesche, 1911, pp. 281–2). In other cases, bodily difference might be deemed the result of an encounter with spiritual power. Lavonna L. Lovern and Carol Locust (2013) write of an infant born with an “open spine” (p. 97). A healer explained that when the mother was pregnant, she must have sat beneath a tree whose trunk had been split open by lightning, but this spiritual disharmony could be rectified through ceremony. If there were a category we could call disability – difference, combined with stigma or the denial of full membership in the community – it had less to do with inherent judgements about a particular body or form of cognition and much more to do with the larger set of relations that surrounded the person and their harmony with the social and spiritual worlds.

European arrivals brought substantially different frameworks of disability, though these too varied across time, space, and cultural context. In Massachusetts in 1641, for example, the law assured that no one would be made to fight in wars or work in the public service if they were impeded “by want of yeares, greatnes of age, defect of minde, fayling of sences, or impotencie of Lymbes” (The Body of Liberties, 1641, s. 6; Nielsen, 2012, p. 21). Many more of this document’s clauses also addressed matters of perceived legal competence. For example, the law limited the right to make wills and testaments, or otherwise alienate property, to those “which are of the age of 21 yeares, and of right understanding and meamories” (s. 11; Carey, 2009, p. 38), while land and estate transactions involving “any woman that is married, any childe under age, Ideott, or distracted person” needed to be ratified by a General Court (s. 14; Nielsen, 2012, p. 21). Other colonies and, later, states enacted similar provisions that prevented such individuals from entering into contracts, marrying, serving on juries, or voting and also excused them from some forms of legal prosecution. These categories of social exclusion and protection had a fluidity that encompassed various permutations of sex, age, and cognitive and physical difference. Yet as Allison Carey (2009) points out, “[w]hile offering some degree of protection, the exclusion from rights simultaneously made individuals vulnerable to segregation, marginalization, and abuse” (p. 2).

Even before the United States was constituted as an independent nation, its civic leaders also sought to exclude those whom they perceived as likely to be dependent; this category was not self-evident and was often characterized by some combination of poverty and supposed infirmity. As early as 1701, for example, Massachusetts passed a statute to prevent “the poor, vicious and infirm” from arriving in the colony. The regulations required the master of each ship to post bonds for arriving passengers who were deemed “lame, impotent, or infirm persons, incapable of maintaining themselves,” with the guarantee that the town would not be charged with their support. If the captain would not or could not provide this, he would have to return the passenger to their port of embarkation (Baseler, 1998, p. 71; Nielsen, 2012, p. 27). For families already living within the colonies, however, infirmity was a common occurrence, given the likelihood of serious injury or illness over the course of one's life. Such infirmity, however, would not necessarily have translated into social ostracism; in many cases, families would retain strong bonds with disabled relatives. Notwithstanding some notable examples of exclusion, disabled people often remained emotionally and spiritually significant members of the community and might continue to take on some of the diverse types of labor required in a pre-industrial society (Nielsen, 2012).

There are, in fact, some well-documented historical examples of environments in which physical, sensory, or cognitive difference did not necessarily translate into any obvious exclusion or discrimination. On the isolated island of Martha's Vineyard, for example, a preponderance of Deaf residents – estimated at as many as 1 out of every 5 people in one neighborhood and perhaps 1 in 156 across the island as a whole in the nineteenth century – meant that many hearing people on the island learned sign language (Groce, 1985, p. 42). Deaf residents experienced life with few barriers to participation. They held political office, engaged in social activities, and otherwise existed seamlessly in Vineyard culture. This continued until the rise of residential schools for the Deaf and the island's growing integration with the mainland, which ruptured the society's enclave existence. In other cases, a supportive family and community ensured that a person with a disability was deeply integrated into local life. Penny Richards (2014), for example, examines the life of Thomas Cameron, a white man from a prosperous slave-holding family in nineteenth-century North Carolina. Planter society, writes Richards, "admired individual achievement and intelligence but also upheld such interpersonal, communal ideals as honor, duty, usefulness, and affection" (p. 38). Cameron, whom Richards understands as having a developmental disability, consequently experienced a high level of social connection, with networks of kinship, business, and religion that "generally served [him] well throughout his life" (p. 38).

In the absence of family or community integration and support, however, discrimination and ostracism were likely to occur, and they often fell along lines of preexisting social tension or prejudice. When Anne Hutchinson, for example, dissented from conventional theological beliefs in Puritan Massachusetts Bay Colony, her non-normative births were singled out for particular condemnation. They were evidence, in the Puritan mind, of God's punishment for her transgressions and evidence to the historian of the intersection between disability and Hutchinson's unsettling of the colony's religious, gender, and political norms and power structures (Nielsen, 2012). Similarly, people with illnesses or developmental disabilities who fell outside the provisions of family support and resources might find themselves confined to the hospital or almshouse, institutions that were increasingly present in the colonies in the eighteenth century. Life in these facilities was notoriously harsh, with bad food, corporal punishment, forced labor, and often torturous and confined conditions. There were important exceptions, however: Laurel Daen, for example, details a system of boarding sick and disabled "strangers" (people without settlement rights) in residents' homes in late eighteenth-century Massachusetts (2020). Disability remained a highly relational experience, defined less by the absolutes of one's body, mind, or senses than by one's connections, support, and belonging in a community.

Race and Slavery

Ideas about disability were also deeply interconnected with ideas about race. Stefanie Hunt-Kennedy (2020) notes the emergence of legal codes in seventeenth-century Virginia, as well as the Caribbean, that made freedom or slavery contingent on the mother's status; these descended, she argues, from beliefs about supposed African monstrosity and an obsession with maternal imagination and maternal inheritance. "The English notion that blackness was a heritable and racial form of monstrosity," she writes, "remained a feature of seventeenth-century English conceptualizations of Africans and their descendants, as a timely and advantageous justification for Africans' subjection in the transatlantic economy" (p. 16).

Such intersections between race and disability would continue to be used to justify American slavery in even more explicit terms through subsequent centuries. As Jenifer Barclay (2014) explains, "whiteness claimed whole, able bodies and rational, sound minds as its ontological terrain, the embodiment of not only 'normal' but also 'perfect.' In contrast, blackness represented various forms of defectiveness and abnormality – one might say *disability* – whether these characteristics were real or imagined, visible or invisible, physical or psychological" (27). Noted writers invoked disability as justification for the racist denial of rights and freedoms, often using ostensibly medical rationale. Slavery's defenders, for example, drew on assumptions that Black people were intellectually deficient and thus unable to participate as equal citizens in American society, enforcing a version of liberal citizenship that hastened to exclude people who did not fit the model of a white, supposedly self-governing, intellectually engaged, and landholding man. When the 1840 census appeared to show, inaccurately, a higher rate of mental illness and "idiocy" among Black people in free states, Secretary of State and former Vice President John C. Calhoun (1844/1859) concluded that "in all instances in which the States have changed the former relation between the two races, the condition of the African, instead of being improved, has become worse" (p. 337; see also Baynton, 2001, pp. 37–38). Physicians and intellectuals also undergirded their racist proclivities by appealing to Black pathology and disability. Perhaps most famously, the southern physician Samuel Cartwright (1851) described two major kinds of illness among enslaved people. "Drapetomania," a portmanteau of the Greek words for "a runaway slave" and "mad," was a "disease of the mind causing [the enslaved person] to abscond" and was ostensibly "well known to our planters and overseers" (p. 707). The cure was supposedly some balance of "humane" treatment, an insistence on the enslaved person's submission, and, if necessary, preventive whipping. Similarly, "Dysæsthesia Æthiopis" was Cartwright's invented medical condition for a kind of "rascality" or misbehavior supposedly common among free Black people and on "badly-governed plantations" (pp. 709–10; Baynton, 2001, p. 38). This might involve sleeping during the day; sabotaging tools, crops, and clothing; raising disturbances; and being seemingly insensible to pain when punished. Again, the solution included physical stimulation through hard work and whipping oil into the skin.

Such grotesque examples of invented medical diagnoses and violent “treatment” demonstrate how labels of pathology and disability, increasingly under the authority of the medical profession, operated as a way to exclude people from freedom and the rights of US citizenship. The proposed “cures” similarly tended to benefit those in power, whether those cures involved medical treatment, institutionalization, or, in the case of enslaved people, more forced labor. Moreover, by setting up a rough equivalency between Blackness, disability, and denial of rights, this discourse pushed some reformers to work within these same logics. Those advocating for abolition, for example, might highlight slavery’s tragically disabling effects or contend that Black people did in fact possess the necessary rational capacity and ability to assume the full rights of citizenship. Many anti-slavery reformers appealed to the sentimental image of the “crippled” bondsperson, reinforcing an idea of disability as a dehumanizing state, while abolitionist Frederick Douglass reportedly asserted at the Seneca Falls Convention that rights had their basis in the “capacity of individuals” (Stanton et al., 1881, vol. 1, p. 87; Nielsen, 2012, p. 52; Baynton, 2001, p. 44). The goals of freedom and citizenship, whether for enslaved people or women, were all too often still expressed in ableist terms. Disabled Black people might even be pressed to make their careers as performers by playing to the persistent tropes of racism and ableism. Under the management of a white man, the Black child performer Oscar Moore, known publicly as “Blind Oscar Moore,” toured the United States in the late 1880s and 1890s. Moore would answer obscure trivia questions from memory, demonstrating what white audiences would have understood as an uncanny combination of Blackness, juvenile age, disability, and intelligence (Owens, 2020).

In practice, many enslaved people bore the results of physically disabling injuries and mistreatment, as well as the intergenerational consequences of trauma, malnutrition, and forced labor. Broken bones, missing fingers, scars, blindness, pellagra, tuberculosis, reproductive difficulties, and other ailments were the result of cruelty and poor living conditions, while enslaved people might also be deliberately mutilated as punishment or to prevent repeated attempts to run away. Disability affected the “soundness” and thus the value of enslaved people, which slaveholders and traders determined through a calculus of assessments about fertility, behavior, and age, as well as other physical, mental, or sensory qualities. There is also evidence that in at least some cases, enslaved people would try to use disability as a tool of agency in the marketplace or to negotiate the terms of their enslavement to the extent that they could. Moreover, though disabled enslaved people might receive some treatment from white doctors, many also had their own methods of care, such as herbal or spiritual remedies, claiming community and self-determination, however constrained, in the midst of oppression (Boster, 2013).

Slaveholders were legally required in most cases to provide basic subsistence for aged or disabled bondspeople, and in an effort to prevent pauperism, laws banning the manumission of disabled slaves were widespread. Many disabled enslaved people continued to fill roles on the plantation until they died, whether caring for children, working as watchmen, or doing manual labor. Yet it is also clear that slaveholders sometimes sought to rid themselves of the responsibility of caring for people who could not labor to their expectations. Some might reduce or even withhold disabled enslaved people's rations, clothing, and shelter, leaving their fellow bondspeople to care for them, for example. There is also evidence of owners selling or hiring out aged or disabled bondspeople for medical research (Boster, 2013). Disability might be understood as a matter of differences of body, mind, or senses, but it also shaped and was shaped by other categories of power, privilege, and citizenship. Its meanings could shift in different contexts, with dramatic consequences for individuals' lives.

Industrial Society and Medical Authority

Profound changes in social and economic life in the nineteenth century further crystallized the exclusion of many disabled people from the American body politic. Sarah Rose, in fact, has argued that "disability" emerged as a newly coherent category as a result of the transition to industrial capitalism. Mechanized work called for "intact, interchangeable bodies" (Rose, 2017, p. 2), and wage laborers in urban settings were less able to support relatives who did not readily conform to the demands imposed by this new form of economic and social organization. Massive growth in the field of prostheses after the Civil War and World War I also shows a concomitant reliance on technology to return disabled soldiers, as well as injured workers, to productive paid labor, the new arena for the adjudication of citizenship in American life.

These processes, too, were shaped by ideas about race. Ellen Samuels, for example, argues that unsettling changes in social and economic life in the nineteenth century led to the emergence of "fantasies of identification," as Americans sought to "definitively identify bodies, [and] to place them in categories delineated by race, gender, or ability status." These categories, which often overlapped with and defined one another, were ostensibly based in verifiable biological fact, but in reality they rested on shifting, and scientifically specious grounds (2014, p. 2). Similar trends continued in the twentieth century. For instance, the Federal Board of Vocational Education (FBVE), established in 1917 and responsible for rehabilitating soldiers into workers, routinely "conflat[ed] disability with blackness," seeing disabled Black soldiers as "defective by definition" (Lawrie, 2016, p. 10). Training programs focused largely on agricultural and industrial education, and physicians would attribute many veterans' disabilities to venereal disease or tuberculosis rather than wartime service. These men might thereby be disqualified from full access to programs and compensation that could have otherwise upset racial hierarchies and undermined the property and literacy requirements that barred many Black people from voting in the Jim Crow South. Paul Lawrie (2016) concludes that "[t]he FBVE's characterizations of blacks as congenital racial cripples rationalized the economic and social self-interest of southern and national white supremacy" (p. 121). Hospitals, moreover, looked for evidence of African American degeneracy and deviance in former soldiers; many of these men were denied anything but palliative care, and in some cases, people with mental and physical disabilities were confined in carceral institutions. Lawrie cites a case in which the Red Cross and Veterans Bureau sent 30 African American veterans with tuberculosis to the Central State Hospital for the Criminal Insane in Nashville, with the justification that "their condition could be attributed to a uniquely racial mental affliction" (qtd. in p. 131).

In the process of America's westward expansion, categories of disability also justified exclusion or violent cure for Indigenous people, who were often cast as disabled in some way. Indigenous people might be incarcerated in the Canton Asylum for Insane Indians, for example, which operated from late 1902 to 1934 in South Dakota. The processes of diagnosis were deeply dubious: they often transmuted resistance, struggle, and dislocation, as well as authorities' stereotypes, prejudices, and exploitations, into categories of disability and thus disenfranchisement (Burch, 2014). In the first decades of the twentieth century, moreover, competency commissions evaluated Indigenous people's capacity to hold the patents for their own land. These commissions assessed people on their physical and mental ability, education, language skills, financial history, and blood quantum, among other categories. The criteria and calculus for "competency" were often improvisational and opportunistic, used to satisfy Americans' desires for land or control or their sense of self-righteous humanitarianism. Disability could be weaponized as tool of exclusion and dispossession in America's westward settlement.

As the United States expanded – both geographically and in terms of the reach of government power – states and the federal government alike became more explicit in their deployment of medical and eugenic authority. Rather than simply excluded from the rights of liberal citizenship, disabled people would be eliminated from American society altogether. Immigration legislation, for one, cast an increasingly wide net of discrimination (Baynton, 2001). The 1891 Immigration Act barred "[a]ll idiots, insane persons, paupers or persons likely to become a public charge, [and] persons suffering from a loathsome or a dangerous contagious disease," as well as criminals and polygamists (s. 1). The 1907 legislation went further, listing "[a]ll idiots, imbeciles, feeble-minded persons, epileptics, insane persons, and persons who have been insane within five years previous," as well as people with two or more previous attacks of insanity, people with tuberculosis or any other "loathsome or dangerous contagious disease," and people deemed "mentally or physically defective" in a way that "may affect the ability of such alien to earn a living." "[P]aupers" and "persons likely to become a public charge" were similarly excluded (s. 2). Flexible interpretation allowed these labels to be applied unevenly, facilitating and compounding discrimination along other axes, including sexuality, gender, and class, as well as race and ethnicity (Baynton, 2001; Dolmage, 2018). As Jay Dolmage (2018) explains, "[i]n the heterotopia of deviation created at Ellis Island, undesirable bodies were shaded with attributions of disability; and disabled bodies were 'raced' as nonwhite, or as disqualified whites" (p. 17).

Eugenic sterilization programs also arose in the opening decades of the twentieth century, as concerns about white racial degeneracy and amelioration evolved into a broader set of associations between heredity, disability, and supposed criminality, social deviance, and dependency. The control of reproduction was ostensibly a way to contain and ultimately eliminate these perceived social ills. While the first eugenic sterilization law was passed in Indiana in 1907, such programs multiplied in subsequent decades, particularly as psychologists such as Henry H. Goddard, Director of Research at New Jersey's Vineland Training School for Feeble-Minded Girls and Boys, promoted new ideas about the hereditary nature of feeble-mindedness. Standardized intelligence tests offered a new diagnostic tool, and Goddard famously coined the term "moron" to refer to a "high-grade feeble-minded person" (Goddard, 1912, p. 11). Estimates of the rate of feeble-mindedness varied, as did the exact parameters of various proposed diagnostic sub-categories, but the label was increasingly associated with susceptibility to criminality, antisocial behavior, and sexual depravity. Most troublingly for reformers, some "feeble-minded" people might be indistinguishable from "normal" members of American society, posing an invisible menace. Compulsory sterilization laws received their greatest boost, however, with the Supreme Court case Buck v. Bell, in 1927. Carrie Buck, a young resident of the Virginia State Colony for Epileptics and Feebleminded, was targeted for compulsory sterilization on the basis of feeble-mindedness, a diagnosis whose danger to society was seemingly confirmed by Buck's already having given birth to a daughter, Vivian, out of wedlock. The state of Virginia selected Buck's case as a testing ground for the legality of their sterilization law, and it was confirmed by an 8–1 majority decision. By the 1930s, more than 30 states had sterilization laws on the books. California alone was responsible for approximately 20,000 out of the 60,000 sterilizations that are known to have occurred across the United States in the twentieth century (Stern, 2016, p. 115).

Sterilization, perhaps unsurprisingly, targeted people who were already socially vulnerable. Women made up approximately 61% of sterilizations by the early 1960s (Carey, 1998, p. 84), and studies of California's sterilization archive have demonstrated that people of Mexican origin were sterilized in disproportionate numbers (Lira & Stern, 2014). Though many compulsory sterilization programs faded after World War II, they did not disappear entirely. Between 2006 and 2010, for example, at least 148 women in California prisons, the majority of whom were Black and/or Latina, were sterilized without appropriate consent (Jindia, 2020), and activists and advocates around the country continue to seek reparations for decades of forced sterilization. Fears about uncontrolled sexuality, racialized reproduction, and social deviance shaped and continue to shape experiences and understandings of disability.

Reclaiming Rights, Resisting Ableism

In the twentieth century, many disabled people have increasingly embraced not only shared identities but also shared political power, seeking liberation from the discrimination and disenfranchisement that have historically characterized so many experiences of disability. Yet this work has happened in sometimes fragmented ways. As activist Paul Longmore explained in an oral history, "there is no single homogeneous disability rights movement. There really are at least a half dozen movements about disability rights and each one reflects the interests and issues and concerns and needs of a particular disability constituency" (2006, pp. 161–2; Pelka, 2012, pp. ix–x).

Though some clubs and publications for disabled and Deaf communities existed in the nineteenth and early twentieth centuries, one of the first major activist organizations for disabled people was the New York-based League of the Physically Handicapped, which operated between 1935 and 1938 and opposed disability discrimination in the Great Depression's job relief programs. Through protest and political meetings, they were able to win some inclusion for disabled people in New York City's Works Progress Administration jobs, for example, but they had more difficulty securing victories at the federal level. Using slogans like "We Don't Want Tin Cups. We Want Jobs," the League's members pushed back against the stigma, assumptions of non-productivity, and social ostracism that had long been associated with disability in industrial America (Longmore & Goldberger, 2000, p. 904).

Other organizations, such as the National Federation of the Blind and the American Federation of the Physically Handicapped, founded in the 1940s, also focused on disabled people's exclusion from the workforce. The latter organization was successful in pushing for the 1945 declaration of "National Employ the Physically Handicapped Week," as well as the establishment of an attendant committee, later known as the President's Committee on Employment of People with Disabilities; the Office of Disability Employment Policy assumed its responsibilities starting in 2001 (Jennings, 2009). This activism explicitly worked within frameworks of liberal American society that privileged work as a pathway to citizenship and sought to challenge the prejudices that excluded disabled people from the workforce.

Some disabled people and communities also created material worlds that resisted ableism and the limitations of the mainstream built environment. Established in 1958 out of the community of the Toomey Pavilion rehabilitation center in Cleveland, the *Toomey J Gazette* shared tips for fashioning do-it-yourself adaptive technologies. It was headed by a team of volunteer women, three of whom were disabled polio survivors (Williamson, 2019). Starting in the 1960s, many disabled Americans also began to present a united force against systems of oppression that excluded them not only from the labor market but also from education, public spaces, and civic life more generally. Activist Ed Roberts famously registered in classes at the University of California, Berkeley, in 1962, and his leadership attracted other disabled students. Ten years later, these young activists would be some of the core founders of the Center for Independent Living, a model of self-directed, community-based living for disabled people (Pelka, 2012). Other disability groups, including associations of psychiatric survivors, also emerged in this era: the Insane Liberation Front was founded in Portland, Oregon, in 1970, while similar organizations emerged in Boston and New York in 1971 and San Francisco in 1972 (Chamberlin, 1990). These activist organizations spoke out most ardently against harsh treatments like forced drugging and involuntary confinement. Disabled people labelled the authorities and institutions that traditionally claimed responsibility for them as oppressive and even violent and rejected limitations on their rights and freedoms.

Protest also became an increasingly important tool for the Disability Rights Movement during the 1970s and 1980s; these activists were inspired, at least to some extent, by the Civil Rights Movement. When the Rehabilitation Act of 1973 was passed, for example, it included Section 504, which prohibited discrimination on the basis of disability by any public or private entity receiving federal funds. Without regulations to guide its implementation, however, the law would offer little legal leverage for disabled people. In 1977, a coordinated, cross-country effort by activist groups resulted in protests at US Department of Health, Education, and Welfare buildings across the country, with the goal of accelerating the regulations' publication. The largest protest was in San Francisco, where activists occupied a floor of the building for nearly 4 weeks. Recognizing a shared struggle against oppressive structures of power, the Black Panther Party – two members of which participated in the sit-in – offered its support (OToole, 2015). In a similar vein of protest, in March of 1988, students at Gallaudet University in Washington DC barricaded the campus, frustrated by the appointment of a hearing university president and a long history of hearing leadership and administration. They called for the appointment of a Deaf president, as well as the reconstitution of the Board of Trustees to ensure a Deaf majority of members. The protest was successful, and I. King Jordan became the university's first Deaf president (Christiansen & Barnartt, 1995).

While numerous local and federal laws addressed disability rights through the 1980s, the best-known legislative achievement of the Disability Rights Movement in the United States is the Americans with Disabilities Act (ADA), passed in 1990. The ADA, a comprehensive work of civil rights legislation, lays out specific requirements for non-discrimination in employment, as well as the accessibility of public services, transportation, built environments, and telecommunications, for example. While many celebrated its scope, as well as its requirements for personalized, reasonable accommodation, the ADA has not been without its critics. Some observers have questioned the ADA's neoliberal orientation. Its provisions against employment discrimination, for example, do little to address low wages and job instability for many disabled workers, and disability benefits remain insufficient (Russell, 2003). Pursuing legal recourse for ADA violations remains onerous. Moreover, in practice, the courts have narrowed the definition of disability, limiting the ADA's applicability, and the media has also often been unsympathetic to disabled plaintiffs, suggesting that the fundamental structures that privilege conformist labor, wealth, and the powerful remain undisturbed (Schriner & Scotch, 2003). Experiences of disability, and even who counts as disabled, continue to be defined and shaped by social and political norms and forces, and many disabled people pair their efforts toward civil rights and inclusion with efforts to build their own communities and alternative social structures.

Conclusion

Disabled Americans continue to advocate for fair treatment and full social inclusion and access while also embracing, in many cases, unique disability identities and communities. The history of disability in the United States demonstrates the category's breadth, malleability, and intersection with other structures of power, prejudice, and discrimination, but disability has also proved a powerful rallying point for individuals to assert belonging and rights and work to end ableism in American life. The field of disability history continues to expand, with a growing presence in classrooms, museums, websites and documentaries, conferences, and scholarly publications. Future work will continue to explore the rich histories of disabled people's lived experiences, especially across other, intersecting categories of identity, as well as disability's political and discursive significance in American history more broadly.

Disability History of Modern East Asia: An Overview

10

Wei Yu Wayne Tan

Contents

Abstract

A disability-based approach to history (disability history) gives us perspectives on historical ideas of disability in modern East Asian societies. This chapter will emphasize three main areas: (1) disability, science, and medicine; (2) disability, law, and activism; and (3) disability and popular culture. In this chapter, the modern period is taken to mean the nineteenth century and thereafter, and the focus will be on China, Japan, and South Korea.

Keywords

Disability · Disability history · Disability studies · China · Japan · South Korea · Modern East Asia · Modern history · Modern societies

Introduction

A disability-based approach to history (disability history) gives us perspectives on historical ideas of disability in modern East Asian societies. This chapter will emphasize three main areas: (1) disability, science, and medicine; (2) disability, law, and activism; and (3) disability and popular culture. In this chapter, the modern

period is taken to mean the nineteenth century and thereafter, and the focus will be on China, Japan, and South Korea (where “Korea” instead of “South Korea” is mentioned, it refers to the Korean peninsula and its inhabitants).

The social model in disability studies informs the general understanding of disability in this chapter. This model recognizes that society creates disability, and that disability is inseparable from the environment or system in which it is created (Adams et al., 2015). This idea about the social and political construction of disability can also be incorporated into the broad understanding that a society and its culture sustain disability (Waldschmidt, 2018).

This chapter’s historical approach validates the relationship between disability and society and between disability and culture. It will become clear that in each modern East Asian society, like in other modern societies around the world, the social, political, ideological, and medical realms of culture have defined disability as a concept and as an experience.

Disability and Its Contexts

1. Disability, Science, and Medicine

The classification of disability in East Asia today generally recognizes the categories of physical, mental, and intellectual disabilities. However, in the premodern (pre-nineteenth century) eras, there was no standard idea of what made up disability nor a designated category of disability in the scientific or medical vocabulary. What we think of as disability today has to be reinterpreted through the lens of the history of medicine of those eras, because disability was regarded as disease and illness. This section surveys the relationship between disability and medicine in premodern East Asia and the relationship between disability and science and medicine in modern East Asia from the nineteenth century through the early twentieth century.

China was the main source of medical thought and practices in premodern East Asia. Through long periods of intercultural exchange, Japan and Korea developed their own styles of medicine based on Chinese sources. *The Yellow Emperor’s Inner Classic*, which dates from the first century BCE or so, was one of the earliest known medical texts in China (Scheid, 2015). That text had tremendous influence on medical thought not only in China but also in Japan and Korea over many centuries. We should note that varieties of Chinese medicine developed within the respective traditions of China, Japan, and Korea (Cook, 2020; Suh, 2017; Trambaiolo, 2013).

The Yellow Emperor’s Inner Classic represents the traditional model of Chinese medical thought. The human body was described as a system of “organs” and “viscera” (we would recognize some of them as organs in modern human anatomy) linked through networks of conduits. Blood and *qi* (breath) flowed along these conduits, and health depended on their flow (Scheid, 2015). Illness could arise, for example, when there was “fullness” or “emptiness” (overabundance or deficit) of *qi* in the organs and viscera or when “winds” that caused disease invaded the body (Kuriyama, 2006). The human body was also understood to be more than a closed, corporeal body in many ways, because it embodied elements of the cosmos and functioned in synchronization with seasons and cycles of change (Kuriyama, 2006; Scheid, 2015). Even today, these interrelated concepts of health and illness continue to be important characteristics of traditional medical thought in East Asia.

The understanding of mental disability, among other disabilities, is one important example that shows how the frameworks of understanding disability changed as East Asian societies evolved. Although current studies of disability urge us to delink disability from medical perspectives, studying mental disability in earlier time periods, in fact, must involve studying the language used in medical sources from those times. In premodern China, medical theories outlined various causes of mental illness. Before the eleventh century, for example, mental illness was thought to be caused by "winds" that harmed the body (Baum, 2018). This is clear evidence of the influence of medical sources such as *The Yellow Emperor's Inner Classic*. Later medical theories, such as those of the Qing period (1644–1911), emphasized the role of mucus and fire in the chest in causing disorders that could affect the heart, which was the site of the body's "mind" (Baum, 2018). Because the "mind" was believed to be inseparable from the physical body, and from the vital flow of blood and *qi* around the body, treatments of mental illness not only aimed to break down mucus but also to restore the balance and flow of life's essence in the body's system.

Medical scholars of premodern Japan and Korea also employed the medical vocabulary of Chinese medical scholars in their approaches to mental illness. In Japan, during the Tokugawa period (1600–1868), some medical scholars linked the stagnation of *ki* (the Japanese reading of *qi*) in the body to emotional and mood changes and to irregular and even immoral behaviors (Kitanaka, 2010). This manifestation of psychological, behavioral patterns hints at clinical symptoms of what could have been mental depression. There were scholars at that time who argued that stagnated *ki* led to the dysfunction of the liver, the organ that was understood to control emotions: when stagnation set in, it could fuel "fire" in the liver and destabilize a person's emotions (Daidoji, 2013). In Korea, during the Chosŏn period (1392–1910), there were also scholars who theorized mental illness as illness caused by "fire," and the general population knew mental illness as "fire illness" caused by unrestrained emotions (Yoo, 2016). It is common to find in popular religions across premodern East Asia the association of mental illness with spirit possession, and popular cures for mental illness included religious exorcism through shamanistic rituals (Kang, 2006; Yoo, 2016).

Psychiatry was introduced from Europe and North America (global, cultural regions commonly referred to in the scholarship as the "West") to East Asia in the late nineteenth century, and its introduction is often seen as a turning point in the history of mental disability. Psychiatry was one of the representative branches of the new, Western medicine that catalyzed the acceptance of medicine based on modern human anatomy. While this may mean to some people that mental disability was "discovered" in the modern era of Western medicine, we may also argue that mental disability had existed for a long time but emerged as a new disability when the medical vocabulary and references changed.

In China, during the Republican period (1912–1949), psychiatry transformed the ways mental illness was treated. Psychiatry reoriented medical thought by emphasizing the brain, not the heart, as the organ of cognition, and clinical therapies were developed around this new psychiatric model (Baum, 2018). At the same time, traditional medical beliefs were not completely effaced by Western medicine, as many people found ways to appropriate familiar, historical practices. One notable social feature of that period was the founding of public mental institutions ("asylums"), such as the Beijing Municipal Asylum (Baum, 2018). As Baum (2018) points out, the early Republican Chinese penal code of 1912 was intended to delineate the place of criminals with mental illnesses in the nation's legal system. Public mental institutions offered a solution to shelter and confine them, and because those institutions were often poorly staffed and underfunded, the level of care was generally poor. Through social and legal measures to contain mental illness, government officials became more involved than before in the surveillance of deviant behaviors (Baum, 2018). Even so, the family remained the core unit of caretaking. This situation was quite similar in Japan as well.

Japan in the early Meiji period (1868–1912) took the lead in East Asia in adopting psychiatry. This was because Japan started to modernize its industries according to Western standards before the rest of East Asia could. The Japanese government studied the German model of medical education and spearheaded the reinvention of medicine in Japan (Kim 2014). Like in China, psychiatry in Japan overturned the traditional understanding of human anatomy and privileged new methods of investigating mental illness as psychological, cognitive disorder. Japanese students traveled abroad to Germany and Austria to study psychiatry and returned to Japan to take up the reins of teaching psychiatry (Kim 2018). Hospitals were new institutions of the Meiji period (Burns, 1997), as were mental institutions (Kim 2018). In the early twentieth century, psychiatry had become part of mainstream medicine, and at hospitals, experimental treatments of mental illness, such as shock therapies, were tested on patients (Suzuki, 2010).

Japan used laws to organize the national and local approaches to mental illness. The Custody Law Regarding People with Mental Illness of 1900 outlined the family's obligation to protect family members with mental illness. However, the outcome was often deplorable because, as a standard practice, many families inhumanely confined those family members in cages at home (Nakamura, 2013). Later, in 1919, the Mental Hospitals Act aimed to offer public support for people with mental illness through hospitals (Kim 2018). The Japanese government also tried to reform the medical system in Korea, after Japan's annexation of Korea in 1910 (Japan's colonial rule of Korea ended in 1945 after World War II). One of the Japanese government's tasks was to oversee the psychiatric care of people with mental illness through the Government-General Hospital (Yoo, 2016). However, due to limited resources, most people with mental illness in Korea, and in Japan, had to be cared for through their own means at home, and treatments at mental institutions did not replace home-based care.

From the late nineteenth century, ideology in East Asia also played a major role in influencing ideas about able-bodiedness and hence ideas about who was able-bodied. In this regard, the ideology was often flawed and prejudiced, because it claimed to use science to prove why some categories of people were more able than others. The rhetoric about race, society, and culture pursued certain reasoning to achieve social and political goals. Hence, as we survey disability history, we have to understand that a society's ideological purpose informs notions of disability.

Darwinism (Darwinist thought) was introduced to East Asia in the early 1870s. Like their European and North American contemporaries, intellectuals in East Asia became interested in exploring the social dimensions of Darwinism – that is, they became interested in how evolution could explain social change and provide a blueprint for society to advance itself (Chung, 2014; Cross, 1996). Social Darwinism, this new area of thought, generated vigorous debates in the intellectual and political arenas. The political environment of East Asia in the late nineteenth century was ripe for Social Darwinism to feed imaginations of national (and nationalistic) agendas. Japan saw the depredations by foreign powers that had befallen the Qing dynasty as a cautionary tale of what could happen to a society that could not defend itself against global threats. Japanese intellectuals aimed to turn Japan into a "strong state" in "the survival of the fittest" (Godart, 2017) and explicitly invoked "race" as an axis to organize the rhetoric of Japan's "racial" superiority (Chung, 2014). At the same time, intellectuals in China and Korea wanted to translate the ideological potential of Social Darwinism into action, to mobilize their respective nations' populations and overcome their "weak" national statuses (Chung, 2014; Tikhonov, 2016).

From the start, eugenic thought (ideas about heredity, birth, and genes) in East Asia was central to discussions of Social Darwinism. Eugenicists argued that those members of society deemed to be the most "useful" (often measured in economic and military terms) had to fulfill society's mission to thrive. Those intellectuals aimed at projecting a masculine image of strength, vitality, and courage of their nations and recognized that women played a necessary role because of their potential to bear "healthy" children and nurture them. Gender was a category that was regulated because of its social and political significance. In Japan, laws from the 1870s through the early twentieth century were revised to define abortion as a crime (Burns, 2013). From the 1920s, when eugenics gained pace, tensions developed between advocates of population control, who supported measures such as birth control, and their opponents (Kim 2008). Advocates of women's issues, including some women, even challenged the patriarchal framing of gender (Otsubo, 2005). In Korea's colonial period, and similarly in those years in China, birth control was debated, because although it was viewed as a means to propagate and enhance "good" racial traits, it could cause low population growth and be detrimental to a nation's strength (David, 2018; Kim 2008).

Clearly, in these East Asian contexts of Social Darwinism and eugenics, disability was interpreted to be undesirable. Associated with "weakness," disability was strongly discriminated against as a negative factor in a nation's plan to cultivate an "able-bodied" population. While societies have a duty to protect their populations, including people with disabilities, the reality is that across East Asia, there was little commitment of resources to ameliorate the well-being of people with disabilities in the period leading up to World War II.

2. Disability, Law, and Activism

World War II had a devastating toll in East Asia in terms of the scale of destruction it caused. The war also permanently rearranged power dynamics in that region. This section looks at disability in East Asia in the post-World War II period and discusses examples of the intersection of law and activism in disability history.

The immediate postwar decades (1940s–1970s) were significant in Japan's disability history. After Japan's surrender to the United States, the Supreme Commander of the Allied Powers (SCAP) oversaw the administration of Japan. During the occupation, the SCAP regarded Japan's demilitarization, democratization, and economic reconstruction as priorities. As a result of the war, there were significant numbers of disabled war veterans, and poverty was a pressing social problem. New laws had to be legislated and implemented to raise the standard of living. The SCAP, in conjunction with the Japanese national government, used legislation to help people regain their livelihoods (Pennington, 2015). As Lee Pennington (2015) points out, the Livelihood Protection Law of 1946 did not create privileges for disabled war veterans. This was a political choice. The SCAP was clear about not rewarding wartime service, particularly because Japan had to be held accountable for its role in World War II.

In 1949, Japan passed the National Welfare Law for People with Physical Disabilities, the first law in Japan that was centered on disability and welfare (Pennington, 2015). Under that law, civilians with physical disabilities and disabled war veterans were regarded equally, and the main goal was to help people with physical disabilities gain access to rehabilitation and other social services (Yamada, 2013). After the occupation, as disability became a mainstream category in welfare, people with other disabilities were legally recognized. The National Law for the Welfare of People with Intellectual Disabilities of 1960 and the Basic Act for People with (Physical) Disabilities of 1970 provided the framework for legal approaches to disability (Stevens, 2013). Later, in 1993, the original Basic Act for People with (Physical) Disabilities was updated to include mental and intellectual disabilities under the same label of disability.

South Korea's postwar disability history, like Japan's, was influenced by democratization and disability rights activism. The Korean peninsula was divided by the USSR and US into North and South Korea at the end of World War II in 1945; the Korean War (1950–53) deepened the conflict between the two Koreas. After the Korean War, South Korea was ruled by military dictatorships until the 1980s when it started to transition to democratic rule. South Korea's democratization, though delayed compared with Japan's postwar transition, proceeded apace. As that happened, there were growing demands by activists for the expansion of disability welfare and laws. Activists used the 1988 Paralympics hosted by South Korea as a context to draw attention to the existing social challenges for people with disabilities (Kim 2017), and by the 1990s, their activism had led to changes in the Disability

Welfare Law, the enactment of the Law to Promote Employment Among People with Disabilities, and the increased representation of people with disabilities through the Korea Federation of Organizations of People with Disabilities (Arlington, 2020). In Japan, the Green Grass Association, an activist group representing people with cerebral palsy, led disability rights movements and was joined by other groups, such as those advocating independent living for people with disabilities and those supporting deaf culture (Nakamura, 2006; Stevens, 2013). As activism gathered momentum in Japan and South Korea, activists achieved some success in lobbying their governments for antidiscrimination legislation to protect the rights of people with disabilities and facilitate their participation in society (Arlington, 2020; Heyer, 2015; Stevens, 2013).

China's postwar experiences, like South Korea's, were tumultuous right after World War II because of postwar conflicts. China was plunged into civil war, and in 1949, the Chinese Communists emerged victorious over their Nationalist rivals. After the civil war, the Chinese Communist Party's (CCP) Chairman Mao Zedong was instrumental as the leader who set China on a new path to accelerate economic and industrial growth. Government campaigns such as the Great Leap Forward of the late 1950s (which was part of the series of Five-Year Plans) were intended to rebuild China's foundations and, also, reorganize Chinese society around a collective sense of nationhood – a nationhood that brought together individuals under a sovereign, national will. Amid the developments that unfolded was the collectivization of Chinese society through units called collective brigades. This collective social arrangement fostered new bonds of belonging among the Chinese population and seems to have supported people with disabilities (Fjeld & Sagli, 2011).

A new phase of disability history in China began in the 1980s. Deng Xiaoping, the leader of the CCP who succeeded Mao, recalibrated Mao's policies to pursue state-controlled liberalization of Chinese society, particularly China's economy, and that included "re-opening" China to the world. Disability in China drew more public attention, generally because of greater awareness of disability following the United Nations' Year of People with Disabilities in 1981 (Kohrman, 2005). In both South Korea and Japan, the United Nations' recognition of disability also raised awareness of disability, and the increased awareness informed the legislative context of disability (Arlington, 2020; Heyer, 2015). In 1982, advocates in China formed the Club for Youths with Disabilities (Disabled Youth Club), one of the earliest activist groups whose work cut across categories of disability (Kohrman, 2005). The China (Chinese) Federation of People with Disabilities was founded in 1988. Deng Pufang was a founding member, and his status as Deng Xiaoping's son was very likely a reason why the federation had support from within the Chinese government (Kohrman, 2005). This disability federation is an example of the system that Matthew Kohrman calls modern Chinese "biobureaucracy," government and non-government institutions that share bio-medical ideals of rehabilitating people with disabilities, whom they regard as people with "damaged," "sickly" bodies (Kohrman, 2005). Using his influential status, and building on the success of the disability federation, Deng Pufang, along with others close to him, played a critical role in cementing the Law on the Protection of People with Disabilities in 1990. In recent years, China has been working toward reforming its disability welfare system so as to more equitably distribute resources across rural places, which tend to have less resources than urban areas to cope with disability, poverty, lack of healthcare, and rising insurance costs (Fjeld & Sagli, 2011).

While many of the laws in postwar East Asia in their respective ways appear to have helped to make disability acceptable, there is a long history of negative attitudes toward disability. In fact, some laws even deprived people with disabilities of their rights. One of Japan's most restrictive laws was the National Eugenics Law of 1940. The 1940 law, which was heavily influenced by eugenic thought and laws of Nazi Germany, legalized the sterilization of people who had hereditary medical and social conditions. For example, Japanese eugenicists regarded alcoholism as a social condition with hereditary causes, and people with mental and intellectual disabilities were among those identified by the 1940 law for forced sterilization (Kato, 2009; Robertson, 2002). It is said that during the wartime period in Japan, just over 530 people with disabilities were forcibly sterilized, and until more information emerges, this figure may suggest that the scale of forced sterilization was limited because of other wartime priorities (Kawashima, 2013).

Even in the postwar period in Japan, eugenics dominated the mindsets of scientific, medical, and government officials and had a devastating impact on the social and medical treatments of disability. Japan's Eugenics Protection Law of 1948 validated eugenic reasoning in legalizing abortion, though it cited maternal health as a reason for abortion (Kato, 2009). That 1948 law, an extension of the 1940 law, also expanded the scope of sterilization to make it legal to perform sterilization even on people who did not have hereditary conditions. For one, what was hereditary was not always scientifically proven or justified, because prenatal testing technology was limited (Kato, 2009). Both the 1940 and 1948 laws, from today's perspective, can be seen as being harshly punitive against people with disabilities – stigmatizing disability as medical abnormality, perpetuating social misconceptions of disability, limiting the reproductive rights of people with disabilities, and reducing a woman's role to that of giving birth to "healthy" babies. In 1952, the 1948 law was revised to make it legal for a woman to cite financial difficulty as a reason to have an abortion, making abortion also an economic choice (Kato, 2009). The law was finally abolished in 1996.

South Korea's postwar eugenic policies have a history that can be traced back to the Korean colonial period. Eugenic thought was introduced to Korea through Japan. While Korea did not have a eugenics law in that period that paralleled the 1940 law of Japan, the Public Health Office, a branch of the colonial government, oversaw efforts to create "strong," "fit" Koreans and even approved of sterilizing "unfit" Koreans (Kim 2017). Though Japan's official policy was to integrate Koreans into the Japanese population, hardline Japanese factions rejected the argument that Koreans were equals (Caprio, 2009). Korean eugenicists occupied a difficult intellectual position, because they could not read against the grain to openly espouse "superior" innate qualities of the Korean ethnicity. Yet they perhaps knew that although eugenic thought was discriminatory, it was still a useful ideological, rhetorical tool to explain how Koreans could become "more progressive" as a society. After World War II, the military government of South Korea revived eugenics in discussing ways to envision the physical, economic health of the Korean nation (Kim 2017). This was one motivation for introducing the Mother and Child Health Act of 1973. Abortion was already a crime from 1953, but the law of 1973 made abortion legal in certain cases, for example, when there was reason to suspect that an unborn child's parent had a hereditary disease – in this context, disability was the same as disease (Kim 2017). The law granted a physician the authority to recommend a patient's sterilization to health authorities should a hereditary disability be discovered or diagnosed. There was little recourse for a patient in such a situation. In 2019, the Constitutional Court of South Korea reversed the ban on abortion and ordered that the law be revised by 2020 (Choe, 2019).

China's history of postwar eugenic policies is part of the nation's history of population growth control and economic planning. During World War II, as living conditions were poor and the war against Japan was claiming the lives of many Chinese, the Chinese Communists saw high birth rate as necessary to compensate for population loss (White, 2006). After World War II, the CCP's drive to regenerate China's population strength influenced the nation-building process in the years between 1949 and 1952. However, as the CCP was planning the first Five-Year Plan (1953–1957), it had to rethink its approach to population growth. There were real concerns that uncontrolled, rapid population growth in the nascent nation could compound the problem of scarce economic resources (White, 2006). The CCP adopted a model of "birth planning," which was conceived as a practical plan to address birth control and as a response to reconcile competing demands for population growth and economic growth (White, 2006). Hence, "birth planning" was integral to China's postwar vision of industrialization that could be sustained by, and not undermined by, population growth.

From 1979, the one-child policy – the government policy of having one child per family – became a necessity and a reality in China. To enforce the policy, the CCP delegated government officials to keep track of birth rates and to order sterilizations to be carried out when necessary (White, 2006). Campaigns to sterilize the population spread across the nation, especially in rural places where a large proportion of the population lived. The policy had exceptions, and what was acceptable depended on how the provincial and local governments of areas where people lived responded to the policy. Between 1983 and 1989, as agricultural reforms were changing the ownership of lands and the organization of labor among the nation's peasantry, some places gave permission to families to have two children (White, 2006). The policy was also adjusted to apply to cases in which a family whose first child was a daughter could try to have a second child – this was a reflection of Chinese society's gender bias for sons. Disability was a significant factor in the interpretation of the policy. A family with a child with disability (or disabilities) could be allowed to have a second child, and this discrimination against disability was reflected again in the Law on Population and Birth Planning of 2001 (Fjeld & Sagli, 2011). Most recently, China has revised its policy, encouraging families to have up to three children to reverse the projected decline as a result of the one-child policy (Wee, 2021). It remains to be seen how disability will impact the future of this new policy.

The history of Hansen's disease (known in the earlier medical and historical literature as leprosy) can be examined in the modern context of eugenics laws in East Asia. Like mental illness, Hansen's disease is a medical condition that has received much attention, because of a history of controversial, discriminatory treatment – a history that can be traced to premodern sources. Though Hansen's disease is often regarded as a disease (as the name suggests), in a medical sense, it can also be a disability because of the serious physiological damage it can cause. Physical disfigurement is a visible sign of the disease (disability) and was a reason why many societies in the past shunned people with the disease (disability), as well as those suspected to suffer from it.

In 1957, China introduced the National Plan for Leprosy Control (Leung, 2009). However, the developments of "leprosy control" from that time were uneven across China, and rural populations were particularly vulnerable because of the limited scale of healthcare. Yet, no matter how the government tried to improve public health, social discrimination against Hansen's disease was ingrained in basic aspects of life. People with Hansen's disease were banned from getting licenses to practice in the medical profession; not only that, they were also denied the right to marriage until civil laws were changed in 2001 (Leung, 2009).

In modern Japanese and Korean societies, Hansen's disease is still a condition that is deeply stigmatized, even though effective therapies to treat it have been around for decades (Burns, 2019; Kim 2017). In 1907, the Japanese government introduced the Leprosy Prevention Law, requiring people with that condition but without family to take care of them to be institutionalized (Arlington, 2016). The 1907 law also influenced policies toward Hansen's disease in colonial Korea. The Japanese law was revised in 1931 as the Lifetime Confinement Law, broadening the government's authority to institutionalize a person for life (Arlington, 2016; Burns, 2012). Under the postwar Eugenics Protection Law of 1948, people with Hansen's disease were forcibly sterilized, though evidence suggests that sterilization had been carried out on inmates at institutions even before that law was introduced (Burns, 2019). Japan's 1931 law was finally repealed in 1996, and that marked the start of a new chapter of activism (Burns, 2012). The legal systems of Japan and Korea have started to respond to allegations of past injustices against people with Hansen's disease, and over the years the activist groups have found new political voices to represent their rights (Arlington, 2016; Burns, 2019).

3. Disability and Popular Culture

The representation of disability in modern East Asian popular culture is an important reflection of themes about disability in cultural history. Cinematic and literary genres introduce audiences to disability, and these genres are also sites where stereotypes of disability, and responses to them, are affirmed or challenged. This section looks at some representations of disability and discusses how they are related to their contexts.

Modern Japanese popular culture (film and television) features blind people in roles that "celebrate" their incredible ability and imagines them to be powerful, sometimes clairvoyant, humans who are more capable than sighted people. Miminashi Hōichi (Hōichi the Earless), a blind musician in the Japanese genre of ghost tales, is portrayed as such a "super" blind person. He uses his music to speak to the supernatural world, but because he is blind, he does not know that he is "seen" by the ghostly audience (Prince, 2018). Another famous blind character is Zatōichi, a masterful swordsman. He is depicted as a "super" savior who does not shy away from tough battles to save victims from injustice (Okuyama, 2020). From a historical perspective, many blind people in premodern Japan were musicians, and though there may be similar ideas in popular culture then and now about blind people, blind musicians' genres and performances belong to the contexts of their times (Tan, 2019). The context of premodern (early modern) Japanese society was also favorable to the social organization of blind people (Groemer, 2001; Tan, 2019). Beginning in the Meiji period, the Japanese government focused on raising the level of student enrollment in primary education. As part of this push for education, students with visual and hearing disabilities could enroll in special schools (schools for blind and deaf students), where they were taught academic subjects and skills for vocations, such as music and artisanry, though it is evident that not every child with disabilities could afford an education (Arakawa et al., 1976; Nakamura, 2006).

Modern Japanese popular culture also tackles themes about living with disability. Ōe Kenzaburō, an iconic Japanese writer, uses his works to explore the ups and downs in his relationship with his son Hikari, who has disabilities. He writes about his emotional struggle upon learning that his son could be born with disabilities and about the anxiety of a parent in a society which strives to eliminate disability (Shek-Noble, 2019). Film and literature also examine disability related to Japan's traumatic past. The atomic bombings of Hiroshima and Nagasaki at the end of World War II resulted in countless deaths, injuries, and intense suffering. In postwar works, survivors of those bombings are portrayed as victims bearing war's physical and psychological scars (Shibata, 2019). In Japan's postwar reconstruction period, environmental pollution posed a serious threat to the nation's growth and to human lives. Ishimure Michiko, a writer and environmental activist, uses literature to shed light on industrial mercury poisoning in the fishing town of Minamata. The disease, diagnosed in the 1950s and called Minamata disease, caused serious physical and neurological disabilities among the local residents (Thornber, 2012). The Fukushima nuclear meltdown of 2011 (following the earthquake-tsunami disasters) is a more recent example of environmental pollution in Japanese history. The incident triggered new fears of disability from exposure to radiation, and there is concern that those fears may deepen eugenic views of disability (Mashimo, 2018).

The modern cultural context of South Korea, like Japan's context, tends to highlight that disability is undesirable and diminishes a person's "value" to society. Eunjung Kim's (2017) analysis of disability in South Korea introduces the idea of "curative violence." It is the idea that disability has to be "cured," but "cure" is not what it seems, because it affirms a certain norm that can disrupt the “personhood” of the person with disabilities who is subjected to that treatment (Kim 2017). In recent decades, South Korean filmmakers produced documentaries about disability and gender, challenging the uncritical idea of disability that demeans women with disabilities and limits their prospects of marriage and other assumptions that are eugenically motivated to stop women with disabilities from fully embracing their personal desires (Kim 2017). Novels and films have also highlighted physical and mental violence inflicted upon people with disabilities to “cure” them, unjustified violence that has become an expression of the systemic oppression to dehumanize people with disabilities (Kim 2017).

In modern Chinese popular culture, film opens up new avenues to explore different dimensions of disability. Early postwar films used disability for propaganda to enhance the trope of surmounting disability (seen as adversity) to become “useful” to the nation’s labor force (Dauncey, 2020). People with physical disabilities are cast in roles that glorify the virtue of persevering against disability to benefit the common good (Dauncey, 2020). This ideology of nation before self, or collective effort before individual needs, was central to the Communist government’s powerful mobilization of national spirit. From the 1980s, with the changeover of political leadership and a slow “opening” in the political climate, Chinese films looked beyond predictable, propagandistic plots with disability – though this does not mean that there was broad acceptance of politically sensitive topics. For example, Chinese filmmaker Zhang Yimou’s *To Live*, a 1994 film, can be seen as an allegorical story of China, told through the life of a young woman with hearing and speaking disabilities whose stoic, unbroken silence is a symbol of the nation’s unhealing wound and its unspeakable pain (Riep, 2018). This film was banned in China (Dauncey, 2007). As Steven Riep (2018) explains, later films from the 2000s about disability such as *Breaking the Silence* have focused on the complex parent-child relationship, exploring the choices that a parent has to make in taking care of a child with disabilities. These perspectives, though not always told through the voices of people with disabilities, make disability an everyday experience to which families can relate and humanize people with disabilities in ways that supersede previous propagandistic, nationalistic themes.

Conclusion

This chapter has surveyed disability history through the discussion of science, medicine, law, activism, and popular culture in modern East Asian societies. In each of the societies presented in this chapter, disability was linked to developments in science and medicine. Laws were influenced by those scientific and medical perspectives, and popular culture expressed popular attitudes toward disability. While this chapter uses disability history to draw out some common points about disability in modern East Asian societies, it also reveals that disability history is about diverse perspectives on disability because disability in each society and each culture is unique.

Transnational History of Disability: Reflections

11

Gildas Brégain

Contents

Abstract

Transnational history is a research perspective that has been widely legitimized and popularized over the past decade, but few disability historians have adopted this approach to date. This chapter aims to review the first transnational studies in the history of disability, highlighting the interest of such a historiographical approach and its benefits and disadvantages. The approach to transnational history continues to be promoted mainly by young historians working in non-Western fields (Eastern Europe, Latin America, Africa) or with a global approach. This innovative historiographical approach generates considerable contributions in terms of knowledge and research perspective. It offers a new reading of history, less national-centric and Western-centric, by shifting the focus to other countries in the world whose experiences in disability public policy must not be ignored by Western historians. It highlights the role of NGOs, private foundations, transnational activist networks, intergovernmental organizations, and new figures (international experts, missionaries, etc.). It thus requires recognition of the foreign contribution to the construction of domestic norms and realities and thus the hybridity of policies pursued at the national level. It also leads to relativizing the singularity of national social movements and national public policies, by pointing out convergences (and divergences) with other

national realities. The adoption of such an approach also leads to situating local or national experience in a more global historical context (international or regional scale), thanks to a better knowledge of the "field of possibilities" of disability policies at the international level.

Keywords

Transnational history · Entangled history · Global history · Disability · Public policies · Intergovernmental organizations

Transnational history is a research perspective that has been widely legitimized and popularized over the past decade and has been the subject of methodological articles, historical dictionaries (Iriye & Saunier, 2009), handbooks (Saunier, 2013), and specialized journals (*Yearbook of Transnational History*). However, there is no single definition of transnational history among historians. One of its main promoters, Pierre-Yves Saunier, defines it as a history that is focused on interactions, connections, and flows between and across nations over the last 200–250 years and that it is not a history of nations (Saunier, 2013). This historiographical trend has already spread widely among gender historians and childhood and ethnic minority historians, but few disability historians have adopted this approach to date. For instance, the recently published collective syntheses on disability history (Hanes et al., 2018; Rembis et al., 2018; Walmsley & Jarrett, 2019) are organized as juxtapositions of articles with national or local points of view. Only a few authors adopt a resolutely transnational perspective by considering transnational flows and transnational actors (Murray, 2018; McCarthy, 2018; Brégain, 2018a).

The history of medicine and public health already took a transnational turn more than a decade ago. Several works note the influence of international conferences, intergovernmental organizations (Hygiene Organization, World Health Organization, Pan American Health Organization, etc.), or private American foundations in the establishment of policies to combat endemic diseases (polio, leprosy, typhus, etc.) at the international level (Weindling, 1995; Borowy, 2009; Vollset, 2013) or more specifically in some European countries (Piana, 2009; Vargha, 2018), Latin American countries (Cueto & Zamora Mesia, 2006; Palmer, 2015), or North American countries (Inglis, 2014). Similarly, several works document the transnational dimension of the promotion of Atlantic and Latin eugenics (Mitchell & Snyder, 2003; Kühl, 2013; Turda & Gillette, 2014).

The fields of the history of psychiatry and, to a lesser extent, deaf history seem to be ahead of other areas of disability, with the publication of books that demonstrate a progressive "transnational shift" (for psychiatry, see Ernst and Mueller 2010; Ernst 2013, and for deaf history, see Murray, 2007 and Kusters and Friedner (eds.) 2015). Some older works deal with transnational movements for the rights of persons with disabilities (Driedger, 1989; Groce, 2002), but they do not meet all the criteria to be considered as works of transnational history of disability, because they are mostly based on a single archive or on data provided by members of a single NGO and therefore contain many approximations. They are also characterized by a hagiographic tone.

This chapter aims to review the first transnational studies in the history of disability and to shed light on both the richness and benefits of such a historiographical approach and its disadvantages. I will first examine the emergence of this field of research on an international scale over the last decade (I), before highlighting the many innovative results of this research perspective (II). I will then analyze the very complex methodology that needs to be implemented (III).

A Field of Research That Has Emerged Internationally Over the Last Decade

Transnational disability history has been developing since the early 2000s and has become stronger in recent years. This timing can be explained by the conjuncture of two factors: on the one hand, the rise of transnational and global approaches in the historical sciences (stimulated by the internationalization of research) and, on the other hand, the adoption of the *Convention on the Rights of Persons with Disabilities* by the UN in 2006, which led many sociologists and political scientists to point out the importance of the internationalization of public disability policies.

At the dawn of the 2000s, new historiographical trends were emerging, all affirming the need to write histories that go beyond the framework of states and nations: connected history (Subrahmanyan, 1997), entangled history (Werner & Zimmermann, 2003), and transnational history (Iriye & Saunier, 2009). The methodological boundaries of these different historiographical trends have not yet been definitely established. These different historiographical trends seek to distinguish themselves from the older currents of world history and global history, which became institutionalized in the 1980s and 1990s (Maurel, 2009). Those currents claimed to embrace the history of all parts of the world in the case of the former and the study of *globalization* and international issues for the latter. Their work is often criticized for its hasty generalizations, heavy reliance on secondary sources, its Western-oriented worldview, and the fact that they tend to perceive contact between actors in an asymmetrical way (Bertrand, 2013). Some works, however, are more subtle, cover only two or three locations, and attempt to combine games of scales with phenomena of interdependence and connections. Sebastian Conrad proposes, for example, to consider the global history as a perspective, which “is often more a matter of writing a history of demarcated (i.e. non-‘global’) spaces, but with an awareness of global connections and structural conditions” (Conrad, 2016: 12).

An advantage of connected or entangled histories over world or global history is that they do not presuppose that the actors studied are aware of the existence of the world as we currently perceive it and that they perceive their life experiences or problems as belonging to the global scale. The actors studied may also be indifferent to what is happening in other parts of the world (Bertrand, 2013). The writing of an entangled history is demanding in terms of method: it requires adopting a comparative approach that considers the historical variability of the categories studied, as well as the existing variations between the different geographical scales, and adopting a reflexive approach (Werner & Zimmermann, 2003). The connected history approach affirms the need to look at non-Western societies, to play with scales (local, state, etc.), and to highlight the trans-state, inter-imperial, and intra-imperial flows (people, objects, knowledge, or political ideas) and interactions. In line with this approach, Romain Bertrand insists on the researcher's obligation to pay the same attention to non-European sources as to European sources; to reconstruct the framework of thought, discourse, and practices of each actor at the moment when the connections occur; and to ensure that vernacular statements are translated in a comprehensive manner (Bertrand, 2013: 195). He wishes to construct a history "in equal parts" by attributing equal dignity to the points of view of actors from different cultural areas. The comparative work carried out is relatively flexible, allowing for the highlighting of existing discontinuities between societies. This method thus accepts the idea of a possible irreducibility of the historiographies of the societies studied and the absence of common points in their worlds of thought (Bertrand, 2013).

While authors of transnational history often employ a variety of methodologies, they always place particular emphasis on individuals, ideas, markets, and organizations that act between and across nations (Iriye & Saunier, 2009: 20). They focus in particular on the work of intergovernmental organizations, international NGOs, and international scientific networks. Nevertheless, the field of transnational history is not free from legitimate criticism. In fact, it may seem inaccurate to speak of transnational history before the 1960s, given the predominance of the imperial form in Europe until that decade (Cooper, 2010: 190).

The transnational disability history approach is mainly promoted by European scholars (Baár, Brégain, De Schutter, Stoll, Van Trigt, Derksen, Walmsley, Ernst, Cleall, etc.) or North American scholars (Murray, Hanes, Commend, Galmarini) and more rarely by Latin American researchers (Ramacciotti) working on the nineteenth or twentieth centuries. They are generally younger historians working in non-Western fields (Eastern Europe, Latin America, Africa, Asia, Soviet Union) or with a global or imperial approach (Cleall, e.g.). These various researchers analyzed intra-imperial, transnational, and international circulation of individuals (association leaders, intergovernmental experts, missionaries, blind or deaf students, disabled athletes, etc.), objects (prostheses, Braille books, etc.), money, ideas, concepts (the idea of the rights of disabled people, the concept of independent living), and practices such as the segregation of people with leprosy (Edmond 2006). These researchers have examined the exchanges that take place in international conferences and meetings (Séguillon, 2002; Benvenuto & Séguillon, 2014), NGOs of disabled or blind (Galmarini, 2021) or deaf persons (Murray, 2007), the migration plans of some deaf people in the nineteenth century (Cleall, 2016), the construction of international or European disability policies, as well as international or foreign influence on the construction of national social movements or on the construction of national disability policies (Ramacciotti, 2015; Brégain, 2018b; Baár, 2020).

The low interest of historians who specialize in Western countries (i.e., the case of the United States, Canada, England, Australia, or Western European countries) in this transnational approach can be explained especially by two reasons: on the one hand, they do not feel that public policies and the life experiences of people with disabilities in their countries have been influenced by intergovernmental organizations or foreign experiences; on the other hand, they wrongly consider the internationalization of public disability policies to be a post-1980s event. On the contrary, researchers working on non-Western countries are quick to perceive the influence of intra-imperial and international flows of NGOs and intergovernmental bodies at the local level. Does this mean that the transnational disability history would be more relevant in non-Western countries than in Western countries, because of the distinct historicity (and supposed lateness) of their public disability policies? The answer is no, for several reasons. For one, if Western countries have indeed been the promoters of models of public disability policies at the international level, it would be wrong to think that the public policies that have been developed there owe nothing to transnational exchanges of information, at least since the nineteenth century. Many Western actors (doctors, missionaries, nursing sisters, etc.) travelled abroad to visit assistance or care institutions and participated in international conferences. In this way, they built up scientific and social expertise based on a broader horizon of experience than just their national territory. This supranational expertise enabled them to establish their legitimacy at the national level among their peers and with political leaders. Even without going abroad, associations and political leaders often used foreign examples or international texts to develop their projects in the field of disability (new legislation or institutions). The institutions created were generally equipped with new technologies purchased abroad (iron lungs, orthopedic control for cars, etc.). In addition, intergovernmental bodies had a direct influence on the construction of national disability policies since the 1950s, by sending international experts to advise governments or by adopting binding standards (in particular the CRPD and ILO Convention 159, as well as the market opening and austerity policies imposed by the World Bank, the International Monetary Fund, and the European Commission) or non-binding standard (like the Declaration on the Rights of Disabled Persons).

Transnational exchanges (cultural, economic, material, etc.) therefore contributed to transforming local realities on many levels: that of public disability policies, life experiences, but also subjectivity and hopes. Indeed, the transnational circulation of the idea of the rights of persons with disabilities contributed to nourishing and strengthening the idea among persons with disabilities that they hold rights, thus creating a feeling of injustice with regard to a situation deemed intolerable. This circulation transformed partly the subjectivity of individuals, which are fundamental to understanding the dynamics of claims and protests.

Unexpected and Surprising Results, Which Lead to Changing the Way We Look at the Scales of Public Action and Social Movements

This innovative historiographical approach generates considerable contributions in terms of knowledge and research perspectives. It offers a new reading of history, less national centric and Western-centric, by shifting the focus to other countries in the world (particularly those in the Global South and in Eastern Europe) whose experiences in disability public policies must not be ignored by Western historians.

First, it highlights the role of NGOs, private foundations, transnational activist networks, intergovernmental organizations, and new figures (international experts, missionaries, association leaders, migrants, etc.) in the construction of international or regional policies. In my book *Pour une histoire du handicap au XXe siècle. Approches transnationales (Europe et Ameriques)*, I detail how these different actors contributed to the construction of international standards on disability until the 1980s. In the inter-war period onward, many NGOs (Fédération internationale des mutilés, invalides du travail et invalides civils, Association internationale des étudiants aveugles, International Society for Crippled Children, etc.) mobilized themselves to defend the rights of the various categories of disabled persons at the League of Nations and the International Labour Organization, but their mobilization largely failed. After the Second World War, other NGOs (World Council for the Welfare of the Blind; the International League of Societies for the Mentally Handicapped, the Fédération internationale des mutilés, invalides du travail et invalides civils, etc.) had a considerable influence on international disability policies, particularly in getting the International Declaration of the Rights of Mentally Retarded Persons approved by the United Nations, and ILO Recommendation No. 168 on the Rehabilitation of Disabled Persons in 1983. I also pointed to the role of intergovernmental organizations (United Nations, International Labour Organization, World Health Organization) in promoting a North Atlantic project for modernization of rehabilitation from the 1950s onward. This project was characterized by a very comprehensive approach to the question of disability (taking into account all problems, prevention, psychological adaptation, legislation, etc.); the equalization of the rights of all categories of disabled persons and the need to coordinate public disability policies; and a very liberal economic approach to occupational integration (refusal of quotas, creation of sheltered workshops, selective placement, etc.) (Brégain, 2018b). Susanne Commend also documented the participation of Quebec philanthropists in the transnational mobilization in favor of disabled children during the inter-war period, demonstrating the sometimes contradictory aspect of their discourse, which included the promotion of a social conception of disabled children and the legitimization of certain eugenicist values (Commend, 2019). Paul Van Trigt has also shown the growing influence of several NGOs (Disabled Peoples' International, European Disability Forum) on European public action, on the development of the Community action programme for disabled people called Helios I (1988–1991) and Helios II (1993–1996) promoting integration and equal opportunities for disabled people, as well as on obtaining the inclusion of disability in Article 13 of the 1997 Amsterdam Treaty, which stipulates that "the Council (. . .) may take appropriate action to combat discrimination based on sex, racial or ethnic origin, religion or belief, disability, age or sexual orientation" (Van Trigt, 2019).

Second, this historiographical approach requires recognition of the foreign contribution to the construction of domestic norms and realities and thus the hybridity of policies pursued at the national level. Katharina Heyer examined how activists in

Germany and Japan were inspired by the US disability rights movement and the Americans with Disabilities Act of 1990 to demand and achieve significant changes in the direction of national policy (Heyer, 2015). She studied the travels of German activists to the United States, as well as the travels of US activists to Japan, which facilitated these transfers. This very interesting work deserves to be put in perspective by two remarks: she focused on American influence (thus prejudging that it is the only foreign influence) and presupposed that there was no transnational circulation of information prior to the American with Disabilities Act (ADA). In my research, I analyzed the way in which experts commissioned by intergovernmental organizations (ILO, WHO, UN) advised the governments of Latin American countries (Argentina, Brazil) on disability issues during the 1950s and 1960s. These experts encouraged governments to coordinate or unify their sectoral policies in the field of disability. They facilitated and participated in the establishment of national rehabilitation centers and reoriented the modalities of occupational integration of persons toward economic liberalization (rejection of the quota principle applied to private companies, creation of sheltered workshops, selection of candidates for professional rehabilitation, etc.). They also promoted a new distribution of medical specialties in the field of rehabilitation (physiotherapists, occupational therapists, physiatrists) and adapted sport. Their intervention favored the partial convergence of national disability policies toward the principles of the North Atlantic rehabilitation project; this convergence was not complete because of the resistance of certain local actors and the low investment of governments. In all three countries, the imperative of coordinating public disability policies led to the questioning of the fundamental characteristics of previously established sectoral policies: the allocation of specific rights to a subcategory (blind, war-disabled, etc.), as well as the existence of administrative bodies responsible for conducting a sectoral policy (rehabilitation, specialized education, assistance for the blind, etc.). Indeed, during the 1970s, there was a partial desectorization of sectoral disability policies, with the disappearance of certain administrative bodies dedicated to a specific disability (war-disabled and blind in Brazil) and the partial disappearance of rights previously given to a subcategory (in particular the blind in Argentina). Other studies have shown that the influence of international organizations on national policies was very heterogeneous and depended on the countries concerned, the local actors, and the times. It often proved to be complex, sometimes very weak and sometimes strong. The historian Monika Baár, for example, has shown that the International Year of Disabled Persons (IYDP) organized by the UN did not result in a strengthening of the British government's action in this field, quite the contrary. The British royal family was very much involved in the organization of the IYPD at national level, but media campaigns were mainly aimed at increasing the resources of large charitable and private organizations (Baár, 2020). British governmental actors were turning away from the concept of independent living to pursue neoliberal policies, rejecting demands for social justice that accompanied the concepts of independent living. They reduced the social benefits of people with disabilities to discourage what they perceived as an attitude of social dependency. They only adopted measures that promoted accessibility and challenged discriminatory attitudes, thus eclipsing the demands of associations in the economic and employment spheres. The measures adopted by the government then led to the aggravation of poverty and the increasing marginalization of persons with disabilities. On the other hand, Sam de Shutter showed that local Kenyan actors did not question the content of the World Programme of Action (1983–1992) put in place by the UN or the universal language used in it (De Schutter, 2019).

Third, the approach of pointing out the convergences (and divergences) with other national realities also leads to relativizing the singularity of national social movements and national public policies, as well as to pointing out the existence of transnational conjunctures (economic, social, political, climatic) in the field of disability history. The study of sources in several countries and the consultation of foreign bibliographies lead us to qualify – and sometimes contradict – the assertions of associative or administrative sources, which generally overvalue the originality and pioneering character of their actions by underestimating the existence of similar projects abroad. By investigating the treatment of intellectual disabilities in France and Germany during the first decades of the twentieth century, Valentine Hoffbeck thus relativized the supposed German advance in their treatment (Hoffbeck, 2016: 114). She showed that the support for German reforms was not universally shared among the French alienists, who were also interested in the experiences of Switzerland, Belgium, and England. She also identified similar dynamics in the two countries (rhetoric of sorting in the treatment of intellectual disabilities, development of a eugenics program, etc.), but Germany stood out radically on an international scale with the introduction of the euthanasia policy in August 1939. Conducting transnational research has led me to observe that the phenomenon of the gradual firing of blind people from teaching posts in ordinary educational institutions and in specialized institutions for the blind observable in the French metropolis during the 1930s (Brégain, 2019) was also observable from 1931 onward in Spain and in 1944 in colonized Tunisia for blind Muslims teaching in Koranic schools. Observing the frequency of this phenomenon prompts the identification of a transnational trend of expelling blind people from teaching posts, linked to the desire to professionalize this specialized education and the gradual devaluation of the teaching capacities of blind people since the beginning of the twentieth century by transnational networks on the education of the blind.

Moreover, Anne Klein has emphasized the importance of the circulation of Western knowledge (notably through the translation into German of the writings of several English and Italian psychiatrists) in the construction of criticisms of psychiatry in West Germany during the 1970s (Klein, 2015). She has therefore shed light on the construction of the anti-psychiatric protest dynamic on a European scale, showing its eminently transnational character. Other research has enabled me to put into perspective the originality of the Anglo-Saxon protest movements of disabled people in the 1970s by insisting on the existence of similar and equally intense protest movements in other countries such as Spain and Argentina, linked to the international promotion of the rights of persons with disabilities, which accentuated the sense of injustice felt by persons with disabilities in many countries of the world (Brégain, 2013). In these cases, it is possible to consider each national experience as a possible variant of the same international dynamic.

Other researchers have studied the borrowings and exchanges between national social movements and national organizations, such as the connections that associations of people with physical disabilities in Hungary had with organizations in other European countries, and with DPI (Baár, 2015), or the support of German disability movements to Nicaraguan disability movements (Stoll, 2015).

Fourth, the adoption of such an approach also leads to situating local or national experiences in a more global historical context (international or regional scale), thanks to a better knowledge of the "field of possibilities" of disability policies at the international level and of the international standards that regulate this field of possibilities. It therefore becomes possible to situate the national or local experience as an innovative policy or one in chronological discrepancy with foreign practices or standards legitimized by international organizations. Let us take the example of the teaching of Braille in specialized institutions, which became widespread in Western countries in the eighteenth and nineteenth centuries and in countries in the South in the twentieth century. This teaching method was legitimized by an intergovernmental organization, the Child Protection Committee of the League of Nations, in 1932 (Brégain, 2018b). The legitimization of this teaching method was accompanied by the marginalization of other experiences of teaching blind children that existed at the same time, such as the teaching of blind children alongside sighted children in municipal public schools in Scotland since the 1870s and France since the 1880s and the oral teaching of blind children alongside sighted children in Koranic schools in Muslim countries (a system that existed at least since the twelfth century). The decision adopted by the Child Protection Committee in 1932 therefore represented a reduction in the field of possibilities in favor of the dominant solution in European countries. Of course, this decision alone does not explain the marginalization of the existing alternative in Arab countries. Other factors contribute to it, including (1) the defense of the system of Braille teaching in specialized institutions by transnational advocacy networks for the rights of the blind; (2) the fact that French people organized a few specialized institutions for teaching French Braille in the empire's territories (like the Algerian colony or Tunisian protectorate) during the first decades of the twentieth century, inspired by the model of metropolitan institutions; and (3) the fact that several dozen blind North African students went to the French metropolis to benefit from schooling in these institutions during the first half of the twentieth century. The latter logically defended this educational modality once they returned to their countries, even after the conquest of independence. More generally, a detailed knowledge of this field of possibilities makes it possible to better understand the perception of local actors of the "modernity," "backwardness," or "anachronism" of their national or local policies.

It also makes it possible to point out the importance of a country's geographical and geopolitical positioning in relation to the different poles of social innovation in the disability sector at an international scale. Esme Cleall has shown the crucial role of the exchange of educational techniques, deaf students, and teachers between the territories of the British Empire, particularly between England, Canada, and

Australia (Cleall, 2015). Maria Cristina Galmarini has shown the crucial role of the All Russian Blind Union in the circulation of knowledge and materials for the blind between the Soviet socialist countries during the 1950s (Galmarini, 2021). In the same way, the geopolitical proximity of some African socialist countries easily explained the choice of new independent governments (like Algeria, Tunisia, etc.) to be inspired by some experiences of the Soviet Bloc countries (Poland, Yugoslavia, etc.) in the field of rehabilitation, like the disabled workers' cooperatives. If circulations of models and experts between socialist countries are perceptible, the attitude of the independent governments of North Africa is characterized above all by their pragmatism. With a great shortage of personnel and equipment, the Algerian and Tunisian leaders sought assistance from many countries, whether socialist or capitalist (United States, Germany, etc.). When asked, the French government refused to send special teachers for the blind to Algeria. Thus, the conquest of independence in Algeria and Tunisia led to the – partly involuntary – break with dependence on France in the field of social protection for the blind, in favor of a multi-polar dependence. On the other hand, the geographical proximity of Mexico to the United States and Canada is a key factor for understanding why Mexico coordinated disability policies in the 1950s by centralizing all the services concerned with disability (including special education) within an administrative department, the *Dirección General de Rehabilitación*, whereas the other Latin American countries did not give impetus to such unification of the rehabilitation and special education sectors until the 1970s. Ultimately, restoring the various possible pasts makes it possible to break definitively with the idea of a linearity of transformations observed on a national scale and obliges us to renounce any glorious interpretation of the national destiny.

Fifth, this historiographical approach also leads to the revision of established periodizations in disability history, by identifying the existence of paradigm shift at the international level and by insisting on the long duration of certain transnational phenomena. It encourages us to take into account not only international conferences, international standards and international programs but also certain national experiences of countries in the North and South as important milestones for understanding disability history at the international and national levels. In deaf history, the *International Congress for the Improvement of the Condition of Deaf-Mutes* held in Milan in 1880 is already well identified as a major turning point because of its role in the international legitimization of oralism and in the discrediting of sign language. Similarly, the first international conference on leprosy held in Berlin in 1897 legitimized the segregation of all leprosy patients as the only means of fighting leprosy. My own research has enabled me to identify several important chronological milestones, including *The Blind (Education, Employment and Maintenance) Act* adopted in England in 1920, a milestone for the cause of the blind at the international level, and ILO Recommendation No. 99 of June 1955, which endorsed a shift toward the economic liberalization of international disability policies under pressure from Anglo-Saxon governments. In fact, during the development of standards on the vocational rehabilitation of the disabled between 1953 and 1955, the United States, the representatives of other capitalist countries, and the employers' representatives succeeded in shifting ILO policies on vocational rehabilitation toward a more liberal economic policy (Brégain, 2019). ILO Recommendation No. 99 legitimated the exercise of a paid professional activity in the context of a liberal market economy. It institutionalized the selective placement of disabled workers in a competitive job market and symbolically depreciated the use of compulsory employment quotas (by submitting its adoption to "specific conditions" and by drowning it in a high number of different possible measures). This recommendation excluded less-productive disabled workers from ordinary work placement and expected them to work in sheltered workshops, as freelance workers, or condemned them to the absence of a remunerated activity. Monika Baár and her team of researchers are committed to demonstrating the crucial role of the International Year of Disabled Persons organized by the United Nations in 1981, a catalyst moment for the politicization of many local and national associations of disabled people (Baár, 2015). The work carried out by this team also leads to reassessing the significance of existing "turning points" in the field of disability at the international level. For example, Paul Van Trigt has shown that during the 1990s there was no "paradigm shift" from a social protection model to an Anglo-Saxon model of civil rights and anti-discrimination at the European Union level, but rather a combination of the two models (Trigt, 2020). It is important to note that most studies continue to legitimize Western-centric periodizations overall, whereas the transnational history approach aims precisely at questioning the legitimacy of Eurocentric chronologies (Clavin, 2010: 627). This persistent flaw can only be overcome once there is a proliferation of detailed studies on the history of disability in the Global South.

Sixth, a transnational approach can lead us to re-examine the originality of the concepts and terms used locally and invites us to denaturalize and historicize socially accepted concepts and point out the importance of linguistic translations. While the French terminology of disability acquired great international renown during the first decades of the twentieth century, the preponderance of the English terminology of disability on an international scale was solidified from the 1950s onward. Thus, while the French concept of *rééducation* was favored by officials of the International Labour Office in the early 1920s, it was then the Anglophone concept of *rehabilitation* (with a distinct meaning and a more economic liberalization orientation) that appeared in the ILO recommendations in the mid-1950s and in UN programs in the sector (Brégain, 2018b). From the Second World War onward, French- and Spanish-speaking actors sought to translate identification (disability, handicapped, etc.) and Anglophone concepts (rehabilitation, etc.) into their languages with varying degrees of difficulty and success. In the Spanish-speaking sphere, disability specialists between the 1940s and 1970s developed multiple proposals for identification inspired by the terminologies disabled (*dishabil*, *discapacitado*) and handicapped (*handicapeado*) or based on other semantic arguments (*menor-válido*, *minusválido*) (Brégain, 2018a).

Seventh, as Ernst and Mueller point out in the introduction to their book on the transnational history of psychiatry, the cross- or transnational approach allows us to cut across and question the relevance of dichotomies such as center/periphery, eastern/western, traditional/modern, and even global/local (Ernst & Mueller, 2010: xi) by highlighting the interactions between these categories and their fluid boundaries. Dóra Vharga, for instance, shows that during the Cold War, Hungarian physicians collaborated with those in the West to find vaccines for the polio epidemic and design appropriate care. In addition, Hungarian hospitals received equipment and vaccines from hospitals in the West and other Eastern European countries (Vargha, 2018). My own research has led me to downplay the supposed "modernity" of the North Atlantic project for the rehabilitation of the disabled promoted by the UN, WHO, and ILO in the 1950s, by giving real legitimacy to other conceptions of progress and other political projects in the sphere of rehabilitation, including socialist projects of rehabilitation and projects from developing countries.

A Complex Methodology to Implement

Historians have used a variety of archives to carry out their transnational research: the archives of international organizations (League of Nations, ILO, WHO, UN, etc.); the archives of international NGOs, diplomatic archives, and administrative and associative archives; and journals of associations, conference proceedings, and also sometimes interviews with administrative officials or activists to supplement the gaps and silences of particular sources, especially in Southern countries like Tanzania (De Schutter, 2019) and Argentina (Brégain, 2018b).

Writing a transnational history has several methodological advantages. By encouraging the researcher to take an interest in different countries and at the international scale, it allows the researcher to identify differences in the historiographical treatment of the same subject from one country to another, to note inequalities in the preservation of archives from one country to another, and to cross-reference data collected in many archives. An archive that is not available or incomplete in one country can be compensated for by discoveries in another country. For instance, the Brazilian parliamentary archives I examined contained many letters from associative, political, or business leaders taking a position on draft laws relating to disability, which was not the case in Argentina. The consultation of international archives (ILO, UNESCO, UN) and some archives of national associations connected in the past to international networks offered great surprises. I have thus found many documents relating to the construction of national disability policies in Brazil, Argentina, Algeria, Tunisia, and Chile in the ILO archives, as well as journals published by associations of blind people in these different countries in the historical collection of the Valentin Haüy Library in Paris.

However, the methodology of transnational history is very challenging to implement. This difficulty is related first and foremost to the complexity of an analytical framework that combines multiple scales and also to the technical, economic, and linguistic obstacles to be overcome, including knowledge of new languages, reading other national historiographies, consulting multiple archives in different countries, significant travel costs, etc. Thus, working on NGO activities during the inter-war period requires the knowledge of several languages (French, English, German) used at international congresses, because communications are rarely translated. Some cases are especially complicated: working on the history of blind people, for instance, entails familiarity with multiple Braille systems (national Braille, abridged, Esperanto Braille).

Moreover, it is not easy to identify all transnational flows (information, mediators, etc.), to pinpoint the regularities in these flows, and to understand their specificities and the issues at stake. It is, for example, difficult to understand the stakes of these journeys for the individuals concerned and to grasp their impact on their life trajectories and ideas. Ideally, the individual's frame of mind, discourse, and practices should be reconstructed at the time when they meet other actors abroad, while giving equal dignity to the points of view of actors from different cultural areas, as recommended by Romain Bertrand (Bertrand, 2013). The social origin, personality, professional trajectory, personal and professional strategies, and multiple loyalties of individuals circulating within the imperial or international arena, or working in international organizations, should also be studied. Indeed, these actors often retain multiple loyalties (with a government, a professional or charitable association, a foundation, the Church, etc.) that influence the content of their actions and the documents they write.

Efforts must also be made to spatialize and temporalize transnational flows to avoid portraying a linear and homogeneous diffusion of ideas and individuals in space. To give meaning to the multiple flows of information observable on an international scale, historian Pierre-Yves Saunier suggests reconstructing circulatory and connective regimes or configurations, "conceived as the regularities that frame the possibilities of actors, contents, directions and impacts of flows" (Saunier, 2010: 152). The historian must try to grasp the attempts by certain actors to put in order the space of flows and the way in which these flows constitute resources for local actors. The aim is to identify "the lasting interactions between mutually identified actors who take part in these flows, whether in the form of competition, cooperation or hierarchy" (Saunier, 2008: 16). From the time of their creation, intergovernmental bodies have played a considerable role in the organization of these flows (information, experts, scholarship holders, equipment). It is their administrations that determine, alongside the directorates of the main NGOs in the sector, the circulation regimes in the disability field.

It is necessary to be cautious in interpreting these transnational flows and not to overestimate their importance in shaping national realities. Sometimes a local phenomenon has no connection with the outside, and the transnational approach is not relevant in this case (Conrad, 2016: 16). Some transnational flows had a strong impact on public policies, on social movements, and on individual or collective memory, while others did not. One of the main reasons for weak influence is the complex process of appropriation of ideas from abroad by local actors. This phenomenon of appropriation "refers to the ways in which the receiving civilization or groups transform and distort inputs to adapt them to their own cultural context and social needs (Ruggiu, 2007)." One should not neglect to consider the potential resistance to transfer from one group to another or the disconnections that result from linguistic difficulties, ideological differences, cultural discontinuities, or pragmatic disagreements. The major challenge is to identify the social and political status of those who take up these ideas or reject them, since their status largely determines the future dissemination of information.

The overvaluing of the information that circulated internationally sometimes leads researchers to make three mistakes. The first is to consider human rights enshrined in international texts as objective and legitimate rights, as universal concepts, when in fact they are social constructs that should be historicized and denaturalized by identifying the conflicts and agreements that have presided over the determination of these rights and by identifying the limits of the universalist claim of these concepts by exposing other conceptions of human dignity. The second is to consider that the local reality of disability must be studied exclusively or primarily through the lens of these international texts. The application of international texts is therefore considered logical and necessary. There is then a great danger of interpreting "everything else as lack, failure or distortion" (Cooper, 2010) and thus of taking a restrictive and simplifying view of reality. This bias is perceptible in many studies, including my own to some extent. While I have questioned the extent to which international disability policies apply to Argentina, Brazil, and Spain and why, I have also interpreted certain local practices that were unrelated to international standards, such as begging and street selling, as practices that were in discordance with international standards (Brégain, 2018b), thus positing them as symbolically inferior to these practices. Dipesh Chakrabarty insists on the need to read this "lack" and inadequacy differently, by interpreting it as creativity (Chakrabarty, 2009: 77). He also suggests revealing the "ambivalence, contradictions, use of force, as well as the tragic and ironic aspects" of this imposed modernity (Chakrabarty, 2009: 89), in order to be able to imagine "the radical heterogeneity of the world" (Chakrabarty, 2009: 92). The third is to have a vision centered on state policies and their collaborators (private associations), unwittingly neglecting the study of the alternative practices of organized groups that act without collaborating with the state, including indigenous communities or certain religious groups.

Moreover, one should not only focus on flows but also question the absence of circulation of certain individuals or elements; the political, economic, or social reasons for this lack of contact with the outside world (especially in the case of authoritarian regimes); and their consequences. Transnational history invites here to pay attention to the material aspects of disability history and to the transnational circulation of new technological objects (Braille printing machines, Braille tablets, adapted car, cochlear implants, etc.). During the 1950s, the manufacture of cars with orthopedic controls was concentrated in Germany, and their price was very high abroad because of the import taxes at that time. The autarkic economic policies of the Franco regime explain why these cars were not imported from Spain at least until the early 1960s, even though Germany was geographically close. The hermetic nature of Franco's regime is also reflected in the lack of change of terminology related to disability: for example, the term *inválidos* (invalid) was retained by associations under state supervision (*Asociación Nacional de Inválidos Civiles*) until the mid-1970s. On the other hand, although geographically distant, associations imported cars with orthopedic controls into several Latin American countries from the late 1950s onward. Because the high price of these orthopedic orders (including taxes) hindered the purchase and use of these adapted cars, Latin American association leaders mobilized politically to obtain exemption from import taxes for these cars throughout the 1960s and 1970s.

The historian interested in transnational dynamics can quickly think of elaborating international comparisons with a multitude of countries from the very rich international archives, digitized sources available online, and secondary sources. This is a temptation to which the historian can easily succumb, but one that I think it is best to avoid, as these different bodies of sources are generally too limited to identify with precision and nuance the characteristics of each national case. It is essential to make systematic visits to the countries under study to search local archives and the local press or to conduct interviews. This makes it possible to broaden the range of sources consulted and to better understand the local context of knowledge production (Ghobrial, 2019: 11). This broadening of sources nevertheless causes another problem: the scope of the subjects to be studied and the considerable quantity of sources (primary and secondary) sometimes oblige the historian, for reasons of time and limited publication space, to synthesize all the data collected and interpreted critically without systematically explaining the conditions of production and transmission of each source.

Another pitfall of most transnational disability history work – including my own – deserves to be pointed out and explained: the scant attention paid to intersectional issues, except in Esme Cleall's works about the British Empire (Cleall, 2015; Cleall, 2016). This lack of attention seems to me to be linked to several converging factors: the enormous quantity of sources to be mobilized in order to construct a transnational history and the limited presence of clues and sources for studying these intersectional issues in the archives of intergovernmental organizations. Let's take the case of the research I conducted on the construction of international disability policies from the 1920s to the 1980s. The international sources mobilized allowed me to briefly mention the mobilizations for the rights of women with disabilities that emerged during the 1970s, but the over-representation of men among the leaders of NGOs and international civil servants gives the impression that the struggle and action for the rights of people with disabilities at the international level remained a male affair until the mid-1970s. I unintentionally made two mistakes: I did not try to explain this confiscation of decision-making power in the field of disability by men; and I unintentionally overlooked the existence of certain women's movements of the inter-war period, which had not succeeded in structuring themselves sufficiently at the European level to challenge the intergovernmental organizations. The sources mobilized at the time did not allow me to have knowledge of them; it is the research in local associative archives that allowed me to bring to light the existence of a transnational network of blind feminist women, visibly structured around two figures, the German Hildegard Mittelsten Scheid and the Swiss Marguerite Schaffer. Indeed, German-speaking blind women organized themselves into an association and demanded, as early as 1913, that they be able to benefit from domestic education in institutions, as well as work opportunities for blind women, and the creation of single-sex homes (Mittelsten Scheid, 1927). Similarly, I have not discussed the interaction between the disability rights and anti-racist movements in my book, as the sources consulted in the archives did not lend themselves to this. Fortunately, I believe that this partial obscuring of other features of social differentiation (gender, ethnic groups, social classes, age, etc.) in the transnational disability history literature is only temporary, as the growing body of work on this topic now provides a comprehensive framework for understanding that allows for more focused studies on these issues (as, e.g., around disabled refugees, etc.).

Another major difficulty in carrying out transnational history work is grasping the nuances of the terminology used in foreign countries, which is necessary to better contextualize the transfer of information. When a study covers several countries, the researcher must generally master several languages. When the study concerns a single country, the researcher may sometimes make mistakes by copying the foreign terminology used in the sources consulted without critical distance. For example, Jan Stoll states in his article that a Nicaraguan organization is called Organización de Revolucionarios Dehabilitados, probably trusting a wrong German source, since the term dehabilitados does not exist in spanish, while the term deshabilitados was used from the 1960s onward by some authors as a translation of the English-speaking concept of *disabled*, thus proving a strong Anglo-Saxon influence on rehabilitation science in this particular organization. In addition, there are the difficulties inherent in translating historical writing into different languages already pointed out by Waltraud Ernst and Thomas Mueller (Ernst and Mueller, 2010, p. xii). In the case of transnational studies based on international and national sources, there are the almost insoluble problems of how to be faithful to the terminology of the national original sources (e.g., the term *lisiado* used in Argentina at the end of the 1940s, which literally translates in English as “crippled”); how to be faithful to the terminology used at the time in the English-speaking sphere; or even how to be faithful to the terminology used in international texts at the time (*handicapped* or *invalids* and their Spanish translation *impedidos and inválidos*).

These multiple difficulties in adopting a transnational perspective lead us to recommend two possible types of transnational studies:

(1) Transnational studies focused on two or three countries. This perspective is very enriching because it opens up a horizon of experiences, historiographical traditions, and vast sources that oblige the researcher to be very reflexive in the construction of the object of study and the chronological boundaries. However, it also forces the researcher to compare national cases, to study the historical variability of the categories studied in each country, while analyzing the relationships, the multiple transfers of information, and the resistance to transfers between these countries. As a result, this perspective proves to be very complex to implement and requires many years of research. Above all, it is difficult to construct a coherent chronological breakdown common to several countries, due to the multiple temporalities to be taken into account. Other difficulties may arise, such as determining the representativeness of the phenomena studied at the level of each country and the “difficulty of establishing the simultaneity or anteriority of phenomena observed in both countries, with a view to cultural and scientific transfers” (Hoffbeck 2015: 43).

(2) Studies based on a single territory, an object, a small group, a single individual, or a short period of time, with a transnational approach (but without necessarily

taking the state framework as a reference), following the principles of “global” or transnational micro-history (Bertrand & Calafat, 2018; Ghobrial, 2019; Vries, 2019). This research perspective requires the researcher to be attentive to small details or clues, to the diversity of circulation that may be seen, to the criticism of archives, and to foreign terminology. This transnational micro-history is concerned with the singularity of the historical contexts (local, regional, national, and international contexts) and may lend itself more to a social history approach, because it restores the framework of thought of the actors and their agency, wishes, and uncertainties and describes their concrete social practices. Rather than focusing on exceptional cases or fascinating personal trajectories, this micro-history is based on “an affinity for methods geared towards experimentation – whether it be the cutting out of the object observed under the magnifying glass, the questioning of major explanatory paradigms, close dialogue with the social sciences, narrative inventiveness, attention to the production of social categories and contexts, or reflexivity with regard to the focal points of analysis” (Bertrand & Calafat, 2018: 10).

Aude Fauvel’s study of the case of Baron Raymond Seillière is a good example of this approach. It analyzes the trajectory of this wealthy individual in France and the United States. Baron Seillière was interned in one of the best French asylums by his sister. He paints a very negative picture of the care he received from the French alienist, a story that was quickly publicized in British, American, and French newspapers (Fauvel, 2010: 213). While doctors such as Charcot considered Seillière to be suffering from “ an excited temper ,” Raymond Seillière admits that he was only “ an eccentric man, but not pathologically so .” The American embassy quickly intervened to demand Seillière’s release. The “Seillière Case” contributed to the international media campaign against the abuses of the alienists and encouraged psychiatrists and administrators of institutions to make international comparisons on how to deal with the mentally ill people.

Conclusion

The approach of the transnational disability history invites the researcher to observe transnational flows, transnational networks, transnational dynamics, international norms, conjunctures in transnational economics (economic crisis, etc.), politics (wars, etc.), and health (pandemics) that can influence the living conditions of people with disabilities in the various regions of the globe. This approach offers a new reading of history, less Western-centric, which considerably renews our understanding of the construction of international disability policies, of movements for the rights of persons with disabilities, and of the hybrid nature of national disability policies. The transnational history of disability is an extraordinary field to explore, with many discoveries still to be made about disability rights movements, about the transnational construction of categories of disability, about colonialism and imperialism, about the challenges of citizenship, as well as about the migration of disabled people.

The adoption of this transnational perspective does not prevent the researcher from conducting intersectional research, but it does make it difficult to take into account at the same time all the other factors of social differentiation (gender, ethnic groups, social classes, age, etc.) as a local historical study allows. The researcher must therefore always bear in mind that the transnational history he or she is writing will always be fragmentary, but that he or she must strive to uncover these intersectional issues, to make visible the life experiences of people with disabilities in all their diversity, in order to avoid reinforcing all kinds of prejudices (gender, ethnic, etc.).

Part III

Disability Paradigm Shifts

Disability Paradigm Shifts: Models, Perspectives, and Philosophical Orientations Driving Change – Introduction

12

Anna Lawson and Margaret Wazakili

Contents

Abstract

In this chapter, we introduce Part III of the handbook and contextualise the chapters within it. We begin by explaining the overall aim of the part. Put simply, this is to explore and highlight the connection between positive social change and ways of thinking about and understanding 'disability'. We then introduce two 'models', or ways of understanding disability, which have had a particularly powerful impact on generating and informing initiatives to enhance full inclusion and participation and to reduce disability-related oppression in all its forms. We then introduce and contextualise three chapters in this part which critically reflect on how these models have been put to work in particular places and particular times. This chapter closes with some brief concluding reflections.

Introduction

In this section of the *Handbook of Critical Disability Studies*, authors explore how different ways of thinking about and understanding "disability" and social responses to body/mind difference have driven and continue to drive change, and the demand for change, in areas such as professional practice, law, and policy. Shifts in how "disability" is modeled or understood have played a key role in the development of

both Disability Studies and disability politics. They have also influenced, and continue to influence, the substantive content of law and policy as well as the process through which it is developed (▶ Chap. 14, "Disabled People's Mobilization Around a Human Rights Approach to Enhance Their Participation in Law and Policy Making in Iceland," by Love and Traustadóttir, this volume).

The social model of disability and the human rights model of disability are two examples of ideas which have proved particularly influential in mobilizing and collectivizing political action, reorienting perspectives, shifting paradigms, and bringing about social change. While they have each been influential across the world (Sansome, 2020), there has been variation – sometimes quite considerable – in their interpretation, application, and impact. Some of this variation is apparent from the different histories, experiences, and challenges discussed in the five chapters which follow – each of which is grounded in a particular geographical, cultural, and socio-political context.

Chapters in this section will engage with these different "models" or ideas, exploring how they have emerged and been put to work in different countries and their role in bringing about positive change in the lives of disabled people. Although questions of how these models relate to each other are interesting and important (Levitt, 2017; Lawson & Beckett, 2021), such issues lie beyond the scope of this section. While the starting-point for the chapters is abstract – an idea, model, or perspective – each chapter demonstrates how making these ideas work to support the goal of improving the lives of disabled people demands strategy, pragmatism, and, very often, compromise. The ways in which these ideas or models are used in practice by change-makers is therefore a central concern of all five chapters.

The idea of the social model of disability originates in the disabled people's movement (Union of Physically Impaired Against Segregation/Disability Alliance, 1976, 3). The idea of the human rights model of disability is born out of disability politics and the work of disability activists working in the human rights system (e.g., UN Committee on the Rights of Persons with Disabilities, 2018, para 9; Degener, 2016; Degener, 2017a, 2017b). Such ideas are valued among those working at the coalface of disability activism for their potential to make a difference in practice. Thus, Mike Oliver (2004, 31) – who first coined the phrase "social model of disability" (1981, 31–32) – described the social model as a "practical tool" and Degener (2016, 46–47) – who played a lead role in the development of the human rights model – described it as a "roadmap" for achieving disability rights. Disability activists have at times become exasperated by academic critique and its potential to complicate, confuse, and thereby undermine political struggles for relevant positive social change. For example, writing from outside the academy, Richard Light (n.d.) once observed that:

> It is becoming increasingly clear that one of the key issues in disability activism – the Social Model of Disability – is subject to repeated attacks, particularly within the academic community. What is equally clear is that much of the 'bad press' has been prompted by interpretations of the social model that many of us would find particularly strange. . . . We believe that it is time for disabled activists to remind academics that the social model originated with us, and that we still have use for it!

Similar frustration has also been expressed by disability activists working within academia. For example, in 2013 (1204–1206) Mike Oliver wrote that "... despite the impact this model has had, all we now seem to do is talk about it" and "the talking has to stop."

Concerns such as these will of course be taken seriously in Disability Studies scholarship, which is closely connected and intertwined with disability activism and disability politics. Nevertheless, critical reflection on how disabled people have put different ideas and models of disability to work in different places and at different times – to achieve the same broad goal of reducing the oppression, inequality, and marginalization experienced by people with impairments or body/mind differences – undoubtedly has valuable contributions to make both to academia and activism. The purpose of these chapters is to reflect on how the social and human rights models have been put to work in the mobilization of disability activism, the legal recognition of disability rights, and the shaping of positive change. To remain useful and relevant, such models or ideas need to be sensitive to the particular time and place in which, and purpose for which, they are being put to work (Levitt, 2017, 589). Accordingly, diversity of context and country has been an important factor in the selection of the chapters that follow.

The first of the remaining five chapters in this section, by Miro Griffiths, focuses on the social model of disability and its power as a call for change, focusing on its emergence and continued importance in the UK. Griffiths makes a convincing case for the social model's continued centrality to understanding and politicizing experiences of disablement and to building solidarity and consensus among activists.

The second of these chapters, by Laufey Löve and Rannveig Traustadóttir, concerns the application of the human rights model in Iceland. It reflects on how disabled people's organizations drew upon this paradigm to persuade government to change the process of relevant law and policy-making. More particularly, the authors explore the use of the human rights approach reflected in the UN Convention on the Rights of Persons with Disabilities (CRPD) to persuade government to more meaningfully consult and engage with disabled people's organizations – an engagement which in turn influenced new disability-related legislation in significant substantive ways consistent with the human rights model.

The third chapter, by Sanjay Jain, provides a fascinating analysis of how social and human rights models of disability have been referred to and used by judges in the context of disability rights cases. He considers how these models, or approaches to disability, underpin key examples of progressive case law. Explicit references to them have increasingly been made by judges in such cases, particularly since India's ratification of the CRPD and the enactment of the Rights of Persons with Disabilities Act 2016. While constitutional and statutory law tend to be the primary focus of disability rights activists seeking positive legal change, Jain's chapter highlights the important role that can also be played by judges and the actual and potential influence of the social and human rights models of disability in this context.

The fourth chapter, by Yi Huang and Bo Chen, again focuses on the human rights model but this time in a very different context – the People's Republic of China. Using several inclusive education case studies, it explores and critiques the power of the human rights approach, in a non-Western and non-liberal regime, to add strength and momentum to civil society initiatives for positive change.

The focus of the final chapter, by Diana Msipa and Paul Juma, extends beyond developments within particular countries to a more regional multinational level. It provides insightful reflection on the relationship between the social and human rights models of disability and the emergence of the Disability Rights Protocol, adopted by the African Union in 2018. The adoption of that Protocol, they argue, was driven in part by calls of disabled people in Africa for greater recognition of the social and human rights models of disability. As Msipa and Juma make clear, while global developments (particularly those associated with the CRPD) were influential in the emergence of the Protocol, the unique lived experience of disabled people in Africa shaped the emergence and content of the Protocol in distinctive ways.

In conclusion, the focus of this section is the translation of ideas into practice. The social and human rights models of disability are two ideas which have proved, and continue to prove, particularly useful to disabled people and their allies, but much work remains to be done to achieve the positive social change that is still so clearly needed. As the chapters in this section demonstrate, that work can take many forms. What is critical is that there is no one template and no single or right way of putting these ideas to work. There must be adaptability so that strategies and solutions can remain responsive to the particularities of the context – temporal, geographical, political, cultural, and social – in which the relevant social change is being sought. Ideas such as these have and will prove important to achieving positive social change for disabled people around the globe.

UK Social Model of Disability and the Quest for Emancipation

13

Contents

Abstract

The route to disabled people's emancipation is complex and requires a critique of how the organization of the social world contributes to disabled people's marginalization. To achieve this, contingents within disability activism have focused on identifying the material and discursive arrangements that (re)produce disabling barriers for people with impairments, health conditions, and diagnostic labels. Activists articulate micro-, meso-, and macro-solutions to destabilize the arrangements that perpetuate disabled people's marginalization and implement alternatives to support disabled people's participation in society. For disability activism and disabled people's social movements to operate effectively, activists need to maintain solidarity. In the UK, activists and social movement members have attempted to build a consensus through determining what disability is and how it is experienced (Griffiths, 2019). This has led to the creation and adoption of the social model of disability – an interpretation that positions disability as an oppressive force, which is imposed on people with impairments through the organization of society (UPIAS, 1975).

Introduction

The route to disabled people's emancipation is complex and requires a critique of how the organization of the social world contributes to disabled people's marginalization. To achieve this, contingents within disability activism have focused on identifying the material and discursive arrangements that (re)produce disabling barriers for people with impairments, health conditions, and diagnostic labels. Activists articulate micro-, meso-, and macro-solutions to destabilize the arrangements that perpetuate disabled people's marginalization and implement alternatives to support disabled people's participation in society. For disability activism and disabled people's social movements to operate effectively, activists need to maintain solidarity. In the UK, activists and social movement members have attempted to build a consensus through determining what disability is and how it is experienced (Griffiths, 2019). This has led to the creation and adoption of the social model of disability – an interpretation that positions disability as an oppressive force, which is imposed on people with impairments through the organization of society (UPIAS, 1975).

The social model of disability (social model) remains integral to and within the organization of disability activism, as well as the progression of disability politics in the UK. The model's significance is identified within the strategies of Disabled People's Movements (Griffiths, 2020; Hasler, 1993), is centralized within the work plans of Disabled People's Organisations (DPOs) across the globe (Berghs et al., 2016; Hallett, 2015), and is referenced by public bodies and government departments in developing disability policy (Department for Work and Pensions, 2019). Within academia, the social model continues to be a focal point within Disability Studies literature – offering an ontological position to understand how people with impairments and health conditions experience disability. The interdisciplinary nature of Disability Studies (Oslund, 2015) provides scholars, who are often engaged in social sciences, law, humanities, and engineering, with opportunities to contribute research findings to disability activism. Such contributions can range from producing research to inform activist strategies through to scholars participating in activist networks and disabled people's social movements.

The chapter begins with an overview of the social model and describes its origins within the UK. It charts the activities of several key disabled activists committed to self-representation and who were instrumental in positioning disability as a consequence of societal organization. Attention is given to the fundamental principles outlined by the Union of the Physically Impaired Against Segregation (UPIAS), which are considered to underpin the social model of disability. The chapter then explores the social model's historical and contemporary relevance to disability activism and disabled people's social movements. This is focused primarily on the UK context; however, the social model's significance on an international level is acknowledged. Exploring the model's relevance is categorized into three areas: individual liberation, collective political action, and organizational policy influence. The final section provides commentary on the model's significance within future mobilizations of disability activism. This reveals possible routes toward ensuring that the social model continues to generate resistance-based practices, which are necessary for progressing disabled people's emancipation. Here, consideration is given to how the social model can facilitate meaningful and accessible participation of newcomers and existing, peripheral members of the UK Disabled People's Movement.

The chapter uses terminology often employed within a UK context. "Disabled people" is preferred over persons with disabilities, as the former places emphasis on disabling conditions and arrangements that are imposed – unnecessarily – on individuals with impairments and health conditions. This is of strategic importance to UK disability activism because the focus is on ideas, practices, and configurations that perpetuate disabled people's marginalization. Similarly, terms such as mental health conditions are used in order to reflect activist identities in the UK. Finally, the notion of resistance is employed throughout the chapter. This is done to frame the ideas and practices emerging from disability activism as acts of resistance. The chapter draws from Foucault's (1997) assertion that resistance provides space to remake the social world and introduce alternatives to the present. Power is considered relational and resistance remains a possibility. Disabled activists have the capacity to instigate practices that resist disabled people's current position in society and can introduce preferable futures that are predicated on inclusion and accessibility.

Origins of the UK Social Model

Disabled people's representation is littered with examples of violence, precarity, and an overreliance on charitable interventions (Hughes, 2015). Individuals and collectives have established resistance practices to challenge the segregative initiatives and deprivations experienced by the disabled people's community – all the while against the backdrop of undermining disabled people's contributions and questioning the value and worth of their existence. Hanes et al. (2018) provide a comprehensive account of the histories of disability – with particular reference to social policies, welfare regimes, education, and labor market access. To understand the origins of the UK social model, it is necessary to focus on the position of disabled people, and policy interventions, post-Second World War. As argued by Barnes (2012), widespread escalation of global violence and conflict resulted in considerable numbers of injured civilians and military personnel returning with health needs and support requirements. In addition, progress in medical treatments and increasing affluence improved life expectancy for disabled and older populations. Policy interventions and welfare regimes were required to "protect" disabled people.

Protection measures were, arguably, a continuation of the tolerated segregative and paternalistic interventions witnessed before the Second World War. The majority of disabled people were still incarcerated within institutions, against their will, and isolated from communities beyond the entrance door of the residential care facilities. Others were confined to assistance from family units, which restricted choice and control over daily life. Disabled people struggled to access, and survive on, social security cash payment. People who were unable to work found it difficult to contribute to insurance schemes (Stone, 1984). This reinforced disabled people's position as passive and dependent, in need of guidance and direction from health and care professionals (Kelly, 2011). Throughout the 1960s and 1970s, disabled people resisted in the hope of articulating alternative approaches to describing and understanding disability, as well as destabilizing current approaches to addressing the "problem" of disability. Groups emerged, which focused on different aspects associated with disabled people's participation in society. Megan du Boisson and Berit Thornberry established the Disability Income Group (DIG), with campaigns surrounding the categorization of "civilian disabled" and the provision of cash benefits and mandatory basic services to meet disabled people's needs (Millward, 2014). Emphasis was placed on the creation of a National Disability Income to respond to the poverty conditions experienced by the disabled people's community. Subsequently, the Disability Alliance (DA) was formed in 1973, which brought together organizations of and for disabled people engaged in reforms to social security and welfare provision.

With dissatisfaction surrounding the limited focus on incomes, some members of the DIG splintered and organized around a central exploration of disability as a form of social oppression. For Paul Hunt (1966), there was a need to highlight how disabled people experienced marginalization through their relations in contemporary society. Hunt argued that disabled people were relegated to occupying positions of tragedy, inadequacy, deviance, oppression, and illness. There needed to be a critique of the current policy initiatives, welfare programs, and service provision in order to understand these positions further and identify how they impacted disabled people on a daily basis. Furthermore, there was a need to reject the narratives perpetuating marginalization, such as the tragic assumptions that surround impairments and the importance placed on charity to alleviate presumed suffering. Hunt and others (Finkelstein, 2007) were concerned with disabled people's isolation and the impact this had upon the development and sustainability of social relations (such as within the family, employment, and local community).

These ideas brought attention to the way disabled people experience discriminatory social relationships. According to Townsend (1966), this reconditioned the understanding of disability through a new, social interpretation. Resisting notions of passivity and dependency, disability was to be understood as a consequence of how the social world is organized. Disabled people were encouraged to challenge the practices, attitudes, and arrangements that restricted their participation in society (Hunt, 2019).

This inspired new forms of activism and the collective organization of disabled people. UPIAS was formed in 1972, occupying a political platform that challenged the ideas of DIG and the DA more broadly. Subsequently, the publication of UPIAS' Fundamental Principles of Disability (1975) presented a concise articulation of disability as a form of social oppression:

> "In our view, it is society which disables [. . .]. Disability is something imposed on top of our impairments, by the way we are unnecessarily isolated and excluded from full participation in society. Disabled people are therefore an oppressed group in society. It follows from this analysis that having low incomes, for example, is only one aspect of our oppression. It is a consequence of our isolation and segregation, in every area of life, such as education, work, mobility, housing etc. [. . .] For us as disabled people, it is absolutely vital that we get this question of the cause of disability quite straight, because on the answer depends the crucial matter of where we direct our main energies in the struggle for change. We shall clearly get nowhere if our efforts are chiefly directed not at the cause of our oppression, but instead at one of the symptoms. [. . .] We see the essential task [. . .] as that of helping disabled people to organise together to take a more active part in struggling for the changes in society which ensure that we are brought into the mainstream of life, rather than being excluded." (p. 3)

There are three important points to draw from this articulation of disability and which remain significant to the contemporary activities and strategies within disability activism. Firstly, it creates the distinction between impairment and disability. Impairment, and by extension health conditions and diagnostic labels, cannot justify the exclusion, isolation, and oppression experienced by individuals and groups. Discursive and material aspects, located within the various arrangements that constitute society, produce the conditions that render people with impairments isolated and excluded from participating in their communities. For Light (2010), this distinction shifts disability to be understood in terms of restrictions imposed upon people. Secondly, this articulation of disability places emphasis on identifying and responding to the barriers within the arrangements that constitute society. Instead of a focus on presumed limitations and losses within bodily functioning and cognitive processing, attention turns to the barriers that emerge through political, economic, social, cultural, technological arrangements and so on. These barriers become the focus of disabled people's resistance practices (Beckett & Campbell, 2015). Thirdly, it promotes the importance of meaningful engagement with disabled people and their self-representation. Aspects that are imperative for progressing disabled people's inclusion within society. A feature of this articulation of disability is the commonality identified through the exclusion and isolation experienced by people with various health conditions and impairments. Disabled people, collectively, have organized themselves to shape policy development (Thill, 2015) and create agendas and strategies that facilitate activist mobilization (French & Swain, 2011).

It is important to distinguish between UPIAS' interpretation of disability as a form of social oppression and its formalization by Oliver (1990), who coined the term "the social model of disability." The former illustrates disabled activists collaborating to understand disabled people's position in society and articulate an approach to bring about social change – an interpretation that was developed by, and for, disabled activists. The latter was introduced as a contribution to the existing literature on the sociology of disability and to aid knowledge transference in learning environments. This chapter is concerned primarily with the social model as articulated by UPIAS and its significance to disability activism. Focus now turns to the application and significance of the social model within historical and contemporary forms of disability activism.

UK Social Model and Disability Activism

As noted in the previous section, social model principles were instrumental to disability activism mobilization in the UK and internationally. As activist networks organized across the globe, and expanded into disabled people's social movements, the social model was considered a central tenet of disability activism (Hasler, 1993). The model facilitated a growth in disability politics, as disabled people identified a shared commonality in their experiences of marginalization and injustice. Solidarity was based on identifying, and challenging, the arrangements within society that (re) produce disabling barriers.

Globally, the United Nations (2004) incorporated the social model into its International Norms and Standards relating to Disability. Its analysis originated from a social model perspective and explored the various forms of discrimination and exclusion experienced by disabled people. It was concluded that disabled people experience violations and, to address this, legislation and policy processes should incorporate a human rights framework. Discussions continue on the significance and application of the social model within United Nations activity, particularly with regard to the Convention on the Rights of Persons with Disabilities (UNCRPD). Clough (2015) argues that UNCRPD harnesses the social model to promote responsive state and judiciary approaches to disability and social justice. Disabled activists, and their organizations, can use such insights as a way to resist the narrow, medicalized perspectives imposed on people with cognitive impairments. It can lead to disabled activists articulating possible and preferable alternatives to supporting disabled people throughout judicial proceedings. For Degener (2016), the social model was pivotal to negotiations over the drafting of the UNCRPD. This reflects the model's significance among disabled activist networks throughout the globe and serves as a tool to reform social arrangements throughout society. Although Degener proposes moving beyond social model application toward a human rights model, others (Harpur, 2012; Kayess & French, 2008; Lawson & Beckett, 2020; Traustadóttir, 2009) acknowledge its significance within and beyond convention drafting. Lawson and Beckett (2020) suggest the social model served four purposes during the drafting of the CRPD: as a reference point to understand disability, to describe disability, as a vision to promote inclusion and equal opportunities, and to build solidarity.

These four purposes are reflected often in DPO work plans and strategic objectives. The European Network on Independent Living is a DPO that advocates and lobbies for de-institutionalization, provision of personalized support, and disabled people's active participation. The Network's statement on appropriate terminology (ENIL, 2021) incorporates the social model in its attempt to build coalitions with

DPOs across Europe. The social model is embedded within its contributions to intergovernmental action plans and policy briefings, such as the European Commission Social Pillar Action Plan on Disability 2021–2030 (ENIL, 2020). Here, the social model is articulated as an approach to differentiate the Network from other disability-related European organizations – notably organizations not controlled by disabled people. The model is used to illustrate grassroots mobilization of disabled activists and to emphasize self-representation. In addition, it is applied to improve transferability of conceptual principles (e.g., choice, control, self-determination) into specific actions and practices. Furthermore, the Youth Network facilitates young disabled people's participation in projects across areas of employment, politics, sexuality and relationships, mental health, education, and the pursuit of independent living. Throughout its work, the social model is referenced as integral to improving youth participation within disability activism across Europe (ENIL Youth, 2015). Manuals developed for increasing participation referenced the social model as an essential tool to build solidarity among disabled young people across European states (Todd et al., 2012). Scholars and activists continue to debate social model application beyond the UK context; Barnes and Mercer (2005) provide a comprehensive collection of activist and academic writings on how the social model impacts disabled activist mobilizations, rights-based agendas, and social policy discourse across Europe and the majority world.

It is important to consider the social model's historical significance to disability activism in the UK. The British Council of Disabled People (BCODP), later renamed United Kingdom's Disabled People's Council, was established in 1981. BCODP represented organizations controlled, and managed, by disabled people across the UK. Its activities focused on progressing disabled people's inclusion within society and positioning disability as a human and civil rights issue (BCODP, 1997). Publications by the BCODP, which were disseminated as resource packs to support the local mobilization of disabled people, referenced the social model in two specific ways. The first is to highlight the importance of self-representation and ensure disabled people remained key actors in the design, development, and delivery of policies and initiatives associated with disabled people's life chances. And the second is to emphasize the extensive range of barriers that emerge through social world organization. It was intended that disabled people, locally, would establish resistance practices in order to challenge injustices experienced by the disabled people's community. According to Campbell and Oliver (1996), BCODP was a turning point in UK disability politics as it promoted a social interpretation of disability, which rejected individualized and tragic narratives associated with disablement. BCODP closed in 2017; however, since the 1960s, social model significance has continued across the UK.

DPOs are essential for campaigning on inclusion and participation agendas, delivering community-based services, and engaging in policy-making processes (Young et al., 2016). Often, the social model serves to commit organizations to pursue disabled people's emancipation through engagement of strategies, actors, and processes. Across the UK, DPOs refer to the social model extensively. The Reclaiming Our Futures Alliance, which is a consortium of DPOs engaged in defending disabled people's existing rights, uses the social model as a way to maintain national and international partnerships. Their statement (ROFA, 2016) focuses on the importance of operating within an international Disabled People's Movement, and their work includes producing aspirational visions for an inclusive society, contributing to UNCRPD Shadow Reports and instigating direct action campaigns. Here, the social model is employed for different outcomes. It is used to articulate an alternative vision for organizing society, one that promotes inclusion and accessibility. This is of strategic importance to organizations because it assists with building solidarity across the membership. Individuals work together, united in presenting an alternative to the current arrangements that constitute society. The model also serves as a tool to critique and analyze the current practices and ideas that perpetuate disabled people's marginalization. It assists with the identification of problems and barriers that restrict disabled people's participation in society.

Another organization, Sisters of Frida, operates as a collective for disabled women to share experiences, provide mutual support, and articulate the injustices experienced by those at the intersection of gender and disability. Following the coronavirus pandemic, the collective have produced guidelines on accessible online communication (Sisters of Frida, 2021). The guidelines provided information on disabled people's rights to accessible information and suggested action plans for improving disabled people's access to existing online platforms. The guidelines reference the social model as a suitable framework for presenting the accessible features necessary for improving disabled people's participation. Here, the social model is used to guide individuals toward the removal of barriers and the development of inclusive-based solutions.

In the context of mental health, Beresford et al. (2016) have proposed supporting individuals with mental health conditions and experiences of mental health services to embrace the social model. Their empirical study identified that people using mental health services would often have their experiences interpreted through an individual model approach (Oliver, 1990). This would lead to individuals internalizing their experiences of injustice and marginalization and relying on medical treatments and rehabilitative interventions to navigate disabling barriers. Participants felt it was difficult for survivors of mental health services to engage in existing disability politics. Tensions emerged between existing demands and ideas promoted through broader disabled people's social movements and the key issues affecting people with mental health conditions. Nevertheless, survivor networks and advocacy groups on mental health have highlighted the need to incorporate social model principles within the design and delivery of mental health support provision (Beresford et al., 2010). The social model has also been applied to neurodiversity activism. Graby (2015) argues for coalitions between neurodiversity social movements and disabled people's social movements. It is suggested that solidarity can be established by demanding an acceptance of human variation and rejection of the normalizing of human bodies. This would align mad activism, neurodiversity activism, and disability politics to challenge the normative tendencies associated with impairment and biology and focus on promoting inclusion and accessibility.

It is evident that the social model remains significant to the collective mobilization of DPOs in the UK and beyond. Nevertheless, the model is important at the microlevel and in supporting individuals through their personal navigation of disablement. Crow (2007) discusses how the model has facilitated disabled people's exploration of self-worth and the building of a collective, political identity. It has supported individuals to resist internalized oppression and challenge the narratives, values, and practices that undermine disabled people's position in society. For Morris (1991), the model is essential for challenging personal tragedy narratives; however, it should not come at the expense of denying individuals an exploration of the personal experiences of disability. This raises an important point about the social model and personal experience. Activists and academics have suggested that the social model denies the significance of impairment effects (Shakespeare & Watson, 2010), and historical DPOs – such as the Liberation Network – have called for disability activism to acknowledge the impact of impairment upon individual functioning and emotional well-being (Liberation Network, 1981). A route through this is to ensure disabled people, and their organizations, determine how the body and impairment are framed within public discourse, policy development, and political action. Returning to Morris (2013), activist spaces should allow for the discussion of the body and impairment, but, crucially, this should be contextualized within a call for access requirements, sufficient support, and a rejection that impairment equates to personal inadequacy.

According to French and Swain (2008), concerns have been leveled at the social model with regard to its inclusion criteria. Historically, its initial development was led primarily by those with physical impairments. This resulted in claims that the model is applicable only to individuals with physical impairments. While there are justifiable claims that there exists a hierarchy of impairment within disability politics and activist mobilization (Deal, 2003; Reeve, 2014), academia and activist networks have worked to demonstrate the model's relevance to all disabled people. Finkelstein (1987) proposed a narrative for disability culture through using the social model to build a collective identity. Individuals, in the exploration of the social model, would become aware that all disabled people experience forms of isolation, segregation, and oppression. Common experiences are identified through similar patterns of injustice, which emerge through the conditions and arrangements located within society. Nevertheless, it is important to recognize that such experiences would differ and individuals would have various diagnosis, conditions, and impairment effects. The importance of disability culture would encourage disabled people to pursue collaborations and forms of solidarity to challenge conditions that perpetuate their marginalization (Lawson, 2001).

The chapter will now consider future mobilizations of disability activism and the implications, and opportunities, which arise through social model application.

The Future of the Social Model

The social model has endured a misconception that has resulted in an irresolvable debate over its validity and usefulness. Discussions on the social model have often presented it as a theory (Bunbury, 2019; Shakespeare & Watson, 2001). This has complicated the application of the social model, as commentators seek to argue whether or not it provides an all-encompassing, grand theory to explain disability. It is important to clarify that those engaged in developing UPIAS' interpretation of disability, which is referred to as the social model in this chapter, did not present or discuss it in terms of theory. Finkelstein (2001) argues that the social model does not explain disability, nor does it position disabled people as the subject matter within the social interpretation of disability. A key point is to determine what the social model does. To answer this, Beckett and Campbell (2015) introduce Hawes' (1975) distinction between theory and model. Whereas a theory provides an explanation, a model offers a description of the properties, functions, features, and characteristics of an object or process. This is important for the sustainability, coherency, and prominence of disability activism. The social model serves to describe the experience of disablement, which activists can use to produce influential strategies and activities for social change. A theory can become entangled within the social model, to offer an explanation as to why disability occurs and is reproduced through the arrangements within society. For example, some UK activists (Clifford, 2020; Williams-Findlay, 2020) combine the social model with specific economic and political theories to determine how, and why, capitalism produces disablement.

Moving forward the social model must remain open and accessible to activists. Its significance comes from disabled activist networks using it flexibly, as part of an array of strategies to realize disabled people's emancipation. According to Oliver (2013) the model is a tool, which can be applied to improve people's life chances and conditions. Rather than debate its validity, activists and disabled people's social movements should use it to build solidarity and progress agendas relevant to the activists involved. It continues to hold relevance within the arenas pertinent to disabled people's participation and inclusion within society, such as research design (Stone & Priestley, 1996), policy and legislative development (Lawson & Beckett, 2020), training and knowledge transfer (Walker, 2004), and radical activist mobilization (Hunt, 2019).

Beckett and Campbell (2015) have sought to position the social model as a form of resistance, a way to present contemporary experiences of disablement and produce radical or reformist alternatives to organizing the social world. Here, the social model is understood as an oppositional device (Holmes, 2007) rather than a tool. It introduces necessary and important questions for disability activism: what current arrangements and practices need to be resisted, what are the alternatives, and what is required to enact or sustain resistance? Framing disability activism and politics through a lens of resistance would assist with shifting the focus away from the endless, and unnecessarily complicated, debates over its validity. Through enacting resistance, possible and preferable futures can be presented and explored by activists. The significance of the social model, as a strategic device for progressing disability politics, remains ever-present. Combining the social model with resistance guides activists and social movements to consider the conditions that create an unjust society in the present, as well as the conditions required to produce and sustain an inclusive and accessible future. For Beckett and Campbell (2015), this means the model can facilitate understanding of how people with impairments exist in society and create dialogue and action to resist the widespread oppression.

The key to the longevity and sustainability of disability activism is ensuring newcomers and less established members have opportunities to learn, influence, and contribute to strategies and agendas. Disabled people's social movements need to maintain open, and accessible, spaces for groups to discuss the principles and application of key concepts underpinning disability activism. Empirical research by Griffiths (2019) identified challenges faced by young disabled people when engaging in the UK Disabled People's Movement. Young disabled people continue to face restrictions on debating social model application within disability politics. They want opportunities to consider the contemporary relevance of the social model in their daily lives and determine how it can support activities to realize an inclusive society. Young disabled activists expect to influence established strategies rather than occupy positions of passivity and dependency. Their intentions are to provide counter-rationalities, which disrupt the existing arrangements that reinforce disabled people's marginalization, but this is often denied by established members and DPOs.

Intersectionality remains an important issue within disability activism (Erevelles, 2011). Disabled people should be supported to explore the daily experiences that emerge through the intersections of their identities. This will broaden disability activism membership and incorporate diverse perspectives and voices into activist strategies. Further research and activist accounts are required to understand the significance of intersectionality in disability politics. The social model may assist disabled activists to engage in social justice issues within, and beyond, disability. Its emphasis on understanding the arrangements within society that are imposed, unnecessarily, on marginalized communities can support broader coalitions of social movements to counter injustice.

Conclusion

This chapter argues that the social model has an important history in the development and organization of disability activism, disability politics, and disabled people's social movements. It was – and remains – instrumental in politicizing the experiences of disability and highlights the political, economic, cultural, and social arrangements that deny disabled people opportunities to participate in their communities. The social model is likened to the concept of the Sociological Imagination (Wright-Mills, 1959), insofar that it provides an awareness of how the personal experience of disability can be understood through the processes, relations, and contexts that produce the social world. By placing emphasis on how society establishes and reproduces marginalization and oppression, disabled people develop an understanding that their biography, experiences, and life chances are affected by societal organization.

The significance of the social model can be identified in three ways. Firstly, the model supports individuals in their journey toward liberation and empowerment (Crow, 2007). It assists individuals to navigate away from dominant narratives of tragedy and body-mind normality and can challenge assumptions that individuals with impairments and health conditions should accept responsibility for the barriers they experience. Secondly, the model is equipped as a tool by activist networks and social movement organizations to instigate radical emancipatory politics (Lawson & Beckett, 2020). It supports disabled people's collectives in developing resistance-based practices against the arrangements, actors, and networks that sustain disabled people's marginalization. The model facilitates discourse and praxis aimed at furthering disabled people's social justice and establishing accessible and inclusive societies. Thirdly, the model remains instrumental within organizational policy and is employed often as a framework to teach professionals about disability equality and social justice (Bunbury, 2019). The adoption of the social model within policy design and delivery transcends the divide between public, private, and civil society sectors – it remains a reference point for government strategy, service delivery, professional development, and inclusion of disabled people's organizations within training and knowledge delivery.

The chapter further argues that there is a danger surrounding social model application in disability activist networks. Notwithstanding its essential role in progressing disability politics, its application has allegedly been employed dogmatically (Shakespeare & Watson, 2001). The UK Disabled People's Movement continues to be scrutinized over how existing activists and newcomers are discouraged from critiquing the model's value (Griffiths, 2019). Disabled people's organizations and networks need to give consideration to developing safe and accessible spaces, which will explore the model's contemporary relevance in the lives of disabled people across the life course. This will support newcomers to disability politics to understand and utilize the social model in their daily lives, as well as facilitate their ideas about how the social model is employed to realize disabled people's emancipation.

Disabled People's Mobilization Around a Human Rights Approach to Enhance Their Participation in Law and Policy Making in Iceland

Contents

Abstract

The right to have a say in decisions that affect one's life is a core human right and a key emphasis of the Convention on the Rights of Persons with Disabilities (CRPD). Securing this right serves to empower disabled people and establish their position as "experts" in matters that affect their lives. This chapter examines how the CRPD and the human rights approach to disability that it embodies have served as a catalyst for the adoption of a new approach by disabled people's organizations (DPOs) to putting pressure on the authorities to engage in a more robust way with DPOs in the development of laws and policies, as called for by the Convention. It draws on the example of the process leading up to the adoption of new core disability service legislation in Iceland, which saw the emergence of the DPOs' use of the CRPD, as well as the General Comments by the CRPD Committee, as a tool to effectively advance the rights of persons with disabilities. This new strategy resulted in key changes to the legislation at the last stages of consultation.

Introduction

The adoption of the UN Convention on the Rights of Persons with Disabilities (CRPD) (2018a, b) not only propelled disability rights onto the international agenda, but it also had a significant impact within academia, particularly in the field of disability law and disability studies, where it led to the development of a new theoretical approach, the human rights approach to disability. As Quinn and O'Mahony (2017) point out, this approach is both driven and supported by the Convention itself. The CRPD and the human rights approach to disability reject the prevailing and often unquestioned perception of disabled people as a social or a medical problem in need of fixing or repair and instead recognize disabled people as rights holders who are more often disabled by barriers created by society than their impairments (Kanter, 2015; Traustadóttir, 2009). The perceived problem is therefore located outside the disabled persons, requiring changes to society to accommodate the difference brought about by disability (Degener, 2016; Kanter, 2007). The human rights approach thus merges the social approach to disability, which regards disability as the result of barriers created by society, with recognition of disability as a human rights issue (Degener, 2016; Kanter, 2007; Quinn & O'Mahony, 2017). From this perspective, the focus turns to society's role in constructing disability and its responsibility to rectify disability-based exclusion (Stein & Stein, 2007). Limitations that are placed on disabled people are identified as violations of their human rights, and the point of reference is changed by substituting needs with rights that can be claimed (Kanter, 2015). As rights holders, disabled people are, therefore, entitled to provisions being made to ensure their ability to exercise their rights (Degener, 2016; Kanter, 2015; Office of the High Commissioner for Human Rights, 2010; Stein & Stein, 2007). At the core of this approach is the Convention's embrace of the substantive equality model, which does not simply call for the equal treatment of all, but rather that people be treated in such a way that the outcome for all is equal (Kanter, 2015). By taking this stand, the Convention recognizes the need to adjust or adapt the traditional principle of equality, "not as an exception, but as a logical requirement to effectuate the true substance of the principle of equality and non-discrimination itself" (Arnardóttir, 2009, p. 60). Recognizing substantive equality establishes a positive obligation by state parties to remove barriers to full equality where relevant (Arnardóttir, 2009; Kanter, 2015). The Convention also develops a new understanding of equality as inclusive of difference, relating to both personal and group differences, as well as differences stemming from socioeconomic disadvantages (CRPD Committee, General Comment No. 6, 2018a).

The Convention and the human rights approach radically shift the focus to what changes need to be made and by whom. What is more, they go further than just stipulating rights and responsibilities. One of their most important contributions is that they lay out a roadmap to achieving change (Degener, 2016). The articles of the Convention themselves serve as a forward-looking guide illuminating the changes needed, with further support provided by the General Comments of the CRPD Committee on the interpretation and implementation of key rights. As such, the human rights approach and the Convention are tools that serve to empower disabled people to claim their rights as human rights holders (Degener, 2016; Skarstad & Stein, 2018).

This chapter focuses on the Convention and the human rights approach to disability as tools to further disability rights. It will do so from the perspective of the Convention's emphasis on the right of disabled people to full and effective participation in the development of laws and policies that affect their lives. The chapter draws on the case of Icelandic DPOs, which strategically used the Convention and the human rights approach to disability as tools to press for changes to core Icelandic disability legislation*, Laws pertaining to services for disabled people with long-term support needs* (No. 38/2018), in the final stages of negotiation before the law was passed by Althingi, the Icelandic Parliament, in 2018. The process, which was a part of the country's ratification of the CRPD, was formally initiated with the establishment in the spring of 2014 of a working group tasked by the Minister of Social and Housing Affairs with drafting the legislation and came to a conclusion in the fall of 2018 when the new legislation became law. The research this chapter draws on examined this process through 18 in-depth interviews, conducted from 2016 to 2018, with leaders of DPOs – both established DPOs, which included umbrella organizations, and grassroots and activist groups. In addition, data were gathered through the analysis of documents that consisted of comments submitted by disability groups and organizations on the draft legislation, as well as written communications between DPOs, academic research institutions, and the authorities during the consultation process (Löve et al., 2018, 2019). The study critically examined to what extent Icelandic authorities have lived up to the obligation to ensure active participation, as stipulated in Article 4.3 of the CRPD, and the strategies developed by DPOs to influence policy. The research showed that in the 5 years that the drafting of the legislation took, there was a change in how DPOs approached the authorities, as they increasingly adopted the human rights approach to disability in the later stages and employed the CRPD as a tool to build unity and strategically enhance rights.

Call for a New Way of Doing Disability Law and Policy

Among the most important changes called for by the CRPD is its commitment to ensuring the right of disabled people to full and effective participation in the development, monitoring, and implementation of disability rights. This is a right that promises to fundamentally change the position of disabled people from having decisions taken on their behalf to being a part of writing the narrative of where society is headed with regard to disability rights. The emphasis on full and effective participation is firmly grounded in the obligation set forth in Article 4.3, where state parties are required, "when developing and implementing policies and legislation concerning persons with disabilities," to "closely consult with and actively involve persons with disabilities" through organizations that represent them (Article 4.3). As Lord and Stein (2010) point out, this emphasis is both implicitly and explicitly woven throughout the text of the Convention, with support in the Convention's preamble, as well as in its mandate that "Civil society, in particular persons with disabilities and their representative organizations, shall be involved and participate fully in the monitoring process" (Article 33.3). Together, these obligations reflect the fundamental principle that those most affected have the right to participate in decisions that impact them and represent one of the most progressive marks that the CRPD makes toward the development of human rights law (Stein & Lord, 2010, p. 698). It is a position that opposes the marginalization and lack of voice in decision-making processes that so often has been the lived reality of disabled people and aligns with and reflects the rallying call of the disability movement, "Nothing About Us Without Us."

Indeed, the powerful participatory focus that runs through the CRPD can be attributed in great part to the unprecedented involvement of civil society, particularly DPOs, and the unique drafting process that was adopted as a result. The drafting of the Convention itself established a precedent for a collaborative process and gave the Convention a direction that is one of its enduring legacies, that of ensuring the due influence and participation of disabled people in their own affairs and in setting laws and policies that affect them, as citizens and representatives of people who have the lived experience of disability.

To further emphasize the Convention's intent and to underline the obligation upon state parties to ensure effective participation in the development of laws and policies, the UN CRPD Committee clarifies that this obligation should be broadly interpreted to cover all legislative and administrative measures that impact the rights of disable people either directly or indirectly, including general laws such as the public budget (CRPD Committee, General Comment No. 7, 2018b). Furthermore, the Committee addresses what constitutes inclusive and participatory policy making by providing detailed and thorough guidance on how to ensure full and effective participation and by providing a guide to the process of producing policies and legislation that are truly collaborative and inclusive. It is, moreover, important to note that while Article 4.3 calls for the participation of disabled people through their representative organizations, the Convention's intent is not to distance disabled people from participation in decision-making processes. The Committee provides clarification in this regard by defining what constitutes a DPO, as "those that are led, directed and governed by persons with disabilities. A clear majority of their membership should be recruited among persons with disabilities themselves" (CRPD Committee, General Comment No. 7, 2018b). This clarification is of key importance as it leaves no doubt that the intent of the CRPD is to ensure that disabled people themselves have access to all decision-making processes and that disabled people are recognized as capable and an important source of knowledge with regard to decision-making that affects their lives.

By bringing disable people into the decision-making process as active contributors, the CRPD ushers in fundamental changes to existing process norms with regard to how disability policy is made and who is involved. It calls for a co-production of social policy where the contribution of disabled people and the lived experience of disability are essential, while at the same time adhering to core principles of representative democracy, recognizing that opinions, suggestions, and comments will not automatically translate into law and policy (Löve et al., 2017). What it does is that it obligates state parties to change established process norms in a culture where "persons with disabilities still face significant attitudinal, physical legal, economic, social and communication barriers to participate in public life" as stated in General Comment No. 7 (para 5) (CRPD Committee, General Comment No. 7, 2018b). By taking this stand, the Convention challenges existing and taken-for-granted power relations and calls for changes to the accepted norms of who makes disability policy, rejecting the often ingrained perceptions of disabled people as lacking in decision-making skills (Arstein-Kerslake, 2017). The right to effective participation in law and policy making has the potential to shift the uneven power balances that have resulted in the marginalization of disabled people and serve as a tool that empowers them in the fight for full disability rights. This stance has been identified as pivotal to changing the position of oppression and disempowerment of marginalized groups by those writing from a critical theory perspective, such as Charlton (1998), Keys (2017), Oliver (1990), Priestley et al. (2016), and Young (1990). As Young emphasizes, only by being a part of the political structure, engaged in setting the political agenda and defining and re-defining issues in a way that reflects their lives and needs, will marginalized groups be able to change their position of marginalization (Young, 1990). In essence, the Convention calls for a radical shift of existing process norms that, as Quinn and O'Mahony have pointed out, provide "unprecedented opportunity for persons with disabilities to influence law and policy locally, nationally and globally" (Quinn & O'Mahony, 2017, p. xxv).

The New Approach in Practice

The human rights approach highlights the role of the CRPD as a guide and a tool for advancing disability rights. The process leading up to the adoption of new core disability legislation in Iceland, *Laws regarding services for disabled people with long term service needs* (No. 38/2018), provides an example of how this approach can be used strategically to advance disability rights.

The drafting process commenced in 2014 when the Minister of Social and Housing Affairs established a working group to prepare legislation that would replace core disability service legislation dating from 1982. From the very beginning, there were troubling signs of a lack of emphasis on ensuring the active participation of disabled people and their representative organizations in the process. The working group was comprised of 12 members with only 2 appointed by DPOs, or 17%. The small representation of DPOs was criticized, as was the fact that the DPOs represented did not at the time fully meet the CRPD's criteria for disabled people's organizations, as defined in General Comment No. 7, i.e., that they be led, directed, and run by disabled people themselves and that more than half of their membership consist of disabled people. In addition, during its 3 years of work, the membership of the working group included only one disabled person, and after this person's resignation half way through the drafting process, no disabled person was a part of the group for the remaining 1.5 years, until it concluded its work in October 2016. The lack of acknowledgement of the CRPD's emphasis on the importance of including disabled people themselves as representatives of the lived experience of disability was concerning and strongly criticized by grassroots and activist groups (Löve et al., 2017).

Concern over the lack of sufficient representation and active participation of disabled people and their representative organizations was also reflected in the in-depth interviews with the leaders of DPOs. They talked about an "incredible reluctance" and that their suggestions, petitions, and opinions often went unheard by the authorities and were rarely taken into account in policy making processes. This perception was shared by both the leaders of the established organizations, including the two umbrella organizations that had the right by law to be consulted on policies concerning disabled people, and the representatives of grassroots and activist groups. Expressing frustration that at times it felt as if decisions had already been made before meetings were convened, some even talked about having to be vigilant to ensure that comments and opinions expressed by their representatives were included in the minutes of the meetings (Löve et al., 2018).

Despite these frustrations, the approach of the established DPOs to influence the authorities continued to be marked by a reluctance to assume an aggressive stance or make outright demands. At the forefront was the emphasis on the need to maintain a collaborative and cordial relationship that focused on building trust and the DPOs' credibility as negotiating partners, including "cultivating a reputation for being trustworthy, calm and professional as opposed to emotional or aggressive" (Löve et al., 2018: 4). Maintaining an open dialogue was a cornerstone of their strategy, and their perception of their position vis-à-vis the authorities in the consultation process was reflected in statements such as "we don't burn bridges," "we don't slam doors," and "we are not loud" (Löve et al., 2018: 4). At times, they described their strategy as having to come to terms with taking small steps toward a set goal rather than having to accept no gains at all.

At this stage of the consultation process, the position of the DPOs was marked by their perceived need to maintain their foothold and position as reliable partners, which draws attention to and highlights the unbalanced power relations that existed and how it had put the DPOs in the position of having to monitor the tone of their demands and expectations. However, during the course of the research, a shift was observed in this regard that saw the gradual empowerment of the DPOs, fueled by the CRPD and the human rights approach during the last stages of consultations before the law was adopted into law by Althingi in the fall of 2018.

The position of grassroots and activist groups, which did not have consultation status in the policy making process, differed and was not as restricted by concerns over maintaining a perception of being calm and trustworthy. They often used more visual and visible forms of expression, such as wearing chains around their necks in public to represent systemic hindrances, organizing demonstrations, and delivering petitions to the authorities (Löve et al., 2018). Their demands were often marked by a more outright insistence on greater representation of the lived experience of disability. They pointed out that this emphasis was often missing from the strategies of the established DPOs. In a comment sent to Althingi regarding the policy making process, one grassroots activist group criticized openly the lack of DPOs nominating disabled people; "[i]t is very problematic that more often than not they [the DPOs] send non-disabled people to the table" (Althingi, 2017).

Following the initial drafting stage and review by the Welfare Committee of Althingi, the draft legislation was opened for comments in the spring of 2017, receiving 36 comments, from public, private, and academic institutions, as well as organizations, groups, and local authorities. It drew strong criticism from DPOs and the research community, among other things, for the lack of full and effective consultations as called for by the CRPD (Löve et al., 2017).

The legislative process had lingered and was now in its fourth year. However, pressure to finalize the process had been building following Iceland's ratification of the Convention in the fall of 2016. In addition, changes to the political leadership, including the composition of the Althingi's Welfare Committee, following general elections in the summer of 2017 had led the leaders of DPOs to believe that there was now an increased willingness to engage in an inclusive and co-operative policy making process. Seizing the opportunity, a joint working group was convened, comprised of representatives and leaders of key disabled people's groups and organizations, as well as the research community.

This was a new approach, as, prior to this, the DPOs had primarily worked independently, often focusing on issues particular to their members' interests and needs, which had resulted in diverging areas of focus that could, for example, be observed in the comments submitted by DPOs to the draft legislation. The spectrum of disability organizations (which includes both DPOs and DOs) in Iceland is broad, with two leading umbrella organizations, the National Disability Alliance (NDI) (Öryrkjabandalag Íslands) and the National Association of Intellectual Disabilities (NAID) (Landssamtökin Þroskahjálp). In addition, there are several other established organizations, including the Icelandic Federation of Physically Disabled People (Sjálfsbjörg), the Icelandic Association of the Visually Impaired (BIAVI) (Blindrafélagið), the Icelandic Association of the Deaf (Félag heyrnarlausra), and the Association of Rehabilitated People with Spinal Cord Injuries (Samtök endurhæfðra mænuskaddaðra). There is also a vibrant and growing community of grassroots and activist organizations, including Tabú – Activist feminist disability group, the Organization of People with Intellectual Disabilities (OPID) (Átak), and the Center for User-led Personal Assistance (CUPA) (NPA Miðstöðin), which have been vocal and often been able to generate media attention.

The key factors that contributed to bringing DPOs together were the perceived urgency to push for changes in the final stretch of consultations, changes in the political leadership, and the need to respond to complaints from several politicians that inconsistencies in the comments, proposals, and suggestions by the various DPOs prevented the parliamentarians from incorporating them in the drafting. The strategy adopted by the informal working group was to focus exclusively on issues that all could agree upon and to leave other matters to be pursued by each organization separately. The Convention provided a natural foundation for this collaboration as all the participating groups and organizations emphasized and referred to the Convention, and the rights and core values it embodies, in their agendas and mission statements. The Convention, therefore, served to focus the DPOs on common interests and shared values and, thus, helped to empower them to stand together and present a united front. "It's hard to ignore us when so many of us are there all saying the same thing" (member of the joint working group).

Members of the working group also increasingly approached the authorities from a human rights perspective, emphasizing rights as opposed to asking for consideration of needs and citing articles of the Convention and their interpretation by the CRPD Committee to support their arguments. A sense of empowerment could be observed as a result of this change. One member stated, "[t]here is a lot more power to it when we can claim a right instead of relying on the willingness of others." The increased use of a rights-based approach was also a reflection of the considerable accumulation of knowledge of the Convention and its key articles among the DPO members and the research community. A member of the group recalled an instance when a member had read out loud before a meeting of Althingi's Welfare Committee a passage from General Comment No. 5 in support of his argument regarding interpretation of Article 19 of the Convention.

There was also an increased willingness to frame issues as violations of rights. As a member of the working group pointed out, "[w]hat I say to people is, just to be clear, this is no longer a question of choice because when Iceland ratified the Convention, it accepted its obligation to consult and ensure participation. If it's not done, then you are in breach of it" (member of the joint working group). The previously expressed hesitation to adopting a confrontational stance vis-à-vis the authorities had also dwindled, as exemplified by a member of the joint working group who, after finding out that the drafting of several regulations had been initiated without calling disabled people or their representative organizations to the table, reported meeting with the Minister of Welfare to protest. "I handed him [the Minister] a document to sign stating our protest . . . pointing out that this was in violation of the CRPD. Two weeks later, we were called to the table" (member of the joint working group). Compared to the more guarded approach that DPOs had previously maintained, these changes signaled an important perception of a shift in the balance of power where DPOs, drawing on a rights-based approach and a united front, felt empowered to represent their case and their claims to full disability equality more forcefully than they had before.

The new unified rights-based approach resulted in several significant changes to the legislation that members of the working group attributed to their efforts during the last round of consultations in early 2018. These changes included an addition to Article 36 of the law that now states that the membership of a consultative body to the Minister is to be composed of a majority of disabled people. This was considered to be a major breakthrough. A member of the joint working group stated, "[i]f the consultative committee is led by disabled people, then I'm confident we can do what we set out to do." In addition, there is now an increased emphasis on the need to consult with DPOs throughout the text of the legislation, whereas before there had only been references to consultations with local governments. Another major achievement that the group attributed to its work was the fact that the law was changed to secure personal assistance as a legally mandated service form for all disabled people. Before, the draft had contained contingencies that could be used to limit the access of children and people with intellectual disabilities.

The working group also succeeded in changing the name of the legislation. It now refers to services for disabled people with "long-term" service needs instead of "significant" service needs as it did before. The change was intended to avoid "leaving it too much in the hands of the local governments to determine how much support you need and therefore whether the law applies to you or not. . .." Members pointed out that there could be financial interests at stake that could impact decision-making. In addition, members of the working group, drawing on their expert knowledge of the CRPD and its fundamental intentions and goals, were influential in the translation of key definitions, ensuring that they were in line with the intent of the CRPD (Löve et al., 2019).

What Changed and Why?

The study revealed a change in the way that the Icelandic DPOs approached the authorities in the 5-year drafting process. The change that occurred can in significant part be explained by the DPOs' embrace of the human rights approach to disability, focusing on rights instead of being dependent on politicians' willingness to accommodate needs, and their strategic use of the CRPD as a tool to build unity and to push for rights. The social understanding of disability, as a foundation principle of the CRPD, was also of great significance, stating that disability is the result of the interactions of people with impairments "with various barriers [that] may hinder their full and effective participation in society on an equal basis with others" (Article 1). This clearly supported the DPOs' demands regarding the importance of societal changes.

The use of the CRPD as a tool by the Icelandic DPOs was multi-pronged. Firstly, the DPOs drew on the Convention's ability to act as a unifying force by bringing together key DPOs and grassroots organizations, with the support of the research community, to create a united front. Previously, the DPOs had primarily engaged with the authorities separately, often focusing on areas of particular relevance to their membership. As is the case in other countries, the diversity of the Icelandic DPOs is a reflection of the diverse nature of disability itself and has served to facilitate the growth of the Icelandic disability movement to better reflect the breath of issues relevant to disabled people (Encalada, 2020; Sherlaw & Hudebine, 2015). In this instance, however, the Convention was uniquely able to support the DPOs in coming together around its core values and the rights that they all shared and had advocated for in their agendas and mission statements. The CRPD, therefore, served as a tool to unite and empower the DPOs who reported finding themselves better positioned to argue their case as representatives of a broad coalition that included a wide spectrum of DPOs with diverse memberships. The group also reported that working together had served to empower and strengthen their position as it had enabled them to share the workload and draw on the various strengths and expert knowledge that each organization and group brought to bear.

Secondly, by adopting a human rights focus, members of the working group strategically employed the Convention as a tool by citing and referring to rights stated by the Convention and underlining the obligation on state parties to ensure that these rights are realized. Furthermore, they drew on their in-depth knowledge of the Convention's intentions and values to support their arguments, for instance, by citing the interpretations of key articles by the CRPD Committee, articulated, among other places, in the Committee's General Comments. Members of the working group also drew on the potential underlying political threat to the authorities of being found to be in violation of disabled people's human rights. This was exemplified by the working group member who requested that the Minister of Welfare sign a document stating that he had been made aware that his actions were in violation of the obligation to ensure active participation of disabled people in policy making, as called for by Article 4.3.

Thirdly, Article 4.3 of the Convention is in itself a tool for advancing disability equality that the DPOs strategically seized upon in their efforts to influence the authorities and, as such, helps explain the shift that occurred in the balance of power between the Icelandic DPOs and the authorities. As stated earlier, the right called for in Article 4.3 represents a fundamental change to existing process norms with regard to how disability policy is produced and who is involved in that process. By obligating the authorities to ensure full and effective participation of disabled people, the Convention calls for a fundamental shift from previously taken-for-granted power balances. In the case of the Icelandic DPOs, this was highlighted by the shift in attitude among the DPOs, from viewing it as their role to be accommodating and, in effect, practicing self-monitoring in order to maintain an open dialogue to demanding an inclusive and effective dialogue as a right. The shift observed reflects the critical theory's focus on questioning and re-examining assumptions and values previously taken for granted. Instead of accepting the status quo, critical theory recognizes that existing social norms and structures are an expression of a particular power structure (Agger, 1989; Minow, 1990). Critical theory claims that only by revealing the underlying power dynamics that maintain the status quo can change take place (Kellner, 1993; Meekosha & Shuttleworth, 2009). Article 4.3 calls for such a reevaluation of existing power structures and obligates states to take a step toward creating a new power balance by securing the full and effective participation of disabled people through their representative organizations in the development of law and policies.

The intent of Article 4.3 is to empower disabled people as full and effective partners in the co-production of disability policy. The right that it encapsulates has the potential to shift the uneven power balances that have resulted in the marginalization of disabled people and to serve as a tool for the empowerment of disabled people in the fight for full disability rights. Article 4.3. exemplifies how the Convention and the human rights approach may be employed as tools to empower disabled people to claim their rights as human rights holders (Degener, 2016; Encalada, 2020; Skarstad & Stein, 2018).

Conclusion

The process of influencing the key disability legislation in Iceland represents a successful example driven by a coalition of the disability rights movement. As has been documented by other activists and advocates around the world (Soldatic & Johnson, 2020), it is primarily the CRPD that has created the international momentum for change, which the Icelandic disability movement has translated into action. The CRPD empowers disabled people by providing new ways to advocate for their rights as well as open new avenues to interact with governments. The embrace of the human rights approach to disability by the Icelandic DPOs, and their use of the CRPD as a tool for asserting pressure in the advancement of their rights, including the right to full and effective participation in law and policy making, served to empower disabled people and the DPOs in their dealings with authorities. Furthermore, it resulted in a change in the balance of power that had previously been taken for granted, including by the DPOs themselves.

Models of Disability and Judicial Interpretation in India

Abstract

How disability is modeled or understood is determinative in the evolution of both Disability Studies and Disability Politics. By focusing on India, this chapter demonstrates that transformation and metamorphosis in the lives of persons with disabilities is contingent and predicated on the adoption of models to evolve conceptions of disability and disability rights. Upon the ratification of the United Nations Convention on the Rights of Persons with Disabilities 2006 by India, a presumption arose that the Indian legal order embraced the social and Human rights models of disability and that disability was no longer to be viewed through the prism of the Medical Model. The judiciary is enjoined to be cognizant to and sensitive of these presumptions while interpreting the Constitution and other

laws, just as the legislature and executive are mandated to reflect the same in the enactment and execution of laws.

This chapter investigates how the judiciary has drawn upon the social and human rights models of disability in advancing the rights of persons with disabilities. The challenges faced by the judiciary in carrying out this role are also addressed. As Dhanda has argued, the approach of courts in India to disability rights cases continues to be dominated by a narrow focus on the facts of each particular case rather than an ambition for more systemic change (Dhanda, 2005). Nevertheless, there are some interesting and potentially important exceptions, which draw upon the social and human rights models of disability implicitly or explicitly.

Models of Disability · Supreme Court of India · High Courts · Constitutions of India · RPwD Act 2016 · PWD Act 1995 · UNCRPD

Introduction

This chapter seeks to interrogate how the judiciary has deployed the social model and the human rights model of disability. It also demonstrates that courts have strengthened legal obligations based on both these models by recognizing the significance of the obligation to provide reasonable accommodation and the idea of the promotion of accessibility. It suggests that ratification of the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) by India played an important role in the deployment of these models by the courts. One of the major steps India has taken post ratification of UNCRPD (to incorporate its obligations as part of the Indian legal order) is to enact the Rights of Persons with Disabilities Act, 2016 (hereinafter RPWD Act 2016). This has had a significant impact on case law, but should not diminish the importance of the judiciary's role in bringing about transformative change – a point elaborated in section "Socio-human Rights Model of Disability in Judicial Discourse Post RPWD Act 2016." When viewed against the text of the Constitution of India, which is marked by ableism and the medical model of disability, the judicial interpretation of disability – both pre and post ratification of the UNCRPD – includes examples which are remarkably positive.

This chapter is divided into three sections. Section "Models of Disability – An Overview" briefly examines the principal models of disability; section "Disability-Rights Based Adjudication in the Pre-RPWD Act Era" presents an analysis of judgments in disability-related cases which do not explicitly refer to the socio-human rights model of Disability, most of which were decided prior to the enactment of the RPWD Act 2016. It is suggested that, despite the grip of Constitutional silence on Disability-based discrimination, the Courts in India were able to deliver some judgments with powerful potential for change in the lives of people with disabilities during this era. In the third and final section, some of the landmark judgments pronounced by the Supreme Court and High Courts of India, which do explicitly draw on the socio-human rights model, are examined. This analysis focuses mostly on cases decided after the enactment of the RPWD Act 2016 and highlights the catalytic role of the socio-human rights model in the recognition and promotion of the human rights of persons with disability. The division of cases between sections "Disability-Rights Based Adjudication in the Pre-RPWD Act Era" and "Socio-human Rights Model of Disability in Judicial Discourse Post RPWD Act 2016" does not necessarily reflect a major qualitative difference in the approach of the courts, but nevertheless it helps to provide structure to the discussion and lays down useful groundwork for future research. It is argued that Courts have been able to effect some structural changes in the political establishment to embed and entrench the rights of disabled people in the legal order. Some clarifications are in order. I deploy the terminology of "Persons with disabilities" and "disabled persons" synonymously and do not wish to engage in debate on the same in this chapter. Secondly, though the social and human rights models are distinct, for the purposes of this chapter, I read them as an integrated whole and demonstrate during the course of discussion in this chapter that Courts in India have not interpreted them as embodying distinctively different standards. Lastly, I have relied on the judgments of Appellate Courts alone because in India, lower courts are mostly arbiters of facts and, moreover, the judgments delivered by these courts are not reported.

Models of Disability – An Overview

A careful analysis of pronouncements on Disability demonstrates that the judiciary in India has deployed Medical, Social, and Human Rights Models of disability. In this section, a brief account of these models is provided.

Smith correctly points out that, on the surface, the medical and social models of disability appear to be two poles that are mutually exclusive, providing opposing interpretations of the concept of disability, but in reality, these models are part of a spectrum that allows "for a range of interpretations between them" (Smith, 2011, p. 107).

Medical Model

Smith envisages two variants of the Medical Model. According to the first variant, disability is caused by fixed medical characteristics that inevitably result in a life of deficiency and "abnormality" – the full-essentialist individual deficiency interpretation. Although the second variant also locates the cause of disability in medical characteristics, it nevertheless recognizes that such conditions can be "partially alleviated by changes in the social environment, so as to enable some degree of 'normal living'" – the part-essentialist individual deficiency interpretation (Smith, 2009, p. 22).

The full-essentialist individual deficiency approach is opposed by the disability rights movement because the policies and practices based on it render disabled people as passive and powerless targets of intervention through non-disabled expertise. Medicalization of Disability is directly linked to a “practice of genetic eradication and even the systematic murder of people with impairments” (Smith, 2009, p. 16).

Although the second variant seems to embody a move away from this full-essentialist individual deficiency interpretation, because of its recognition of the role of social environments as a cause of disability, reliance on medicalized understanding of disability is still the pivot of this model (Smith, 2011). By perceiving persons with disabilities as problematic, owing to their inability to internalize dominant standards of “normality,” it perpetuates the Ideal or Best. By highlighting the role of non-disabled experts in “changing the individual’s deficient or tragic condition through medical intervention, and/or providing rehabilitation programmes for making individual adjustments to that condition” (Smith, 2011, p 111), the power dynamic in the decision-making process is distorted by being pushed towards the “privileged and expert knowledge” of these professionals.

Thus, under both these variants, there is hardly any focus on the removal of environmental barriers (Morris, 1991; Smith, 2011).

Social Model

Essentially, the social model locates Disability not in an individual’s limitations but in societal failure to provide appropriate services and accessible environments (Hendren, 2020, p. 14).

Firstly, the social model distinguishes between impairment and disability – the former is individual and private, the latter is structural and public. The Social Model calls for a focus on the removal of disability and thus for a shift away from an exclusive focus on the remedying of impairment. Secondly, the social model views disability as a societal construct, whereas the medical or individual models see it as a physical or mental deficiency. Thirdly, distinguishing disabled from non-disabled people, the social model attributes the causes of oppression of the former to the latter. Civil rights rather than charity are regarded as the way out for the empowerment of persons with disabilities. “Nothing about us without us” is the mantra underlying this model (Davis, 2021).

A number of scholars have questioned the efficacy of the social model by arguing, inter alia, that it neither helps in comprehending the complex interplay of individual and environmental factors in the lives of disabled people nor does it account for the number of resources to be allocated for the removal of barriers (Shakespeare, 2021). However, there are also a large number of scholars robustly defending its continued relevance. They contend that this model is relevant internationally in the Disability Rights Movement because of its emphasis on recognition of the distinction between notions of impairment and disability. Even though the goal of this model is to bring societal change, that change will not be successful unless it takes into account various impairment types, effects, and needs. Understood in this way, Degener’s observation that the human rights model acknowledges impairment-effects and demands them to be considered when social justice theories are developed applies equally to the social model (Lawson & Beckett, 2020).

From this discussion, it becomes clear that the social model is neither a dogma nor a theory; it merely is a symbolic representation and articulation of different disabling barriers. Viewed in this light, it is historically, socially, and topographically contingent. For example, in India, apart from placing emphasis on the socio-cultural and economic-politico and legal barriers, it is also important to attend to religious and cultural constructions of disability. In other words, the Indian social model of disability must also combat the notion that persons with disabilities (PWDs) are victims of their past karmas (deeds of previous birth).

The traditional British interpretation of the Social Model, construed as the "politics of disablement" discussed above is only one of the possible theoretical description of causes of disability and does not prevent its further substantive interpretation in order to be attentive to specific policies or practices. Smith offers an alternate interpretation alongside exposing limitations of the British social model. He contends that despite being fundamentally transformative and substantially problematizing both versions of the medical Model, the British version of the social model nevertheless falls back on the mythical binary of "ordinary" or "normal living" and "ideal" and "non-ideal" states of being (Smith, 2011).

Although "deficit" is described as a "social concern," the British Social Model has a flaw in that it focuses on achieving the ideal state of ordinary citizenship. In other words, PWDs are expected to be in a similar condition to non-disabled people. The distinction drawn under Disability constitutionalism in India, between "sound Mind and unsound Mind," also reflects these mythological dichotomies. The recently rolled out draft policy on persons with disabilities is also symptomatic of this. Let me allude to the observations in the policy in the context of employment of persons with disabilities.

> There are also instances where PwDs often shy away from applying for certain jobs fearing social stigma. There is also perception among PwDs that they may be treated differently post entry into organisation. In the absence of an effective integration process, a conducive environment in an organisation for inculcating inclusive culture will be unrealistic.
>
> Some of the constraints PwDs face in the employment market are lower literacy level, lack of daily living skills, lack of self-esteem and confidence, overprotective parents, lack of basic trade skills, poor knowledge of language, health issues, rural disconnect from the market and preference for government jobs. (Draft National Policy for Persons with Disability 2022, p. 40, para 7.6 and para 7.7)

The mythological dichotomies and conformance to Idealist structure are issues that Smith tries to overcome in his alternative interpretation of the Social Model. He opines that inaccessible and discriminatory social contexts, as well as their "social construction," or "social construction of disability" are the main causes of disability. Therefore, it is important to characterize the individual deficit or dysfunction (as well as their opposites – "talent" and "capacity") by relating them to certain social and political processes. This interpretation complements the British social model of Disability by shedding light on "social and political discourses defining what are in the first-place talents and handicaps." It amplifies the Positive aspects of a disabled person's identity, reflecting their subjective experiences of impairments (Smith, 2011).

Human Rights Model

With the entry into force of the UNCRPD, some scholars have advanced the human rights model of disability as a historical progression from the social model. Degener attempts to distinguish the human rights model from the social model through the following propositions:

> Firstly, the social model merely articulates disability whereas the human rights model directs attention to recognition of values as part of disability policy to acknowledge the human dignity of PWDs. Secondly, the ambit of the social model is narrower than that of the human rights model. The former is anchored mainly in anti-discrimination policy and civil rights reforms, whereas the latter implicates first (civil and political) and second generation (economic, social and cultural rights) of human rights. Thirdly, the human rights model is, sensitive to the impact of impairment and its effects on PWDs, by contrast with the subdued response of the social model to the same. Fourthly, the social model does not attach attention to identity politics as a significant element of disability discourse, whereas the human rights model is sensitive to the minority and cultural identities of disabled people. Fifthly, the social model completely rules out disability prevention policy, whereas the human rights model affords a basis and justification for the recognition of the positive dimensions of the same and links it with human rights protection claims. Sixthly, while the social model provides a cohesive narrative as to how two thirds of the billion disabled persons in this world live in relative poverty, the human rights model provides a roadmap for transformation in their lives. (Degener, 2014, pp. 34–47)

Degener is categorical in maintaining that the human rights model is not a substitute for the social model. Rather, she claims, the former develops, builds on, improves, and moves beyond the latter. She agrees with the analysis of Rosemary Kayess and Phillip French that the version of the social model that influenced the drafting of the CRPD was a populist conceptualization of the social model, rather than a critical theory of disability (Kayess and French, 2008). The formulation of the disability human rights paradigm evolved by Stein & Stein has striking resemblances to that evolved by Degener. "Disabled persons are entitled to equality by virtue of their equal humanity, not because they satisfy sameness norms and 'antidiscrimination as well as equality measures' demanding the investment of resources are recognised" (Stein & Stein, 2007, p. 1212).

Similarly, a recent research project led by Maria Berghs directs attention to evolving a new model, the social model of human rights, to contest and combat "the negative disability-related impact on equality, social protection and other human rights of policies such as austerity and the shrinking of welfare states" (Berghs et al., 2019).

However, in a recent paper, the views of Degener have been contested inter alia by arguing that both social and human rights models are complementary and that it is not therefore helpful to regard the human rights model as an improvement of the social model. By advancing what is termed the "complementarity thesis," Lawson and Beckett argue that both models build on and support each other (Lawson & Beckett, 2020). Oliver strikes a cautionary note against multiplying models of disability, given the risk of adding to confusion (Oliver, 2004). It is asserted that the primary roles of the social model are descriptive and heuristic in articulating the causes of disability, while the role of the human rights model is prescriptive in providing guidelines for policies, laws, and programs to foster the identity of PWDs through the principles of human dignity and substantive equality. The evolution of new models, by collapsing descriptive and prescriptive theories of Disability, apart from leading to incoherence analytically, has the potential to cause great dis-service to the Disability Rights Movement.

Thus, it is not the social model but explanatory theories of disablement which account for how disabling barriers exist and persist as noted by Thomas (Thomas, 2004). In the light of the aforementioned discussion, the virtue of the social model to adapt to specific local contexts, needs and circumstances need not be reemphasized (Oliver, 2004). Lawson and Beckett observe that the "…human rights model operates to support the development of particular types of law and policy, together with particular governmental and intergovernmental structures and mechanisms for overseeing and monitoring their implementation. By contrast, the social model is more open textured. It operates in connection with emancipatory disability politics more generally" (Lawson & Beckett, 2020, p. 370).

It is important to highlight the nuances in the debate around these models in order to enable the judiciary to evolve jurisprudence based on relevant conceptions of disability. It also ensures that the judiciary takes into account the efficacy of both the social and human rights model as complementary. Against this backdrop, this paper seeks to evaluate how the Indian Judiciary has deployed these models as a changemaker in the lives of PWDs.

Disability-Rights Based Adjudication in the Pre-RPWD Act Era

In this section, a brief critique of ablism in the Indian legal order, with special reference to the Constitution, is followed by an analysis of the judiciary's responses to disability rights cases prior to the enactment of the RPWD Act 2016. As will be demonstrated, in the majority of these decisions, the courts focused on providing remedies to individuals without a broader structural approach. Prior to all this, the section provides a snapshot of the judicial process.

Broadly speaking, the journey of the judicial process around the world has evolved from the mere application and enforcement of law to its creative and innovative interpretation. This interpretative role of the judiciary has been highlighted and promoted by Dworkin, for whom the concept of law is actuated by the considerations and purposes it seeks to achieve. In other words, he focuses on the purposive role of law by emphasizing its best moral interpretation (Dworkin, 1996). This is a paradigm shift from the conventional approach, which confines the role of judges to merely ironing out minor problems and gaps in the law (Cardozo, 1921).

Dhanda aptly captures the role of the judiciary in the context of disability rights adjudication by pointing out that judges have to make a choice between evolving disability rights jurisprudence or reinforcing the status quo and thereby perpetuating the social construction of disability. These choices are at least partly determined by the language of the statutes and the legislative preferences thereof. However, these choices are also driven by historical ideas of disability based on generosity and charity.

The Indian Constitution significantly restricts the legal framework and offers less room for interpretive judicial maneuvers, because of its medical leanings toward disability. It also stifles the agency of PWDs (Dhanda, 2005). The Indian Constitution fails to explicitly list physical or mental Disability as one of the prohibited grounds of discrimination. Additionally, it prohibits people with disabilities from holding certain forms of public office, such as being a judge of the Supreme Court or High Courts, or a Member of Parliament or the State legislature.

On other provisions of the Indian Constitution too, the influence of ableism is telling. Article 41 one of the Directive Principles of State Policy (not enforceable in the Courts of law) enshrined in Part IV of the Indian Constitution reads, “The State shall, within the limits of its economic capacity and development, make effective provision for securing the right to work, to education and to public assistance in cases of unemployment, old age, sickness and disablement, and in other cases of undeserved want.”

Deploying a very disparaging tenor and tonality, disablement is situated alongside the negative conditions of unemployment, old age, and sickness in this provision. Although the State is obligated to make effective provisions for securing the rights to work, education, and public assistance, the obligation is watered down by the phrase, “within the limits of its economic capacity and development.” This provision suggests that PWDs deserve certain rights only if affordable to the State. According to Nordenfelt, “The very classification of a person as handicapped presupposes an ethical or political decision” (Nordenfelt, 2000, p. 123).

Thus, before the Persons with Disabilities Act of 1995 was passed, disabilities were primarily used in the Indian legal system to determine compensation for accidental injury and to bar people with disabilities from specific occupations. Space constraint does not allow me to deal with this issue any further. Analyzing some significant court decisions rendered during this period may help us gain some insight into the models of impairment used by the Courts at the time and to examine whether the same inhibited or shaped judicial approaches in any way.

Article 13 of the Constitution of India declares every State action and in certain cases even actions of non-State bodies to be unconstitutional if they are in breach of fundamental rights under the Indian Constitution. The mandate of this article has been strengthened by the advent of public interest litigation (PIL). PIL is a post-colonial instrument and can be invoked by any public spirited individual or social activist to vindicate the cause of vulnerable sections of society who would otherwise lack both resources and access to courts. PILs can be filed in both the Supreme Court of India and High Courts. In the context of disability rights, it is one of the most sought-after actions resorted to by activists to take up the causes of PWDs and to legally assert their rights. Considered against an ableist Constitution and status-quoist legal order, the response of the judiciary to these PILs is most commendable, particularly prior to the enactment of the PWD Act.

In *National Federation of the Blind v Union Public Service Commission* (1993), a young blind lawyer sought a direction from the Supreme Court of India to the Union Public Service Commission which would allow blind persons to take examinations with the assistance of a writer or by writing the papers in braille. The Court held, “If some of the posts in the Indian Administrative Service and other allied services, as identified by the committee can be filled from amongst the visually handicapped persons then we see no reason why they should not be permitted to sit and write the civil services examination” (*National Federation of Blind v Union Public Service Commission*, 1993, para 13). However, the court qualified this by pointing out that, once recruited to the lowest level of the service, the visually impaired person should have no right to claim promotion to a higher post if that particular post was not suitable for them. While implementing this judgment, although the Union Public Service Commission recognized the entitlement of blind people to the assistance of writers, it withdrew the choice given to blind persons by the court to write the answer in Braille – on the ground that this would make it impossible for examiners to distinguish between the scripts of different blind persons.

Another case concerned the refusal by the State Government of Orissa to provide financial assistance and recognition to a school for deaf and people with speech impairment on the ground of financial incapacity. The Orissa High Court in *Ramchandra Tandi v State* (1994) held that the decision of the state, based on financial instability and austerity, was untenable. Allowing the petition, the court held, “After nearly half a century of independence, it does not befit the State to take plea of unsound financial condition to deny meagre amounts needed for a few ‘deaf and dumb children’ ” (Ramchandra Tandi v. State of Orissa (1994 *SCC OnLine Ori 29 Para 5*).

Although the courts do not specifically mention any disability rights models in these two cases, a detailed examination of the judgments reveals that the judges were swayed by the “partial essentialist individual deficit approach,” a variant of the medical model discussed above. In these cases the Courts also supported the human agency of Persons with disabilities and anchored the idea of disability in the fundamental rights of Part III of the Indian Constitution.

In sharp contrast to these two cases, where the court was able to uphold the rights of disabled people by recognizing the State’s correlative obligation, were several other cases decided during this time period. Thus, as discussed by Dhanda (2002, pp. 92–93 (drawing on news article in the *Times of India*, 29 June 1994, p. 6)), the Bombay high court failed to find any *malafide* in a state government’s decision to allow large-scale hysterectomies of girls with intellectual disabilities residing in institutions, where notice was issued to the State by the court but the case did not progress.

This case is a textbook example of the "full essentialist individual deficiency" interpretation discussed above. The decision of the State was clearly actuated by the possibility of women with intellectual disabilities remaining pregnant after they had been sexually abused by the employees of the institution.

In other cases relating to the administration and proper management of the mental asylums of Agra, Ranchi, Gwalior, and Shahadra such as *Rakesh Chandra Narayan v State of Bihar* (1989), *S.R. Kapoor and Others v Union of India and Others* (1990), *Supreme Court Legal Aid Committee v State of M P and others* (1995), *Aman Hingorani v Union of India* (1995), separate petitions were filed and the Court gave almost the same recommendations in each of the cases. According to Dhanda, "In such cases the Court should have suo moto taken suitable actions and issued proper directions to each of the mental hospitals within the country to abide by the court's guidelines and also instruct the respective governments to take necessary steps to initiate changes" (Dhanda, 2005, pp. 376–377).

The cases from this era thus demonstrate the courts' tendency to adhere to the medical model of Disability, treating impairment as an irreparable deformity and thereby leaving the fate of persons with impairments to the discretion of the State. However, in some cases, the courts were able to anchor Disability rights in values of equality and fairness set out in the fundamental rights of Part III of the Indian Constitution, thereby bringing about some systemic transformation. Surprisingly, Courts have been able to accomplish the same in the teeth of very ableist Constitutionalism and the absence of any legislation.

The Persons with Disability (Equal Opportunities Protection of Rights and Full Participation) Act of 1995, passed in response to the First Asia Pacific decade of Disability (1993–2002), by the Parliament of India, did not significantly alter the legal environment. By defining disability in terms of the severity of physical impairments, Parliament endorsed the medical model. However, the law was also influenced by the part essential individual deficit interpretation, a moderate variant of the medical model discussed above.

The case law in relation to this Act primarily concerned the dismissal of employees who had acquired disabilities whilst in the employment of the State or one of its agencies, and the implementation of job reservations for PWDs in public employment. However, courts also delivered some judgments, influenced by the part essentialist individual deficiency approach, concerning the State's obligations under sections 30, 38, and 42 of the Persons with Disabilities Act 1995 to initiate and evolve schemes and programs for the realization of positive rights. Courts are required to step in should the State fail to formulate such schemes in order to prevent them becoming merely discretionary (Sikri, 2004).

Javed Abidi v union of India (1999) I is one such case. Along with the general enforcement of the persons with Disability Act 1995, the petitioner in this case also sought directions to provide aisle chairs in every aircraft and install ambulifts in all airports. It was also argued that discounted Airfares should be extended to people with other types of disability besides blind people. Playing down this argument, the Court held that enforcement of this law was contingent on economic capacity, and found that wholesale extension of concessionary air travel was implausible. But, emphasizing the severity of other impairments, the court directed the airline to extend discounted airfares within the country to people with “locomotor disabilities” of 80 or higher percentage (*Javed Abidi v Union of India* (1999) 1 SCC 467, Para 5). In response to this ruling, Indian Airlines agreed to offer ambulifts and aisle chairs to passengers with disabilities at all the airports in a phased manner.

Disabled Rights Group v Chief Election Commission and others (2004) was a public interest litigation seeking directions to the State to provide an enabling environment, by way of ramps, disabled-friendly voting machines (EVMs), security measures in the polling booths, and identification of their disability status in the electoral rolls, for casting votes by PWDs in various general and local elections. The Supreme Court ordered the Chief Secretaries of all the Indian States to coordinate with the Election commission of India to ensure installation of wooden ramps to make polling places at least in cities and metropolitan areas accessible for PWDs.

Fifteen years from the date of this judgment, there has been structural change in the policy of the Election commission of India, with repeated emphasis now being placed on the accessibility of polling booths and allied facilities. This has been possible due to sustained cause lawyering through a series of petitions demonstrating the influence of the social cum human rights model of Disability.

In *National Association for the Blind and Others v Central Board of Secondary Education and Others* (2001) and *Dhaval S Chotai v Union of India and others* (2003), the Delhi High Court and Bombay High Court respectively acceded to the contentions of students with visual impairment and cerebral palsy to provide extra time for writing examination papers. Due to paucity of time, the Delhi High Court did not allow an additional claim in respect of modification of the mathematics paper and supply of question papers in Braille. However, the court directed modification of the curriculum and examination system, in light of the objectives of the Act.

In *Anka Toppo v AllMS* (2001), a final year MBBS student upon sudden loss of sight when not allowed by College Authorities to appear in the examinations, moved the National Human Rights Commission of India. The college defended its action by contending “in view of the severe visual loss suffered by Shri Toppo. It would not be possible for him to work in the medical profession.” However, after considerable persuasion by the National Human Rights Commission of India and upon furnishing of numerous examples of blind people successfully pursuing medical practice, the college finally agreed to allow the petitioner to appear in the examination for the MBBS course with appropriate modifications. Against the backdrop of this case, the National Human Rights Commission recommended to the Medical Council of India (the Apex Body governing medical education in India) to fine tune and tailor its policy for providing the same facility and system for students in such conditions in other medical institutions of the country as well. (*Anka Toppo vs AIIMS*, No.1754/30/2000–2001).

Given that the above cases were decided before the ratification of the UNCRPD by India and the narrow scope of the Persons with Disabilities Act of 1995, the influence of the medical model of disability and a profoundly ableist constitutional framing, the approach taken by the judiciary in these cases is remarkably progressive in advancing the rights-based approach. Prima facie the jurisprudence evolved by the

Courts thus far seems to be confined to particular controversies or responses to individual case. However, a close look on the impact of these decisions demonstrates that both at the time of their pronouncements and in terms of their impact on policies and structures of the State, the same deserve the tag of "change makers." With the pronouncement of the National Federation of the Blind decision in 1994, more than 100 individuals with different disabilities have been permitted entry into the higher echelons of Indian bureaucracy, thereby seriously contesting myths about the unproductivity of people with disabilities. A number of professional bodies, such as the Institution of Charted Accountants, have tailored examination procedures so as to incorporate provision for reasonable accommodations for people with disabilities. Thus, the impact of this jurisprudence is much ahead of its time in espousing the socio-cum-human rights model of Disability, albeit implicitly.

In 2006 the UNCRPD was adopted by the United Nations. India became one of the first signatories of this convention and later in that year also categorically ratified the same. However, the Disability Rights Movement had to wait another 10 years for concrete action in the form of legislation making the convention part of the Indian legal order. During this time, the Judiciary continued to deliver a number of important pronouncements. In a significant study, Dr. Atrey shows that, from the date of ratification of the UNCRPD by India to the enactment of the Rights of Persons with Disabilities Act 2016, the Supreme Court and High courts referred to the UNCRPD in 28 cases, but only twice (*Jeeja Ghosh v. Union of India*, 2016; and *Vibhu Dayal Sharma v. Director High Court of Punjab and Haryana*, 2013) made an explicit reference to models of disability rights. In none of the cases was contemporary disability rights scholarship alluded to.

The Delhi High Court, in *Javed Abidi v Union of India and others* (2008 unreported) II, while dealing with the issue of inaccessibility of public buildings under section 46 of the PWD Act 1995, made relief subject to the conditionality of the economic capacity of the State. In other words, the right to accessibility was enforceable only as far as it was affordable to the state, bringing into play the "part essentialist individual deficiency" interpretation.

Unexpectedly, courts did not draw on the UNCRPD in most of these judgments. To illustrate, unlike *Javed Abidi I* in 1999, where the Supreme Court had only partially accepted the defense of economic capacity when providing relief to people with severe locomotor disabilities, in *Javed Abidi II* the Delhi high court simply accepted uncritically the State's arguments based on financial constraints without weighing them against obligations under the UNCRPD.

In the next section, judicial discourse explicitly referring to the socio-human rights model of Disability is analyzed.

Socio-human Rights Model of Disability in Judicial Discourse Post RPWD Act 2016

This section explores how the Supreme Court of India and High Courts of various States have developed jurisprudence in light of socio-human rights models of disability for the amelioration of the lives of people with disabilities. It focuses mainly on cases decided after the enactment of RPWD Act 2016, by drawing on the MANUPATRA and SCC data bases. Supreme Court and High courts mentioned the UNCRPD in 13 cases between December 2016 and December 5, 2022, with eight of those judgments making reference to the socio-human rights model. It is important to examine these cases to determine whether such references were merely rhetorical or whether they resulted in a paradigm shift in the conception of disability or structural change.

In *Vibhu Dayal Sharma*, the pertinent question before the Punjab and Haryana High court was whether cancer should be considered as a disability with in the definition of persons with disability under the PWD Act 1995. The court assumed that conditions like cancer with their "adverse impact" on the life course of such people "can medically qualify as disabilities" in a broad sense and that they would therefore meet the criteria of "impairments" for purposes such as reservation in educational institutions. However, the court declined to follow this course of action, holding that this was an issue of public policy and as such was not one for the court to decide. Accordingly it disposed of the case with the hope that, during the revision of the 1995 Act, the legislature would enlarge the scope of the definition of Disability to cover such conditions in line with the UNCRPD (Para 17), observing that "The UN Convention had adopted the social model of disability and recommended to the signatories of the Convention to define disability as including those who have long term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others" (Para 11).

A careful analysis reveals that the court here offered valuable guidance to the Legislature, urging it to extrapolate the legal propositions from the mandate of the UNCRPD and Social model of disability (*Vibhu Dayal Sharma v Director and others*, 2013). As a consequence, the Indian Parliament added 14 additional impairments or health conditions to the pre-existing seven, thereby introducing a significantly broadened definition of disability through the RPWD Act 2016.

A Public Interest Litigation was filed in *Pramod Arora v Hon'ble Lt. Governor of Delhi and Ors.* (2014) to uphold the right to education of Children with disabilities under Section 26 of the PWD Act 1995. It was argued that the amendment to section 2(d) of the Right to Education Act 2009 put disabled children at a disadvantage by defining "child belonging to disadvantaged group" as including disabled children. As a direct result of this amendment, disabled children would have had to compete within the 25% quota earmarked for the general category of "child belonging to disadvantaged group" under section 12(l) of the Right to Education Act – instead of benefiting from a distinct and separate 3% quota guaranteed under section 39, read with section 26, of the Persons with Disabilities Act 1995 which required free education in an appropriate environment to be granted to disabled children, in order to facilitate their integration. According to the petitioners, the values of accessibility, integration, and an enabling environment – instantiated in Section 26 of the Persons with Disabilities Act 1995 – would be undermined if disabled children were uncritically segregated within the category of "Children belonging to disadvantaged group." They therefore pressed for implementation of a separate 3% quota for Children with disabilities, across all schools in the National Capital Territory of

Delhi (NCT) and sought effective compliance with obligations to implement the right to inclusive education, including the upgrading of infrastructure to include appropriate modifications and the readiness of schools to address the needs of disabled children in accordance with the UNCRPD. After reviewing relevant constitutional and statutory provisions, the Court expressed its dissatisfaction at the appalling standards of admitting and integrating children with disabilities in primary schools and directed NCT to desegregate its 25% quota so as to create a sub-classification for children with disabilities, assuring that their right to a 3% reservation would not be diminished. An elaborate admission and reporting process for disabled children in primary and first grade classes was also recommended by the court. Importantly for current purposes, the court cautioned against viewing Disability rights through the lens of "Medical and charity models" and opined that

> The social model, on the other hand, views disability as the product of pre-existing barriers created by society. Education is therefore the first step for breaking down these barriers, which prevent full and meaningful participation of persons with disabilities in the processes of life and mainstream of society. . . .Though a small minority (2.1% of the population), they deserve no less than the rights under the Persons with Disabilities Act 1995 and the Right to Education Act 2009. It is time all concerned stop viewing those with disabilities as ill and incomplete and instead help them take hold of their lives. (Para 63)

This is therefore one of the landmark decisions which, although pronounced before the RPWD Act 2016, categorically demonstrates the capacity of the courts to inject the spirit or values underlying the UNCRPD into an Ableist legislative framework. Following this case, the Supreme Court heard a series of Public interest litigation cases which pressed for recognition and enforcement of rights to accessibility and reasonable accommodation in Educational institutions (*Rajive Raturi v. Union of India,* (2018) 2 SCC 413, the litigation is ongoing). The court has also issued a slew of directions to secure enabling environments and appoint resource teachers in educational institutions to enforce the right to education of children with disabilities (*Rajneesh Kumar Pandey v. Union of India*, 2021 SCC OnLine SC 1143, the litigation is ongoing).

In these cases, although the socio-human rights model is not explicitly referenced, it is clearly foregrounded in the approach of the court.

In *Vikash Kumar vs. UPSC* (2021), the question before the Supreme Court was whether "a student with writers' cramp" was entitled to the assistance of a scribe to write an examination. The Union Public Service Commission contended that assistance of a scribe was an entitlement only for persons with disabilities recognized in the RPWD Act under the rubric of benchmark disabilities. After perusing the relevant provisions of the RPWD Act 2016 and UNCRPD, however, the Court rejected this argument and directed the authorities to allow him to write exams with the help of a scribe. The Court held that the RPWD Act had carved out a particular context for the category of benchmark disability to come into play and cannot have been unduly expanded to whittle down the scope of overarching principles underlying the RPWD Act, 2016. It also held that, because the principle of reasonable accommodation is a threshold for the attainment of disability equality, its ambit could not be cut down to apply only in respect of benchmark disabilities. In fact, the court read this principle as an equality-enabling and justice-individualizing concept. It supported this reasoning by referring to the social model of disability. According to it, the RPWD Act 2016 has a more inclusive definition of "persons with disability" evidencing a shift from a stigmatizing medical model of disability under the 1995 Act to a social model of disability which recognizes that it is societal and physical constraints that are at the heart of the exclusion of persons with disabilities from full and effective participation in society.

In order to give teeth to this observation, the court directed the Union Public Service Commission to formulate a revised scribe policy. In response to the judgment, the Department of Disability Affairs in the Government of India has issued Guidelines for conducting written examinations for persons with specified disabilities falling within the definition of Section 2(s) of the RPwD Act 2016, but not falling within the definition of Section 2(r) of the said Act – i.e., persons having less than 40% disability and having difficulty in writing

http://disabilityaffairs.gov.in/upload/uploadfiles/files/Corrigendum-08-02-19.pdf

In *Ravinder Kumar Dhariwal vs. Union of India* (2021), the Supreme Court considered the legality of the suspension of an Assistant Commandant on grounds of misconduct and "mental disability" under the Persons with Disabilities Act 1995. The petitioner had a history of receiving continuous treatment for "obsessive compulsive disorder, secondary major depression, and bipolar affective disorder" since 2009. He alleged that he was continuously posted in insurgency areas for years together as a consequence of which, he developed "mental disorders" in 2008. The Central Reserved Police Force department, instead of applying Section 47 of PWD Act 1995 mandating alternative employment in case of acquiring disability during service to his case, suspended him from his duties in 2010.

The Court opined

> While a causal connection may need to be established between the ground for discrimination and the discriminatory act, it is not required to be shown that the discrimination occurred solely on the basis of the forbidden ground. As long as it can be shown that the forbidden ground played a role in the discriminatory action, the action will violate the guarantee against non-discrimination. (Para 116)

Extending the above law to the disability context, the court observed that

> A person with a disability is not required to prove that discrimination occurred solely on the basis that they had a disability. Disability needs to be one of the factors that led to the discriminatory act. Thus, in the present case, the appellant is only required to prove that disability was one of the factors that led to the institution of disciplinary proceedings against him on the charge of misconduct. (Para 119)

Highlighting the facts of the instant case, the court opined that

> An interpretation that the conduct should solely be a result of an employee's 'mental disability' would place many 'persons with mental disabilities' outside the scope of human rights protection... The over-emphasis on the choice or agency of a person with a mental health disorder furthers the stigma against them." (Para 120)

Evidence does not support the indiscriminate association of "mental impairment" with violence or the notion that someone with a "mental disability" is a danger to society. Therefore, a complex and customized approach to discrimination claims based on "mental impairments" is necessary, with a focus on the disadvantage resulting from the same.

The Court opined

> a person with a mental disability is entitled to the protection of the rights under the RPWD Act 2016 as long as they meet the definitional criteria of what constitutes a 'person with a disability' under Section 2(s). Having regard to the complex nature of mental health disorders, any residual control that persons with mental disabilities have over their conduct merely diminishes the extent to which the disability contributed to the conduct, it does not eliminate it as a factor. (Para 123)

The Court critiqued the Social construction of disability by observing, "Disability, as a social construct, precedes the medical condition of an individual. The sense of disability is introduced because of the absence of access to facilities" (Para 34).

The Court articulated the idea of full legal capacity by invoking the socio-human rights model of disability and the UNCRPD and by drawing from General Comment 1

> In order to fully recognise the 'universal legal capacity' where all persons inherently possess legal capacity regardless of disability or decision-making skills. They may however be provided with support (and not substitution) to exercise their legal capacity. This shift from the substituted legal capacity model to the supported legal capacity model is important for recognition of the agency of disabled persons and adoption of social model of disability. (General Comment 1, Para 25)

On the strength of the spirit of General Comment 1, the Court inferred, "the recognition of the legal capacity of persons with psychosocial disabilities confers on them legal personhood, where they can be a bearer of rights and exercise those rights" (Para 59).

The Court held that as the appellant had been receiving treatment for mental health disorders for a long time since 2009 and diagnosed with 40–70% of permanent disability by a government hospital, he was more vulnerable than non-disabled people to engage in behavior that could be classified as misconduct because of his mental disability. In such circumstances, his interests must be protected against both direct and indirect discrimination. Accordingly, the court set aside the proceedings as discriminatory on the ground of disability, in violation of the RPWD Act, and afforded him the reasonable accommodation by directing the respondents to assign him an alternate post not involving the use of or control over fire-arms or equipment which may pose a danger to the appellant or others in or around the work-place. A careful analysis of this case demonstrates that the court has deployed the socio-human rights model of disability – along with UNCRPD doctrines, standards, and principles such as Reasonable accommodation – not only to transform the life of the petitioner, but also to improve the service conditions of the Central Reserved Police Force and set up new benchmarks by which to influence engagement with similar future cases.

The Court has also drawn on the socio-human rights model to move away from the ableist view that persons with "Mental health conditions" pose a danger to society. In a ground-breaking judgment, *Bhavya Nain v High Court of Delhi* (2020), the Delhi High Court actively responded to Vikash Kumar by rejecting the arguments made by the Administrative side of the Delhi High Court for the disqualification of a person who was bi-polar from holding the office of a judge. Although the court did not cite the UNCRPD or explicitly refer to the social or human rights models of disability, it infused the spirit of the same into its reasoning. It observed that:

> The mere apprehension that the respondent has – that the petitioner may not be able to handle the responsibility and stress which a Judicial Officer faces, cannot be a reason to declare him medically "unfit", or to say that he is not entitled to claim reservation. There is no medical opinion placed on record, or considered by the respondent, to come to the conclusion that a person – who is suffering from BPAD, and is under remission, would not be able to discharge his responsibilities as a Judicial Officer. Pertinently, there is no exemption granted by the appropriate Government referable to the proviso to Section 20(1) of the RPwD Act. (Para 53)

On appeal, in *Akanksha Singh v High Court of Delhi* 2020, the Supreme Court upheld this approach. This decision is highly significant as it busts the myth that disabled people are not eligible to serve as judges. Nevertheless, the fact that the judgment was extremely short represents a missed opportunity for the more explicit development of principles of disability equality and recognition of their importance.

The case of *Disabled Rights Group v Union of India* (2017) was based on a public interest litigation claim in which it was argued that directions should be issued to the State to implement a reservation in higher education institutions and secure an accessible and barrier-free environment for students with locomotor disability. The case entails ongoing court monitoring. The Court cast the arguments of the petitioners in the social model of disability, observing that

> The Social Model of Disability locates disability as being socially constructed through the creation of artificial attitudinal, organisational and environmental barriers. Impairment is regarded as being a normal part of the human condition, with everyone experiencing impairment differently and having different access needs. Life is accepted as including negative experiences, and impairment may be-but is not necessarily-one of them. Disabled people are defined as being people who experience the unnecessary barriers created by society within their daily life. Social Model of disability has gained ground in the international debate. This views disability as a social construct and emphasises society's shortcomings, stigmatisation and discrimination in its reaction to persons with disability. It

> distinguishes between functional impairments (disability) both of a physical and psychological nature, and the loss of equal participation in social processes that only arises through interaction with the social setting (handicap). These developments have contributed to a new (WHO) model, which bears in mind social as well as functional and individual factors in its classification of health and health-related areas. Keeping in view the above, proper facilities need to be provided to differently-abled persons while having higher education. (Para 11)

Thus, informed by the social model, the court required the University Grant Commission to consider the feasibility of setting up a Committee to frame “Guidelines for Accessibility for Students with Disabilities in Universities/Colleges”; for purposes of ensuring compliance with Section 32 of the Disabilities Act 2016 (which lays down a 5% reservation for Students with disabilities in Higher Educational establishments) and explore the feasibility of establishing in-house bodies within each Higher Education institution “for taking care of day to day needs of differently abled persons” as well as implementing Schemes devised by the Expert Committee (Para 17 (ii)). Since then, the court has issued numerous compliance orders. In March 2022 a committee, of the type envisaged by the Court, was finally established and charged with the responsibility of formulating policies addressing the issues raised in the petition. This case demonstrates the role of the social model as a change-maker and proves that, despite challenges, it is possible to secure accountability of stakeholders for the effective implementation of the RPWD Act 2016.

In *Shobha Gopalakrishnan v State of Kerala* (2019), the question before the Kerala High Court was whether, in the absence of any specific statutory obligation, Article 226 of the Constitution of India empowers High Courts to appoint guardians for persons in “comatose conditions.” Ruling that High Courts did have such a power, its judgment explicitly referred to the rights-based approach to disability and acknowledged its attendant paradigm shift in disability rights jurisprudence. In its words:

> The “rights-based approach” towards persons with disabilities came to be accorded by the U.N. Convention on the Rights of Persons with Disabilities, 2006, treating the lives of persons with disabilities as valuable as that of any other human being. It is pointed out that the Convention brought a paradigm shift in its approach and attitude towards disability, shifting from a model where persons with disabilities are treated as “objects of medical treatment, charity and social protection”, to the platform where they are recognised as persons with equal rights and a vested right of participation. Accordingly, the Persons with Disabilities (Equal Opportunities, protection of rights and full participation) Act, 1995 was repealed and the new Act-Rights of Persons with Disabilities Act, 2016 (RPWD Act) was enacted. It was simultaneous to the enactment of the RPWD Act, 2016, that the old Mental Health Act, 1987 came to be repealed giving rise to the Mental Health Care Act, 2017 in tune with the norms of the U.N. Convention, whereby a “rights-based protection” was brought about for mentally ill persons. (Para 21)

This case is therefore another in which judges drew on the mandate of the human rights model of disability and the UNCRPD to address gaps in domestic law.

In *Jeeja Ghosh v Union of India* (2016), the Supreme Court severely criticized a private airliner for its insensitive treatment of the petitioner, who it had prevented from flying because of her cerebral palsy. The Court ordered the airline to pay her INR 10 Lacs by way of monetary compensation. In its judgment, the Court attributed the cause of the petitioner’s ill-treatment in the medical model of disability and cautioned against viewing disabled people as dependent, weak, or vulnerable. It observed that

> The subject of the rights of persons with disabilities should be approached from human rights perspective, which recognised that persons with disabilities were entitled to enjoy the full range of internationally guaranteed rights and freedoms without discrimination on the ground of disability. (Para 43)

This case has led to important new guidelines being issued by the Ministry of Civil aviation the "Harmonized Guidelines for Standards of Accessibility and Provision of facilities for Persons with Disabilities (Divyangjan) under the Rights of Persons with Disabilities Rules, 2017" (https://www.civilaviation.gov.in/sites/default/files/Accessibility-Standards-and-Provision-of-facilities-for-Persons-with-Disabilities.pdf).

In *M. Sameeha Barvin v Joint Secretary Ministry of Youth and Sports Department of Sports Government of India and Others* (2021), this paradigm shift in how disabled people should be treated was again recognized – this time by the Madras High Court. In its words,

> The RPwD Act is a paradigm shift from a technical model of disability carrying with it the heavy burden of stigma under the 1995, Act to a model of disability that encompasses within its fold physical, mental, intellectual, social, psycho-social and other barriers that accompany disability which lie at the heart of exclusion of the disabled from realising their full potential and participating in society as full and equal members and citizens as contemplated by the framers of our Constitution. (Para 27)

This case concerned the denial of opportunities to the petitioner, who was a female athlete with 90% hearing impairment, to participate in an international sport event organized by the World Deaf Athletics Championship in Poland. The Court held that the selection authorities' decision that she should not be part of the team because she would be the only woman was discriminatory. Invoking the principle of intersectionality, the court highlighted the vulnerability of women athletes with Disabilities and issued detailed guidelines to sports authorities which required them, among other things, to

> ensure that all the women athletes whether with or without disabilities, be given equal treatment on par with males, so as to enjoy full and equal rights and freedoms and to maintain their dignity. (Para 55(xii))

This case is significant because it highlights the importance of recognizing and promoting rights to recreation and participation in sports by women athletes with disabilities.

Conclusion

I have argued in this chapter that, against the backdrop of an ableist Constitution and a very narrow antidiscrimination legislative regime, the Indian judiciary has found ways to superimpose transformative jurisprudence by deploying the social and human rights model of disability, creatively invoking the UNCRPD and thereby facilitating a progressive interpretation of the PWD Act 1995 and RPWD Act 2016 (Jain 2021). Parliament's enactment of the RPWD Act 2016 has undoubtedly opened up more space for such judicial initiatives and thus played an influential part in the judicial recognition of a paradigm shift from medical to socio-human rights models of disability. In section "Disability-Rights Based Adjudication in the Pre-RPWD Act Era" above, I analyzed Court judgments which did not explicitly mention the Socio-human Rights Model of Disability; and in section " Socio-human Rights Model of Disability in Judicial Discourse Post RPWD Act 2016," I highlighted judgments which did explicitly mentioning the same. This division provides structure to the discussion and demonstrates the positive impact of explicit incorporation of the socio-human rights model of disability in judicial discourse.

Even before the enactment of the PWD ACT 1995, examples can be found of judges reducing the potential impact of the strongest version of the Medical model by drawing on the "part essentialist individual deficiency" interpretation discussed above. Thus, the *National Federation of the Blind case* (1993) led to the appointment of a number of disabled persons to civil service posts. Due to the absence of relevant data, it is not possible to provide exact figures for exactly how many disabled officers have been appointed over the subsequent 30 years (https://www.thebetterindia.com/187610/upsc-results-differently-abled-inspiring/, https://www.indiatoday.in/magazine/education/story/20060626-12-physically-challenged-candidates-clear-indian-civil-services-exams-785080-2006-06-25).

Nevertheless, it is clear that the approach to disability employment and opportunity within the civil service has become more positive (https://www.livemint.com/news/india/defying-disability-and-poverty-inspiring-stories-of-upsc-toppers-11653932165222.html).

Courts, while adjudicating individual claims, have at least on some occasions have invoked the social and human rights models of disability to address structural and systemic deficit by strengthening mechanisms for holding stakeholders accountable. This is clearly illustrated by the decisions in Viakash Kumar, Jeeja Ghosh, and Aravinder Dhariwal.

Analysis of adjudicatory practice since India's ratification of the UNCRPD and the enactment of the RPWD Act 2016 demonstrates how courts are able to factor in the social and human rights model of disability for empowerment of people with disability as a heterogeneous social group. Through disability rights adjudication, the Courts have infused the public law emotions of compassion and empathy into the Indian legal order. The values of equality, dignity, and personal liberty (underpinning Articles 14, 19, and 21 of the Indian Constitution) have been used implicitly and explicitly by courts to constitutionalize the rights of people with disabilities. The same has transformed the enforcement of socioeconomic rights by recognizing the State's positive duties to address the lingering and systemic disadvantages faced by disabled people. Examples of unhelpful or restrictive approaches can of course also be found in the judgments of courts tackling disability-related cases in India. Nevertheless, it is clear that the social and human rights models of disability have on occasion been used by judges in India to engage in some degree of judicial activism and thereby to advance the rights of Persons with disabilities. This is itself significant.

The need of the hour is to encourage such judicial efforts and to complement them with stronger measures to give effect to the concepts of respect for difference and human dignity which underlie the social and human rights models of disability. Such a mission cannot be accomplished merely with the passing of Laws. The State must also focus its attention on the development of institutions for evolving the rights-enabling conditions needed to secure compliance with such laws.

In conclusion, I allude to Robert M. Hensel's observation that "There is no greater disability in society than the inability to see a person as more."

Disability Rights Advocacy in China: Inclusive Education, Civil Society, and Mobilizing Ideas

16

Yi Huang and Bo Chen

Contents

Abstract

This chapter examines the impact of the United Nations Convention on the Rights of Persons with Disabilities and the human rights model of disability on which it rests, on disability rights advocacy in China. It does so by presenting three case studies of initiatives to enhance inclusive education, each of which was led by a civil society organization using ideas rooted in the rights and principles of the Convention. Through a qualitative study into the campaigns led by registered parents' groups and unregistered grassroots disabled people's organizations, the chapter analyzes the various roles played by these actors and the strategies they used, highlighting critical factors relevant to promoting disability rights and social change in China.

UNCRPD · Disability rights in China · Inclusive education · Civil society organizations · Disabled peoples' organizations · Human rights model

Introduction

Since the adoption of the United Nations Convention on the Rights of Persons with Disabilities (CRPD) in 2006, a growing number of scholarly and civil society research projects have emerged, with the aim of examining CRPD's impact and implementation in different state parties. This chapter is one such effort – with a particular focus on China. The implementation of disability rights in China has attracted particular interest. This may in part be because (as discussed in section "Background information") China has the largest population of persons with disabilities in the world. Also, as Stein (2010) points out, in comparison with the leading role it played in the drafting process, China has demonstrated a less progressive approach in advancing disability rights at the domestic level. Additionally, some interest in the implementation of disability rights in China may be generated by curiosity about experiences of and strategies for advocating for disability rights in a non-Western, non-liberal state which has significantly restricted the domestic space for international civil society (Huang, 2020). This chapter engages with such issues. It presents three case studies of how inclusive education, at various levels, has been promoted by civil society organizations, inspired by and using the rights and principles from the CRPD.

Of all the fields of disability rights addressed in the CRPD, inclusive education has been selected for attention here for a number of reasons. The primary one is that, as will be discussed below, advocacy for inclusive education in China has involved very diverse stakeholders, including individual persons with disabilities; grassroots disabled peoples' organizations (DPOs); groups of parents of children with intellectual disabilities; the general education system; the China Disabled People's Federation (CDPF) and its local branches; and educational departments of local governments. Given this diversity of stakeholders and the complex interactions between them, different actors have adopted varied strategies in their advocacy. The role of the CRPD in these strategies warrants examination. In addition, the highly contested practicality of inclusive education poses a global challenge to its implementation (De Beco, 2018), and reflection on Chinese experiences of advocating for inclusive education might well be useful to other advocates working in wider contexts.

Before tackling the case studies, section "Background information" will first outline some critical background information, including essential demographic data on persons with disabilities, the changing political environment for civil society, and brief development history of inclusive education in China. In doing so, the CRPD framework of inclusive education and the participation of persons with disabilities and their representative organizations in public decision-making will also be briefly explained. Then, section “Three campaigns for inclusive education in China” will present the case studies. It will describe three campaigns and discuss the common themes drawn from them. This will be followed by the conclusion.

Background Information

In this section, we will set out some essential geographical and demographic information. We will also lay out the political/social environment in China that civil society organizations (CSOs) in disability issues and DPOS have to work within and briefly introduce the development of inclusive education in China.

Demographic Context

China has the largest population of persons with disabilities in the world. The World Health Organization’s (2011) statistics indicate that 15% of the world’s population is disabled, though the Chinese government reported a lower percentage, namely, that only 6.34% of Chinese people have a disability (the Government of China, 2010). According to its initial report to the Committee on the Rights of Persons with Disabilities (CRPD Committee), over 80 million persons held disability certificates in China’s mainland (the Government of China, 2010). Statistics published by the International Labour Organization (2008) show that about 75% of these people live in rural areas, less than a million ever receive higher education, nearly half of them are illiterate, and only around a quarter are employed.

Closing Social Space for Disability Rights Advocacy

In the past decade, CSOs working in the field of disability and DPOs have experienced a firm shift from a comparatively open and accepting social environment to a highly restricted one for public interest campaigns and the growth of civil society. New laws have been enacted to restrict the activities of foreign CSOs in China and set a very high bar for Chinese CSOs and DPOs to receive funds from overseas (Huang, 2019). Due to the reality that most of the rights-advocating CSOs and DPOs were reliant on international funds to maintain their functioning, they were more seriously affected than service-providing CSOs and DPOs (Huang, 2020). This background is critical to the current study, as it demonstrates the challenges faced by the relevant CSOs and DPOs. It also helps to explain the fact that, in the current social and political context, surviving CSOs and DPOs very often have had to combine service provision and advocacy – the division of labor between idealists and realists, service providers, and rights advocates no longer being possible.

On the other hand, the CDPF and its connected associations for specific impairment types (e.g., China Association of People with Physical Disabilities and other associations of blind people, deaf people, people with intellectual disabilities and their relatives and friends, and people with “mental disabilities,” as used in Chinese and their family and friends) work directly with governments at all levels in developing and implementing disability-related law, policy, and service provision in China, playing a central role in disabled people’s daily lives (Committee on the Rights of Persons with Disabilities, 2011, para 148, 149; Zhao & Grotz, 2019). Claiming to be a national umbrella organization for the disabled, the CDPF has provincial, municipal, and local branches. The system of the CDPF and its local branches also represents the interests of the government which funds most of their activities and staff (China Disabled Persons’ Federation, 2016; Zhao & Grotz, 2019). It has been conceptualized as a “half government and half civil society” approach (Zhao & Grotz, 2019) or so-called government-organized nongovernmental organization (Hasmath et al., 2019). In some situations, the CDPF has the potential to be a strong advocate for disability rights and welfare, even where this entails challenging the government (Chen & Xu, 2011). Its role is less clear or promising in other situations, however, as illustrated by the case study described below.

This changing social/political environment poses a significant challenge to the implementation of Article 29(b) of the CRPD – which requires state parties to “[p] romote actively an environment in which persons with disabilities can effectively and fully participate in the conduct of public affairs” through CSOs and DPOs and representation at all levels, including participation in the policy-making process on disability-related issues (required by Article 4(3)) and the monitoring mechanism of the CRPD (required by Article 33).

Inclusive Education in China

In the official Chinese version of General comment No. 4 on the right to inclusive education issued by the CRPD Committee (2016), the term “inclusive education” is translated into “bāoróngxìng jiàoyù” (包容性教育), which is seldom used in either academia or practice in China. More commonly used translations of inclusive education in academia are “rónghé jiàoyù” (融合教育) or “quánnà jiàoyù” (全纳教育). It is also worth pointing out that the most commonly used term in policies and among frontline teachers and administrators is “suíbān jiùdú” (随班就读), which could be directly translated into “learning in regular classrooms” (LRC). LRC has been commonly misunderstood as the primary method of achieving inclusive education in China, and many policy-makers and scholars use the terms interchangeably. Arguably, however, due to ongoing CRPD-related discussion, there is a growing understanding of the difference between the two. More problematically, in the official Chinese version of General comment No. 4, the term “rónghé” (融合) is used as the translation of both “inclusion” and “integration,” despite the fact that these terms have substantively different meanings in the context of inclusive education and disability rights in general. According to General comment No. 4, integration is the process of placing disabled students in mainstream educational institutions with the precondition that they can meet certain criteria, while inclusion requires an overall and systematic reform of the educational institution to embrace diversity and provide all students with a learning experience in accordance with their needs and preferences. It is worth pointing out that the term "rónghé jiàoyù" (融合教育) is commonly used by Chinese scholars to describe a situation in which disabled students are in mainstream school settings – the implications of which, for integration and inclusion, are often very unclear.

These differences in translation reflect how the idea and practice of inclusive education in China may be shaped and reshaped by the social, political, economic, and cultural conditions, in which the ideologies and values embedded in the CRPD have begun to take root. In the remainder of this section, we will review the development and current practice of education for disabled people in China, thereby providing important context for the three cases which will be discussed in section "Three Campaigns for Inclusive Education in China."

The beginning of modern education for disabled people in China was marked by the special schools funded by Western missionaries in the late nineteenth century. However, not until the 1980s did the Chinese government develop strategies regarding education for disabled people. Since the 1980s, the government has put most of its effort into establishing special schools. National statistics indicate that the number of special schools grew steeply from 292 in 1980 to 1539 in 2000, following with a relatively relaxed growth to 1706 in 2010 (An et al., 2018).

In 1985, the Ministry of Education, associated with several other governmental departments, published the Regulations on Admission and Graduation of Juveniles with Disabilities in Higher Education, requiring that higher education institutions should not reject disabled students if the impairments did not affect their ability to study, work, or live independently. Following this policy, some universities and colleges set up segregated entrance examinations for disabled students, wherein upon successful completion of which, disabled students could be enrolled on specific majors created for them (Deng et al., 2001).

The concept of LRC which, as explained above, has been used as the equivalent of inclusive education in China, was first adopted in 1986. This took place in a pilot project in which a number of students with visual impairments were integrated into regular classes (Gu, 1993). This project, to some degree, raised awareness of the fact that segregated special education is not the only way to provide education for disabled students. It is important to note, however, that the LRC was initiated neither in response to the idea of mainstreaming nor to promote inclusion. Instead, it was introduced to address the problem of making education available for disabled students, given the limited number of special schools at that time (Chen, 1997).

The Compulsory Education Law, enacted in 1986, was ambiguous as to whether it granted disabled students the equal right to public education. The law stipulated that all children beginning at age 6 must receive 9 years of free public education regardless of their "gender, race, ethnicity, family socioeconomic status, or religious belief." However, "all children," as defined in the law, did not include children with disabilities. The revised version of the Compulsory Education Law enacted in 2006 provided a clearer recognition of disabled children's right to education. The Law on the Protection of Disabled Persons, revised in 2008, explicitly required that regular schools should accept disabled students given that certain conditions were met; and

LRC was formally defined as a form of education available to disabled students. Further action was introduced by the Special Education Improvement Act in 2014 by the Ministry of Education of China, setting the goal of promoting inclusive education to ensure that all students with disabilities could receive an appropriate education. In the previous law and policies, disabled people's right to education had been essentially conditional on the ability of the individual student. The Special Education Improvement Act 2014 takes a step away from this approach, requiring capacity building of educational institutions, with a view to ensuring inclusion. The required measures for regular schools include establishing resource rooms with individualized learning materials, providing access to therapeutic equipment, and employing more teachers with experience in special education.

This change in the tone and direction of law and policy after 2008 reflects a more inclusive approach to education for disabled people. The fact that it was in 2008 that China ratified the CRPD suggests that the CRPD has been influential on relevant law and policy-making in China. However, these laws and policies are still not CRPD-compliant. For example, the Compulsory Education Law, as revised in 2016, states that regular schools should accept disabled students who have the capacity to receive general education, but it does not clarify who has the authority to make relevant capacity assessments nor how this should be done. The acceptance or rejection of disabled students by regular schools therefore becomes a rather arbitrary decision, which necessarily raises concerns about discrimination based on disability.

More significantly, current law and policy do not impose a clear obligation on regular schools to provide support for disabled students in processes for deciding on admission. The absence of such a legal obligation reinforces the notion that inclusive education is conditional and largely based on the severity of impairment and the individual's ability – an approach which contravenes CRPD's principles and requirements. Even those students who are included in regular schools are more often merely "sitting in the regular classroom" than learning or participating in the regular classroom, as in most cases there is no monitoring or evaluation mechanism on the quality of education provided to disabled students (McCabe, 2003).

In response to these issues, the CRPD Committee (2012) pointed out, in its Concluding Observations on China's initial report, that the large number of and continuing efforts in developing special schools are incompatible with the requirements of the CRPD. The committee further recommended reallocating resources from the special education system to promoting inclusive education in mainstream schools. The strategy at the national level, however, still puts emphasis on establishing more segregated special schools (Central Committee of the Communist Party of China, 2010). The government has proposed that special schools should serve as resource centers that provide both (a) education for students with severe disabilities and (b) support for regular schools for enhancing their inclusion of the majority of disabled students with less severe impairments.

However, such a dual system can hardly be justified under Article 24 of the CRPD. General comment No. 4 states clearly that inclusive education in the CRPD's context entails merging well-resourced segregated special education and general education to create "whole systems" (CRPD Committee 2016). Accordingly, without denying that the Chinese government promotes a more inclusive approach to education for disabled people than formerly the approach to inclusive education in China still deviates from the CRPD requirements. It can therefore be argued that law-making and government-oriented action to develop education for disabled people fails to demonstrate a clear commitment to fully implement Article 24 of the CRPD. Against this backdrop, the next section presents a case study of how CSOs and DPOs in China have attempted to narrow the gap by effective campaigns.

Three Campaigns for Inclusive Education in China

Aim of the Case Studies

This section reflects on three campaigns for inclusive education, focusing on the role played by the various CSOs and DPOs in promoting inclusive education and on how they used the CRPD. As explained above, the CRPD, and Article 24 in particular, has exerted only a limited influence on top-down law and policy reform on inclusive education in China. This section, however, demonstrates that it has been more influential on Chinese CSOs and DPOs. In this section, we present and analyze three campaigns in the form of case studies. We consider not only how the human rights ideas and principles in the CRPD have mobilized CSOs and DPOs in China but also how these CSOs and DPOs have mobilized the CRPD as a powerful tool in their advocacy for inclusive education.

The data used in the case studies have been collected primarily through participatory observation in these campaigns over the past decade. The names of the individual participants, CSOs, and DPOs will be kept anonymous. Due to the word limits of this short chapter, only a brief introduction to the campaigns led by the three CSOs or DPOs will be given, the focus being on common themes shared by the different campaigns.

General Information About the Three Campaigns

Case study A is an “LRC support program” initiated in 2008 by CSO A, an organization founded by parents of persons with intellectual disabilities or autism. This program was designed to provide special education assistant to disabled students who receive education in the form of LRC. Children of the founders of Organization A were the first to receive the service in question. After years’ pilot, CSO A managed to develop partnerships with educational experts and universities in its region, and this in turn has resulted in further rollout of the program – including through the training of more special education assistants; the provision of support to more students in the form of LRC; and the development of service evaluation and monitoring. Further advocacy by the parents’ group, CSO A, led in 2012 to the “LRC support program” being acknowledged by the local education bureau, which later agreed to fund it (albeit partially) from public monies. Interestingly, while CSO has A has developed connections with a wide range of stakeholders (such as local universities, mainstream schools, the local special education center, the media, and the local education bureau), the local CDPF is not part of the "LRC support program" network.

Case study B is another inclusive education pilot project. It was initiated in 2017 by CSO B, an association of parents of children with intellectual disabilities or autism. Unlike case study A, which started by providing a direct service to individual disabled students, case study B from the outset entailed a clear and definite vision of how the education system could be changed and made more inclusive. CSO B began this work by communicating the ideas, values, and principles of the CRPD, and Article 24 in particular, to parents, teachers, school administrators, and the local education bureau. It did this by providing training programs and submitting policy proposals. While CSO B did provide certain forms of support in individual cases, its primary focus was the independent evaluation and monitoring of the quality of education provided to disabled students. It also undertook to examine the degree to which relevant government departments had fulfilled their obligation of protecting and promoting disabled people's equal right to education. In doing so, CSO B has managed (impressively) to interact with schools and government officials in a manner which is more cooperative than critical. It has managed to empower the school teachers to offer more effective assistance to disabled students, support the pilot schools to mobilize their policies and funds in a more efficient way, and facilitate constructive dialogue between parents and government. Between 2018 and 2020, CSO B provided regular evaluation and monitoring of the quality of inclusive education in two mainstream schools and delivered training to 601 school teachers, which benefits 189 students with special education needs.

Case study C consists of a program of continuous policy advocacy for inclusive education carried out by DPO C – an organization formed by people with visual impairments. The first highlight was in 2014 when DPO C supported a massage therapist to take China's National College Entrance Examination (NCEE) in Braille. This was the first time a blind person managed to take the mainstream college entrance examination in Braille instead of simply taking the segregated entrance examination for disabled students. From its foundation, DPO C has been dedicated to identifying and removing different forms of discrimination against disabled people in education. Other examples of its work include initiating or participating in strategic litigation, applying for the Disclosure of relevant Government Information, calling for antidiscrimination scrutiny of existing policies, and submitting policy suggestions to responsible government departments. In contrast with CSO B, DPO C's interaction with the government has been more critical – grounded on the clear objective of reforming discriminatory policies that impede the realization of disabled people's equal right to education. As a result of a range of advocacy initiatives demanding reasonable accommodation in NCEE in 2014, a national policy was introduced the following year which expressly adopted this obligation. In contrast with CSO A, DPO C did not provide any direct service to individual disabled people.

Although these three case studies occurred at different times and in different contexts, our analysis identifies several common themes relating to the role played by the CRPD in each of them. The common themes, all connected to the CRPD and the human rights model concern the awareness of the equal rights of each individual with disabilities, how to turn from personal needs into public issues, and becoming experts in disabilities by lived experience.

Awareness of the Equal Rights of Each Individual

The CRPD has been described as "a catalyst for change" that enshrines a "paradigm shift" away from seeing disabled people as the "objects of charity, medical treatment and social protection" to recognizing them as "subjects of rights" (Arbour, 2006). The experience of CSO B and DPO C suggest that the CRPD and the "paradigm shift" it represents provide a radically new human rights framework for disabled people and their parents to promote the view that a disabled person is an individual with equal rights.

Inspired by the motto "nothing about us without us," DPO C was one of the grassroots DPOs formed after China ratified the CRPD. The formation of DPOs such as this is an example of how the human rights ideas and values underlying the CRPD have mobilized disabled people to rethink their identities and experience based on a novel human rights framework. Before DPO C's prominent work in 2014, the segregated college entrance examination for disabled students had long been the generally accepted norm and indeed was even treated as a measure through which to promote disabled people's access to higher education. Based on the idea of substantive and inclusive equality, underpinning the CRPD and elaborated by the CRPD Committee (2018), DPO C questioned this widespread understanding of "segregated but equal," by highlighting the barriers facing a blind person who wished to take the mainstream college entrance examination. It also vernacularized the concept of reasonable accommodation by demanding that exam papers should be provided in alternative formats.

A turning point in this case occurred when the public knew that the blind person had submitted blank answer sheets for two of the four subjects. This was because the blind person was not fluent in Braille and the examination body had refused his application to take the examination in an electronic format – which would have been an accommodation of his needs – rather than in Braille. That said, the blind person concerned and DPO C both faced enormous criticism from sighted people and blind communities. Despite this, DPO C maintained its clear position that, as an important component of the right to education, a disabled person must be provided with an equal opportunity to take the college entrance examination and that reading and writing an exam in an alternative form is neither a privilege nor a waste of public resource but rather a measure required to guarantee the substantively equal enjoyment of the right to education. DPO C's approach is thus a solid stand based on the human rights framework derived from the CRPD. To what extent the controversy created could have been avoided by an improved dialogue within the disability community is an important point of discussion (Ma & Ni, 2020). At the very least, however, this case illustrated that the CRPD and the human rights model of disability had an evident impact on mobilizing DPO C to reframe the experience of disabled people. In this process, the international human rights framework is transposed in the local context to strengthen the proposition made by disability rights advocates.

The human rights ideas and values underlying the CRPD have also provided a new way of thinking to parents of disabled people. Before CSO B was established in 2015, most parents of disabled people did not know about the CRPD, neither were they familiar with the human rights approach. In the context of education, for example, studying in mainstream schools was accepted by parents to be available to children with disabilities only if certain preconditions were satisfied – as something which was conditional rather than a basic right based on the principle of equality. Parents whose children had been admitted to mainstream schools tended to regard it as a favor or privilege bestowed by the school and thus that it was important for them to do everything possible to convince the school that their child would not cause any trouble. Some parents resorted to services, such as the special education assistants provided by CSO A, as discussed above. For parents unable to afford such services, however, many train themselves to be the “shadow teacher” or support teacher and accompany their children in school.

When CSO B was established in 2015, systematic training in the CRPD was part of its training package for parents of disabled people. Such training was rare at that time, as most training for parents then focused on rehabilitation. By offering training in the CRPD, CSO B aimed to convey to parents, from the outset, the idea that “we are not asking for a favor but a right to which our children are entitled.” Feedback from the training showed that such awareness-raising made parents realize that the enjoyment of rights should not be conditional on their child’s ability. It also gave them a new frame which redefined their role – from that of solver of all problems caused by their child to that of advocate for their child’s equal rights. This illustrates how the human rights ideas and values in the CRPD mobilized CSO B – which also repackaged these ideas in culturally resonant wrappings for presentation to parents of disabled children.

It is important to note that the human rights ideas also raise parents’ awareness of the subjectivity of their children. It provides the parents with a framework to understand that their willingness and preference may be different from that of their children and reflect on the difference between being a supporter and a substitute decision-maker of their children. As the children are growing up, some of the parents have shown the awareness that they should not only speak for their children but also empower their children, as a supporter, to speak for themselves.

From Personal Needs to Public Issue

As has been widely pointed out, there has been a longstanding tendency to understand disability as an individual problem or personal tragedy (Swain & French, 2000). This has resulted in a tendency to respond to the problems faced by disabled people by way of tackling a personal need rather than as a social or public issue. The early stages of case study A illustrate how this sort of understanding influences strategies adopted to fulfil disabled people's needs. The "LRC support program" in case study A was initiated because the founders of CSO A learned from the experience of their children that disabled students who receive education in the form of LRC may need additional personal assistants. They therefore mobilized their personal resources to provide such support, in the form of the special education assistants, for their children. Resorting to personal resources rather than public social support has been a common reaction, particularly among the parents of disabled people, to the reality that only limited social resource was allocated to address the needs of disabled people.

The CRPD provides a human rights framework which transfers the disability issue from the private sphere to the public domain. It, first of all, echoes the social model of disability by demonstrating clearly that disadvantage and exclusion should be attributed, not solely to one's impairment but to the interaction between the impairment and various social barriers. By stipulating that state parties must remove the social barriers faced by disabled people, the CRPD requires that responding to disabled people's experience and needs should be a public issue entailing the engagement of diverse social actors and sources. Moreover, particular rights (such as the right to inclusive education under Article 24) are elaborated together with examples of key obligations imposed on state parties, thus providing implementation guidelines for how it should be tackled as a public issue. This human rights framework has provided new critical perspectives for people with disabilities, parents, and relevant CSOs, prompting a redefinition of disabled people's experience of social barriers as a public issue and reshaping their strategies for removing such barriers. In case study A, for example, CSO A, instead of limiting its efforts to action within the resource of parents involved in the organization, started making changes to the "LRC support program" by engaging with a wide range of social actors and resources, including local government.

Compared to the gradual change evident in case study A, case study B represents a more radical approach to the promotion of inclusive education. When CSO B initiated its "pilot project on inclusive education" in 2017, the fact that there had been continuous training in the CRPD since 2015 meant that CSO B's leader and its parent representatives were already familiar with a human rights approach. Accordingly, CSO B was able to develop a clear vision of disabled people's rights to inclusive education as a public issue calling for the commitment of a wide range of social actors and resources. Accordingly, in situations where disabled students in mainstream school settings need personal assistants, CSO B does not attempt to provide the services needed but instead supports parents to compile their applications for personal assistance from relevant schools and works with parents to ensure that responses from schools are effective. CSO B has also established long-term collaborations with several schools – which it supports to develop relevant policies and funding models, as well as to develop good practice and expertise in inclusive education among school teachers. In addition, CSO B has carried out periodical independent evaluations of the implementation of relevant local policies and monitoring of the quality of education delivered to disabled students. The results of these evaluations and monitoring sessions have been submitted to the local education bureau, thereby serving as evidence for further policy reform and advocacy.

The inclusive education promotion strategy adopted by CSO B demonstrates its commitment to facilitating communication between not simply individual parents and school administrators but also the association of parents who advocate for the rights of their disabled children and representatives of the education system. It further illustrates how, at the same time as parents of disabled people are using CRPD's human rights framework to argue that disability-related barriers are a public issue requiring social change, CRPD's human rights framework also operates on the parents themselves – transforming them into a powerful force involved in public issues more broadly.

Being Recognized as Disability Experts

Scholars working in disability studies, particularly from an emancipatory perspective, have long recognized the importance and value of expertise derived from lived experience (Löve et al., 2017). However, in the social context of China, lived experience of disability has slightly counted for. As all three case studies suggest, however, the principles and values underlying the CRPD can operate to increase the importance of lived experience and empower disabled people and their parents to play more active roles in disability-related public issues.

DPO C has dedicated itself to promoting inclusive education through some relatively radical strategies – such as applying for Disclosure of Government Information and demanding antidiscrimination scrutiny of existing policies – which are not always welcomed by the government. However, these strategies have led to some meaningful communication and engagement with government. One of the key factors differentiating DPO C from politically sensitive human rights advocates is that it utilizes the CRPD as the theoretical and normative framework for its policy advocacy. Instead of just complaining about the social barriers faced by disabled people, DPO C articulates such complaints in the form of clear propositions, explaining carefully how these relate to China's obligations under the CRPD. This grounding also enables it to draw on the lived experience of disabled people to express their views and perspectives and to offer the government practical suggestions for policy reform. This effective blending of lived experience of disability and familiarity with CRPD's human rights framework is what gives DPO C its distinctive expertise.

Similar observations can be made of the experience of CSO A and CSO B. For both, the CRPD provides a framework for parents to theorize their experience of being the parents of disabled children and reflect on policies which affect them. This framework also empowers them to do more than simply articulate the needs of disabled people and their families – it enables them to engage in constructive dialogue, represent themselves rather as the substitute of their children, with government and other public bodies. Once the experience of being parents of disabled children is valued as a kind of expertise, they are in a position to drive forward, from the grassroots level, human rights ideas and values, and to promote the implementation of the CRPD in the local context.

Conclusion

In this chapter we have presented three case studies of campaigns for inclusive education in China. The campaigns were led by different organizations which adopted a range of approaches, but each of the campaigns was influenced and made possible, in significant ways, by the principles and human rights ideas of the CRPD. These case studies suggest that in China to date, the impact of the CRPD and the human rights model it promotes has been more apparent on civil society organizations, including disabled people's organizations, than on government and the CDPF system. This is unsurprising and likely to be in line with developments in other state parties. Yet, the impact of this human rights model on civil society actors and the campaigns they lead is an interesting subject worthy of further attention. We suggest that, inspired by the CRPD, civil society and disabled people's organizations have demonstrated and promoted increased awareness of a human rights model of disability. They are successfully using this idea, and the commitments made on ratification of the CRPD, to further shift perceptions of disability – away from being a private matter, to be addressed by the individuals themselves and their families, to being a public matter with implications for policy and public resource. In this process, there appears to emerge increasing respect for expertise based on lived experience. However, whether there would be a better appreciation of the value and importance of actively involving disabled people and their organizations in relevant reform processes requires further observation.

The African Disability Protocol: Toward a Social and Human Rights Approach to Disability in the African Human Rights System

17

Dianah Msipa and Paul Juma

Contents

Abstract

The adoption of the Protocol to the African Charter on Human and People's Rights on the Rights of Persons with Disabilities in Africa marked a pivotal juncture in the shifting approaches to disability in the African human rights system. The African Disability Protocol abandoned the medical and charity approaches to disability that are dominant in many of the preexisting African human rights instruments, in favor of a social and human rights approach to disability. This chapter argues that the unique lived experience of persons with disabilities in Africa dictated the shift from viewing disability in light of the medical model of disability to perceiving it as a human rights issue. Prior to the adoption of the Protocol, African human rights instruments had failed to translate into real change in the lives of persons with disabilities, making it necessary to reevaluate the approach to disability in the African human rights system. The process of rethinking approaches to disability did not take place in a vacuum.

Global trends encapsulated in the Convention on the Rights of Persons with Disabilities had an enormous influence on this process. Using the social and human rights models of disability, the African Disability Protocol therefore takes stock of the unique African context while maintaining the gains and victories won in the Convention on the Rights of Persons with Disabilities.

Keywords

Human rights model of disability · African Disability Protocol · African context · Shifting approaches to disability in Africa

Introduction

In recent years, disability has received significantly greater attention in international human rights discourse. After decades of advocacy, disability rights activists have succeeded in shifting the conversation about disability from the medical and welfare fields to the human rights arena. At the global level, the idea of disability as a human rights issue is neatly encapsulated in the Convention on the Rights of Persons with Disabilities (CRPD), which was adopted by the UN General Assembly in 2006 and came into force on 3 May 2008. Africa embraced the CRPD as exemplified by its ratification by the majority of African states. At the time of writing, 50 of the 55 African states had ratified the CRPD. Indeed, the social and human rights approach to disability in the CRPD held enormous potential for the realization of human rights and fundamental freedoms by persons with disabilities which the medical and welfare models of disability had failed to do.

However, in spite of its progressive approach and extensive rights, the CRPD is yet to fully transform the rights experience of persons with disabilities in Africa. This is partly because the experience of disability discrimination faced by persons with disabilities in Africa is unique and distinct from the rest of the world. Similarly, the existing instruments in the African human rights system have not improved the enjoyment of human rights and fundamental freedoms by persons with disabilities in Africa. The CRPD has been criticized for not sufficiently taking the African context into account while the regional instruments are criticized for not sufficiently taking disability into account (Kamga, 2013).

Dissatisfied with the failure of the existing human rights legal framework at global and regional levels to achieve full inclusion for persons with disabilities in Africa, disability rights activists on the continent called for the adoption of an Africa-specific and disability-specific human rights instrument (Biegon, 2011). In 2018, the African Union subsequently adopted the Protocol to the African Charter on Human and People's Rights on the Rights of Persons with Disabilities in Africa (African Disability Protocol). This chapter demonstrates how the African Disability Protocol responds to the unique experience of disability discrimination faced by persons with disabilities in Africa by simultaneously curing the context deficiency at global level and deficient approach to disability at the regional level.

The chapter is divided into five sections. It begins, in the first section, by explaining why the social and human rights models of disability are capable of realizing the rights of persons with disabilities and why the medical and welfare models are not. The second section demonstrates the deficient approach to disability in African human rights instruments. In the third section, the lack of context-specific approaches in the CRPD are highlighted. The fourth section illustrates how the African Disability Protocol cures both deficiencies. The fifth and final section concludes the chapter by summarizing the main arguments.

Unearthing Deficiencies and Strengths in the Various Approaches to Disability

Over time, disability has been understood differently, as exemplified in the various approaches depicted in different models of disability (Retief & Rantoa, 2018). These models explicate the causes of disability and influence the response to disability both in societal attitudes and through law and policy. Indeed, the adequacy of the response to disability is determined, in part, by the specific approach to disability that is relied on.

The medical model of disability, which came about as a result of advances in science that led to a better understanding of impairments in the mid-1800s, perceives disability as inherent in the individual with impairment (Retief & Rantoa, 2018). Under the medical model, persons with disabilities are defined by their impairments or medical conditions (Aschalew, 2020). Because disability is viewed as a health issue, intervention occurs through medical means including medication and rehabilitation, which seek to "fix" the individual with impairment, rather than the environment (Olkin, 1999).

Closely related to the medical model is the welfare or charity model of disability. The charity model of disability regards disability as a welfare issue and is driven largely by emotive appeals to charity (Amponsah-Bediako, 2013). Under the welfare or charity model of disability, welfare associations must provide "care" for persons with disabilities (Grobbelaar-du Plessis & Reenen, 2011). Consequently, persons with disabilities are viewed "as objects of charity. and social protection" (Jere, 2011).

In the 1960s, the social model gradually replaced the medical and welfare models of disability. In stark contrast with the medical model, the social model distinguishes "impairment" from "disability." It perceives disability as a socially created disadvantage arising from an environment that takes little or no account of people with impairments (Union of the Physically Impaired against Segregation, 1976). Having the impairment alone does not result in disability. Rather, disability is perceived as the product of the "interaction between a person with impairment and attitudinal and environmental barriers" (CRPD, preamble para e). In contrast with the medical model, which treats the individual's impairment as the loci of the problem and responds by attempting to cure or rehabilitate the individual, the appropriate response under the social model involves making adjustments to the external environment in response to the person's needs.

In recent years, the human rights model of disability was introduced. This model affirms that all persons with disabilities are entitled to certain inalienable rights by virtue of their humanity (Amponsah-Bediako, 2013). The human rights model perceives persons with disabilities as holders of rights in line with the Universal Declaration of Human Rights (UDHR), 1948, which declares that "all human beings are born free and equal in dignity and rights" (article 1). It therefore shifts the emphasis away from the impairment and focuses on the entitlement of persons with disabilities to hold and exercise rights (Degener, 2016). The appropriate response to disability exclusion under the human rights model involves the promotion of the rights of persons with disabilities (Degener, 2016).

The manner in which disability is understood therefore influences the responses and interventions in law and policy. It is also an important factor in determining the level of inclusion of persons with disabilities. Because the medical model views disability as a medical condition inherent in the individual, it fails to take into account the impact of environmental and attitudinal barriers on the exclusion of persons with disabilities. Therefore, responses formulated in line with the medical model focus on curing and rehabilitating the individual as far as possible and do not involve interventions to address barriers in the external environment. Consequently, the medical model is conceptually incapable of fully and effectively including persons with disabilities in society.

Similarly, the welfare/charity model focuses on providing "care" to persons with disabilities and fails to address the impact of environmental and attitudinal barriers on the exclusion of persons with disabilities. Moreover, this model does not view persons with disabilities as subjects capable of holding rights, but as objects of pity and charity. Consequently, it is incapable of achieving the much needed empowerment of persons with disabilities through upholding their fundamental rights and freedoms.

In contrast, the social model of disability takes into account the impact of the individual impairment as well as the impact of environmental and attitudinal barriers. Recognizing that the disabling process "results from the interaction between persons with impairments and attitudinal and environmental barriers," the social model is cognizant of matters that the preceding medical and welfare models of disability are not (CRPD, preamble para e). The social model is therefore capable of adequately addressing the barriers to the full inclusion of persons with disabilities.

Similarly, the human rights model places emphasis on the identity of persons with disabilities as subjects of rights rather than objects of charity recognizing the right of persons with disabilities to hold and exercise all human rights and fundamental freedoms on an equal basis with others. Therefore, responses fashioned in line with the human rights model of disability address the deficiencies in the earlier medical and welfare models of disability. For that reason, the human rights model of disability holds great promise for the realization of the rights and fundamental freedoms of persons with disabilities in Africa.

In combination, the social and human rights models of disability complement each other in such a way that they have enormous potential to formulate responses that are capable of bringing about the required social change in the lives of persons with disabilities. Accordingly, this chapter subscribes to both the social and human rights models of disability as the approaches most capable of achieving full inclusion of persons with disabilities.

A Deficient Approach to Disability in the African Human Rights System Prior to the African Disability Protocol

In many African cultures, disability has historically been associated with disease, sin, and shame (Patterson et al., 2019). In Zimbabwe, for example, having a child with a disability is perceived by some as a sign of witchcraft or as evidence that the mother was promiscuous during her pregnancy (Chimedza & Peters, 1999). In Eswatini (formerly Swaziland), persons with disabilities are prohibited from participating in some national events because of the belief that if the king or queen mother encounters persons with disabilities, this will bring them bad luck (Kotze, 2010). These harmful beliefs have informed and influenced the dominant approach to disability found in the legislative, policy, and institutional frameworks in the African human rights system. The deficient approach to disability is exhibited in the reliance on the outdated medical and welfare models of disability as well as the inadequate coverage of disability in various African human rights instruments.

Prior to the adoption of the African Disability Protocol, the rights of persons with disabilities in Africa were scattered in various general and group-specific human rights instruments within the African human rights system. The provisions relating to disability in each of these instruments adopt the outdated and deficient medical and welfare approaches to disability, as evidenced by their reliance on the provision of "care," "protection" (welfare approach), "treatment," and "rehabilitation," (medical model approach) of persons with disabilities. The instruments also focus on the "needs" of persons with disabilities and require member states to provide "special measures" in response to those needs indicating a reliance on the medical and welfare approaches to disability as shown below.

The African Charter on Human and People's Rights (African Charter), which is the main human rights instrument in Africa, states that persons with disabilities are entitled to "*special measures* of protection in keeping with their *physical or moral needs*" (art 18(4) emphasis added). Abbay argues that the term "physical and moral needs" signifies measures whose purpose is to rehabilitate persons with disabilities rather than ensuring the enjoyment of their rights in all spheres of life (Abbay, 2015). This is evident in how states have responded to persons with mental disabilities. They have resorted to building mental asylums, such as Chainama Hospital in Zambia, for internment of persons with mental disabilities as a way of ensuring their "physical and moral needs," signifying a reliance on the medical model of disability.

Similarly, article 13 (1) of the African Charter on the Rights and Welfare of the Child (African Children's Charter) makes provision for "measures of protection" for children with disabilities in the following terms: "[e]very child who is mentally or physically disabled shall have the right to special measures of protection in keeping with his physical and moral needs.” Moreover, article 13 (2) of the African Children’s Charter requires member states to give *assistance* to “a disabled child and to those responsible for his care” and stipulates that such assistance “is appropriate to the child’s condition” indicating a medical and welfare approach to disability.

Crucially, article 13 of the African Children’s Charter deals with the rights of children with disabilities under the heading “[h]andicapped children.” “Handicapped” is an archaic term used to refer to persons with disabilities. The Oxford English Dictionary (1986) defines “handicap” as persons, especially children, who are physically or mentally defective. The term is believed to have originated with King Henry VII in his attempt to improve the welfare of disabled veterans following a brutal war in England in 1504. The King passed a landmark legislation proclaiming that begging in the streets is legal for persons with disabilities. This legislation allowed disabled veterans to go into the streets, with their “cap in hand,” to beg for money, thus the term “handicap” (Karapita, 2017). Labels are important because they affect how persons with disabilities are perceived (Galvin, 2003). Certain labels such as “handicapped” infer vulnerability and lack of agency. They position persons with disabilities as a separate group that is distinct from others in all material respects and is regarded in a negative light by society (Muzata, 2019). The use of the term “handicapped” also signifies a reliance on the deficient medical and welfare models of disability.

The Protocol to the African Charter on Human and People’s Rights on the Rights of Women in Africa (Maputo Protocol) contains provisions relating to women with disabilities. Article 23 of the Maputo Protocol emphasizes the “protection” as well as the “needs” of women with disabilities. Article 23 (a) of the Maputo Protocol provides that States parties undertake to “[e]nsure the *protection* of women with disabilities and take specific measures commensurate with their *physical, economic and social needs* to facilitate their access to employment, professional and vocational training, as well as their participation of decision-making” (Emphasis added). Similarly, section 23 (b) of the Maputo Protocol continues to highlight the need for “protection” of women with disabilities by stipulating that States parties should “[e]nsure the right of women with disabilities to freedom from violence, including sexual abuse, discrimination based on disability and the right to be treated with dignity.” Although the Maputo Protocol has achieved great strides in promoting the rights of African women in general, the rights of women with disabilities have lagged behind. This is largely because the Maputo Protocol focuses on the “care” and “protection” of women with disabilities instead of considering them as subjects capable of holding and exercising rights on an equal basis with others.

The African Youth Charter also exhibits a medical and welfare approach to disability. Article 24 (1) of the African Youth Charter provides that “[s]tates Parties recognise the right of mentally and physically challenged youth to *special care*.” The phrase “special care” indicates an approach to disability as a medical and welfare issue with persons with disabilities being perceived as recipients of “care” rather than as holders of human rights. Furthermore, the African Youth Charter uses language that emphasizes the individual impairment, rather than societal barriers, by referring to youth with disabilities as “physically and mentally challenged youth.”

The emphasis on impairment has been criticized for being derogatory thus reinforcing stigmatization (Viljoen & Biegon, 2014).

The provisions relating to disability in the African Union Convention for the Protection and Assistance of Internally Displaced Persons in Africa (Kampala Convention) are also based on the medical model of disability. Article 9 (2) (c) stipulates that States Parties shall "provide *special protection* for and *assistance* to internally displaced persons with special needs, including ... persons with disabilities..." (emphasis added).

Further evidence of the lack of a human rights approach to disability lies in the fact that the African human rights system has been underused in advancing disability rights (Heyns, 2001). This is evident when one considers the fact that there is only one communication involving disability that has been brought before the African Commission on Human and People's Rights (*Purohit and Moore v The Gambia*, 2003). In part, this is due to the perception of persons with disabilities as objects of charity rather than subjects entitled to human rights. In *Purohit and Moore v The Gambia,* the complainants argued that the provisions of the Mental Health Law in the Gambia, known as the Lunatics Detention Act, constitute a violation of the right to dignity of the person and the right to health (*Purohit* paragraph 1). The African Commission adopted a human rights approach and affirmed persons with disabilities' right to health as:

> vital to all aspects of a person's life and well-being, and is crucial to the realisation of all the other fundamental human rights and ... includes the right to health facilities, access to goods and services to be guaranteed to all without discrimination of any kind. (*Purohit* para 80)

The African Commission added that there should be no discrimination in accessing the right to health and encouraged the Gambia to:

> take concrete and targeted steps, while taking full advantage of its available resources, to ensure that the right to health is fully realised in all its aspects without discrimination of any kind. (*Purohit* paragraph 84)

The Commission also acknowledged the scarcity of resources in most African states but emphasized that the little resources at their disposal should be allocated in a nondiscriminatory manner.

The Commission further acknowledged that the labeling of persons with mental disabilities as "lunatics" and "idiots" is based on the medical model of disability and deprives them of their dignity (*Purohit* paragraph 59 and 60). *Purohit* is an important communication for persons with disabilities in Africa. It analyzed the situation of persons with mental disabilities from a human rights perspective. This rights-based approach affirms that persons with mental disabilities have a right to equal protection of the law and nondiscrimination. Abbay (2015) has argued that *Purohit* is important because it provided the African Commission with an opportunity to interpret and apply the provisions of the African Charter relating to persons with disabilities. It also provides a precedent for persons with disabilities to rely on in the future. The

Commission is to be commended for infusing a human rights approach to disability in Africa. However, the fact that the Commission has only ever received one communication relating to the rights of persons with disabilities continues to hint that persons with disabilities in Africa are not generally perceived as subjects of rights.

The African human rights instruments do not adequately address matters of disability. Various instruments do not expressly include disability in their nondiscrimination clauses. For instance, the African Charter fails to expressly include persons with disabilities in article 2, which sets out the grounds upon which discrimination is prohibited. Article 2 lists various grounds such as "race, ethnic group, colour, sex, language, religion, political or any other opinion, national and social origin, fortune, birth or other status." Disability is not included in this list. It is implicitly rather than expressly included in the antidiscrimination clause in the African Charter through phrases such as "other status" (Abbay, 2015). Indeed, it is accepted that phrases including "such as" serve to introduce the various grounds upon which discrimination is prohibited and the phrase "other status" suggests that the list is not exhaustive (Biegon, 2011). Moreover, the phrases "every individual," "every human being," "every citizen," and "all people" signify that persons with disabilities are equally entitled to the rights and freedoms enshrined in the African Charter. In *Purohit,* the African Commission confirmed this when they held that disability is included in "other status" under article 2 of the African Charter.

Similarly, the provision on nondiscrimination found in article 3 of the African Charter on the Rights and Welfare of the Child (African Children's Charter) does not expressly include disability in its nondiscrimination clause. Children with disabilities are included within the ambit of this provision only through inclusive interpretation. Kamga correctly argues that "this approach fails to ensure the visibility of the rights of children with disabilities" (2013).

Furthermore, the provision on nondiscrimination in the African Youth Charter does not expressly include disability in the list of grounds upon which discrimination is prohibited, making it necessary to include disability through inclusive interpretation. The grounds listed in article 2 (1) of the African Youth Charter include race, ethnic group, color, sex, language, religion, political or other opinion, national and social origin, fortune, birth, or other status. Article 15 (4) of the African Youth Charter provides for nondiscrimination only with regard to one particular right, the right to employment. It affirms that states should "ensure equal access to employment and equal pay for equal work or equal value of work" and offers "protection against discrimination regardless of ethnicity, race, gender, disability, religion, and political, social, cultural or economic background."

The failure to expressly include disability in the discrimination clauses in the African Charter, the African Children's Charter, and the African Youth Charter (save for the provision relating to employment) can be remedied through inclusive interpretation. Nevertheless, this is undesirable as it leaves the matter open to different interpretations (Abbay, 2015). The recognition of the right of persons with disabilities to equality and nondiscrimination should not depend on inclusive interpretation, particularly when this right is explicitly protected in relation to other population subgroups (Abbay, 2015). Consequently, the equal application of the rights and freedoms of persons with disabilities remains weak and insufficient.

The inadequate handling of disability in some of the African human rights instruments is exhibited in the fact that not all types of disabilities are taken into account. For instance, article 13 of the African Children's Charter has been criticized for reducing disability to mental and physical impairments only (Kamga, 2013). Article 13 applies to "[e]very child who is mentally or physically disabled." This leaves out others, including children with visual impairments, and those with hearing and speech impairments. A similar approach is adopted in the African Youth Charter, which limits disability to mental and physical disability to the exclusion of other types of disabilities. Article 24 (1) of the African Youth Charter states that "States Parties recognise the right of mentally and physically challenged youth to special care and shall ensure that they have equal and effective access to education, training, health care services, employment, sport, physical education, and cultural and recreational activities."

Moreover, some of the instruments privilege certain rights over others in relation to persons with disabilities. The Maputo Protocol, for example, specifically mentions that women with disabilities have the right to access "employment, professional and vocational training as well as . . . participation in decision-making" (article 23 (b)). Other rights, particularly civil, political, and cultural rights, are not specifically mentioned (Abbay, 2015). Similarly, the African Youth Charter specifically limits the provision of "special care" to specific rights including "education, training, healthcare services, employment, sport, physical education, and cultural and recreational activities" (article 24 (1)).

As shown above, the African human rights instruments are largely modeled on the medical and welfare approaches to disability. The African human rights system considers persons with disabilities as objects of charity and welfare rather than as subjects with rights (Ngwena, 2006). The use of terminology and phrases such as "handicapped," "special care," and "physical and moral needs," among others, indicates a focus on individual impairment without taking account of environmental and social factors (Oyaro, 2015). Consequently, these instruments fall short of international human rights standards such as those prescribed in the CRPD.

Contextual Gap in the CRPD

At the global level, the CRPD adopts a more holistic approach to disability than the African human rights system. The CRPD espouses both the social and the human rights models of disability. In accordance with the social model, the CRPD recognizes that disability "results from the interaction between" an individual with impairment and various barriers (CRPD, preamble para e). Barriers may be social, cultural, material, physical, or attitudinal, and they exclude persons with impairments from mainstream life (Franklin et al., 2018). In line with the human rights model of disability, the purpose of the CRPD is to "promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities, and to promote respect for their inherent dignity" (CRPD art 1). The CRPD therefore contains an extensive list of human rights and fundamental freedoms to which persons with disabilities are entitled. Articles 10–30 of the CRPD cover civil, political, economic, social, and cultural rights. The right to equal recognition before the law entrenched in article 12 of the CRPD is particularly significant to the human rights approach to disability. Article 12 (2) provides that "[s]tates Parties shall recognise that persons with disabilities enjoy *legal capacity* on an equal basis with others in all aspects of life" (emphasis added). The meaning of the term "legal capacity" was the subject of much contention during the drafting of the CRPD (Dhanda). There was contention about whether legal capacity includes capacity to hold rights as well as the capacity to act in order to exercise those rights. In the interest of progress, a compromise was reached and the CRPD did not define the term "legal capacity" anywhere in its text. Nevertheless, the Committee on the Rights of Persons with Disabilities clarified that legal capacity means both the capacity to hold rights and the capacity to act (General Comment number 1). The CRPD acknowledges that persons with severe disabilities may require support and provides that States Parties have a duty to provide this support. According to article 12 (3), States Parties "shall take appropriate measures to provide access by persons with disabilities to the support they may require in exercising their legal capacity." Contrary to the dominant substituted decision-making regime, requiring support in order to make decisions and act to exercise one's rights is no longer a justification for the denial of legal capacity. Rather, the provision of support is regarded as a vital part of the right to legal capacity. The CRPD is therefore much more than just an instrument that lists the rights and fundamental freedoms to which persons with disabilities are entitled. Through its provisions on legal capacity and supported decision-making, the CRPD demonstrates an unwavering commitment to a human rights approach to disability according to which all persons with disabilities hold and exercise their human rights and fundamental freedoms on an equal basis with others. In that respect therefore, the CRPD adopts an approach that is capable of enabling persons with disabilities to hold and enjoy human rights and fundamental freedoms.

The CRPD was well received by African countries. At the date of writing, 50 of the 55 African States had ratified the CRPD with Botswana being the latest country to ratify it on 12 July 2021. Moreover, a number of African states participated in the drafting process of the CRPD. Nevertheless, some African disability activists and scholars have argued that while the CRPD is undoubtedly relevant in Africa, it does not adequately represent the African context and experience (Appiagyei-Atua, 2017). Some of the concerns are that the CRPD does not provide for harmful traditional beliefs and practices that are rampant in Africa and have driven the mutilations and ritual killings of persons with albinism. Matters of HIV/AIDS as well as poverty that have a significant impact on the enjoyment of human rights and fundamental freedoms by persons with disabilities are also not addressed in the CRPD (Kamga, 2013). Although the CRPD falls short of explicitly protecting persons with disabilities infected with HIV/AIDS, persons with disabilities are entitled to access HIV/AIDS health programs on an equal basis with others under article 25 (Human Rights Watch, 2014).

Dissatisfied with the manner in which the African human rights system addressed disability rights and the lack of local context in the CRPD, disability activists in Africa began to call for the adoption of an Africa-specific and disability-specific instrument.

Addressing Gaps at the Global and Regional Levels: The African Disability Protocol and Other Relevant Regional Documents

In order for Africans with disabilities to realize their rights and fundamental freedoms, there was a need to adopt a new approach that is simultaneously relevant to the unique African context, capable of promoting the equal enjoyment of all human rights and fundamental freedoms by persons with disabilities in Africa. This came in the form of the Protocol to the African Charter on Human and People's Rights on the Rights of Persons with Disabilities in Africa (African Disability Protocol).

Prior to the adoption of the African Disability Protocol, there was already a shift taking place from the medical and welfare models to the social and human rights models of disability. The initial impetus for Africa's transition from the medical to the social model of disability began in 1980 with the Africa Regional Conference on the International Year of the Disabled which resulted in the adoption of the Agreement for the Establishment of the African Rehabilitation Institute (the ARI Agreement). Prior to the establishment of the ARI, Member States of the Organisation of African Unity (OAU, established in 1963), the precursor to the African Union, addressed the needs of persons with disabilities at domestic level. The African Rehabilitation Institute (ARI) was subsequently established in May 1988, in Harare, Zimbabwe. ARI was responsible for developing subregional and regional training and research programs on the rehabilitation of persons with disabilities. The ARI Agreement is based on the medical and welfare model of disability as shown in article 3 which states that one of the mandates of the ARI is to assist member states to "enhance disability prevention and rehabilitation services and to ensure the inclusion of persons with disabilities in all aspects of life." The core functions of the ARI center exclusively around the provision of rehabilitation services, indicating a reliance on the medical and welfare approaches to disability. Some of the core functions include the formulation of a "unified approach for promoting the development of prevention and rehabilitation services" (a); the creation of "facilities to satisfy the needs of handicapped Africans who, because of their disability, find it difficult to adapt themselves to the rapidly changing world" (b); the promotion of the development of "rehabilitation centres in all countries of the African continent . . ." (c); and the creation of "favourable conditions for inter-African co-operation and mutual assistance as part of rehabilitation and strengthening the already existing rehabilitation institutions in various parts of Africa. . ." (d). The use of phrases such as "handicapped Africans" and "creation of facilities to care for" persons with disabilities indicates a reliance on the medical and charity models of disability (Biegon, 2011).

The shift toward a human rights approach commenced during the OAU's Ministerial Conference on Human Rights in 1999. This Ministerial Conference resulted in the adoption of the Grand Bay (Mauritius) Declaration and Plan of Action, which dealt with the rights of persons with disabilities, people living with HIV/AIDS, women, and children. As Murray correctly points out, this document "indicated a shift from human rights being seen as the domain of the African Commission in Banjul to a more integrated perspective within the OAU itself, and marked an important turning point in the OAU's recognition of its role in this regard" (Murray, 2004). After the OAU Ministerial Conference, the OAU Labour and Social Affairs Commission (LSAC) declared 1999–2009 the African Decade of Persons with Disabilities. The aim of the African Decade was to drive the implementation of the World Programme of Action Concerning Disabled Persons (WPA) in Africa.

During the African Decade of Persons with Disabilities, the OAU was transformed to AU through the AU Constitutive Act. The AU Constitutive Act clearly defined the human rights mandate of the AU (Baimu, 2001). It provides that one of the AU's objectives is to "promote and protect human and peoples' rights in accordance with the African Charter on Human and Peoples' Rights and other relevant human rights instruments" (AU Constitutive Act, article 3(h)). As a result of the AU's objective to safeguard human rights the Continental Plan of Action for the African Decade of People with Disabilities of 2002 (CPOA) was adopted. This instrument was based on the human rights model of disability and focused on strengthening equality, empowerment, and full participation of persons with disabilities (Biegon, 2011). After the CPOA, in May, 2003, AU Ministerial Conference on Human Rights in Africa was held in Kigali, Rwanda, followed by the Disability African Regional Consultative Conference in Johannesburg, South Africa. The Rwanda Ministerial Conference encouraged African states to support ARI. It also adopted the Kigali Declaration. The aim of the Kigali Declaration was "to develop a Protocol on the protection of the rights of people with disabilities and the elderly" (Kigali Declaration, paragraph 20).

Following the Johannesburg Conference, the Secretariat of the African Decade of Persons with Disabilities (SADPD) was established to coordinate and ensure that governments, organizations of persons with disabilities (OPDs), and other non-governmental organizations (NGOs) implement the CPOA. The SADPD facilitated five programs in poverty reduction, gender law and policy, livelihood opportunities, and youth and children, in various countries including Ethiopia, Kenya, Rwanda, and Senegal. National African Decade Steering Committees were also created in Burkina Faso, Burundi, Cameroon, Cape Verde, Egypt, Gambia, Ghana, Guinea, Mali, Mauritania, Namibia, Senegal, South Africa, Tanzania, Togo, and Zambia (Kamga, 2013).

The next regional disability rights initiative occurred in 2007, which was the Africa Campaign on Disability and HIV/AIDS. It was also based on the human rights model of disability. This campaign brought together disabled persons and AIDS organizations with the aim of incorporating a disability rights lens within policies and programs on HIV in Africa. Thereafter, the 2008 Kampala Declaration on HIV was developed and signed for that very purpose (Gerntholtz et al., 2010).

The years 2010–2019 were subsequently declared as the second African Decade on the Rights of Disabled Persons.

The last social and human rights-based initiative occurred in 2008 through the Windhoek Declaration on Social Development (Windhoek Declaration) (2008). Among the affirmations and resolutions related to persons with disabilities in the Windhoek Declaration was a commitment by states to promote human rights and improve the quality and standard of living of their citizens, including persons with disabilities (Windhoek Declaration, preamble). The Windhoek Declaration took note of the challenges that persons with disabilities face in Africa, such as poverty, violence, and lack of access to social services, among others. In order to combat these challenges, the Windhoek Declaration envisaged the adoption of a social development program under the auspices of the AU Commission that would combat poverty, and promote employment, human rights, dignity, and access to social services by marginalized groups including persons with disabilities. Although these are positive features, Abbay (2015) argues that the "social development" focus of the Windhoek Declaration reinforces disability as a social development rather than a human rights issue.

Although the African Decade of Persons with Disabilities was predominantly founded on a social welfare perspective, it had a human rights tinge. It was based on the principles of full participation, equality, and empowerment of persons with disabilities, which African states were encouraged to foster. The gains of the African Decade of disabled persons can be seen in South Africa, which developed a rights-based legislative framework and incorporated the principle of self-representation of persons with disabilities.

The African Union subsequently adopted the African Disability Protocol on 29 January 2018. The Protocol was adopted in accordance with article 66 of the African Charter on Human and People's Rights (Banjul Charter) which states that "[s]pecial protocols or agreements may, if necessary, supplement the provisions of the present Charter." The African Disability Protocol is not yet in force since it has not yet received the requisite number of ratifications. Fifteen member states need to ratify the African Disability Protocol in order for it to come into force (Article 38 (1) African Disability Protocol). At the date of writing, the African Disability Protocol was signed by 11 out of 55 African countries. These countries are Angola, Burkina Faso, Cameroon, Central African Republic, Gabon, Mali, Malawi, Mozambique, Rwanda, South Africa, and Togo. Only three countries have ratified the African Disability Protocol, namely, Kenya, Mali, and Rwanda. Despite the fact that the African Disability Protocol is not yet in force, it remains an integral part of the African human rights architecture, and it is only a matter of time until it comes into force. The African Disability Protocol addresses gaps in the approach to disability found in the African human rights system by abandoning the medical and welfare approaches and employing the social and human rights models of disability.

The Convention on the Rights of Persons with Disabilities (CRPD) has had a significant influence on the African Disability Protocol. The content of the African Disability Protocol is testament to the influence of the CRPD. Like the CRPD, the

African Disability Protocol adopts a social and human rights approach to disability. In article 1 of the African Disability Protocol, the term "persons with disabilities" includes those with "physical, mental, psychosocial, intellectual, neurological, developmental or other sensory *impairments which in interaction with environmental, attitudinal, or other barriers* hinder their full and effective participation in society on an equal basis with others" (emphasis added). Furthermore, the African Disability Protocol adopts a human rights approach to disability. The African Disability Protocol reaffirms the rights that are found in the CRPD. The following rights are found in both the CRPD and the African Disability Protocol: the right to equality and nondiscrimination (Art 5 and 6 African Disability Protocol and article 5 CRPD); the right to equal recognition before the law (Art 7 African Disability Protocol and article 12 CRPD); the right to life (Art 8 African Disability Protocol and art 10 CRPD); liberty and security of person (Art 9 African Disability Protocol and art 14 CRPD); freedom from torture or cruel, inhuman, and degrading treatment or punishment (Art 10 African Disability Protocol and art 15 CRPD); situations of risk (Art 12 African Disability Protocol and art 11 CRPD); access to justice (Art 13 African Disability Protocol and art 13 CRPD); right to live in the community (Art 14 African Disability Protocol and art 19 CRPD); accessibility (Art 15 African Disability Protocol and art 9 CRPD); education (Art 16 African Disability Protocol and art 24 CRPD); health (Art 17 African Disability Protocol and art 25 CRPD); habilitation and rehabilitation (Art 18 African Disability Protocol and art 26 CRPD); work (Art 19 African Disability Protocol and art 27 CRPD); adequate standard of living (Art 20 African Disability Protocol and art 28 CRPD); participation in public and political life (Art 21 African Disability Protocol and art 29 CRPD); freedom of expression and opinion (Art 23 African Disability Protocol and art 21 CRPD); access to information (Art 24 African Disability Protocol and art 21 CRPD); participation in sports, recreation, and culture (Art 25 African Disability Protocol and art 30 CRPD); family (Art 26 African Disability Protocol and art 23 CRPD); women and girls with disabilities (Art 27 African Disability Protocol and art 6 CRPD); and children with disabilities (Art 28 African Disability Protocol and art 7 CRPD).

Crucially, the African Disability Protocol includes a definition for legal capacity that is in line with that found in the Committee on the Rights of Persons with Disabilities' general comment number 1. Article 1 of the African Disability Protocol defines the term "legal capacity" as the "ability to hold rights and duties and to exercise those rights and duties." Neither the CRPD nor the African Disability Protocol creates new rights. Instead, they formulate existing rights in a manner that is specific to the experience of persons with disabilities. Because of its reliance on the social and human rights models of disability, the African Disability Protocol is capable of transforming the rights experience of persons with disabilities in Africa.

The African Disability Protocol also addresses the contextual gap in the CRPD by including rights that are specific to the African context. It includes issues and rights that are specific to the African context like ritual killings (article 1), harmful practices (article 11(1)), youth with disabilities (article 29), older persons with disabilities (article 30), persons with disabilities as duty bearers (article 31), definition of deaf culture (article 1), and the role of the family, caregivers, and community (article 25) and also includes marginalized groups such as persons with albinism.

The African Disability Protocol has also reformulated and extended CRPD rights in order to suit the African context. The African Disability Protocol has restated the rights of access to justice, living in the community, legal capacity, habilitation and rehabilitation, freedom from torture, work and employment, and political and public participation. These rights have been contextualized to suit the African context in different ways. Access to justice has been extended to include customary law forms of justice (article 13(2)). Living in the community includes living independently in the community (article 14). Legal capacity includes the right to hold documents of identity (article 7 (2)(f)). The right to habilitation and rehabilitation includes the requirement to develop, adopt, and implement standards that are suited to local conditions (article 18 (e)). Freedom from torture includes the inclusion of forced sterilization and other invasive procedures (article 10). Work and employment includes "reserving and enforcing minimum job quotas for employees with disabilities" in the public sector, and the principle of equal pay for equal work (article 19). Political and public participation includes amending laws that restrict the right to vote, stand for, or remain in office (article 21).

On certain issues, the African Disability Protocol is not as detailed as the CRPD. Article 15, on accessibility, omits references to private entities, training, and the Internet. Article 16, on education, does not mention braille, alternative script, augmentative and alternative means, modes and formats of communication, orientation and mobility, peer support and mentoring, and raising disability awareness of staff across all levels of education. Article 18, on habilitation and rehabilitation, omits reference to earliest possible stage, multidisciplinary team, and the concept of being voluntary. Article 19, on work and employment, omits reference to the open labor market. Article 20, on the right to an adequate standard of living, omits access to public housing programs, and women and girls as a specific group requiring inclusion in social protection programs. Article 25 on family is not explicit about the duty states have to assist persons with disabilities in raising children.

Despite these areas of concern, the African Disability Protocol is dedicated to promoting and protecting the rights of persons with disabilities in Africa. Article 36 stipulates that "[n]o provision in this Protocol shall be interpreted as derogating from the principles and values contained in other relevant instruments for the realization of the rights of Persons with Disabilities in Africa." It further provides that "[i]n the event of a contradiction between two or more provisions of this Protocol, the interpretation which favours the rights of Persons with Disabilities and protects their legitimate interests shall prevail" (article 36 (2)). A similar safeguard clause is found in article 4 (4) of the CRPD. Therefore, the African Disability Protocol addresses the deficient approach to disability in the preexisting African human rights instruments as well as the lack of local context in the CRPD.

Conclusion

Cumulatively, the social and human rights models of disability hold great promise for the adequate protection of the rights of persons with disabilities and their full inclusion in society. In contrast with the medical and welfare approaches to disability, the social model takes into account the impact of external environmental barriers, while the human rights model perceives persons with disabilities as subjects capable of holding and exercising human rights. Prior to the adoption of the African Disability Protocol, the African human rights instruments adopted the deficient medical and welfare approaches to disability. Furthermore, the few provisions expressly addressing disability did so in an inadequate manner. At the global level, the CRPD does not sufficiently depict the African context and experience with pertinent matters such as harmful practices and traditional systems of justice being absent from its text. The African Disability Protocol addresses both the deficient approach to disability in the African human rights system and the lack of local context in the CRPD. It therefore brings rights home while taking the African context into account.

Studying Critical Disability: A Consolidating Field

Studying Critical Disability: A Transformative and Inclusive Agenda for Social Change – Introduction

18

Theresa Lorenzo

Contents

Abstract

Disability studies has grown as an emerging discipline since the 1980s across mainstream disciplines in academic, which has influenced policy processes at global and local levels. The chapters of this section present both personal and political experiences of the authors who have engaged in critical dialogues in their profession, which has generated a credible shift in co-creating disability-inclusive curricula in higher education institutions involving persons with disabilities teaching and researching with academics, and students, some of whom have experienced barriers to equal opportunities due to their impairments themselves; the complexity of the social determinants of disability that have entrenched inequalities and discrimination experienced by persons with disabilities and their families, within their communities and wider society; and the stereotypical views of disability that are challenged by using intersectionality as a lens to explore the axes of privileges and power in their different academic disciplines, so that we dismantle systemic structures that cause inequalities in access to health, education, and economic development so there is sustained social change.

Introduction

When asked to be an editor of this section, it raised critical questions in my mind as an occupational therapist about how we explore power and privilege related to disability inclusion for social change in the discipline of occupational therapy as a start and then beyond other disciplines in health sciences, humanities, law, business sciences, and economics. I also wondered, in light of the objectives for this section, how a social discipline could decolonize its epistemology and who sets the agenda of what is written by who. Reflecting on these questions highlighted the benefits of using an intersectionality lens to critique intradisciplinary theories and practices with the aim of strengthening disability-inclusive social systems. Interrogating the interconnected nature of social categorizations from a disciplinary perspective could reveal transformative and more inclusive approaches to disrupting systems of discrimination or disadvantage, especially at local government level as the executive hub for the implementation of disability-inclusive policy and practice across all state sectors. Similarly intradisciplinary epistemic critique in the higher education sector would ensure that the graduates we produce are able to implement inclusive policies and practice.

I studied for a Bachelor of Science in Occupational Therapy at a South African university and qualified in the mid-1980s. The medical model of disability that focused on an individual's impairment formed the framework for the curriculum. There was very little reference to the socioeconomic and political determinants of human health and well-being, so we did not exit the program with professional competences for promoting social justice and inclusive social change. Reflecting on my professional socialization now, I am struck by the marked absence in the curriculum then to conscientize occupational therapy students toward social, economic, and political development that would prepare us for context-relevant practice. For example, we treated many young black youths who sustained upper limb amputations from throwing hand grenades during political protests in the townships. They were further disabled, since we were not allowed to issue upper limb prosthesis to them as these were considered "dangerous items" in prison. No one in the rehabilitation team thought to advocate for the prisoner's rights to optimal rehabilitation.

Two years after graduating, I was offered a research post in a rural "homeland" of South Africa that extended my grasp of the social and political injustices of apartheid. The destruction of family and economic systems caused by the migrant labor system was seen all around the rural villages where I worked. When the research ended, I was able to get a therapy post in the hospital. I struggled to know how to respond to poverty and to be involved with persons with disabilities to address their needs in a relevant and meaningful way. With little understanding of sociology and the politics of poverty and development, I experienced inner conflict between the conventional understanding of my professional role and the absence of discipline-specific knowledge and skills in addressing the social determinants of disability. My Christian faith and spirituality became a source of strength, hope, and inspiration to make sense of the professional impasse I found myself in. The growth of deep, meaningful cross-cultural friendships with a diverse range of people whose beliefs were different to my own gently challenged me to reflect on my beliefs and values. There were three women (Bahai, Jewish, and Christian), in particular, who as mentors had an impact on my transformation in political conscientization including a deeper understanding of the politics of disability and the intersections with race, disability, gender, religion, and class. They each brought a different perspective to life and enriched my appreciation of the diversity of faiths that enriched community living and working.

Those formative years shifted my practice from an individual rehabilitative to a human rights and development approach. My emerging political conscientization was further fuelled by my interactions with Disabled People South Africa (DPSA), which led to me to understand disability as a form of social oppression. The Rural Action Group on Disability (RURACT) provided regional and national forums for discussion, debate, and social engagement between disabled people who were members of DPSA and service providers such as myself from the health, education, and welfare sectors. With exposure to disability activism, I began to see that the components of equal opportunities and social integration of community-based rehabilitation (CBR) (WHO, ILO, and UNESCO, 1994) could make a direct contribution to the human development of persons with disabilities. The rural communities where I worked provided an abundance of opportunities for development projects.

Although the shift in professional focus was overwhelming for a young practitioner, my approach to inclusive development was deeply influenced by Paulo's Freire's approach of conscientization through respect for everyone's experience and the idea that knowledge and action produced through mutual learning become the catalysts for social change (Hope & Timmel, 1995). My work in rural health and development also involved the training of undergraduate health science students from one of the universities in rural health and inclusive development. Final-year medical, occupational therapy and physiotherapy students did 3- and 4-week rural blocks at the hospital, respectively. Training students was an opportunity to hone my skills in interdisciplinary teaching and intersectoral practice, as well as in managing conflicts and tensions between academia and disability activism.

Together with the rehabilitation team at Tintswalo Hospital in Acornhoek, I took some bold professional steps in rural development practice through initiating CBR services, focused on training early childhood development centers to become disability inclusive and skills development for youth and adults with disability to start sustainable livelihoods projects. I became increasingly convinced that women have much to contribute to our understanding of disability in the context of poverty, Inclusive development, and the role of practitioners to facilitate inclusive services and systems for sustainable development. We applied Freire's principles of creating conscious awareness; finding relevance through identifying strong feelings; and problem-posing on the need for community re-integration for persons with disabilities, to plan a curriculum together with the Department of Occupational Therapy at the University of the Witwatersrand for training community rehabilitation workers (CRWs) as mid-level workers, using action reflection cycles.

My continued involvement with the disability rights movement during this time meant that I had to grapple with the "health and disability" debate (Lorenzo, 1991; Lorenzo, 2001a, b). I was fortunate to do a Masters in Community Disability Studies at the Centre for International Child Health at the University of London after 7 years of rural experience. Here I met disabled academics such as Mike Oliver and Vic Finkelstein who influenced my thinking regarding the contributions disabled people could make in academia. Afterward, I worked for a primary health-care NGO back in South Africa, before accepting a lecturing post at the University of Cape Town in 1996. Straddling the two worlds of academia and a nongovernment organization (NGO) practice provided the opportunity for me to meet and work with the Disabled Women's Development Programme of Disabled People South Africa (DPSA) while expanding the undergraduate occupational therapy curriculum to include competences in disability-inclusive community development. My experience as a facilitator in CRW training programs, as well as capacity building workshops for the Disabled Children's Action Group (DiCAG) and lecturing in CBR and Disability Studies, provided opportunities for me to reflect on how the occupational therapy profession needed to change.

I began to realize that change was a complex, intricate process that occurred on multiple levels and that the academy also needed to change to address the power dynamics in service delivery and partnership development (Lorenzo & Cloete, 2004). A growing interest in initiating a disability studies program in partnership with DPSA and DiCAG in South Africa started to emerge while they were guest lecturers in the Masters of Science in Occupational Therapy program at University of Cape Town. Together with members of DPSA and DiCAG and the Centre for Disability Studies at Leeds University in the UK, through a Higher Education Link Programme award from British Council, we developed a curriculum for a Postgraduate Diploma in Disability Studies, using recognition of prior learning as an assessment strategy for redressing exclusion from the education system for applicant without a first degree. Two of the authors of chapters in this section who accessed the program through RPL have obtained their PhDs. In this way, disability studies has raised critical consciousness in academia and the disability movement and wider civil society and government, in a way that has generated authentic, transformative, and inclusive social change.

The chapters in this section illustrate this golden thread of how practitioners and policy makers across all sectors of society, and academics across all disciplines, who engage in "studying critical disability" find a space to empower themselves to address the rights of persons with disabilities and their families, which leads to meaningful social change. The presence of the coronavirus (COVID-19) has shown up global inequalities and the urgent need for strategic transformative and inclusive development. At times of such disasters and emergencies, persons with disabilities are further marginalized and excluded (Ned et al., 2020; McKinney et al., 2021). They are also at higher risk of contracting the virus because of factors that include the need for interpersonal caregivers and living in residential facilities.

Studying critical disability is articulated as a form of knowledge co-production that is both collaborative and disruptive. Epistemic collaboration is valued as a strategy for the emergence of transdisciplinary theories and practices suited to meet the sustainable development needs of persons with disability in a globalizing world. Disruptive knowledge production is advocated as a strategy to foreground, critique, and challenge the hegemony of the many forms of oppression that individuals, families, and communities experience: the hegemony of global north; the hegemony of white privilege; the hegemony of professionals; the hegemony of patriarchy; and the hegemony of ableism, to name a few. The diverse positioning of the authors enriches the critical engagement with existing knowledge in critical disability studies. Ranging from academics, professionals, and non-professionals, who may also be persons with a disability, and practitioners on the ground, the authors provide a global north and south balance of perspectives on inclusive practices in all spheres of life.

Hisayo Katsui and Jennifer Muderedzi explore the structural violence of poverty and disability through a case study of families of children with cerebral palsy in rural Zimbabwe. They explain the convergences between critical disability studies and the disciplines of economics, political science, and international development by describing the vulnerability and embodied inequalities of these families. In so doing, they provide practical exemplars for the realization of the UN Agenda 2030. They argue that social disciplines too often take vulnerability and inequalities as ontological facts; they conclude that a critical disability perspective provides for a radical change in how these disciplines analyze and theorize structural violence.

Olwethu Sipuka and Sindile Ngubane-Mokiwa focus on higher education institutions and their leadership in addressing social justice. They argue that higher education institutions need to lead significant curricular change so that all academic disciplines prepare their graduates for disability-inclusive development. In particular, academic programs for the health, education, economics, and social development sectors should develop curricula that address the complexities of structural and systemic changes needed for inclusive social change, underpinned by political empowerment approaches.

Lieketseng Ned, Lucia Hess, Anthea Hansen, Sumaya Gabriel, and Amshuda Sonday apply a critical disability studies lens to the rehabilitation sciences curricula. They argue that the social determinants of disability are closely linked to the social determinants of health. Professional transgression and professional identity are co-created by an interdisciplinary focus in higher education institutions.

Christina Sadiki, Gubela Mji, Lucia Franco, and Lindsey Nicholls write on reciprocity in co-creation and co-production of knowledge through recognizing the need to hear the voices of mothers of children with disability traditional healers and elite of rural communities and persons with psychosocial disabilities who are marginalized and experience discrimination and isolation as a result of multiple hegemonies in healthy and higher education systems.

Disability Studies – Here today, gone tomorrow is a reflective critique of the roots of disability studies in the UK and USA by one of the leading disabled academics and activist in the UK, **Colin Barnes**, who was Professor of the Centre for Disability Studies at University of Leeds. He has written with **Simon Prideaux**.

The chapter makes a critical contribution regarding the socio-political dimensions of disability that are at risk of being lost in the current academic and policy debates, globally and nationally.

Closing Reflections

Studying critical disability presents opportunities for demystifying disability practice, professionalism, and research as vestiges of power and privileges that serve only to alienate and exclude certain people. Paulo Freire's pedagogy of the oppressed and his principles of adult education are still relevant today in considering the global shifts to disrupt ongoing oppression marginalization and isolation that exacerbate inequalities. If we are not conscious of the different forms of power, we may further oppress persons with disabilities through our policies, practice, and research. The writings of many disability activists and academics conscientized me about how persons with disabilities have been alienated and excluded from research and socioeconomic and political development, when researchers and practitioners remain unaware of the power of language and education.

I hope that practitioners, policy makers, academics, and researchers are encouraged to work in authentic partnerships with persons with disabilities at grassroots, national and regional levels, and, in so doing, embrace the transitions and differences that have potential to enrich everyone's lives. As Hartley (2002) commented that while knowledge is power, sharing knowledge is progress. I encourage practitioners, researchers, academics, and policy makers to engage with persons with disabilities to promote and sustain inclusive development. The critical turning points and lessons that are shared in the chapters in this section will hopefully shape the values and beliefs that inform an inclusive development approach so that equal opportunities for persons with disability move beyond being hidden aspirations to being fully achievable through reciprocal relationships of learning, being, belonging, doing, and becoming.

Contents

Abstract

This chapter explores the convergences between critical disability studies and the disciplines of economics, political science, and international development. We look ahead to UN Agenda 2030, theorizing the impact of globalization on disability inclusion and sustainable human development within an emerging new world order. We scrutinize the case of Tonga families with children with cerebral palsy in Zimbabwe, through which their vulnerability and embodied inequalities are shed light on so as to understand global and structural violence. We argue that vulnerability and inequalities are too often taken for granted as an ontological fact. We conclude that the critical disability perspective enables us to radically change our analysis by focusing on the starting point of vulnerability and inequalities.

Introduction

This chapter describes the inequalities and vulnerability experienced by persons with disabilities and their families in the Global South using a case study of Tonga families with children with cerebral palsy in Zimbabwe. We use structural violence (Galtung, 1969) as a theoretical framework to examine the disintegrated disability in the global society and critically analyze the families' inequalities and vulnerability. Using a critical realist perspective of disability studies (see Vehmas & Watson, 2013), we answer the following three key questions: (1) How vulnerable are the Tonga families in the context of structural violence? (2) What are the embodied inequalities? (3) How can a critical disability perspective contribute to the sustainable development discourse in this time of globalization?

In the era of the United Nations (UN) Convention on the Rights of Persons with Disabilities (CRPD) (2006) and the Sustainable Development Goals (SDGs) (2015), disability inclusion has become more important on the international political agenda than ever before. In line with the ideology of the disability-specific convention, the SDGs strive to leave no one behind, including persons with disabilities. The global discourse on disability seems to have changed dramatically since the time of UN Universal Declaration of Human Rights (1948). The declaration made only one single reference to disability in Article 25, whereas the SDGs have a standalone goal of inequality reduction and refer to disability and persons with disabilities in their various targets and indicators related to education, growth and employment, inequality, accessibility, data collection, and monitoring (Katsui, forthcoming). Today increasing efforts are being made to create disability inclusion guidelines and policies such as the United Nations Disability Inclusion Strategy (2019) and the UN Policy Brief on a Disability-Inclusive Response to COVID-19 (2020). In other words, the political will toward disability inclusion has strengthened at the global policy level.

However, a huge gap remains between the globalization of disability inclusion in sustainable development discourse and in local realities (Katsui & Chalklen, 2020). The COVID-19 pandemic has manifested this gap in reality. Under the pandemic circumstances, persons with disabilities around the globe have to fight to maintain their disability services, if they have any at all. Many of the services have been put on hold and consequently greatly jeopardize the well-being and health of these people (Abrams & Abbott, 2020; Langa, 2020). The total extent to which the pandemic has negatively impacted this specific group of people is not yet exactly known. Nevertheless, the aforementioned UN Policy Brief on a Disability-Inclusive Response to COVID-19 (2020) already displays extremely worrying realities:

> *'The global crisis of COVID-19 is deepening pre-existing inequalities, exposing the extent of exclusion and highlighting that work on disability inclusion is imperative. People with*

> *disabilities—one billion people— are one of the most excluded groups in our society and are the hardest hit in this crisis in terms of fatalities. (United Nations,* 2020*: 2*)

Nevertheless, the inequalities experienced by persons with disabilities are embodied and thus individualized (Katsui & Mesiäislehto, 2022). They often remain undiscovered if careful attention is not paid to their perspectives. In this context, structural violence provides a useful analytical framework. The concept of structural violence describes how economic, political, legal, and other social structures can prevent individuals, groups, and societies from reaching their full potential. It refers to systematic ways in which social structures harm or otherwise disadvantage individuals (Galtung, 1969). Structural violence is useful for understanding the real dynamics of inequalities and how power works (see Farmer, 2004). Global and local social fabrics are intertwined in the structure at stake and are embedded in political and economic organization at both local and global levels (ibid.), in their deep histories (Farmer, 2010:293), and in embodied experiences (Katsui & Mesiäislehto, 2022). This analytical framework of structural violence enables us to investigate structural power relations and inequalities.

Vulnerability is another key concept through which critical disability studies help us understand the disintegrated phenomenon of disability in local realities (see Heikkilä et al., 2020). Vulnerability as a concept is notoriously absent from the mainstream discussions on disability, probably due to the stigma that the notion is perceived to carry and the way in which it is seen to internalize and individualize disability as an ontological factor, which contributes to the normalization of the existing power relations within societies (Clough, 2017). The vulnerability of persons with disabilities has long been understood as a direct consequence of individual impairment in a medical model of disability (Barnes, 1991). The disability community extensively challenged this approach for individualizing disability and victimizing persons with disabilities, which stigmatizes them (e.g., Goodley, 2014; Grue, 2016). This change led to the emergence of a social model of disability, which contested the very assumption of "normality" and redefined disability as a form of social oppression (French, 1994). Consequently, contextual factors became a more important focus than impairments in deconstructing social vulnerabilities. The difference between inherent/ embodied and situational/embedded vulnerability became prominent. Furthermore, the UN CRPD, more precisely a human rights-based approach brings to the fore the notion of rights-holders and full subjects among persons with disabilities. A critical realist perspective in disability studies acknowledges particular vulnerability so that individuals can have their rights realized on an effectively equal basis with others, which is a precondition for the universality of social justice, not only in books but also in practice (Heikkilä et al., 2020).

At the intersection of the local and global fabrics of vulnerability and inequalities, this chapter first introduces the methodology of our case study in Binga, Zimbabwe. Second, we present profound experiences of vulnerability and inequalities and analyze them using the key concept of structural violence. Subsequently, we link the case study findings of vulnerability and inequalities with the sustainable development and human rights discourses. We argue that vulnerability and inequalities are too often taken for granted as an ontological fact. We conclude that the critical disability perspective enables us to radically change our analysis by focusing on the starting point of vulnerability and inequalities.

Case Study: Tonga Families with Children with Cerebral Palsy in Zimbabwe

The case study fieldwork was carried out among vulnerable communities in an extremely poor, rural remote area of the Binga district of the Tonga in the northwest of Zimbabwe on the border between Zimbabwe and Zambia. The people live about 10 km away from the Zambezi River, which reaches inland up to the remote villages in the Chizarire Mountains. Our case study examined Tonga families with children with cerebral palsy in Binga. The Tonga is a matrilineal, ethnic minority group residing in the Binga district, which has a total population of 146,606 (Zim, 2016). It is geographically, socially and politically marginalized within Zimbabwe (Munsaka & Charnley, 2013). Of the 59 districts in Zimbabwe, Binga has been one of the most neglected and lacks essential services such as health, education, communication, and agricultural development (MacGregor, 2009; Mashingaidze, 2013; Munsaka, 2012). It has the highest poverty rate in the country, with 70% of its inhabitants classified as poor or extremely poor (Rural Poverty Portal, 2015). The Matabeleland North province recorded the highest HIV/AIDS prevalence among children, at 3.2% (Zimbabwe Demographics Health Survey, 2015). At 74.3%, Binga has the highest proportion of households that practice open defecation, resulting in contaminated drinking water that causes cholera, diarrhea, hepatitis A, and other infections (Zim, 2019). Only 2 of the studied 53 families had makeshift toilets on their homesteads. Previous literature has reported how hunger and poverty have created devastation in these communities (Mudimba, 2015; Munsaka, 2012) in terms of malnutrition, disability, morbidity, and mortality among infants (Colson, 1970; Muderedzi, 2006; Reynolds & Crawford-Cousins, 1993; Tremmel, 1994). In her study of the Tonga, Maclaine (2006) found that between 85% and 90% were not even self-sufficient during a normal year, and subsistence farming or rain-fed agriculture communities were always at risk of hunger. We selected Tonga families with children with cerebral palsy for this case study due to their profound vulnerability and inequalities (please see Muderedzi (2020) for detailed methodology and ethical issues).

The case study (Muderedzi, 2020) was conducted in all 21 wards in the Binga district and was longitudinal, qualitative, and ethnographic in nature (Sandelowski & Barroso, 2003; Silverman, 2013). The fieldwork took place between 2005 and 2012. The research methods included 53 in-depth interviews in both 2005 and 2012, 20 participant observations, 10 focus group discussions conducted in the local language of Chitonga, field notes, and secondary data. The first cohort (2005) consisted of 30 families with infants with cerebral palsy aged from under 1 to 5, of which 23 died during the first 2 years of the study from malnutrition, diarrhea, malaria, meningitis, and other infections. The second cohort (2012) consisted of 7 from the first cohort and 23 newly recruited families with children with cerebral palsy aged 8 and 13. Thus, altogether 53 families participated in the study. The families were purposively selected on the basis of the following inclusion criteria: (1) being Tonga families living in Binga, (2) having children with cerebral palsy, and (3) having children of the aforementioned age range. In-depth semi-structured interviews were conducted among all the 53 families to elicit information on, for example, their experiences of life before and after having a child with a disability, beliefs and attitudes toward disability, and the factors influencing the care of the child. Participant observation was carried out during a 3-day stay at an informant's homestead with the researcher immersed in most of the daily activities such as fetching water and gathering wild fruits. This observation allowed co-author to meet the extended family and neighbors, especially in the evenings, when disability songs, stories, and life in the Zambezi valley were narrated. The data were translated into English and transcribed verbatim. Data analysis was carried out using the NUDIST (N-VIVO 6) package and the content analysis technique with development of codes (Silverman, 2013).

The Families in the Case Study Experienced Intersection of Poverty and Disability

The studied families have gone through very difficult times and continue to experience profound vulnerability and inequalities today. Deplorable living conditions consisting of poor structures of pole and dagga huts with grass thatched roofs are some of the clear signs of poverty in Zimbabwe. Some interview excerpts depict their daily lives in Binga and illustrate their profound poverty in the remote villages:

> 'I have two children. Four died in infancy. One was bewitched and the others died from the disease. My husband had to take on two more wives'. (Married woman in her 40s)
>
> 'These days we only manage to find enough water for cooking and drinking. Bathing is a luxury'. (Mother in her 30s with a child with skin disease and bouts of diarrhea)
>
> 'My wife and baby died during labor because there was no transport or road infrastructure to the nearest health center (20 kilometers away). . .. My son can't walk. He isn't able to go to school and will never have a job'. (Man in his 30s, with six children)
>
> 'I can't run away from elephants when they attack children going to school. . .We have no food or water to take to school. . .. The school is very far. . .. My parents can't afford the school fees. . .. There are no bridges on the rivers for us to cross safely to school'. (A 10-year-old boy with mobility disabilities)
>
> 'We now have one meal a day. . .. We no longer have staple food like maize or sorghum. . .. We are surviving on wild leaf okra without the starch. . .. We last had something to eat two days ago. . .. We have no proper food to feed our disabled child. He can't chew wild fruits or dried game meat'. (A married mother in her 30s with four other children)

The combination of disability and poverty means the paramount form of inequalities, namely, infant mortality, because as many as 23 families out of the 30 of the first cohort passed away during the first 2 years of the study. Only 3 of the 30 families reported having less food shortages than the rest of the informants. However, neither poverty nor disability can be taken for granted when critically investigating their experiences. We now turn to the history of the Tonga people.

Structural Violence

Disability and poverty in Binga in Zimbabwe are not ontological facts. On the contrary, a number of power relationships and globalization have greatly impacted the lives of the studied Tonga families with children with cerebral palsy. The predicament of the Binga district is largely attributed to the involuntary displacement of about 57,000 people, mostly Tonga, in the 1950s from the ecologically rich Zambezi river plains (MacGregor, 2009; Manyena, 2006; Manyena et al., 2012; Mudimba, 2015).

Even prior to the dam construction, the colonial history of Great Britain overshadowed this area in terms of the growing energy shortage in its copper production and the need for stable electricity. This history is exemplified in the final funding, which consisted of a 28.6-million-pound loan from the World Bank, 28 million pounds obtained from the mining companies and Barclays and Standard Banks, and 15 million pounds from the Commonwealth Development Corporation (Scudder, 2005: 6).

The binational dam was constructed in a very tight timeframe and had not only an environmental impact but a huge social impact on the resettled Tonga people (Scudder, 2005). The governments of both Northern and Southern Rhodesia (current Zambia and Zimbabwe, respectively), without consulting the Tonga community, agreed to the construction of the World Bank-funded hydroelectric power-generating Kariba Dam (Mashingaidze, 2013; World Commission on Dams, 2000). Some of the Tonga population resisted and were killed. Eventually, they were forcibly removed and resettled in arid lands where they could not access the electricity and waters of the Kariba Dam or the wild animal resources in the safaris and national game parks bordering their new villages (MacGregor, 2009; Mashingaidze, 2013). The shortage of large areas of cultivatable land made it impossible for communities to be resettled together, so they ended up scattered many kilometers apart. The wealth of the area was siphoned off to the cities. The government provided the Tonga with basic foods such as maize meal, salt, cooking oil, pulses, or beans for 2 years, but neither the colonial nor Zimbabwe governments compensated the Tonga any further for the forced displacement (Basilwizi Trust, 2004; Conyers, 2003; MacGregor, 2009; Mashingaidze, 2013). Without going into detail, the collapsed price of copper, war and landmines, and government urbanization policy, to name only a few reasons, all intertwiningly affected the deterioration of the economic, cultural, and social situation of the Tonga and continue to do so (Scudder, 2005).

The average cost of electricity in the region dropped by about 30% in 1961–1977, whereas the average price of other commodities and services rose by more than 75% (Soils Inc., 2000 cited in Scudder, 2005). The mining and other industries in both countries benefitted from the dam, as did the government – 80% of Zambia's foreign exchange came from copper from in the second half of the 1960s until the end of the

1980s (Scudder, 2005: 8). Many people in urban areas benefited from the dam at the expense of others, including the Tonga people, who still live in areas with a poor electricity supply. The schools and clinics in Binga started to have electricity in the 1990s. The extremely high infant mortality, one of the negative consequences of the forced relocation, illustrates the great inequalities and vulnerability of the Tonga people, until today. Swift and De Graaf (1994) similarly found that the Tonga community lived in a terrible state, with 60–80% child mortality caused by the lack of vaccinations, malaria, diarrhea, tuberculosis, leprosy, and bilharzia among the adult population. They suffered from acute food and water shortages and are heavily reliant on national and international food aid, resulting in people who do not know their histories and biographies labeling them "donor dependent" and "lazy." This situation prevails, with new infections such as HIV/AIDS and communicable diseases emerging (Scudder, 2005).

The Tonga lamented their destroyed shrines and homes, but most importantly the Zambezi water: "We want our water that we have left behind," to which the white administrators replied, "Go, the water will follow*"* (MacGregor, 2009; Tremmel, 1994). The "River Tonga," those evicted from the Zambezi valley, now aged 80 and above, told us with misty eyes how they were still waiting for the promised water. The same applies to the rest of the communities, who are angry with the government, which claimed to be contemplating sending water to the city of Bulawayo 450 km away. They still remember the huge differences between the previous land and the current one:

> *'We had a good life. The soil was fertile and we had more water than we needed. We grew corn, sweet potatoes, bananas, vegetables and many other crops twice a year—life in the Kasambabezi (Zambezi valley) was good'. (Old grandmother in her 80s, partially blind)*
>
> *'We can no longer perform traditional ceremonies to honour our ancestral spirits (mizimu) – the river connected us to our relatives and friends (bamutala) on the other side'. (Old grandfather in his 80s, married with five wives)*

The Tonga were seldom victims of famine prior to the construction of the dam (Colson, 1971; Natalie & Dayer, 2006; Tremmel, 1994; WCD, 2000). Some Tonga managed to stay or benefit from business opportunities and the water around the dam. Some animals were saved in the name of "Operation Noah" when they caught the attention of the international media during the dam construction. However, the Tonga children did not attract media attention and were left to die (Scudder, 2005). One administrator who took part in the evictions stated: "Their diets changed so much such that there was a great deal of malnutrition and many deaths especially among the children. Many felt totally marginalized and disorientated and it took many years for them to adjust and integrate" (Muderedzi, 2020:30).

After the relocation, poverty served as a social leveler, with little difference in access to mainstream public services among both people with and without disabilities (Muderedzi, 2006). It is not surprising that the Tonga people feel bitter toward the government for what it has done to them. Recent history and current consequences have led the Tonga people to grow into the government's opposition. The government uses their devastating food insecurity as a way to control the Tonga people. More precisely, it sometimes bars food aid from international communities such as nongovernmental organizations (NGOs) in this district. The government's deliberate withdrawal of food aid was noted mainly during elections. The vice president of Zimbabwe stated in October 2005:

> *'We all know that you [the Tonga people] do not vote for the government. As a result, you shall all perish from hunger and the government does not care. I have just come past the grain silos and they are empty. The government will not provide food for you. This is because you vote for the opposition' (cited in* Muderedzi, 2020*:31).*

We observed stunted growth among 37 of the studied children. Some informants reported having undergone several HIV tests anticipating a positive result in order to access food aid from the few NGOs in the district. Only in the mid-1990s did the Zambian government start to support the Tonga people on the side of Zambia in the framework of an established World Bank project. Under this initiative, the Zambian government built schools and health clinics and developed irrigation schemes. Yet the reality of the Tonga families is still extremely harsh, which indicates that both governmental measures and international projects have not been sufficiently transformative. Muderedzi was also disturbed by the government of Zimbabwe when conducting her fieldwork, as they obviously did not want to reveal the profound inequalities and vulnerability in the Binga district. The richer people and foreign investors continue to grab land (Scudder, 2005). Only a few of the Tonga people are employed in unskilled and semi-skilled jobs in tourism around the dam and nearby safari (ibid.) These are only a few examples of the inequalities and vulnerability caused by the asymmetrical power relations between the Tonga and urban people, the government, international development cooperation agencies, and international investors. In other words, stereotypical descriptions of the Tonga as "marginalized, isolated, poor, backward, minority, primitive, and dangerous" (Manyena, 2013:25) need to be demystified.

Decolonial Coping Mechanisms

The Binga district is dominated by the Tonga culture and characterized by political oppression and isolation (Basilwizi Trust, 2004; MacGregor, 2009; Munsaka, 2012). Despite the effects of globalization in Zimbabwe, Tonga's cultural beliefs still dominate their understanding of the causes and implications of bodily impairment (Munsaka, 2012). Even though it has lost almost everything, the Tonga culture has survived and is a strong driving force for self-assertion, resilience, and development. The people still turn to it for answers to experiences of misfortune, such as disease, disability, and death (Muderedzi et al., 2017; Munsaka, 2012; Muntanga, 2001). The perceived causes of disability among the Tonga were their ancestors' sorrow or anger (mizimu), disturbed social relations, and less witchcraft (kuloyiwa) (Scudder, 2005: 2). These perceptions see disability as a curse, punishment, or gift, largely absolving the child and the parents (especially the mother) from taking the blame for the child's disability (Muderedzi et al., 2017). The Tonga perceive disease as a sign of social or cosmic disorder projected on the human body. The most effective prevention against disease and other misfortunes is to properly care for and manage social and divine relations (Muderedzi, 2006; Ingstad & Whyte, 1995; Devlieger, 1995).

The settling of European missionaries in most parts of the country resulted in the conversion of large parts of the population to Christianity. However, the missionaries did not settle in the Zambezi valley due to the harsh weather conditions such as extreme temperatures, little rainfall, and malaria (Colson, 1970; Tremmel & the River Tonga People, 1994). This historical fact has resulted in the Tonga relying on their cultural beliefs without much outside influence (Siamwiza et al., 2013). The matrilineal lineage and clan, along with polygynous marriage systems, are seen as assets that facilitate broad social networks and flexible systems of resource access, helping people meet their material needs (Siamwiza et al., 2013). Their perceptions and treatment of disabled children were found to be contextual and influenced by past and present histories, culture, and low socioeconomic status. Retrospective information on disability was gathered from the "River Tonga" who had then been young men and women, as they narrated their history from the time they lived in the valley to date.

The "River Tonga" recounted how their ancestors used to carry out infanticide but stopped the practice due to high infant mortality as a result of diseases such as malaria, measles, and other infections, which would wipe out some families' children. As a result, children with disabilities started to be taken care of as well as other children. The informants asserted that it was better to have a disabled child than no child at all: "Having a disabled child is a life event" or "it is one of those things that happen in life." They often stated, "a child is a child." Many informants saw similarities among children with and without a disability:

> *'He is not capable of doing anything for himself, but still he keeps us company'. (Parents of a 6-year-old boy with cerebral palsy)*
>
> *'A disabled person can also provide the family with children who in the future can look after themselves'. (Parents of a 12-year-old boy with a disability)*

The Tonga proverb, *Kocilema kunywigwa maanzi* meaning *It is better to be disabled than dead* was echoed among the communities. Informants reiterated that when having a child, they were mainly worried about whether or not the child would survive, not about any possible disabilities. Personhood was prioritized.

Structural violence, resulting in extreme poverty, played a key role in the shift in the majority's conceptualization of disability in the Binga district, though we observed both positive and negative attitudes toward disability among the studied families. Nevertheless, most children were valued and seen as part of the workforce from an early age. This perception rarely attached stigma to disability. The Tonga largely embraced their children with disabilities, encouraging them to do as much as they could. They hoped for a continuation of the family clan. As a result, they saw children with cerebral palsy as persons from birth and took good care of them.

The Tonga people showed strong resilience against the long-lasting inequalities and vulnerability that were manifested in their daily life struggles. *Ubuntu* means "I am because we are" (Bannink Mbazzi et al., 2020). This collective understanding of people with or without disabilities, referred to as "humanness" (Mji et al., 2011), plays a large role in this society.

Lessons Learned from the Tonga Case Study

This case study of the Tonga people indicates, first of all, the globalization of neoliberalism, which has disproportionately impacted not only children with cerebral palsy but also their entire families and beyond. Although the causal relationship between disability and poverty and health is not well-established due to insufficient robust data, Groce et al. (2011) nevertheless identified 27 evidence-based studies that verified a substantial link between disability, poverty, and health. The Tonga case contributes to this theory. The increased pressure of neoliberalism and its globalization have delegitimized disability movements and their collective agency (Soldatic, 2019). This global trend also applies to the collective agency of the families in this particular case study. Inter- and intra-household dynamics and power relationships exist (Groce et al., 2011). Yet, the Tonga case study vividly illustrates the multilayered disintegrations in the lives of the families in the form of inequalities and vulnerability.

The Zimbabwean government ratified the CRPD in 2013 as a member state of the UN, so it is party to the SDGs. International law and policy are not reaching the Tonga due to the profound and intertwined power relationships that favor powerful parties such as foreign investors, the World Bank, the government, and urban dwellers. Disability inclusion continues to remain rhetorical on paper even in the era of the UN CRPD and SDGs and even when the Tonga people themselves treat their children with disabilities as children on an individual household level. The Tonga case shows us some of the global challenges of disability inclusion, even when the historically rooted negative connotation attached to disability is either intentionally or unintentionally minimized at a local level, that is, a human rights-based approach alone does not lead to critique of the global system (Uvin, 2002: 9) or further to a change in the ableist and growth-centered global order (Katsui, forthcoming). Each context in which a human rights-based approach is operationalized encompasses multiple layers of power relationships with local and global fabrics, which are important (Katsui, 2012).

For instance, the CRPD has a standalone article on education (Article 24). It stipulates that "Persons with disabilities can access an inclusive, quality and free primary education and secondary education on an equal basis with others in the communities in which they live" (Article 24, 2b). When the living environment was as harsh as that in Binga, many households valued personhood much more than the existence of disability. Yet, most of the children with cerebral palsy stayed at home without basic education and often passed away due to extreme poverty. In the Tonga case, many of their siblings also stayed at home without basic education and similarly passed away during the fieldwork. Although the CRPD stipulates that education opportunities for children with disabilities should be “on an equal basis with others in the communities in which they live,” their rights continue to be compromised, because others also miss out on these rights (see Katsui & Chalklen, 2020). In the same vein, the “leaving no one behind” slogan remains insignificant for many families who experience structural violence in Binga and beyond.

Concluding Remarks: Embodied Inequalities and Vulnerability as the Starting Point of Inquiry

How then can the critical disability perspective contribute to the sustainable development discourse in the era of globalization? It is the key question to be answered. The Tonga case study eloquently informs us that at the time of globalization, the multilayered inequalities and vulnerability that are embodied in the lives of individuals with disabilities and their families crystalize the very need to elaborate on them on both local and global scales. In fact, we need to take them as the starting point of investigation rather than take them for granted as basic conditions or ontological facts (Katsui, forthcoming). When we examined the Tonga case from the critical disability perspective, we learned how they have been systematically peripherized and deprived of their power to the extent that many of their children cannot even live their lives. We learned that their poverty, disability, and poor health are not the Tonga people’s fault. The analytical framework of structural violence shed light on the embodied and individualized inequalities and vulnerability and revealed the importance of people’s experiences, and analysis of them helped us understand not only their situations but also globalized inequalities. As inequality reduction is one of the 17 interlinked SDGs, this particular critical disability perspective, as well as a decolonial global South perspective, is useful and usable to remind ourselves to start important analyses with embodiedness (see Rohleder et al., 2019; Russell, 2011; Siebers, 2001). By considering embodied realities, it becomes harder to globally bypass the agonizing and urgent realities of many persons with disabilities and their families, as well as their agency (Katsui & Mesiäislehto, 2022).

Evidence-based scientific studies that prove the deep interlinkage between disability, poverty, and health have started to accumulate (Groce et al., 2011). A longitudinal Tonga case study (Muderedzi, 2020) eloquently supports this theory and further contributes to add the importance of a global perspective to it. A closer look at the Tonga case revealed the non-implementation of disability rights even in the era of the CRPD and SDGs. The globalization of neoliberalism has hit the Tonga people hard, multiple times, over the last six decades, through various power relationships, both locally and globally. Their own transformation and resilience in the form of appreciation of personhood over disability was overshadowed by the globalization of ableism and growthism as well as local politics. It was difficult to realize disability rights through a grassroots-level change alone. In this sense, full disability inclusion in any local context is not only a local but also a global issue, in which the Global North also has stakes in multiple ways.

Our examination of the Tonga people's experiences taught us the significance of taking embodied, multilayered inequalities and vulnerability as the starting point of analysis rather than assumed ontological facts. The critical disability perspective of embodiment enables us to question the system in which local and global fabrics are intertwined and which hinders the full capabilities of the people concerned. This inequality and vulnerability analysis through embodiment is an important point of departure for the discourse of sustainable development, to which we aimed to modestly contribute through this study.

One of the missing layers here is the environmental aspect, which was beyond the scope of our chapter. Now that posthumanism has entered the discourse of sustainable development, human beings are increasingly conceptualized as part of the environment rather than as privileged (Fox & Alldred, 2019). The analysis of embodied inequality and vulnerability that stemmed from the critical disability perspective would similarly contribute to helping us understand the complex relationship of human beings with their changing environment. Climate change and environmental anomalies impacted this multiply disintegrated people with disproportionate force (e.g., Lunga et al., 2019; Omolo & Mafongoya, 2019). These anomalies are an equally important area, through which a critical disability perspective and embodied inequality and vulnerability analysis may contribute to the sustainable development discourse in future research.

Rethinking Power and the Complexities Between Critical Disability Studies and Decoloniality in Higher Education

20

Abstract

This chapter explores the intersecting facets of people with disabilities and open distance learning. It examines how the increased decolonization of higher education (HE) and experiences for students with disabilities in a South Africa university can be positively and negatively affected. We relate the biggest issues to the institutional level strategic support, personnel preparation and understanding, policy reflection and planning, inclusive programs, and student engagement. Above all, how disability inclusion drive change is reflected through decolonized

Student Walk system that has been conceptualized can play a pivotal role in the education of students with disabilities. It found structural discrimination; staff and students alike poorly understood social injustices, suggesting there are more obstacles than opportunities for further decolonization in HE. The chapter suggests that several contradictory institutional support programs need to be decolonized and integrated within inclusive teaching and student support.

Keywords

Disability inclusion · Decolonization · Transformation · Inclusivity · Student support · Student Walk

Introduction

The United Nations Convention on the Rights of Persons with Disabilities defines persons with disabilities as including individuals who have long-term physical, emotional, intellectual, and sensory impairments which in interaction with various barriers may impede their full and effective participation in society equally with others (UN, 2006:1). The South African Constitution (1996) states that all citizens "in theory, have the right to equality and grants disabled people the same rights as all the other citizens" (Heap et al., 2009:858). The Convention on the rights of Persons with Disability advocates the fair enjoyment of all human rights by all persons with disabilities and holds a respect for the intrinsic dignity of all individuals (UN, 2006:1). The University of South Australia concurs that persons with disabilities should not be discriminated against in schools, workplaces, social climate, etc. Disability is a term referring to how society limits an individual's ability based on their disability (DPSA, 2001). As previously discussed by Lorenzo (2011), disability is a common label that can stigmatize and reinforce false stereotypes, particularly where students with disabilities are treated as being not as competent as their peers or the impairment as a "disgrace." Lorenzo (2011) also finds that students frequently counter negative assumptions about their disability with their own positive self-perceptions.

Confidentiality of disability disclosure by students is essential and is often voluntary. Studies have shown that people with disabilities could be intimidated by the prospect of revealing their health details to the authorities (Burgstahler, 2008). This avoidance also follows students because of the stigmatizing of students with disabilities; for instance, a student who has epilepsy will not be relaxed in university as he/she fears losing friends because of stigma. Students with more visible disabilities may have difficulty revealing these issues. Picard (2017:1) states that students can disclose a disability, such as epilepsy or a chronic pain condition, without needing to provide it to others. The so-called "hidden" mental health problems may be hard for students to reveal because many may believe that they are safe if they look good. In certain cases, a student may exhibit unusual behavior which may be linked to their impairment (Walters 2010:428).

Scorgie et al. (2010) argue that physical impairments lead to derogatory views of people with disabilities. This is similar to how people who use wheelchairs may be subjected to being labeled as having an intellectual disability. Beyond physical appearance, students with concealed disabilities also confront other students who might dismiss their impairment by saying, "You look fine." Picard (2017) argue that the average undergraduate appears to rate an individual with learning difficulties as less able to learn. They note that some educators believe that students with learning disabilities can perform at lower levels than their peers. Despite having learning disabilities, students can learn new knowledge as long as they acquire, process, store, and/or react to it differently (Picard, 2017:1). There are many gifted and talented students with disabilities, just as there are among other groups of students. Bley and Thornton (2001) argue that disability should not be an obstacle to gifted people with disabilities as it offers no factor restricting their capacity. In the philosophy of education of students with disabilities, cultivating and accepting the gift in the student is far more important than placing the student down in the field where the student is poor because giftedness is often ignored in students with disabilities. Acceptance of one's special abilities and supportiveness is important to mitigate the effects of a disability. HE ought to be able to consider the individual needs of each student by recognizing their abilities and impairments. The learning environment needs to be attentive and motivating, as this will allow for the best learning experience.

Decolonization is a process to repair the damage caused by colonialization. Maldonado-Torres argues that decolonization is disrespectful because it casts doubt on the legitimacy of the colonial context. The decolonization strategy included a plan to change the colonial situation. In HE, it is even more important today that an Afrocentric but culturally and globally influenced awareness is needed so that institutes of learning remain the cornerstone of transformation, reform, and progress. The critique of decolonization deconstructs the consequences of colonization and its coerced foundational structures. It understands the developed abilities to explore indigenous knowledge structures (Alfred, 2008). Those who apply a decolonization analysis are likely to be more accessible to other learning contexts and speculations. A decolonization review looks at how imperialism affected the Indigenous peoples of the region. Decolonization is an act that draws in imperialism and colonialism at many levels. A second concern is that expansionism and dominion frame those as less deserving and capable. As a result, although colonialism continues to exist today, it has discovered ways to be more covert in its dominance over and erasure of Indigenous people. Throughout history, colonialism has manifested itself in various forms of systemic oppression as well as educational practices and policies in HE institutions (Arvin et al., 2013). This highlights the importance of indigenous traditions and the influence of colonialism in combination with colonial structures. A decolonial approach provides an ideal means to thoroughly analyze the effects of colonialism.

Disrupting hegemonic understandings of disability can be accomplished through the critical disability studies (CDS) and critical race theory (CRT) (Crenshaw et al., 1995). Disability studies (DS) have long been criticized by racial minority voices in the disability community for universalizing a white experience of disability as the default norm and failing to include the experiences and meanings of disability for persons of color (Erevelles & Minear, 2010). At the same time, CDS observes a glaring absence of disability inclusion in CRT (Annamma et al., 2013). Nonetheless, it is beyond this paper to comprehensively explain the junction of CRT and CDS viewpoints.

However, the primary implication of CDS for the decolonial project is that it provides epistemic resources for understanding coloniality as enabling and disabling people to take part in society. In the aftermath of colonial violence that gave rise to the modern order, HE is endowing with capacity for action, freedom from constraint, and scaffolding for (over)achievement that people in these settings understand as the full realization of natural human potential. A process of disablement or coloniality of being (Adams et al., 2018) is inextricably linked to this process of modern enablement: the destruction of community, the expropriation of means of production, and the consequent reduction in the capacity of the subordinated majority to meet environmental demands and to achieve even the most modest aspirations. Thus, colonial violence caused disablement not just by producing bodily damage, but also by placing restrictions on people's ability to act and accomplish their full potential despite their inherent abilities.

Psychology's hegemonic conceptions on enablement hide the cultural-historical architecture that supports it and instead portrays ability as an essential individual trait, a sign of merit, and the basis for the allocation of rewards. In a similar vein, hegemonic global institutions' decoloniality is a groundbreaking way of cultural advancement, which is elevated to the level of a standard for universal emulation. By framing inequality as the just-natural product of intrinsic distinctions in merit or deservingness, both types of hegemonic understanding help to cover up or legitimate colonial injustice. CDS perspectives shed light on the cultural affordances that serve as the foundation for otherwise naturally occurring abilities. Consequently, the performance of persons in dominant positions is not simply the natural product of greater talents, but also serves as evidence of their value and an explanation for superior outcomes from this perspective. Instead, their performance is aided by epistemic and material investments that serve as performance-enhancing devices, artificially inflating their outcomes in ways that, if one were to think otherwise (Escobar, 2007), one's conclusion may be illegitimate.

This is why global citizenship and associated dialogues on globalization are often problematic because of the ethical liberal reaction to the expanded notion of ethnicity, class, sexual identity, transient, and ethnic inequality (Ormrod, 2008). This frequently imported liberalism lives awkwardly and directly close to widening politically and religiously invested social and religious polarization, diligent and malicious levels of destitution, worldwide violence and conditions of war, widespread hardships of the population, and mass displacement, among others. It incorporates an accompanying ascent in cosmopolitanism and world traditionalism alongside new discontinuities and reconciliations as the political territory shifts under the economic troubles, where innovation and private enterprise are alternatives.

With the emergence of humanism and philanthropy comes a revival in humanism and philanthropy (Gonzales, 2012). While humanism opens the door to an individual's well-being, that individual's well-being faces a long-term sustainability risk in the absence of philanthropy. Nonetheless, while philanthropy can help, aid, and support people on its own, it will be less effective if it is not accompanied by empathy. As a result, humanism is required in philanthropy to empathize with and comprehend the true needs of people, rather than making assumptions about what will work best for underprivileged people. Reflecting on this topic from the HE specifically, perspective in recent decades, global citizenship discourses have been taken up with some force in policy documents and studies, vision articulations, HE and tutoring, and studying curricula documents within Western-based structures. They have also invaded and become increasingly common in educational settings.

These discussions allow local responsibility for and understanding global interdependence and mutualism. Under globalization and monetary progressivism, the world that these talks proclaim seems incontestable and lives in the judgement poisonous and soiled order of things that make choices improbable and unreasonable (Bourdieu, 2002). It is, however, imperative to point out that in the globalized information and knowledge economy, there are questions about who takes the interest, when, what they focus on, and how getting enrolment rates up in HE can contribute to societies' economic and social growth and improvement and consequently lessen destitution (Olukoshi & Zeleza, 2004). The 2009 World Conference on HE in Paris discussed the importance of reinvigorating HE in Africa – a critical tool for the growth of the continent (UNESCO, 2009).

Since then, the current problems and prospects for the future of regionalization of HE are inextricably linked to these historical settings as well as the institutional dynamics of both regional and subregional institutions (Woldegiorgis, 2017). However, even if domestic dynamics within the African HE landscape play an important role in regionalization processes, the majority of HE regionalization initiatives are affected and driven by global policy changes and international actors to a certain extent, which may affect inclusion directly.

All in all, factors such as poor communication and commitment to policy changes, disproportionate reliance on external funding, wavering commitment, fragmentation and duplication of processes, and the lack of a participatory nature of the policy in terms of engaging all stakeholders are cited as reasons for the slow implementation of regionalization in African countries (Woldegiorgis et al., 2015).

However, there is some work to be done to ensure that broadening the interest of regionalization is not just a question of "a flood of students into increasingly broken organisations" (Yusuf et al., 2009:110). Equality and inclusion are not only about increased acceptance of disabled students but also a deeper sense of social citizenship for disabled students (Barnes, 2007).

In response to Barnes (2007), it has become increasingly clear in the recent past that the essence of educational regionalism happens when institutions of various profiles and levels of education begin to focus their work on regional requirements and are then integrated into regional socioeconomic systems (Shannon & Galle, 2017). For education decolonization or regionalization, the following are essential components: an emphasis on the needs of individuals as they are manifested in the local social context; the identification of concrete regional features in education system activity organization; development of spheres and directions for vigorous and inclusive education system; and the development of training program structures and courses that are geared toward learning about a particular population or group.

These opposing viewpoints can be seen in the many educational policy frameworks that deal with internationalization. In the twenty-first century, the adoption of the Convention on the Rights of Persons with Disabilities (CRPD) by the United Nations General Assembly on December 13, 2006, was a major event. Both the CRPD and its Optional Protocol went into effect on May 3, 2008, marking its one year anniversary. Although the Convention does not define disability specifically, it acknowledges the following:

> as the idea of disability evolves, so does the way people with impairments interact with attitudinal as well as environmental barriers that limit their capacity to participate equally in society on an equal level with everyone else. (UN, 2016, p. 1)

An inclusive society can only be achieved through implementing inclusive education as a means, not an aim in and of itself. That is why anybody advocating for inclusive education has a stake in dismantling obstacles that exclude people based on race, gender, or any other characteristic.

Decolonization in HE

Decolonization promotes the incorporation and inclusion of students with disabilities in the education system as the way toward understanding and eliminating obstacles in facilitating equitable access to HE (Heap et al., 2009). Similarly, a selection of students with disabilities does not lead to greater support or college life and student relations. Access to finance needs to be followed by some assistance, but not too much, to achieve in the field (Ormrod, 2008). There is a need for uniform guidelines and procedures to embed disability into all programs and planning (Picard, 2017:12). In the global HE inscription, how students manage the state of becoming incapacitated with both attitudinal and physical challenges is lacking (Ritskes, 2012). A study in sub-Saharan Africa has yielded comparable findings (Scorgie et al., 2010). The low intention to make educational systems and programs more available and minimal scholarly and non-academic support build obstacles to the retention and achievement of students with disabilities (Scorgie et al., 2010).

It is only through the acknowledgment of cultural differences that cultural diversity may be embraced into HE. Students with impairments are seen by some educational models to be capable of engaging in meaningful learning experiences (Shannon, & Galle, 2017). HE programs all over the world are now accepting and enrolling more persons with impairments, even those with severe disabilities. New methods of teaching and training focus on supplementary, targeted, or personalized support, considering the essence of any weakness or strength. These programs, on the other hand, promote provision rather than assurance (Gaztambide-Fernández, & Murad, 2019). As the world gets more interconnected, so does the demand for more prestigious HE institutions with a diverse student body. Race, gender, and curriculum classes occur once an organization emphasizes inclusion" (Gaztambide-Fernández, & Murad, 2019:7). Democratization of the learning environment and the learning content puts emphasis on the following attributes: (i) adult education which is part of lifelong learning, (ii) technological developments that emphasize the introduction of new technologies in every sector of education which are radically and constructively changing the entire landscape, and (iii) the dynamics of heterogeneity that relate to human society and the sharing and exchange of information leading to knowledge which are the building blocks for its development and prosperity. The unique characteristics of individuals with disabilities along with the advancements and innovations in these areas of inclusion could provide a new impetus to the inclusion provisions of HE. It is feasible that this type of student will be included in an educational setting that is non-offensive, meaning that diversity is noticeable.

Our contribution argues that HE system decolonization is revealed in teaching method, research, and administrative areas. Many institutes now focus on post-colonial settings and how rights can be granted to historically marginalized citizens. The chapter explores current and past thinking that emphasizes the basic features of individual support for students with disabilities. In a separate study, Sipuka (2020) argues that student support is ad hoc and institutionalization of inclusion across the entire University is more theoretical than practical.

Decolonization and Transformation of HE

Decolonization is a useful mechanism from which to examine the change facilitated by the HE sector. This chapter calls for a more progressive change in the education system as implemented around the world. Ndlovu-Gatsheni (2017) highlights the importance of appreciating decoloniality as a mechanism that can allow and liberate thinking and practices that spur on possibilities of other knowledge and worlds. He writes that:

> At the epistemological level, decoloniality is about disobedience to the norms and practises of epistemological, ontological, and metaphysical norms. At the political stage, there are new critical approaches, new analytical tools, and new praxis directions. In resistance to the awareness of equilibrium and typical methods that function as part of colonial matrices of control. (Ndlovu-Gatsheni, 2017)

> The need for education transformation arose from the view that what is required to drive existing debates on decolonization in HE is expressions of enactments aimed at undermining dominant power structures and institutional cultures to shed light on democratized traditions and spaces that bring to the fore previously marginalized voices and information. For transformation and renewal activities to be impactful in the academy, we can, alongside students students, by criticism contribute to the self-clarification of the struggles within our

> universities. Such introspection and debate could reveal how, in epistemic terms, the "systemic anchoring of socio-economic disparities and discriminations" in institutes are, in part, constituted and reinforced by the daily habits of individual social agents.

To incorporate the aims and efforts to promote a reconsideration of "decolonization" in university education and society, scholars are challenged to be skeptical of theorizing which has been distilled into propaganda, to question certain demands to decolonize HE which themselves are steeped in power hegemonies, and thus to advance emancipatory praxis in HE contexts specifically, which then influence deep changes across the education system from ECD, schooling, tertiary, and lifelong learning. Such context also advances the notions of egalitarian epistemologies and social justice. The authors included here each present a unique critical stance on interrogating efforts to "decolonize" education, which foreground a social justice orientation and practicality, thus contributing valuably to current discourses in the broader field of the transformation of HE, specifically in decolonization. The series of 12 studies shifts the emphasis from theorizing decolonization because of a critical study of its implications for promoting HE pedagogy and praxis and influencing curriculum growth (Mahabeer, 2018; Mampane et al., 2018; Sathorar & Geduld, 2018). These authors highlight the democratization of knowledge among students and the disruption of existing power structures in HE.

Two prominent academics provide unique perspectives on the role of student voices in shaping education reform (Cherrington, 2018; Stuurman, 2018). Though McAteer and Wood (2018) address the civic position of the university through positive community engagement, other scholars showcase how decolonization-in-praxis can open possibilities for fostering inclusive classrooms and universities (Mfuthwana & Dreyer, 2018; Muthukrishna & Engelbrecht, 2018) in South Africa. They end with a reflection on efforts that could threaten institutional spaces and democratize expertise in academia (Walters, 2018). Michalinos (2018) explores the potential for transformative possibilities of decolonial theoretical ideas with the notion of "humanizing pedagogy." The article's primary focus is on the relation between humanization and decolonization in HE and the implications these have for pedagogical practice. He argues that there is a crucial need for institutions of HE in South Africa to focus on why they should decolonize pedagogies in knowing and knowledge-making. This research shows that an informed post-colonial pedagogy can be reconceptualized within the decolonizing and transformative context to challenge current colonial powers within the academy. This study challenges HE lecturers, academics, and researchers to interrogate the latest Eurocentric pedagogical methods by building on and twisting these very practices.

The next discussion moves the emphasis of decolonization from theoretical debates to case studies that demonstrate the importance of considering the personal opinions, motivations, and perspectives of students and scholars on how to change education systems at the curriculum level. In certain cases, however, they are not inclusive, which this chapter aims to discuss in the future. Student views on decolonization of HE, as well as the role of socioeconomic change in the design of new national qualifications in the Adult and Community Education and Training

Sector (ACET) have not been sufficiently incorporated. Mampane et al. (2018) address issues of indigenous awareness, culture, literature, technology, and discourse within HE in Africa. Their study analyzed the decolonization of education and the use of students from Africa in their research. The study showed that students view decolonization as a means of resolving historical injustices and marginalization by simultaneously valuing and exploiting indigenous languages and culture while incorporating relevant and cost-effective technology: in other words, the best of both worlds, the past and present in service of a better future.

The focus of Ismail's project is on the Adult and Community Education and Training Sector (ACET), intending to create new national qualifications for ACET to respond to the needs of the adult education community is a case in point. In designing the qualification, they attempted to incorporate new criteria, vital transformative instructional practices, feedback from community educators, and student views on a decolonized curriculum. Ismail (2018) asserts that these structures contradict one another particularly in a capitalist environment in which education is narrowly conceptualized as preparing students for the workplace. Ismails' (2018) project aimed to include in the certification new policy requirements, transformational educational methods, and viewpoints from community educators, as well as current requests from students for a decolonized and inclusive curriculum while designing this degree.

Another case by Mahabeer (2018) described the rapid changes that have occurred in HE in South Africa in the past 20 years. The contribution notes that even though South Africa is committed to reform, it is continuing to enforce standards and specifications which are foreign. The author suggests that there is a need for curriculum evaluation and that Pinar's approach should be used to evaluate an inclusive curriculum. She appreciates that the traditional Western way of thinking is being challenged by changing perspectives on the curriculum. Mahabeer's (2018: 1) research finds that "curriculum decision-makers are neither complacent nor at the mercy of Western awareness and ideologies." The decolonization of the curriculum is discussed through a case at a university in South Africa. Mheta et al. (2018) assert that the University of South Africa UNISA as an ODeL university remains Eurocentric and suggest that decolonization is necessary to address this imbalance. They suggest a way forward by exploring various options and ways of (re)thinking university curricula and open the debate for further discussion on this seminal subject, not only for UNISA but for all HE institutions.

Similarly, Cherrington (2017) aimed to provoke action in a teacher education program through the strategic use of hope. Key transformative research shows how incorporating hope directly into discussions with student-teachers about becoming agents of change had a positive transformative value for the participants and therefore implications for HE revitalizing initiatives. Cherrington (2017) proposes that the perspectives of student-teachers need to be valued as a viable means for empowering learners. Therefore, until this point, there is a need for education decolonization. She stresses the importance of critical thinking regarding university decolonization initiatives, calling on students to think critically and make a social impact.

Pragmatics of coloniality is inherently linked to a university's mission and character, as well as the way it engages with its internal and external cultures. Cajete (2015) and Coulthard (2014) call on the university to work on concrete community initiatives. The advocacy is for building more alliances with communities to achieve change and social justice. With a participatory action research project investigating university-community cooperation, the authors argue that when university researchers step away from seeing themselves as "experts" to instead seeing themselves as "facilitators," the process of information creation and democratization is improved. Coulthard (2014) shares a unique insight into rethinking the relationship between universities and their communities as one of epistemic democracy, which can meaningfully contribute toward mutual understandings of decoloniality and sociality.

The pragmatics of coloniality is intricately related to the function and character of the study units and how they interact with their internal and external scholarly cultures. McAteer and Wood (2018) propose that the university needs to engage in community-based initiatives. They argue that alliances and collaborations with communities need to be core to the university's transition and social change efforts. In a participatory action research project examining university-community cooperation, the authors propose that when university researchers see themselves as "facilitators," their participation would be more successful and thus the process and products of information democratized. McAteer and Wood (2018) further provide unique insight into the possibilities of re-imaging a university in relationship with its society as a place of epistemic democracy, meaningfully contributing toward mutual understandings of decolonisation and social justice. It is also imperative to apply concepts discussed to education outside the South Africa context. The chapter focuses on the generation of education transformation into the institutes and inclusivity. Scholars feel they have difficulty enforcing the policy of inclusion in HE since it comes from the North and is poorly transposed to the South. They recommend rethinking the current delivery of quality education for students with special needs in under-resourced South African universities.

Muthukrishna and Engelbrecht (2018) utilize 5 years of research documenting political advocacy for inclusive education in Southern Africa. Amid these tense and nuanced issues, they propose a vital, inclusive curriculum that is aimed at anti-oppressive social justice. They emphasize the need to provide teachers with the skills to recognize, analyze, and assess the ethical and social consequences of inclusion pedagogy. Furthermore, Muthukrishna and Engelbrecht (2018) revealed that HE is critical in ensuring that people with disabilities have equal access to good jobs and a fair social standing. Higher learning institutions need to broaden knowledge and understanding of the broad perspective of achievements and experiences of this group of students in HE and to compare them with those of students without disabilities. This is especially true now that legislation has been passed to support access to HE and attitudes toward people with disabilities have changed.

In their article, Muthukrishna and Engelbrecht (2018) assert that quality education needs a critical structure for disputing decoloniality and inclusive ideology. Mfuthwana and Dreyer (2018) examine how inclusive education policy is poorly communicated by various stakeholders. Via a series of interviews, this research explains the difficulties teachers have in integrating multicultural education in South Africa. Although the teachers mostly agreed that there is a shortage of training and support, the authors criticize that through not considering local contextual factors brought about by colonialism and apartheid legislation, any attempt to better implement inclusion in the HE environment would be ineffectual and would only perpetuate inequalities. Although Mfuthwana and Dreyer (2018) suggest universities need to be more assertive in internalizing and mandating transformation pedagogical and organizational spaces for driving decolonization, Walters (2018) believes that "mainstreaming" such initiatives will bring about control rather than turbulence. Walters also discusses strategies for navigating the "in-between" spaces for transformations within the academy. Her study details two instances of the University of the Western Cape questioning traditional institutional culture and hegemonic power relations and brings them to a "decolonized university." Walters's (2018) critique of these events affirms that developing alternate institutional procedures is a vital component of decolonizing education.

However, unit-based initiatives to transform the university were combined into the teaching and learning unit. Therefore, Walters cautions that much can be lost when every program is decolonized from within rather than given its room to thrive. Together, these elements highlight some major concerns that must be addressed as we strive to dismantle colonized cultural systems and promote a social justice orientation. The chapter explores possibilities in changing the information system, reshaping institutions, and envisioning education transformation as a phase of humanization.

Transformation and Inclusive Student Support in HE

Inclusion is about the university structure, learning environment, and curriculum so that all students can work together successfully. An inclusive classroom is described as a learning environment that provides a welcoming learning environment for all learners, including those who have learning disabilities. Inclusivity recognizes everyone, including those of different backgrounds and cultures. By teaching our students the value of acceptance, we will build a more inclusive and understanding atmosphere in all universities, in society, and beyond. An inclusive university can only be effective when every student feels included and connected to the university. We argue that it is in the peculiarity of professional preparation, with its high demands of both theory and practice that creates specific challenges for students with disabilities, thus the need for the development of self-advocacy for students with disabilities, continuous institutional and social reform, and greater research into the experiences of students with disabilities studying for professional degrees. This can only happen through free, frank, and respectful dialogue about differences and current situations, an open, welcoming community where everyone feels valuable and respected. Change in inclusive education, teaching, and learning in HE has embedded strategies for developing course materials and methods of delivery to include all students in meaningful learning. This fosters a sense of appreciation for the individual and their community, which can enhance their lives and learning (Quinn & Vorster, 2016).

Tait (2003) claims that institutional support provides a positive learning environment that encourages student success and also institutional growth. He suggests that an approach focusing on three spheres, cognitive, affective, and systemic support, will be more beneficial (Tait, 2003). Cognitive support improves academic skills, while affective support provides students with a desire to learn. The method assists students in recognizing and dealing with institutional laws and in knowing how to use learning structures in a way that achieves competence. Students who receive help from administrators experience institutional success. He also maintains that increased institutional support decreases the dropout rate. Vorster and Quinn (2015) recommend that the addition of student support resources to the teaching and learning process could result in their being ignored in curriculum and evaluation design processes.

Non inclusive learning climates in HE harms students with disabilities. The World Health Organization (WHO, 2001:214) asserts that obstacles are “actors in a person’s environment that limit functioning and create impairment.” The WHO (2001) divided environmental factors into five groups and how they affect the participation of students and staff in HE (Fig. 1).

In congruent to WHO observations, the CDC (2017:1) notes that the burdens of people with disabilities are exceedingly difficult to overcome. Students with disabilities can compete directly with other students for college scholarships. In some countries such as the United States and the United Kingdom, studying is provided in a way that depends on how much money the student has access to. These federal government grants allow students with disabilities to achieve their full potential. The

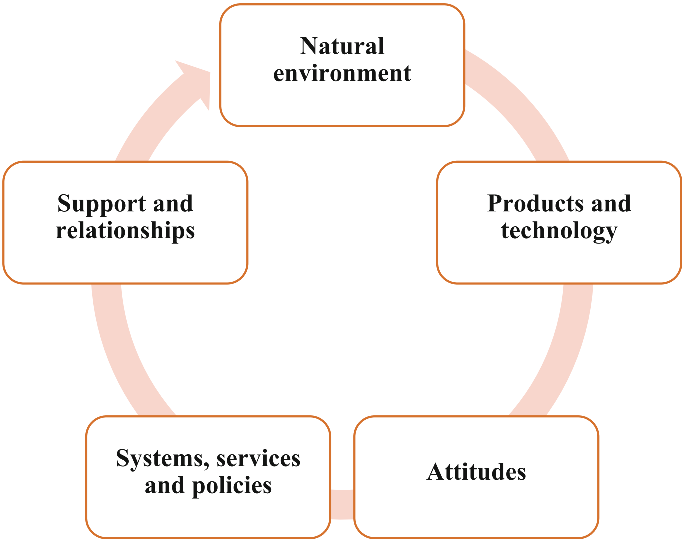

Fig. 1 Environment factors that may influence learning in HE. (Source: WHO, 2001)

research on student support services shows that decision-making on whether to use different student support services was guided by several factors, such as the current climate of transformation, inclusion and disability policies, various support structures, and funding. There is, however, caution regarding finding a comprehensive road map to boost student support programs in HE (Tait, 2003). Because of the unique nature of each organization's or institution's belief system, all organizations can have support facilities.

Our contribution provides a way to investigate the needs of students with disabilities and the educational ethos of UNISA**.** This chapter is drawn from many years of experience as a member of staff interacting at different platforms advocating for inclusion, as well as my recent PhD research on the related matter. The choice of UNISA is based on its size as Africa's largest ODeL university whose role in the decolonization of HE curriculum has become increasingly important. Moreso, how such a mega none contact university deals with issues of inclusion in its decoloniality efforts raises significant interest in the topic.

The Case Study of the Inclusive Student Walk at UNISA

The history of UNISA dates to 1946, with the founding of the world's first college dedicated to distance education (Le Grange, 2016). UNISA is in the nation's capital, Pretoria. UNISA has long been the largest provider of studying opportunities in South Africa, and during the politically enforced era of racial discrimination, it continued to serve black students without regard to ethnic or racial classification. Seedat (2018) explains that the university aimed to resolve issues of social equity as the Afrikaners defined it. The Afrikaners felt discriminated against by the British in South Africa when the HE system was first established in the country. UNISA used to provide university education to Afrikaners at their farms all over the country because of the Afrikaners being farmers and ranchers. Unfortunately, the experience many Afrikaners had in South Africa did nothing to teach them about the violence or exploitation of others.

Paradoxically, and incomprehensibly, UNISA provided learning opportunities to many black and colored students, many of whom were previously excluded from educational opportunities, even as they had been excluded from political rights (Engelbrecht et al., 2016). To increase access and combat the suffering of students, the Office of the Registrar deemed it appropriate to draw up a user-friendly framework that would assist students in finding help within the respective student support units. The framework is called the Student Walk (Student Walk, 2016/17). This Student Walk model has generated a great deal of rhetoric and debate about the intention to be more inclusive. In consideration of the commitment of UNISA to students with disabilities, a directorate called the Advocacy and Resource Centre for Students with Disabilities (ARCSWiD) was established in February 2003. The directorate profiles students with disabilities, as well as providing targeted support for them. ARCSWiD uses creativity to deliver its core functions, specifically the production of study material in alternative formats and the facilitation of needs-based support regarding teaching, learning, assignments, and assessment.

The case study examined factors influencing inclusiveness within the Student Walk, which involved in-depth exploration of a specific setting or context of the UNISA Student Walk model. A phenomenological approach (Yin, 2009) was adopted to allow several participants to explore their lived experiences. Creswell (2017:99) describes a case study as an "empirical inquiry that investigates a contemporary phenomenon in depth within its real-life context."

The case study comprised data collection from students and the staff of South Africa's oldest university, namely, UNISA. Owing to its approach, it is assumed that UNISA as a university without walls can be more inclusive and accessible than mainstream academic Institutes (UNISA, 2018). The case study generated several policy areas which are summarized in the sections below. for instance, for programs benefiting students with disabilities, data shows that there is inadequate institutional support in place for integration, decolonization, teaching and student support.

Although an inclusive study is carried out every year, its efficacy and the problems it poses to ARCSWiD and other UNISA personnel have not been investigated, particularly its examination into the assistance offered to UNISA students with disabilities. The key research gap by Sipuka (2020) was the need to examine how students with disabilities are accommodated through the UNISA Student Walk model for decolonizing the university.

The understanding of current student support programs, the importance of reviews, peer mentoring, and non-academic counseling methods is underscored. Since student support services are not well organized, those students qualified for these services are seldom aware of them. Another belief is that the expansion of online service hours and funding for students with disabilities is insufficient and unrealistic, particularly when inadequate Internet connectivity and accessibility related to computer technology and online learning negatively affect those on the autism spectrum. The study showed that there is presently no plan in place to include decolonization in any student support. The Student Walk model is intended to provide adequate student support for all students who needed assistance from application, enrolment, orientation, and throughout their study period. Unfortunately, this assistance is hardly rendered. For its progress in decolonization, the project lacked inclusivity, inadequate conceptualization from the beginning, and the exclusion of students with disabilities. This was combined with a weak understanding of the problems and needs of the students with disabilities, along with their needs for the model. Findings reveal that reveals that the university has insufficient tools to address racial disparities and how to decolonize.

Another hurdle at admission for students with impairments is the tension between impairment and disability. The two are considered together as a social construct by critical disability studies, whereas they are truly separate. Decolonial theory helps us comprehend the conflict between impairment and disability in light of the structure of society using "normalcy" as the standard. However, students may continue to face discrimination in HE if the root reasons for the barriers they face are not made clear to them and the relevant stakeholders. Getting rid of obstacles necessitates being aware of their root causes.

There is an undeniable divide between disability and curriculum as such curricula were not adapted to the student's respective disabilities; more specific was that teaching and learning methods are not accessible to all disabled students depending on their impairment needs. The Student Walk was designed so that students with disabilities could be supported and to also serve as an example for pedagogically sound inclusive curriculum development. The responses showed that the decolonization of HEIs will restore the ideology of HEIs. Until HE becomes aware of the root cause for the barriers students with disabilities face upon entrance, it will be impossible to remove inequitable behaviors and systems. As a result, "treating the underlying cause" would mean bringing together all oppressed social groups and non-disabled people who are also battling oppression to engage in coloniality. The characters, legends, and various sources of knowledge are an integral part of a typical curriculum decoloniality. That may change both the students and the faculty by affecting both the teachers and the students. This may not be a fast shift, but it must be addressed to be timely and efficient.

When considering decolonizing the curriculum, one must recognize that the present curriculum is not viable because in the critical disability studies (CDS), students are increasingly taking up these themes in their coursework. Similar to how CDS developed from previous conflicts, CDS is now tied to the workings of ableism as a "socially designed complex machine of disempowerment which connects with, and is just as widespread, as many oppressive institutions" in its struggle. Instead of following the linear narrative of progress, CDS proposes "alternative temporalities" that challenge "ableist notions of 'normal' [academic] orientations and periods" (Lega, 2021). Disability studies' Eurocentric character is denounced, and study on the experiences of students with disabilities in developing countries is included. Therefore, HE should address this question and call upon colleges and universities to help facilitate positive systemic change.

One of CDS's goals is to make life better for everyone, especially the devalued and mistreated individuals with disabilities. Those who support CDS are post-conventionalists, post-structuralists, and postcolonialists who, among other things, are critical of ableism and disablism and want to develop a new understanding of disability in light of intra- and/or intersectionality, suppressed voices, and recognition of difference. What's most noticeable by the CDS proponents is the desire to broaden perceptions of disability outside the Eurocentric Global West. Decolonizing disability may be possible if we view it from this perspective. People with disabilities and other marginalized groups will be made aware, liberated, and given agency as a result of this initiative.

Regarding the prospects for and obstacles to the decolonized curriculum, it has been found from the study that decolonization is not well understood by both staff and students; there are more barriers than opportunities. Although HE in South Africa enjoys intellectual freedom, most of the ODeL curricula perpetuate Western philosophies and ideas that perpetuate the hegemonic state of information, education, learning, and study as this was noted by the CDS. Western influence can be seen in how programs or policies are designed. Eurocentric information institutes continue to inhibit graduates from entering the market by forcing them to take jobs within the status quo. Transformation to create an inclusive curriculum has been feared as a wasted opportunity. Barriers to inclusion, including insufficient government and legal aid, facilities and equipment, skilled personnel, teacher development, instructional skills, adaptive teaching methods, supportive management, and cultural attitudes, have been identified. Staff and student experiences suggest that it may be more beneficial to find methods of identifying and expanding already positive inclusive education practices than focusing on vulnerabilities. Focusing on factors within the physical and social environment will reduce the extent to which further additional support is required and allow the implementation of individual support to be minimally intrusive.

Addressing Structural Discrimination and Social Injustices in HE

UNISA needs to pronounce itself regarding the practical implementation of regulations about inclusive initiatives with decolonization with disability inclusion in mind. Specifically, a clear policy on support of students with disabilities is developed by universities, with the aid of organizations working with people with disabilities, students, and other key stakeholders. To enhance the chances of success of the Student Walk model, the policy needs to:

(i) Indicate how information about disability can be used.
(ii) Stipulate how various university divisions can offer support to students.
(iii) How teaching and learning services can be strengthened to make it simpler to use the system.
(iv) Stimulate research on the success and completion rates of students with disabilities the university enrolls.
(v) Explore ways to adapt programs currently inaccessible to students with disabilities, these from a decolonization perspective.

While such a plan will not ensure that students with disabilities be enrolled and engaged in HEs successfully, it would still be a significant initial phase toward presenting both students and organizations with a starting point and structure to continue to tackle current gaps in participation as well as in the inclusion of education and learning.

These policy imperatives are summarized in the model below:

To understand the application and interconnectedness of pillars of the Student Walk model to inclusivity in a HE environment, They are briefly discussed below:

Institutional Level

At the institutional level, issues of decolonization which offer an inclusive approach to teaching and learning processes within an ODeL environment would require inclusive support from all faculties, centers, schools, and institutes within the university. There is a need to rethink the direction of decolonization from different department levels and ascertain its relevancy and trajectory toward curriculum revision in an inclusive approach. It would also be necessary to re-look the admission to various programs within the various institutional universities, especially those that alienate students on disability grounds. Sound career guidance and counseling services need to be provided so that students understand the course requirements at the admission level as well as the foreseeable challenges. Institutional barriers toward academic and professional development entrenched in an inclusive approach should be investigated.

Further issues that require consideration at an institutional level are the underrepresentation of staff members with disabilities in charge of student affairs; the limited awareness of most of the staff members of the issues of diversity and cultural sensitivity and an overall understanding of disability issues; and finally, the relevant pedagogical approaches that should be adopted. Curriculum design and redesigning are culturally and institutionally sensitive and require a firm commitment and professional dedication. A university comprises several campuses, institutes, or departments, and together they strategically maintain an organic control that significantly warrants strategic debates and discussions about curriculum redesigning and inclusivity at large. An institution needs to realize its role in diversity and inclusive curriculum redesigning.

Inclusive Policy and Practices Initiatives

It is important to ensure that inclusive preparation is adopted at all levels of national policies and guidelines. The legislation holds that all people are deserving of inclusive education. In cooperation with disabled persons' organizations, NGOs, parents of children with special needs, teachers, and others in the community, comprehensive education policies and guidelines must be instituted. Often findings claim that university inclusion policies remain vague, uncompromising, and optimistic. The multicultural programs are not directly linked to any public policy. Students have negative perceptions about the value of inclusive student support programs.

There needs to be systematic policies and guidelines in place to support inclusion and those that create a conducive environment for innovation to produce a curriculum that is culturally and institutionally relevant. The institutes need to review diversity and inclusion, not only regarding the number of students enrolled with disabilities but also a fair and conducive environment for learning for students with disabilities. This would require early inventory into the comprehensive barriers to enrolment and throughput on certain programs by students with disabilities. Without such a broader understanding of students' challenges, it would be difficult to devise inclusive initiatives. Whereas several initiatives are inclusive, apart from the enrolment, there are noticeable gaps throughout the tenure of the students on certain programs during assessments. Such comprehensive initiatives would entail a detailed examination of learning materials, the forms of assessment for students with disabilities, and online support for the various disability categories to offer students opportunities to succeed.

When there is an unclear policy on decolonization, there have been few strategic and departmental debates about it. As was observed by Higgs (2016), the success of any HE system is based on the curriculum; an inclusive approach needs to be based on a thorough understanding of the indigenous knowledge embedded in it. This requires systematic support through strategic policies and procedures that create the right place for sharing knowledge systems and that are innovative enough to explore the relevant curriculum. One obvious issue was the work overload and that many of them are inclined to pay attention to the basic tasks of teaching and student support while giving insufficient attention to a critical examination of curriculum, content redesigning, and discussions related to curriculum redevelopment. Such policies and guidelines would provide a platform that supports and develops critical and analytical thinking by members of the staff relating to exploring indigenous knowledge to produce contextualized and indigenous curriculum.

Awareness Programs for Staff

One shortcoming identified by this case study was ignorance exhibited by members of staff about disability and, at worst, minimal to no knowledge on how to deal with students with disabilities at various levels during their programs of study. Second, knowledge about decolonization was limited to very few members of staff, which showed a total lack of understanding of both decoloniality and inclusivity. It would be ideal if the current cohort of staff were trained and kept informed about issues of disability and inclusivity. They need to be encouraged to learn more about the decolonization of curriculum and whether their current positions require post-training, research, and innovation support toward decolonization. It might be worthwhile to consider that members of staff who embrace transformation and decolonization initiatives have relatively smaller teaching workloads so that further research and curriculum development initiatives can be driven by such cohorts.

Strategy on Decolonization of Curriculum Inclusively

The university needs to investigate the various ways and forms through which the curriculum is conveyed and imposed on several qualifications. It is important to investigate the content that students are always exposed to (convert colonial curriculum). This would require institutes to pay attention to the content, knowledge pedagogical approaches, and all aspects that are embedded in the ways of knowing. There is also a need to relate decolonization and transformation to internationalization by ensuring that this is in line with global developments aimed at improving the quality of livelihoods of people who consume it. Institutes need to reduce the level of student stigmatization, especially that linked to disability and language, for example, cases, where additional classes offered to improve students in English language and academic writing to place such students at an acceptable academic level, were a reflection of colonial knowledge consumption and perpetuation. Shay (2015) reflects that language and knowledge are synonymous and apart from subjects such as medicine or the sciences. Students can adjust to different contents taught in the home languages as that would constitute an aspect not only of diversity but cultural contextualization so that no one is left behind based on language inadequacies. It is important to identify imperial ideologies and how they shape academic practices. Scott (2015) emphasized that there is no way institutes can create new ways of teaching and learning by reverting to the old way of doing things. Decolonization and inclusion cannot be achieved through old outdated formulas but would require extensive innovation across languages culture, technologies, and content.

Change and Quality Assurance Programs

Several HE Institutes in Africa are tackling decolonization and internationalization of curriculum inclusively. Decolonized teaching does not mean the adoption of compliance-based approaches, which may entail good teaching through a contextualized cultural environment. The university and its departments need to benchmark the existing good evidence and practices from international platforms to identify which work well from an indigenous perspective. This would require reaffirming the cardinal role of staff in promoting and supporting good practices and opportunities and institutional agendas for professional staff development, innovative teaching, and acknowledgment. Such initiatives would undoubtedly lay a foundation for quality assurance measures in curriculum development. It may also be necessary to put quality control processes and measures in place with results, where such information can be shared and peer-reviewed for further improvement of the design of the curricula. As was reflected in the role of students, such a process would take feedback from them to capture how certain courses are matched with students' needs skills and the existing job gaps.

Faculties/Departments and Departmental Support

The chapter observes the role power plays at different institutional and departmental levels. A good staff cohort is the epitome of any successful academic institution. There needs to be coordinated and proper identification of staff who have a better understanding of the internationalization of the curriculum and its pedagogical approaches. Such staff need to be guided by deans who are well-respected academicians and researchers that are bound to lead by example. Further support requirements include a foundation for research excellence that is based on a well-supported and evaluated peer review and promotions process that fosters accountability related to disability-inclusive practices; the initiation of staff innovation award system, especially for high-performing lecturers; and streamlined processes for better governance of the various universities or departments to meet certain diversity targets. Finally, promoting synergies and collaborations among individuals and research units that lay a proper foundation for indigenous curricula need to be encouraged.

A Framework for Decolonization and Inclusivity

The Student Walk model was developed as a would-be user-friendly framework to assist students in finding help within the respective student-related units and sections using a unique seven-step journey. Whereas the Student Walk helps every student to comply with requirements, maximize their UNISA experience, and ultimately succeed at UNISA, we found that it may fail alone in ensuring decoloniality and inclusive access for students with disabilities. The proposed framework (see Fig. 2) accommodates students with disabilities at every step of the way. It pays attention to the overarching context of the institution where students from all backgrounds learn. This inclusive framework suggests that the institutional outlook to inclusiveness from a decolonized perspective would require institutional policies and procedures that drive the goals of the Student Walk model. It also notes that an inclusive approach as well the curriculum needs to accommodate provisions that are decolonized. Such pedagogical approaches could easily break down curriculum content in such a way that no student is left behind. Different curriculum, whether

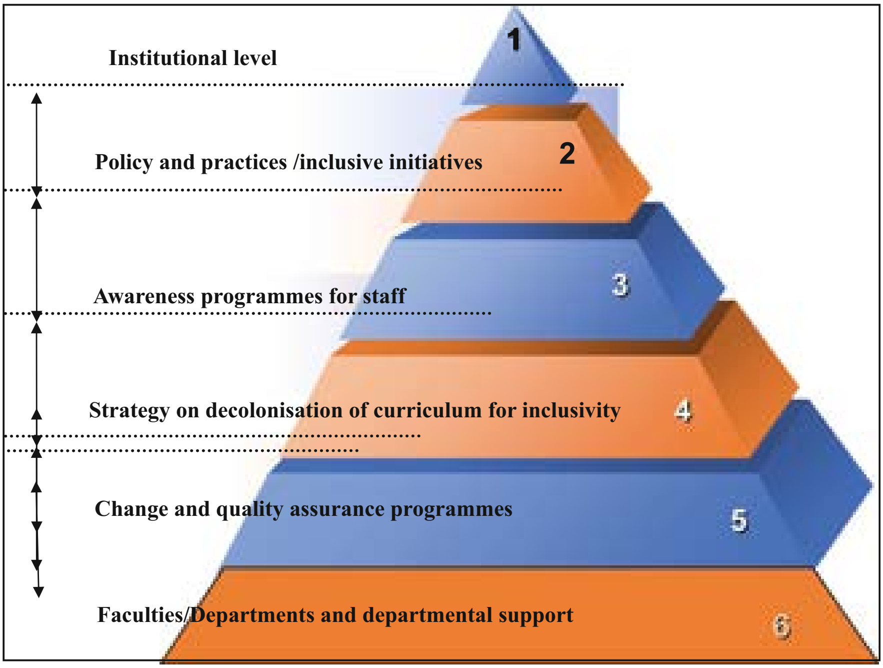

Fig. 2 Proposed pillars of an Inclusive Student Walk

visible or not hidden, may translate into the production of graduates whose outlook regarding employability and lifelong learning is more assured.

For this reason, in the recent HE drive toward internationalization, more prominent consideration has been paid to refreshing and modernizing the educational curriculum to make it increasingly comprehensive of the most recent disciplinary information and aptitudes and progressively intelligent of humanistic qualities (for instance, coordinating multi-culturalism, human rights, and economic improvement into the educational programs). This refocus supports two types of curriculum, the hidden and inclusive. The hidden one alludes to those verifiable lessons adapted casually and even unwittingly through regular social cooperation and the communication with the more extensive organizational culture, statements of faith, and standards. This concealed educational curriculum may likewise impact one's mentalities and attitude on race, ethnicity, sex, sexual orientation, social class, and different variables.

Inclusive practices relate to the hidden curriculum that advances mentalities and acknowledgment of all aspects and barriers to diversity and inclusion among people, especially those with disabilities. This practice is contrary to the common non-comprehensive and concealed educational curricula which may accidentally advance antagonistic generalizations and preference of others dependent on race, ethnicity, gender, sexual orientation, social class, and distinct elements. Actualizing a vision of inclusivity and value involves creating arrangements and projects reliable with that vision and building a long-term strategy that includes required objectives, targets, and assessment and evaluation programs that measure the adequacy of such arrangements. This vision generates reliable institutional policies and regulations not only linked to the overall organizational context but deeply embedded in the strategic plans. Such plans are bound to produce and support decoloniality efforts and showing how inclusive such decoloniality can be.

This implies that decolonising curriculum may not be a pillar alone in the framework but needs to ensure that its content addresses the hidden and unhidden curriculum content through pedagogical means that advocate and support inclusivity at all stages of the Student Walk. Here, inclusive student support programs begin at the institutional context of policies faculty admission of students as it is a well-understood and inclusive process throughout. The framework also advocates for content to be articulated inclusively through relevant pedagogical provisions so that it is accessible to all students regardless of their disability. As an example, special computers for students with visual impairment have to be available to the students from start to end, while their study material would require to be converted to alternative formats, namely, braille, audio, or soft copy so that teaching, learning, and assessment would automatically translate into realistic outcomes – a decolonized and inclusive curriculum.

Conclusion

One of the solutions is to allow the use of inclusion to promote the decolonial movement and to reject the coloniality of expertise, authority, and life in areas of inclusion, by creating a mutually respectful, non-discriminatory atmosphere that promotes diversity and fairness. Studies have shown that students react better when they feel their lecturers' trust in them and that their lecturers reflect less on their weaknesses. HE should also aim for a welcoming community both within the classroom and outside. This is because students are allowed to respect and trust each other, which makes empathy and compassion trendy and encourages learners to support each other with constructive and pro-social attitudes. Efforts and plans should be made by helping others succeed and encouraging progress. This can be done by developing an atmosphere that reflects the diversity of students' interests and by discussing learning that focuses on what students can do and what they would like to do next. Instruction can be provided through tutorials, Individual Learning Plans (ILPs), and setting short- and long-term goals for the students to make them feel they own the learning. If students have chances to tell you what is working, they will have more useful feedback when you make plans. There should be efforts to consider the culture as you learn and teach. Ideals are built by a student's cultural background and their exposure to other perspectives. Invoke the culture to bring the classroom into the inner city. Creating an inclusive environment will not only benefit those students with learning disabilities, but it will also help those students who do not have a learning difference by making them more knowledgeable and accepting of each other.

Students with disabilities and others involved in access issues may continue to be barred from accessing certain professional degrees at the institution if the unseen underlying causes of entry barriers are not evident to them and those involved in access issues. When there is understanding and consciousness that colonialism lies at the root of the barriers faced by immigrants upon arrival, it is only then that these inequitable practices and institutions may be eliminated. As a result, "fixing the underlying cause" would include bringing together all oppressed social groups and non-disabled people who are also resisting oppression to engage in colonialism. In the case of a national intervention, the goal would be to push for a full reform of the tertiary education system as well as complete institutional change to allow all diverse students to obtain professional degrees, learn, and graduate. Graduates with impairments may thus also pursue professional careers and contribute to the development of professional skills for a global, varied market, as would be anticipated in a democratic nation.

Acknowledgments The authors hereby acknowledge Professors Theresa Lorenzo and Kasturi Behari-Leak who supervised the doctoral study where the case study used here emanates.

Abstract

The aim of this chapter is to historicize the status quo of rehabilitation in South Africa and make an argument for Southern Critical Disability Studies to be integrated and embedded in the curricula of rehabilitation sciences (Physiotherapy, Occupational Therapy, Speech Therapy, and Audiology). Three case studies to support the argument anchor the discussion to motivate the logic and demonstrate the mechanics though not exhaustively but with an immensely generative potential in constructive insights for the future of these fields. The central question centers around the productive tension that emerges in a sincere engagement between Critical Disability Studies and Rehabilitation Studies and the implications therein for the overall praxis of rehabilitation sciences. Integrating and embedding critical disability studies that accounts for the hegemonic effects of marginalizing disability as a total social system of oppression may facilitate re-imagining a critical rehabilitation science.

Keywords

CDS · Rehabilitation sciences · Curriculum higher education · South Africa

Introduction

The aim of this chapter is to historicize the status quo of rehabilitation in South Africa and make an argument for Southern Critical Disability Studies (CDS) to be integrated and embedded in the curricula of Rehabilitation Sciences (Physiotherapy, Occupational Therapy, Speech Therapy, and Audiology). Three case studies to support the argument anchor the discussion to motivate the logic and demonstrate the mechanics though not exhaustively but with an immensely generative potential in constructive insights for the future of these fields. The key question centers around the productive tension that emerges in a sincere engagement between CDS and Rehabilitation Studies and the implications therein for the overall praxis of Rehabilitation Sciences. We, the authors, are disability and rehabilitation scholars (three occupational therapists, one audiologist, and one physiotherapist). We are all women of color in the middle-income bracket but with concurrent working class families and other relations. Two of the authors teach and research in the occupational therapy field while three teach and research in Disability Studies across different universities.

The notion of disability is contested within a myriad of theories or models that continuously shape the rehabilitation discourse. These theories serve as defining tools of impairment and inform interventions aimed at dealing with the subject of disability (Ndzwayiba, 2017). The most prominent amongst these include frameworks such as the medical model, the social model, the biopsychological model, and the critical disability lens.

Pothier and Devlin (2006) argued that disability is not fundamentally a medical or health issue nor a phenomenon of sensitivity and compassion but an issue of politics. This reading transcends the liberal social model and posits the normativity and supremacy of able-bodiedness within an oppressive social system that masquerades as a natural state while it limits social and economic opportunities and benefits for those deemed disabled (Barnes & Oliver, 1993; Meekosha & Shuttleworth, 2009). CDS (CDS) emerged from the disability rights movement to challenge the Western medicalization of the lives of persons with disabilities (Grech and Soldatic, 2016; Magasi, 2008). CDS asserts that disability is relational, political, material, and an embodied experience (Garland-Thomson, 2011; Kafer, 2013; Meekosha, 2011). Our understanding of disability echoes Ben-Moshe and Magaña's (2014, p. 105) assertion that "one is always dis/abled in relation to the context in which one is put." By CDS, we also refer to an understanding of disability and impairment in transnational, national, and local contexts as a way of disrupting monolithic discourses of disability in the Global South (Meekosha & Shuttleworth, 2009), while simultaneously opening a platform "to think through, act, resist, relate, communicate, engage with one another against the hybridized forms of oppression and discrimination that so often do not speak singularly of disability" (Goodley, 2013, p. 641). So we advocate for an interrogation of hegemonic Western praxis that will make room for Global South theorization.

We extend Global South perspectives within Disability Studies that remain largely rooted in Eurocentric epistemologies. These Global South critiques advance four moves: (1) the claim of universality that silence realities of persons with disabilities in the south from a different vantage point; (2) centralizing the metropole at the expense of the periphery; (3) grand erasure of the majority of the world's population that lives in the global south; (4) denigration and undervaluing of theory formulated outside of the metropole (Meekosha, 2011).

Black feminist thought proposes use of an intersectionality framework which largely influences CDS scholarship. This framework has also been challenged for positioning disability as an afterthought of race, gender, and class or sometimes an omission (Erevelles, 2011). Broadened discussions on the effects of racialization and colonialism in the Disability Studies scholarship are still needed (Meekosha, 2011). Senier and Barker (2013) argue that even within the vast literature about the health of indigenous peoples' certain impairments (including congenital conditions, mobility impairments, and cognitive differences), the connections to colonialism has not been strongly made. While connection between gender and disability have been made sufficiently (Reed-Sandovala & Sirvent, 2019), it is necessary to probe further when considering the connection between disability and coloniality and the ways which the modern/colonial gender systems reinforce and serve ableism by creating disability and disabled bodies. Specifically, we need more scholarship that accounts for the extent to which coloniality may have created and perpetuate disability itself. The impact of colonialism and imperialism in installing structural violence, disablement, poverty, and inequality for African people in general and persons with disabilities in particular is crucial. To date, our scholarship has not sufficiently addressed the disability–poverty relationship in the Global South and much less connecting it to imperial capitalism.

Within rehabilitation practice, professional areas are also critiqued for their neglect and under-research of the lived experiences of rehabilitation (Shakespeare, 2014). In this chapter, we specifically focus on the core rehabilitation team, namely: physiotherapist (PT), occupational therapist (OT), speech therapist (ST), audiologist, medical orthotist and prosthetist (MOP), and related mid-level workers (MLWs). With mutual benefit between Disability Studies and Rehabilitation Sciences, rehabilitation research remains the preserve of Rehabilitation Sciences and separated from Disability Studies (Shakespeare et al., 2018). Other scholars critique the co-option of Disability Studies language in Rehabilitation Sciences merely for normalizing ends, while not questioning the disabling structures within rehabilitation approaches (Meekosha & Dowse, 2007; Meekosha & Shuttleworth, 2009). Rehabilitation service professionals still treat and discuss disability within a diagnostic perspective, highlighting individual deficiency and still carry controlling and regulatory undertones, even when subsumed under Disability Studies (Meekosha & Shuttleworth, 2009; Leshota, 2013). Oliver and Barnes (2012, p. 42) support this:

> The concept of rehabilitation is laden with normative assumptions clustered around an able-bodied/mind ideal. And, despite its limitations in terms of returning people with acquired impairments such as spinal cord injury, for example, to their former status, it has little or no relevance or meaning for people born with congenital conditions such as blindness or deafness other than to enforce their sense of inadequacy and difference.

Adding on the use of pathology language, Siebers (2013) has similarly critiqued rehabilitation regarding use of simulation activities, as they emphasize a preoccupation with sensations of bodily inadequacy to an extent that participants cannot perceive disability as resulting from social barriers, which is an acute point in CDS.

Historicizing Rehabilitation in South Africa

Owing to its Western orientation as a settler colony, South Africa's public healthcare services have mirrored Eurocentric models where for a long time rehabilitation provision was predominantly institutionalized in individualized bodily impairment therapy (Mji et al., 2013). This biomedical perspective was presented in many definitions of rehabilitation, including the World Health Organization (WHO, 1981) and the United Nations (UN) Standard Rules on the Equalization of Opportunities for Persons with Disabilities (UN, 1993) which subsequently invited many critiques. For example, during the late 1980s, persons with disabilities in South Africa mobilized themselves to challenge rehabilitation professionals to work with the disability rights movement. One of the main criticisms about the medical model of disability was that it places sole responsibility for change upon the individual while paying little attention to barriers that hinder full social integration of persons with disabilities (Chappell & Johannsmeier, 2009). This individualistic focus contributed to the limited recognition of the role of empowerment in the rehabilitation process across fields from health, education, livelihoods, social inclusion, and social justice. The disability rights movement shaped the shifts in the way disability was constructed, thus distinguishing between impairment and disability (Rule et al., 2006; Mji et al., 2013).

The alliances between persons with disabilities and rehabilitation professionals in the 1980s in support of Community Based Rehabilitation (CBR) was also a significant turning point for rehabilitation (Rule, 2008), which promoted and extended the disability rights movement and ultimately mobilized persons with disabilities and their families to re-shape rehabilitation practice. CBR, as developed by WHO in 1984, also focused on impairments in the training of village health workers initially. The 2010 CBR Guidelines expanded the approach from rehabilitation to include poverty reduction and social inclusion (WHO, 2010). Again, a crucial paradigm shift here was a move from conceptualizing CBR as purely a rehabilitation and health-orientated strategy located in the community, to a disability-inclusive development strategy that could have an impact on implementation, training, and policy (Deepak et al., 2011; M'kumbuzi and Myezwa, 2016; Rule et al., 2008; Rule, 2013; Wickenden et al., 2012; Morris et al., 2019; Rule et al., 2019). While it is often misunderstood as referring only to services provided outside of institutions, CBR is a general community development strategy aiming at the inclusion and full participation of persons with disabilities in all aspects of community life (WHO, 2010). Noteworthy is the mutuality of core principles with comprehensive primary health care (PHC), including accessibility, affordability, acceptability, self-determination, empowerment, and intersectoral collaboration (Sherry, 2014). However, the continued reluctance in comprehensively implementing and supporting CBR has not only undermined these alliances, but also raised questions about whether rehabilitation continues to reinforce individualization of disability and institutionalized solutions.

With the advent of democratic governance in South Africa in 1994, policy changes were made. A White Paper on the Transformation of the Health System in SA was developed in 1996 and enshrining the outlawing of discrimination on the grounds of disability. However, recognition of rehabilitation was still generally poor in healthcare as it was overlooked as a component of PHC and not integrated into vertical health programs. This oversight was evident from the poor inclusion of rehabilitation in the PHC package for SA: a set of norms and standards (2000/2001), and the resultant limited budgets for rehabilitation. In 2000, the National Rehabilitation Policy (NRP) (National Department of Health, 2000) acknowledged this oversight and ensured that budgets are allocated towards rehabilitation for each province in SA.

Later, both the WHO (2011) and the UN's Convention on the Rights of Persons with Disabilities (CRPD) (UN, 2006), broadly defined rehabilitation as a set of measures that enable individuals with disabilities to achieve and maintain optimal functioning in interaction with their environments. South Africa signed and ratified the CRPD in 2007 and 2008. Since ratification, South Africa also domesticated it through the White Paper on the Rights of Persons with Disabilities (Department of Social Development, 2015). In 2016, the Framework for Disability and Rehabilitation Strategy (Department of Health, 2016) was published with an aim to integrate disability and rehabilitation services within priority healthcare programs at all levels of the health system (from primary to specialized care) and through coordinated action across sectors. It also advocated for comprehensive services across the lifespan. However, the policy lacked provincial implementation guidelines and there has not been provision of such services to date. While the White Paper on the National Health Insurance (NHI) (Department of Health, 2015) acknowledges rehabilitative care as included in the PHC continuum, there are currently no integrated rehabilitation indicators. These shifts have reshaped not only rehabilitation practice but also the education and training of these professionals in order to produce the required graduate competencies. In all these shifts, we see a picture where rehabilitation continues to occupy the margins. Even in discussions about interprofessional health teams, rehabilitation is often excluded and reference is only made to other medical teams (see Volmink, 2018).

While CDS has offered both a critique of rehabilitation and an opportunity to improve practice, it is not clear how rehabilitation education has been mindful of such critiques. Despite these policies, disability remains an afterthought and the transformative issues raised by persons with disabilities and the disability rights movement remain ignored. The policies similarly have not transcended the preoccupation with binary conceptualizations of disability that CDS has long criticized. These limitations have been recognized in the struggles to implement CBR practice and rehabilitation remains focused within the health sector only. Likewise, the commonly used International Classification of Functioning Disability and Health (ICF) (WHO, 2001) in the health sector is particularly critiqued for reproducing the Western discourse of normal/abnormal binary and maintains that abnormality is deviant and in need of intervention at biomedical level (Mosleh, 2019). For instance, Mosleh (2019, p. 9) argues:

> ...the ICF's acknowledgment of the social mediators of disability does not preclude its reliance on the discourse of normal/abnormal. Indeed, my analysis has rendered visible the multiple ways in which an understanding of dysfunction predicated by statistical norms, and a bio-reductionist understanding of impairment perpetuate an understanding of impairment as objectively defective prior to its measurement. These ideas are pervasive and extend beyond the ICF and rehabilitation, and influence how disability is understood in social contexts. The normal/abnormal, abled/disabled dichotomy is a prevalent social "truth," which has a long history and holds severe implications for the way in which persons with disabilities are understood.

Mosleh concludes that the ICF re-inscribes the abled/disabled dichotomy in ways that privilege "abled bodies" while devaluing disabled bodies. Additionally, Mosleh suggests that resolving these tensions may offer unique opportunities to negotiate and prioritize what really matters when working with and for persons with disabilities.

We posit that it is crucial for rehabilitation education to impart a CDS perspective in order to produce practitioners who are open to changing the status quo, instead of maintaining it. We hold the view that rehabilitation education must respond to CDS critiques in order to make itself more responsive, more relevant, and more empowering to persons with disabilities in the Global South, through challenging disabling systems, social structures, and the ongoing marginalization and devaluation of people with disabilities (Magasi, 2008; Kielhofner, 2005). It is here that rehabilitation could also shift from being perceived as practice "done to" rather than "done with" the collaboration of people with disabilities. These developments guide the perspectives described in this chapter.

Southern CDS and Rehabilitation Sciences Curricula: The Shortcomings

Building from the theoretical case made earlier for Global South theorization, Nguyen (2018, p. 5) asks: "Why do we need to engage Southern theory?" For us as disability and rehabilitation educators located in the South, this question is important because it begs another question about discursive knowledge production in Disability Studies. As intimated, knowledge production has historically privileged the Global North (Meekosha, 2011; Nguyen, 2018) so this question is an opening and a call for Global South epistemologies. While Disability Studies transcended disciplinary borders, the most authoritative representations of persons with disabilities still arise from therapeutic- or medical-related disciplines. The crucial role that Higher Education plays in preparing graduates to be agents of change in rehabilitation practice cannot be over emphasized. Alsop et al. (2006) argue that traditional approaches to health professions education (inclusive of Rehabilitation Sciences), with its exclusive focus on biomedical knowledge, were not adequate to develop graduate competencies required for community-based rehabilitation (recently advocated for as community based Inclusive Development). The same can be argued for shaping rehabilitation practice that embodies CDS. Building on Nguyen's question above, are we engaging indigenous ways of knowing about disability in our curricula and interrogating the dominant western theory? How does this shape practice in the South?

Rehabilitation Sciences curricula should produce relevant rehabilitation professionals who are not only clinically competent but who also critically engage with the contexts and histories in which they practice. In the context of disability, critical engagement implies that rehabilitation professionals are able to respond to issues of diversity, equity and inclusion to achieve social justice as these issues cannot be separated from the lived experience of disability. Luckett and Shay (2017) assert that curriculum renewal is one means of challenging and dismantling injustices and inequalities in society, if power dynamics are addressed explicitly in the curricula. They suggest that a transformative approach to curriculum could consciously address questions of difference and power in society. This transformative approach speaks to a different kind of Rehabilitation Sciences curriculum. Literature on a decolonial approach to higher education (Ramugondo, 2018) as well as Freire's concepts on reflexivity and critical consciousness (Freire, 1990) provide a lens for thinking about Rehabilitation Sciences curricula that would deliver practitioners who provide relevant services to a diverse population and who are also competent as disability activists in the contexts within which they practice.

Re-framing Rehabilitation Sciences Curricula Within Southern CDS

In the following sections, we present and draw on three case studies to frame our position around curriculum re-design and integration of CDS in Rehabilitation Sciences education. In an attempt to improve a curriculum, improvement of rehabilitation curricula inclusive of CDS is important and the following cases are in service of that argument.

Case 1: A Case of Annie D: The Humble Servant

Professional role transgression is conceptualized as a means by which individuals enact professional agency within hegemonic structures (Sonday et al., 2019). It is considered as a form of occupational consciousness which refers to "the ongoing awareness of the dynamics of hegemony and recognises that dominant practices are sustained through what people do every day, with implications for personal and collective health" (Ramugondo, 2015, p. 488). The case of Annie D stems from a doctoral study (Sonday, 2016) that describes how occupational therapists navigated their professional role transitions along a trajectory in time, post-apartheid. Annie D's role as an occupational therapist within the specialized education sector was seemingly clear as she pursued a career at a special school for children with disabilities. However, role clarity became blurred as events unfolded that forced Annie D to continuously reposition herself. The ratification of the Employment of Educator Act of 1997 called for all therapists working at schools, to be called education therapists. The fear of what occupational therapists were going to become felt like a loss of professional identity. Annie D referred to herself as the humble servant. She graduated in March 2001, with all her hopes and dreams on the verge of becoming a reality. She made the shift from working in the health to the education sector. This shift was motivated by greater positive prospects. However, this was not the case for Annie D. There was a disparity between the interview expectations with job reality. The biggest perception that was taught to her during her training years was that an occupational therapist could offer many roles at a school. The aim of employing other occupational therapists was to improve on the intervention outcomes for school children. Practice was meant to shift from an individual to group and population focus that could potentially extend beyond the school. These ideas really excited Annie D. She was promised an outlined job description with roles and duties which come to pass. In reality, the school had no such documentation and the role was controlled whimsically by the management, made up of the principal and the foundation phase teachers with no fellow therapists. There were two occupational therapists at the school under the supervision of a deputy principal with limited understanding of occupational therapy's potential. For Annie D, it felt like a militaristic command chain where she was forced comply to orders with no alternatives. As time progressed, Annie D searched for alternative work.

She realized that the role context determined, she had customized to that. She became aware that the school management type determined one's place in the system. At the time, she did not realize the erosion it had caused at her professional identity as an occupational therapist:

I started adapting to the school environment in my second year. When you start adapting, that environment becomes the norm, and that is scary. I started feeling as if my wings had been clipped. I felt like a puppet on a string. My mind was telling me to do the right thing, but my body was being controlled by a management system at the school that I had no control over.

There were many contextual factors that contributed to Annie D's struggle. First, the immediate schooling environment limited freedom of expression and thus severely impacting the value of an occupational therapist where participating in decision-making is critical:

As a therapist you are isolated and the lack of structure contributes to this sense of isolation. I think that if I were offered more support, things would be different. I really did not function well in this school environment, which explains why I ended up getting admitted to a clinic.

Second, patriarchal decision-making hierarchy controlled and selectively filtered information down to the therapists, a fundamental breaking point for Annie D.

I've come to the realization that the management at the school is limiting our role as occupational therapists and our scope of practice. They are not giving us the scope to take on different roles. For example, we can play a role in contributing to management decisions regarding therapy services for the learners. But our role is not only restricted within the four walls of the school, our role extends beyond here and into the community. As occupational therapists, we have a background and knowledge on normal development and barriers to learning, which we can share with teachers and other staff members in the form of a workshop, but these opportunities are not granted to us.

Third, there was no leadership opportunities for growth and professional development at the school. The autocratic governance expunged the scope for new ideas of practice:

The school is 25 years old and the play area is still not established. Along with the occupation of schooling, play is one of the main occupations of a child. But, you see, upgrading this part of the school is not seen as a priority because occupational therapy is not valued. So why would they value a play space? Sometimes I feel that we're just there because we are there. So, act like you are doing something because it's okay as long as they see you working with people. I battle with understanding how pretending to be effective is ethical practice? There is this vision of justice and working together, but it's not the reality. There is a breakdown in teamwork and it's got nothing to do with occupational therapy, unfortunately, it's on the management side. That makes it difficult. There is potential for occupational therapists to offer more, but we are prohibited by so many factors.

These factors point to Annie D's struggle with adaptation and role fulfillment in working with children with disabilities. Some questions for reflection:

If the knowledge and skills in negotiating the interplay between structure, professional identity and professional agency was included and taught in her undergraduate training, would Annie D have responded differently?

What critical elements related to professional identity development should have been foregrounded in her training that could have better prepared her?

Case 2: Re-designing a Curriculum for Disability Inclusion in Occupational Therapy

The influence of a critical curriculum are exhibited by its graduates through their own empowerment beyond the confines of the university (Freire, 1990). Uncovering graduates' practice could illuminate developments in the curriculum that may be required to address critical competencies. This second case is based on a descriptive case study that involved seven novice occupational therapy graduates from the University of the Western Cape (UWC), Cape Town, South Africa (Hess-April, 2013). An overview of the graduates' practice experiences within PHC services in the Eastern Cape, Northern Cape, and Western Cape provinces was generated through participant observation, semi-structured interviews, and document review. The general practice contexts of the occupational therapy graduates were rural and characterized by poverty, thereby a high prevalence of inadequate access to disability health services. Occupational therapy services were predominantly individualized within a clinical, reductionistic approach. Most persons with disabilities in PHC clinics wanted to apply for a disability grant as a means for income as jobs for persons with disabilities were scarce due to employer discrimination, even amongst those encouraged to search for work. This limited view meant few people accessed occupational therapy services with disparities in population and disability profile. Travel costs and transport inaccessibility also meant a lower turn out not for occupational therapists but other rehabilitation professionals as well.

The biomedical approach dominated the graduates' practice with resources mainly dedicated to curative services provision with little attention to community integration for people with disabilities. The medical model of disability, which sees disability as individualized and draws attention away from the oppression of persons with disabilities societally, neglecting the role of activism around disability rights and inclusion. Some graduates demonstrated advocacy and inter-sectoral collaboration to network for opportunities for people with disabilities to sustain their livelihoods and to access resources available to them. Practice involving disability inclusive development were minimal and the graduates were not effective in establishing strategic collaborations to address meaningful change; even if they managed to establish such partnerships, their managers and the provincial Departments of Health gave no recognition of it as part of their role. Similarly, while the graduates appeared to be critical about unavailable resources or policy implementation to address disability inclusion, they did not engage in actions to address these issues, resulting to an unchanged practices around disability inclusive development.

In assessing the extent of the graduates' competencies towards fulfilling disability inclusion, political proficiency and critical reflexivity on issues of diversity, inclusion and justice would be useful. This consideration then raised several questions:

- What form of reflection was being facilitated in the curriculum?
- Was it oriented towards analytical reflection rather than critical reflexivity examining both personal and professional values?
- Does reflection move beyond the individual level to include a critical perspective that takes into account issues of power leading to change actions to address these?

Subsequently, the need for the integration of a CDS component into the UWC occupational therapy undergraduate curriculum became clear. Informed by critical disability perspectives, the curriculum was re-designed to enable students to question and challenge their own and others' attitudes, beliefs, and actions around disability. The implication was the adoption of critical pedagogy (Freire, 1990) and transformational learning (Mezirow, 1997) as a teaching and learning approach. Through active dialogue and Freire's problem-posing methods, educators actively challenge traditional constructions of disability, thereby disrupting students' attitudes towards people with disabilities. This facilitation is done from the position that occupational therapy education must challenge systemic issues that perpetuate marginalizing practices and thus influence historical perspectives on rehabilitation. In addition, the curriculum facilitates understanding of international and national policies for disability and rehabilitation and how these policies inform practice for advocacy and enhancing disability inclusion through CBR/disability inclusive development. A key learning outcome is the development of students' capacity for questioning and challenging the status quo concerning people with disabilities. The following extract from a student's reflective journal on the integrated redesigned curriculum testifies:

When we were children, my mother taught me to help those in need and be grateful for what I have, and in many aspects of life I am immensely grateful for the lesson. However, from these lessons rooted a certain perspective or prejudice towards people with disabilities. Whenever we came across people with disabilities my mother would say something like "shame," and tell us to be grateful for our healthy bodies, followed by a slight scolding for staring too long. My grandmother did the same, and so did her mother.

I realized that in my years of study, I had been implementing the charity model of disability. In retrospect I observed that I had been taking what my mother taught me as kindness, empathy, and twisted it into the very thing that is perpetuating the problem. Although I often concentrated on the strengths of the clients rather than their disabilities, I found that I always saw their disability first, and then immediately saw them as patients. I was reducing them to their problem, and I was separating them based on pity.

Although I was initially weary of the word privilege, which rooted from my lack of understanding, I was refusing to admit that my own identity as a person without a disability was the root of the pity that I demonstrated. My prejudice as a therapist may be even more damaging than that of the rest of society.

The knowledge I have acquired over the past 4 years also came with its own risk and responsibility. Even as a student and future occupational therapist institutions and systems grant me a certain level of "power." However, in the hands of people who have the wrong perspective on people with disabilities, this may lead to power mechanisms that may oppress and reduce the clients to passive recipients of care.

I realized; before I can advocate for inclusion and fulfil my responsibility as an occupational therapist, I need to critically examine and rectify my own practices that are perpetuating oppression. I thought I was advocating for inclusion when in reality I was advocating for mere integration. I wondered if this may not be happening with many other therapists. The question arose for me, how can we make society self-reflect? How can we make society question their own behavior?

Through the adoption of critical learning and teaching approaches as explained above, students re-examined their understanding and approach to disability. Rather than uncritically adopting a deficit-model approach, they began to challenge oppressive practices that traditionally influence occupational therapy practice as illustrated in the quote.

Some reflective questions to consider:

1. To what extent does education equip rehabilitation professionals to counter hegemonic pressures exerted on them?
2. How can the curriculum facilitate competencies to engage in relevant practice actions for disability inclusion?

Case 3: Training a New Cadre of Community-Based Workers: Interdisciplinary Collaboration in the Higher Certificate in Disability Practice (HCDP)

The focus of this case is on the Higher Certificate in Disability Practice (HCDP). Grounded in the ideological intention of a socially just curriculum, the HCDP facilitates the delivery of equitable healthcare to people with disabilities at community level. It furthermore encourages rehabilitation professionals to work in an inclusive and interprofessional manner (Gamiet & Rowe, 2019). The HCDP program seeks to include and address national and global trends in education (Hartman et al., 2012) and health with a focus on Interprofessional Education and Collaborative Practice (IPECP), PHC and CBR. This program is within the Division of Disability Studies in the Department of Health and Rehabilitation Sciences at the

University of Cape Town, South Africa, and sets out to achieve the outcome of affirming, advocating and accounting critical disability priorities across sectors. The Division of Disability Studies is interdisciplinary and emerged from a need for disability activists from various organizations such as Disabled People South Africa (DPSA) to have a qualification as well as the need for disability inclusion across academic spaces and the need to develop disability-inclusive research capacity in South Africa. Through its interdisciplinary academic programs, the Division has a multi-pronged approach in achieving this outcome. The programs offered are a Higher Certificate in Disability Practice (HCDP), a Postgraduate Diploma, Masters of Philosophy and a Doctorate of Philosophy in Disability Studies. Disability Studies alumni are able to make an impact, at the level of higher education curricular change, service delivery, community advocacy, policy, and planning. This impact is achieved through their work in community, non-governmental, governmental, higher education and private sector entities where alumni have an influence and voice.

The pilot of the HCDP was done collaboratively through an initiative of the Western Cape Department of Health, who funded the curriculum design and implementation of the pilot of HCDP program in 2012. Two universities collaborated with the Division namely, the Department of Physiotherapy and Interdisciplinary Unit in School of Public Health at the University of Western Cape, and the Centre of Disability and Rehabilitation Studies and Department of Community Health at Stellenbosch University. The HCDP qualification responds to the policy on re-engineering PHC in South Africa, which necessitated the development of human resource capacity, particularly in the field of rehabilitation and disability services, which is under-resourced, and not meeting the needs of persons with disabilities and their families (Department of Health, 2016).

The HCDP curriculum is innovative by its educational design and in its delivery. Multiple elements of curriculum design, which included content, teaching and learning activities, assessment practices, the ideological approach (McKimm, 2007), were considered and carefully mapped out by relevant stakeholders.

The pedagogical approach used in the HCDP involves a focus on interprofessional teaching. The teaching team includes persons with disabilities, social workers, audiologists, occupational therapists, speech therapists, physiotherapists and community rehabilitation workers. In order to deliver the curriculum in an interprofessional way, the facilitators have to model interprofessional practice by stepping out of their professional silos. The intention was to make explicit to students and therapists how interprofessional collaborative practice might be applied in service delivery when working with persons with disabilities, families and communities. Action learning (Freire, 2016) was intentionally used as an approach to reciprocal learning with more traditional didactic teaching methods. In using an action learning approach students were given the opportunity to experientially engage in activities and practicals in class, reflect on these learnings and apply it in future teaching and learning spaces. A cognitive developmental approach is adopted in the teaching and learning spaces (Toohey, 1999; Biggs, 2012). It is important for graduates to be critical thinkers and reflect-in and -on action (Schonn, 1987) in order to collaborate in problem solving. During the Work Integrated Practice Learning courses, HCDP students were afforded the opportunity to practically work closely with various health care professionals and community development practitioners across a variety of contexts in order to understand the value and purpose of interprofessional collaborative practice.

In order to transform rehabilitation at community level, the HCDP qualification supports the National Department of Health's human resource plan to have community rehabilitation workers as part of the PHC team to address disability and rehabilitation needs in communities (Department of Health, 2015). The curriculum aims to capacitate graduates with integrated rehabilitation skills to access information, to communicate with families, communities and the PHC teams, as well as to support services and programs for persons with disabilities and their families. HCDP graduates have a generic set of clinical skills to screen and identify persons with disabilities. They implement an intervention designed/developed by therapists related to addressing individuals' impairments, remove barriers to participation and inclusion and create spaces for persons with disabilities to empower themselves.

The graduate can play a key role in the PHC platform, contributing to the promotion of health, prevention of disease, access to the provision of assistive devices and technology and augmenting rehabilitation services at community level. The HCDP graduate can also play a key role in community and social inclusion. Their role facilitates the reintegration and inclusion of persons with disabilities into communities so that they are able to participate and are included in spaces of living, work, learning, playing and socializing. However, challenges for this cadre of community based worker both within the level of training and at the level of service delivery still remain.

At the level of training, interprofessional education across all cadres of Rehabilitation Sciences remains challenging due to administrative, logistical concerns and the protection of professional identities. Within the training model, a shift in ways of being and thinking is required. Undergraduate training programs in Rehabilitation Sciences such as physiotherapy, occupational therapy, and communication sciences could consider introducing a CDS approach in their curriculum planning and design. There is potential for all these undergraduate professional qualifications to train their students, including this new community worker, on CDS in an interprofessional way. CDS will lay the grounds for disability inclusive practice and collaboration amongst students of all Rehabilitation Sciences. In addition, it would be beneficial if the therapy students are provided with experiential learning opportunities to work more closely and collaboratively with the HCDP students and graduates at practice learning placements. This collaborative practice will not only afford them an opportunity to understand and value the role that each rehabilitation practitioner plays within the system; it will also foster an understanding of how each profession needs to work together to ensure that inclusion of Persons with Disabilities is prioritized.

As educators of rehabilitation professionals we need to reflect on what underpins our training. When drawing on Kaplan's (1999) elements of organizational capacity development, we need to redefine our conceptual frameworks to include critical disabilities studies at the core, and then accordingly adjust the organizational values, vision and mission and our approach to drive the training and acquisition of skills. The CDS theory and CBR guidelines are useful frameworks to guide learning and position CDS as a theoretical underpinning in rehabilitation curricula. Currently frameworks and professional ways of being remain that are negatively influencing our ways of practicing and service delivery.

At the level of service delivery, there remains an uncertainty about the role of the community rehabilitation worker and how and where they fit into the healthcare system. Concerns about a potential threat of the community rehabilitation worker to the employment opportunities of other rehabilitation professionals was noted. Challenges around the responsibility of rehabilitation therapists in relation to the supervision of the community rehabilitation worker also created uncertainty. This cadre of community based worker is recognized as an important new human resource in Africa (Dawad & Jobson, 2011) as well as locally within the Western Cape Department of Health's 2030 Healthcare plan (Western Cape Government Health, 2014). The challenge with professional regulation of the community rehabilitation worker has the potential to limit service delivery. Regulating their scope of practice is often complicated by power dynamics between and within these professional regulatory bodies. This professional regulation may further be complicated because their scope of practice is integrated and includes skills and roles from different rehabilitation professionals. Adequate remuneration, finances, resources and ongoing professional development needs to be allocated to establish their integration into the service delivery platform (Booyens et al., 2015).

Some reflective questions to consider:

- What pedagogies can we use to embed CDS as a conceptual framework in Rehabilitation Sciences education and curricula and
- How can CDS drive the necessary interprofessional education and collaborative practice in the teaching and learning spaces in Rehabilitation Sciences curricula?
- How do we extend our engagement beyond formal educational spaces to dismantle systems and structures that uphold professional sectarianism and asymmetrical power relations?
- On a service delivery platform, how do we integrate this cadre of worker into the rehabilitation team to facilitate collaborative practice and strengthen PHC and CBR?
- How can educators of health and rehabilitation professionals become change agents to drive instructional, institutional and systemic transformation?

Discussion: Imperatives of Southern CDS for Rehabilitation Sciences Curricula

It is a mandate of higher education institutions (HEIs) to develop programs that influence social change and address challenges facing disadvantaged members of society. The three cases above demonstrate that curricula transformation is required, if we are to produce graduates who are agents of change in their respective contexts.

To prepare these graduates adequately to facilitate critical disability work in its full complexity, notions of curriculum design and pedagogy within Rehabilitation Sciences must be re-examined. Kaplan (2000) provides three tangible and three intangible elements for organizational capacity. Tangible elements focus on elements that are quantifiable are on their own not effective in building organizational capacity. Intangible elements largely determine the way in which an organization achieves what it sets out to do.

In the following section, we intentionally use only the three intangible elements of Kaplan's framework, i.e., conceptual framework, organizational attitude; and vision and strategy, to provide a critical analysis of the capacity of higher education to facilitate an integration of southern CDS into Rehabilitation Sciences curricula in light of issues raised by the three case studies. We highlight gaps and opportunities that exist in Rehabilitation Sciences curricula as well as consider implications for the integration of a southern CDS.

Conceptual Framework – Reconceptualizing Disability and Rehabilitation Within Rehabilitation Sciences

In recent years, there has been a shift towards education programs in Rehabilitation Sciences becoming socially responsive thus alerting to a conceptual framework that reverences the right to equality and equitable access to opportunities for persons with disabilities. In order for the Rehabilitation Sciences curriculum to effectively facilitate the development of practitioner competencies to facilitate the community integration of persons with disabilities in practice, there must be a shared conceptual framework and understanding of disability that is holistic, that views disability as an issue of social justice and that takes intersecting identities into account. Unless all educators share an appreciation for the complexity of the disability experience and the embodiment of disability (Siebers, 2013), and free themselves from the doctrines of the medical model (i.e. an individual impairment focused approach to disability inclusion), health sciences education will not fully comprehend and intervene into issues of disability exclusion. Sieber's (2013) theory of complex embodiment calls for neither a prioritization of the medical or social model, but rather for the complexity of disability to be recognized. The theory of complex embodiment also enables the understanding of a disability identity amongst other identities as an epistemological construction containing an array of theories about navigating the social context. The body and social representations are mutually transformative and intersecting identities such as race, gender, socioeconomic status, education, religion, sexuality interact or overlap, contributing to multiple layers of possible vulnerable identities and social oppression.

Organizational Attitude: The Importance of Critical Reflexivity and Agency in Affecting Social Change

In Case Two, the practice of novice occupational therapy graduates illuminated that they seemed to view disability as primarily related to loss of function rather than as a form of social oppression. This assumption is not surprising, as Rehabilitation Sciences traditionally understood disability within a reductionist perspective that emphasizes individual impairment. This perspective has clear consequences for education and practice. While not directly implied in Case One, a reading of the case poses questions on how disability is conceptualized in the special school setting. However, Case Two does also illustrate how the curriculum, informed by CDS, undertook to enable students to question and challenge their own and others' attitudes, beliefs, and actions around disability. Adopting CDS perspectives allows for the recognition and confrontation of harmful systemic representations of disability. A core premise of CDS is that it challenges the view of disability as an individual deficit that "experts" such as occupational therapists can remedy through medical rehabilitation. Taking a critical reflexive stance can bring change through action. As illustrated in Case Two, students could re-examine their implicit biases and begin to challenge oppressive practices that traditionally influenced rehabilitation.

Freire (1990) stresses the importance of allowing students to recognize connections between individuals and the broader social contexts in which their experiences are embedded, through the deconstruction of power relations. Case Two highlights how integration of CDS in a curriculum could develop critical graduates through facilitating reflexivity that enables them to interrogate their own values addressing questions such as:

- How do my own value systems influence my practice?
- How might my practice change as a result of reflections on my value systems?
- How do different forms of power in my practice context influence my practice?
- What processes could I use to challenge different forms of power?

At the center of an organization's ability to effectively deal with issues pertaining to disability and social inclusion/exclusion, lies how it understands and interprets the construct of disability. As highlighted by the above discussion, both Case One and Two illustrate some success in influencing an occupational therapy student's perception of disability through the introduction of critical reflexivity around theorizing of disability in the curriculum. The value of critical reflexivity for Rehabilitation Sciences educators around these questions should not be underestimated and could provide momentum to a transformation on how health professions education views disability and rehabilitation and the adoption of CDS as a conceptual framework for the curriculum.

Vision and Strategy: A Transformative Rehabilitation Sciences Curriculum as a Change Agent Within Itself Through CDS

CDS perspectives underline that disability is currently dominated by medical knowledge and power. Adopting CDS perspectives allows for the recognition and confrontation of harmful systemic representations of disability. Currently traditional rehabilitation perspectives on disability receive more attention in Rehabilitation Sciences curricula, portraying an organizational attitude of cultural privilege that is ignorant of the important role of critical activism where rehabilitation professionals could collaborate with the disability rights movement around disability rights and inclusion.

CDS contributes substantially to the examination of political strategies of intervention that can confront barriers to social inclusion. While Case Two provides an example of facilitating this much needed shift on transcending the impairment focus in order to deliver holistic rehabilitation services, Case Three challenges notions of invisibility by bringing in persons with disabilities not only as students or recipients of rehabilitations but as lecturers in the program. These critical shifts address/highlight the hegemonic medicalization of disability that has contributed hugely in making disabled bodies invisible and in perpetuating dehumanizing ways of thinking about disabled populations (Reed-Sandoval & Sirvent, 2019).

Case Two illuminated novice occupational therapy graduates' inability to engage with disability as an issue of difference and highlighted the need for curricula to equip students with skills to work collaboratively. Julio, Chen, Bhutta, Cohen, and Crisp et al. (2010) advocate that engaging stakeholders is crucial to ensure that partnerships reflect mutually negotiated objectives and community needs. They call on education programs to form networks and alliances with relevant stakeholders in order to harness educational content and teaching resources. The inclusion of persons with disabilities in curriculum development as well as teaching and learning is imperative (as Case Three highlights) to foster values of inclusion as part of the educational environment. An important principle for education is that it reflects valuing the lived experiences of persons with disabilities and learning from, and working in, partnership with disability networks and organizations in offering health-related rehabilitation, as well as advocacy campaigns and disability inclusive development programs. However, Rehabilitation Sciences departments at higher education institutions need to put in the work required for the questioning of coloniality and the colonial/modern system's reinforcement of ableism; and the creation of disabled bodies and disability.

Most importantly, any decolonial work requires prioritizing voices of the oppressed. This mandate demands Rehabilitation Sciences engage Reed-Sandoval and Sirvent (2019, pp. 1553–1554) questions of "who gets to define ability and disability in a given context" and "how disabled bodies and spaces serve as sites for producing theory, knowledge, and philosophy and the historical and colonial formations and manifestations of the ability-disability distinction." For instance, due to a largely colonial way of providing education (Ned, 2019), we have not adequately accounted (in policy, theory and practice) for African indigenous approaches to understanding and dealing with disability. This absence / gap is because curricula have generally focused on Western ways of knowing and being, which reinforces epistemic vulnerability of disabled population, particularly those from the periphery. There is limited conceptualization of disability from the frames of reference of those in the periphery. Considerations of how indigenous approaches to disability would influence rehabilitation practice must be explored. There must be transformative actions implemented to undo past practices, informed by engaging questions such as:

- Who is the ideal knower regarding disability in rehabilitation disciplines?
- How can persons with disabilities themselves become part of academic practice?
- What practices need to change and how?

Given that even CDS' theorizing and critiques have largely ignored indigenous people (Driskill, 2010), care must be taken not to perpetuate this exclusion of indigeneity through ignoring political factors that caused the inequalities and the dominance of the global North and unthinkingly adopting these cultural values and beliefs in the Global South. Case in point are minimum standards for Rehabilitation Sciences education that are set by World Professional Bodies that do not consider Global South contexts. A transformation of organizational attitude implies the Rehabilitation Sciences curriculum transforming to the extent that it becomes a change agent within itself in how it responds to the world around it, through adopting CDS as a conceptual framework in which Rehabilitation Sciences curricula.

Vision and Strategy: CBR as Tenet of a Transformative Rehabilitation Sciences Curriculum

Health sciences curricula generally do not portray a clear vision and strategy for rehabilitation services or for developing relevant practitioner competencies to deliver such services (Volmink, 2018). As illustrated in the three case stories, there appears to be different approaches adopted within different programs. A clearer vision and strategy foregrounding CDS must be exhibited within the tenets of the curriculum, outlining priority areas for practice, particularly as related to community integration and disability inclusion.

A CDS curriculum implies preparedness of practitioners to engage in a critical practice of rehabilitation as encompassed in the CBR Guidelines (WHO, 2010), where rehabilitation refers not only to the components of health but also of the social, education, and livelihood which are underpinned by the empowerment, to achieve disability inclusive development. CBR, itself, is seen as an effective strategy for promoting disability rights and to operationalize the CRPD through equaling opportunities for development. These components have nonetheless been neglected in rehabilitation shown in the disconnect between CDS and practice (Hess-April, 2013; Ned & Lorenzo, 2016). This neglect highlights an imperative for Rehabilitation Sciences curricula namely interprofessional education and collaborative practice (IPECP).

Frenk et al. (2010) highlight that educational instructional and institutional reform is required to promote and drive interprofessional education for Health professions. They argue that fostering interdependence in interprofessional learning has the potential to dismantle professional silos and hierarchical relationships. This dismantling is a necessary iterative process between education and practice required to train competent graduates committed to disability inclusion through participation (Frenk et al., 2010; Barr, 2011). Barr (2000, p. 6) asserts that interprofessional education provides opportunities to develop "productive learning relationships" between students. The experience of this model of collaborative practice during training facilitates opportunities for replication in practice upon qualification. Volmink (2018) support this model as he credits IPECP as a catalyst for transformation. In addition to transformative learning being reciprocal between students and educators in ways that alters power dynamics and creates critical reflexivity (Freire, 1990), learning to collaborate in a transformative way can be achieved by facilitating teamwork and collaboration between students in educational spaces. However, barriers to IPECP are still rife in Rehabilitation Sciences' education and practice.

Barriers include hierarchical and power dynamics and administrative logistical challenges (e.g., coordinating schedules). Such a situation continues to perpetuate inadequate delivery of rehabilitation services. These barriers are compounded by findings that rehabilitation remains on the margins in public healthcare (Sherry, 2014) and limited as a cross-sectoral practice (Ned et al., 2020). Dufour and Lucy (2010) highlights the need for a "paradigm shift" that goes beyond a diverse health care team to include other stakeholders in other sectors. An example here is Case One that shows an OT in a special school that is within the education sector. We argue that for a paradigm shift to be implemented, it must start with training with transdisciplinarity. We submit that higher education institutions' embrace integrated and embedded service learning programs for rehabilitation science students by facilitating opportunities for students collaboration stakeholders across sectors including persons with disabilities organizations.

The implications of holding on to the four disciplines of occupational therapy, physiotherapy, speech and language therapy, and audiology are seen in Case Three where collaboration yields interprofessional co-valuing of each professional in the rehabilitation service chain even beyond the health sector given rehabilitation's expansive reach.

While Case One acknowledges having to deal with restrictive governance models, the effect of professional identity erosion affects change agency. Volmink (2018) argues that "professional tribalism" is another important barrier to effective collaborative practice and transformative change in healthcare. Attitudes of practitioners lead to hierarchical classifications that need to be addressed (Snyman et al., 2015).

Gordon (2006), calls for disciplinary decadence which he defines as:

the phenomenon of turning away from living thought, which engages reality and recognizes its own limitations, to a deontologized or absolute conception of disciplinary life. The discipline becomes, in solipsistic fashion, the world. And in that world, the main concern is the proper administering of its rules and regulations (Gordon, 2014, p. 86).

Community rehabilitation workers (see Case Three), in some way, can play a role in disrupting this decadence because their training is, by design, interdisciplinary. While interdisciplinarity has been the response to disciplinary decadence for some time, it is not without critiques as well. For example, Gordon (2014, p. 87) problematizes it as a decadent structure too because of the presumed disciplinary completeness which allows disciplines to "simply work alongside each other like ships passing in the night." What is required then, is what Gordon calls "teleological suspension of disciplinarity" (Gordon, 2014, p. 87) which is a decolonial act that must include persons with disabilities. In IPECP that is the common approach, defined by the WHO (2010, p. 12) as "Interprofessional education occurs when two or more professions learn about, from and with each other to enable effective collaboration and improve health outcomes." The goal for collaboration must be holistic inclusion of the community. Hierarchies still exist currently where the superiority from medicine remains. Reports that look into reconceptualizing health professions education in South Africa (Volmink, 2018), show that Rehabilitation Sciences do not feature in the health professions cited. How then should Rehabilitation Sciences facilitate such a suspension of disciplinarity?

Reflective spaces for students to understand agency and structure as it relates to professional identity (Sonday et al., 2019) serve a transformative role. Hout and Rudman (2010) described this interplay further as being positioned along a continuum, affording individuals who navigate this continuum possibility of new ways of practice.

Navigating the Interplay Between Socio-Political Hegemony and Curricula

In order to counter hegemony, rehabilitation educators must resist the hegemonic pressures exerted on them as they encounter managerialism and neo-liberal cultures that constrain critical practice. Case One highlighted that being occupied by a structural system impacted on how occupational therapists chose to enact their professional agency. Sonday et al. (2019) described three mechanisms, namely, anchoring, complying and transgression whereby occupational therapists enacted their change agency in response to the varying schooling environments. Annie D struggled to transgress as she became aware of the boundaries, not only of the Western Cape Education Department, but also the imposed rules of the Occupational Therapy profession. Her attempt in resisting the dominant way of doing in that schooling environment determined how power was negotiated within a gendered hierarchical structure. The core focus of a profession like occupational therapy is to enable participation and engagement for persons with disabilities (Ramugondo, 2018). With a fundamental understanding that context plays a critical role in shaping and influencing practice and who enacts this practice, lends itself to the history of how health professionals are trained and prepared. For instance, Kinsella and

Whiteford (2009) argue that it is important to reflect on how knowledge is generated and used within occupational therapy. This reflective praxis applies to all Rehabilitation Sciences in general particularly regarding interrogating the theoretical frameworks that are used to inform curricula. Situating knowledge production at the level of the curriculum can contribute to shaping rehabilitation professionals who are socially just and competent.

The curriculum would have to pay attention to the development of competencies such as political lobbying (Kronenberg, Pollard, & Ramugondo, 2011) in order to make meaningful contributions to the disability agenda. The curriculum should address competencies such as skills to facilitate collaboration and the development of advocacy and mediation skills (AASF, 2018). In addition, it must address social policy processes in terms of interpretation, analysis, implementation and monitoring in order for graduates to acquire these skills. Likewise, students must participate in collaborative action research projects that deal with disability issues with persons with disabilities and parents of disabled children or other family members. Inviting persons with disabilities who already have these competencies, for example, writing policy briefs addressing recommendations for change (see for example Lorenzo & Janse van Rensburg, 2016), from working in NGOs or collaborative projects in the government or higher education sectors as co-educators in health sciences education is an imperative strategy towards realizing the vision of a transformed curriculum with CDS embedded in it.

In Case Three, transformational learning advocated by Mezirow (1997) has proven to be beneficial for graduates of the HCDP as they highlighted an understanding and critical appreciation of the importance and value of the inclusion of persons with disabilities in various contexts of rehabilitation. Gamiet and Rowe (2019) reflect on the perceptions of rehabilitation therapists on HCDP graduates (CRWs) from a service delivery perspective. Based on their exploration of how the role of CRWs is understood by rehabilitation professionals, their study highlighted that therapists appreciated that CRWs has a clear understanding of the context and communities that persons with disabilities come from, and are integral in facilitating active participation and reintegration of persons with disabilities.

Volmink (2018) asserts that health sciences educators need to be supported to challenge the dominant ways of training and become "agents of change" in order to dismantle dominant ways of practicing in educational spaces and the community. Duncan et al. (2006) coordinated sessions titled "conversations on practice" with educators and therapists as a change management process in order to challenge the dominant ways of practicing and to explore the implications of working with new emerging professionals in the rehabilitation domain. They reported that these conversations were not always easy; resistance and ambivalence were expressed through concerns about workload, anxieties about role boundaries and fears about the professions becoming redundant. Therapists reflected uncertainty about the level and the limits of the knowledge and skills held by these new mid-level workers and the implications of the supervisory role that therapists would have to hold when working interprofessionally with them. In addressing this issue, Ned et al. (2020), propose articulation as a strategy to decentralize training where the early years of professional training could include CRWs and be based in the community. They assert that this strategy would foster reciprocal learning and collaborative practice for all cadres of rehabilitation professionals.

Conclusion

There needs to be an intentional consideration of how transformation of rehabilitation education is facilitated at the level of higher education, policy development and implementation, as well as monitoring and evaluation of disability and rehabilitation services. This intention includes rethinking our own dominant use of theories and models of disability that do not necessarily speak to the southern realities in order to enable engagement of more nuanced understandings of disability in Rehabilitation Sciences. Given that currently the health system predominantly works within an individual, biomedical model within a largely stratified work approach with silos, rehabilitation personnel need to work more intentionally to prevent the narrow service delivery systems that undermine the potential of broader IPECP training. Graduates need to become agents of change to dismantle the current approaches to rehabilitation so that they are better equipped to work within and between CPH, CBR and CDS frameworks.

In order for Rehabilitation Sciences curricula to create the space for graduates to empower themselves to be change agents who advocate for IPECP, consciousness of power dynamics and hegemonic ways of practice that exist need to be addressed. The curriculum needs to create opportunities for them to acquire leadership competencies and advocacy skills to challenge and transform current approaches to service delivery. They need to collaborate with persons with disabilities and develop a collective voice to facilitate the paradigm shift towards inclusive and collaborative development practice. Through the cases presented in this chapter, we draw from a CDS lens a contribution towards re-imagining a critical Rehabilitation Sciences by integrating and embedding CDS that accounts for the hegemonic effects of marginalizing disability as a total social system of oppression through and beyond the body.

Abstract

The chapter is divided into three linked contributions by authors who discuss their experience of, and thinking about, reciprocity in different health care and educational settings. Christina described how the disrespectful attitude of health care staff toward her as a new mother with a disabled child led to her active engagement with community projects. Gubela has looked at a history of coloniality that dismissed the local knowledge and wisdom related to health thereby which has ruthlessly impacted on the well-being of a rural community. Lindsey and Lucia have described the process of "learning from" each other in a PhD supervision partnership.

Keywords

Reciprocity · Disability · Indigenous knowledges · Cooperative learning · Common humanity

Introduction

In Casement's introduction to his seminal book "On Learning from the Patient" (1985) he states, "*there have been some genius analysts, such as Freud and Winnicott, who learned naturally how to learn from their patients*… *Opportunities for learning from the patient are there in all caring professions*" (pg. x). This belief in the value of learning with and from the "other" is a cornerstone of reciprocity in knowledge production. It values the coming together of two or more minds to inquire, explore, and attempt to understand experiences that are essentially those of being human. With the world still reeling from the COVID-19 pandemic, this chapter seems ever more prescient as we recognize that we will not survive without knowledge exchanges across borders, community cooperation in creating safe spaces, and neighbors reaching out to those who have become isolated or unwell. Reciprocity relies on a respect for another's knowledge and experience and the recognition of a shared humanity, in other words to survive we need each other.

The following chapter in divided into three linked contributions by authors who have discussed their experience of, and thinking about, reciprocity in different health care and educational settings. Christina describes how the disrespectful attitude of health care staff towards her as a young new mother with a disabled child led to her active engagement with community projects that can assist parents and children with disabilities learn from each other and demand their rights. Gubela has looked at a history of coloniality that dismissed the local knowledge and wisdom related to health thereby creating a split system of health care, traditional knowledge, and "Western medicine" that has ruthlessly impacted on the well-being of a rural community. Lindsey and Lucia have described the process of "learning from" each other in a PhD supervision partnership.

Our hope is to add to the scholarship in critical disability studies (Vehmas & Watson, 2014) that goes beyond binary notions, of who is able and who is disabled, to considering how creating a third space of knowledge benefits all. This chapter explores how relationships built on reciprocity move beyond "doer and done to" (Benjamin, 2018) to one of shared learning and a recognition of a common humanity.

The chapter concludes with the four authors considering how reciprocity becomes more than an exchange of "goods," as it facilitates disability inclusion that is part of an overall "ethic of care" (Tronto, 1993). Some of the barriers to relationships based on mutual respect, fear of vulnerability, and an acknowledgment of the need for the other will be addressed. The authors, through the use of personal and political accounts of the barriers to, and rewards of, sharing knowledge, hope to show that moving beyond the rigid professional boundaries held by clinical staff, academic researchers and educators can provide new knowledges and nurture the emotional well-being of all.

The following section begins with Christina describing, in vivid detail, her experience of having a child with disabilities as a new young mother in a rural South Africa setting. The narrative is followed with some of Christina's theoretical reflections on the experience, with suggestions about improving the system of health care. She states there should be more joint working between parents of children with disabilities and health care staff, a form of reciprocal learning from and with each other.

The Experience of Parenting a Child with Disabilities in a Rural South African Setting

My child was born 8 months premature and was in an incubator for 1 month. When I was discharged from the hospital, I did not know that my child was disabled. I thought my child is normal like other children I did not see anything wrong to him. He has all parts of his body like other children. After some few months, I discovered that my child was not physically developing like other children of his age. He was too weak to sit upright on his own, he continued to fall occasionally, and his age group were about to crawl. I suspected that something was not right, and the health professionals would be the right people to assist. I took him to my nearest hospital and explained the situation of my child to the health professionals.

When I realized that something was not right to my child, I approached my nearest hospital, and my first point of contact was the doctor and the nurse. I presented the health condition of my child in my vernacular and the nurse translated to the doctor in English.

I was told that all he needed was to practice certain exercises and that with time he would be able to walk. I was advised to take him to physiotherapy and occupational therapy every second week of the month, but their reasons were not clear to me. I tried to ask what the cause of the disability and I was told not to worry "the child will be fine." I felt irritated because I was told the same thing over and over again, and I did not see the progress to my child.

The Emotional Impact of Parenting

I felt ashamed because I was such a young mother and I used to ask myself constantly, why I gave birth to this kind of child? What was the cause? It God's punishment? I am bewitched? These are some of the questions I cried over every day. The most painful part of all was that I could not find anyone with whom I could share my misery. I was given false hope, reassurance that his situation would get better which sounded promising. I was in and out to the hospital for therapy sessions without seeing any improvement to my child. They keep on telling me "Do not worry, he will be fine." Those words strengthened my hope because I had trust in the therapist as they know best about health issues.

The father of the child was still at school. When my mother suspected that I was pregnant she informed my aunt, and I was approached by my aunt to confirm with me if indeed I was pregnant. I confirmed with her that is true. My family took me to the boyfriend family to inform them that I am pregnant. My boyfriend refused and told his parents that he does not know anything about my pregnancy. This meeting was before the child was born.

My elder brother told me to take my child to Nthume institution for persons with disabilities because he is disabled. I felt powerless because there was no support from anyone until I was introduced to Disabled Children Action Group. There was no support from anyone, family, friends, or adequate knowledge about parenting a disabled child. It was an emotional straining to find myself being disconnected from the people I love and trusted most.

Family and Friend's Attitude

I struggled immensely at that time as I received no support from my family and friends. There was no one I could turn to for advice or even simply to talk to about the attitude from my family and friends. Inadequate emotional assistance led to an escalation of the stress I already suffered due to the circumstances. My best friends laughed at me and used to tell me that having a child is a burden, because you must carry the child wherever you go like a "handbag." At that time, the analogy seemed too moderate as my child was more than a handbag, like a big suitcase filled with stones. The burden seemed to be more I could bear. Crying was part of my daily routine as my parents were constantly angry because they expected me to go to school not to have child. Since it was my first child, I experienced stress as well as feelings of depression, anger, shock, denial, self-blame, guilt, and confusion. It was not easy at all because you have no life, no life at all. I could not go anywhere; I had not enough time to be social because I did not have anyone to help; and I was overwhelmed with stress, frustration, and fear of parenting a disabled child.

Fear of Health Professionals

I experienced a deep fear of health professionals because they were reputed to scold those who asked too many questions. The hardest thing to deal with, however, was the false promise that the child would eventually be able to walk. I really trusted health professionals and were very few in my area during that time. I thought that they knew everything, well-educated doctors who had all the answers to the problem of my child. I had expectations for my child as great as any other mother's, but as time went on, I realized that what I was told by the health professionals, mostly physiotherapists, could not come to pass.

Diagnosis Discovered Professionals Quantifying and Naming the Disability (Parents and Therapist)

I learnt the name of my child's disability was cerebral palsy (CP) when I was queuing with other parents of children with disabilities at the physiotherapy department. One of the officials came outside and said "parents of CP children should move from this queue and queue to the other side of the building." I told myself that my child's disability was CP, now I know, it was a big English word to hear it for the first time in my life, I did not realize the two letters it stood for Cerebral Palsy. When it was my turn to get in the consultation room, I explain the condition of my child and asked will he be able to walk one day? The response was "Don't worry he will be fine!!!!!".

I was told how I should stretch the hands and feet of my child when I am at home. Every time when people ask me "why you are carrying your child at your back going in and out to the hospital?", my response was my child has a "CP" problem, and that was the only answer I could give. I did not ask anything because I believed that professionals know better, well-trained medical doctors and highly qualified to do their job, and, as a result, I have to listen to and take their instruction.

Educational Assessment

When my child was 8 years old, I took him to my nearest special school for admission. The process for admission was long, because you have to take an application form to the psychology department to assess the IQ of the child. The day I visited the hospital for the psychologist to assess the child, I realized he was a white man who spoke English and I was not fluent with my English. I was stressed because there was no translator, and I could not express myself confidently in English. I put the form on his table and pointed for him to complete his part in the form. He did so without asking any questions and at the last part he wrote 48% IQ.

There was no instrument that he used to assess my child as having a 48% IQ. Because of this score, his application to the school was rejected and I was told that his IQ level was too low for admission. I went back home worried about the IQ score because the difference was 12% to make 60% for my child to get admission. I wanted my child to go to school, then I could look for a job. I went back to the psychologist after 3 months to tell him the IQ he wrote was too low for the school to accept my child. He asked me what he must write. I told him that he can write anything above 60% IQ and he then wrote 68% IQ. The head of the school then accepted the application of my child and I was just over the moon about the admission of my son. I felt helpless because at that time I could not read English or write English as a parent. I had to rely on the goodwill and actions of "expert" others.

Negative Experiences of Parenting

In writing this narrative and revisiting this painful past, there are questions I have about how health care services can meet the needs of parents who have children with disabilities. This response is particularly important when parents, as I was, do not come from privileged backgrounds of race, class, education, and socioeconomic security. Parents may not speak the English language of the medical staff, they may have little or no previous experience of disability, and they may live in rural communities that hold negative views of disability. Yes, rural areas hold negative views. My experience is more of the rural area I come from than in the urban areas.

Having no clear explanation for my child with disabilities made me vulnerable to ostracization by family members and the community. Callery (1997) claims that the integration of parental and professional knowledge has potential benefits in the management of children's health problems. It was easy to internalize the negative comments thrown at me, when there was no other plausible explanation that I could use to explain my child's disability. Studies have found that parents are also dissatisfied because they do not feel that they are respected as partners who have parental expertise and competence (Balling & McCubbin, 2001; Fisher, 2001). As a parent of a child with a disability, I was not given an opportunity to share my observations and experience of parenting my child. I was afraid to ask questions, I just have to take what I was told to do. Gona et al. (2018) assert that health professionals underestimate the emotional distress and need for information experienced by parents and carers of children with disabilities. I remember when the physiotherapy gave me pamphlets to read that were written in English with pictures of children and persons with disabilities, but I could not read the pamphlet. The information was of no use, because I could not understand the language. It was not my first language, and I could not find any help.

Fear of Societal Stigma

Having a disabled child means the destruction of parents' dreams of their ideal child (Schmitke & Schlomann, 2002). I had no social or emotional support when raising my child with a disability, and I avoided public places with him to keep him away from the community. If people saw him crawling outside, I would rush to put him on my back and hurry into the house. Dura-Vila (2010) suggested that raising a child with a disability has significant consequences for parents and family. The major problem with this system of avoidance came in the child's need to visit the clinic. On those days, I knew that the child and I would be exposed to the public, and everyone will know that I have a child with a disability. So, I devised a plan to avoid many questions.

Finding a Way Forward: The Value of Local Support Groups

The coming together of mothers of children with disabilities was a platform to share life experiences collectively to promote acceptance and equality for our children to be recognized as part of the South African future and society. The formation of Disabled Children Action Group, parents' organization, restored my dignity, gave me confidence, and reduced the stigma of the community. The organization was of vital importance because it helped to normalize my experiences of parenting by meeting together as parents of children with disabilities. Through our joint efforts as parents of children with disabilities, we share challenges, solutions, and developed strategies towards affirmation of integration and equal participation in our society.

Today, I walk tall, an active proud mother of an adult son with a disability, committed to advocate equal opportunities for and able to mentor other parents and persons with disabilities to advocate for their rights. I salute Disabled Children Action Group for having played a significant role with a wealth of information acquired from sharing knowledge through parents' empowerment workshops, trainings, seminars, and conferences. Today, I am a disability inclusion activist, and I obtained my Master's degree in Disability Studies and Doctor of philosophy.

The Future Practice for Health Professional and Parents of Children with Disabilities

Health professionals as change agents can make a difference in the lives of children with disabilities and their families in a number of ways. By using the social model of disability, health professionals in partnership with people with disabilities and parents can address sociopolitical constructs that create challenges for persons with disabilities. As can be seen in my narrative, I cannot emphasis enough the importance of the provision of early diagnosis and information to parents in the process of care and rehabilitation of their child with disability. In providing diagnoses and information related to disabilities, family members should be included wherever possible. This inclusion could limit blaming and attitudes from families and could strengthen the support base for the parents. The social model promotes opportunities for Disabled Children Action Group, parents' organization, to advocate and lobby for the rights of children with disabilities, remove societal barriers, attitude experienced, and critique the manner in which society perceive children with disabilities and their parents. The attitudes towards children with disabilities impact parents' experiences and challenges parenting children with disabilities.

The formation of local support groups at grassroots levels to provide for the sharing of challenges and information could have a positive impact on parents and the community. Continual efforts to raise awareness about the rights of children with disabilities within the society through traditional councils and community radio stations would reduce the challenges of stigma and attitudes experienced by parents within their communities. Parents of disabled children have a great role to play in the development and well-being of their children, because parents know their children better and are able to inform the health professionals about their child's development. They can help health professionals to understand their children better, they can give advice about individual behavior, and they can contribute to the design and implementation of joint learning and support strategies. It is for this reason that health professionals and parents of children with disabilities should work together to close the gap existing between parents and health professionals for the betterment of the child.

This collaboration is an appropriate responsibility for health professionals, seeing that the core values of health professionals include service delivery and the enhancement of dignity, worth of children with disabilities, parents, and society. The health professionals incorporated to local parents branches to create social networks on disability and diversity awareness programs for social cohesion. Parents share their own experiences of parenting children with disabilities to health professional forum meetings. The provision of adequate and effective information about disability management which is relevant to children with disabilities in their vernacular language through seminars. Appropriate counselling at the grassroots levels, i.e., at the local clinics. Training on food security income generating projects to unemployment parents of children with disabilities.

In this next section, Gubela Mji highlights the impact that "Western" medicine, religion, and education have had on the traditional healing practices of an indigenous African culture, the AmaBomvane, in the Eastern Cape Province of South Africa. The AmaBomvane experienced a prolonged period of symbolic violence through a process of colonization, which viewed their languages, education, health care systems, and spiritual practices as inferior to those espoused by the white Western world. The lack of respect shown by the West towards knowledge that existed over generations that are part of the healing traditions within an African context provides a powerful example of how the lack of reciprocity can lead to damaging health outcomes. Gubela ends her discussion with some considerations of future possibilities, and in this way, joins the call for decolonized learning in all health, education, and social environments. This decolonial learning is only possible if there is a genuine sharing of knowledges without privileging some as being "superior" to others, i.e., that "Western" medicine is viewed as better than traditional and/or local practices of health care. Gubela suggests that there is much to be learnt and shared with the "other," which are the elders of the AmaBomvane clan.

Hope Amid Symbolic Violence

The hegemonic knowledge of the "West," i.e., the USA, the UK, and Europe, which promotes "scientific knowledges" that are based on medical diagnosis of a single cause of a disease, which frequently is addressed by either surgical or pharmacological cures has negative impact to indigenous peoples who see health and sickness in a relational manner. This approach to patients tends to apply colonial power of imposition whereby the body of the indigenous person is something to be studied and divorced from seeing the body as belonging to a human being. This approach is described by Jansen (31 Jan 2021, cited in Mji, 2013) when describing how colonial doctors managed indigenous patients: "The crisis in western medicine is that investigations concentrated upon certain mechanisms, upon special organs, and systems to good purpose. The patient was provisionally ignored: he was merely the incidental battlefield of bacteriological conflict, or irrelevant container of a fascinating biochemical process" (Mji, 2013, pg. 46).

Unfortunately, the colonizers used this lens of imposition on all aspects of life in countries which were colonized. This colonization resulted in a tendency of choosing to be arbiters of existing indigenous knowledges systems, frequently viewing these health knowledge systems as inferior forms of health care, and describing some indigenous healers, such as amaxwele (herbalists) or amagqirha (diviners), as charlatans who use a mixture of witchcraft and trickery. It appears that Western medicine saw itself as superior, which created mistrust of the traditional practices of the village healers.

The way these new knowledges systems were introduced throughout South Africa during the period of colonization and which continued during apartheid has been seen by indigenous peoples as a form of symbolic violence. Burham (31 Jan 2021, cited in Mji (2013) shares this concern about the Xhosa people who are part of AmaBomvane:

> We are getting too one-sided in our development of the rational side of our being and getting psychologically impoverished and also severed from roots which nourish us. How can we claim to be healers when we have become technologists? Especially healers of people to whom technology has less meaning and the human being is still supreme? This difference might be partly because western technology is moving away from the essence of being human and from participating creatively with the rest of the world. The Xhosa healer is not only essential for his own people but, to some extent, for all of us (Mji, 2013, pg. 47).

The AmaBomvane People and Their Obligations

The AmaBomvane people are proud indigenous people. The highest determinant of health and well-being for the Bomvana person was to live and exist as an embodiment of the Bomvana culture, as a spiritual being who honored and practiced the beliefs of the Bomvana. The AmaBomvane believe that the highest indicator of good health is to live and exist as a Bomvana, and as such, there are certain obligations for the status of being a Bomvane. These responsibilities include ensuring that there is sufficient food to feed all families until satiety, peace, and security, looking after children from conception until maturity and giving reverence to ancestors. Since the introduction of the Western practices of education, religion, and medicine to this area, the Bomvane people now live below the poverty line with their community blighted by diseases such as malnutrition, tuberculosis (TB), and human immunodeficiency virus (HIV and AIDs).

The current Chief of AmaBomvane laments that the modern (Western) knowledge systems of delivering health, religion, and education that entered their calm existence had overlooked their daily cultural practices, which contributed to the health and well-being of AmaBomvane. The indigenous people of this area regard themselves as having been practicing education, religion, and health for the well-being of their families long before the foreign entry of Western medicine. They believe that the colonizers' introduction of Western-based knowledges undermined their civilization by introducing Western understandings and interpretations of education, religion, and health. The blatant disregard of the indigenous knowledge system of AmaBomvane by the imposition of Western knowledge can be interpreted as being a form of symbolic violence.

This Chief believes that the enforcement of these three aspects (health, education, and religion) by external agents who seemed to have assumed that the AmaBomvane communities were "blank slates" who had no knowledge and wisdom at all. This belief resulted in a fractured ill community struggling with their "beingness" and becoming, i.e., being part of an evolving community.

The Relationship Between AmaBomvane Community and Allopathic Health Care Providers

The section of this chapter will focus on the relationships between the "western" health care providers in the district hospital, their nine satellite clinics, and the AmaBomvane community.

The AmaBomvane community currently receives health services from two set of health providers, namely the allopathic health care practitioners in secondary hospital and the clinics and the indigenous health practitioners embedded in the Eastern Cape indigenous community of South Africa. These two health systems run parallel to each other, but the allopathic health care providers have assumed they are being the "better" health providers. In many respects, this high moral ground assumed by the allopathic health providers has been reinforced in the colonial education practices that are so vehemently contested in the struggle against the apartheid government.

Due to these separate and parallel health systems, there exists a subtle conflict between the indigenous health practitioners and the allopathic health practitioners that operate in the areas of Bomvaneland. Patients from this area who seek to utilize both indigenous and allopathic health strategies to manage their illness are negatively affected by the tensions with allopathic medicine and its practitioners belittling the indigenous health practitioners. The AmaBomvane view health as dependent on the status of relationships between the individual, the family unit, the community, the ancestors, and the environment. Illness is seen as result of these broken relationships (Mji, 2013). For the AmaBomvana, it is more important to prevent illness rather than to cure it, so their indigenous health system is focused on strengthening these relationships rather than curing physical disease (Mji, 2013).

Due to the general level of mistrust between the allopathic health professionals and the indigenous healers, many patients and their relatives try to contain the health situation "on the quiet" by using indigenous health advice before visiting the hospital or the clinic. This practice frequently results in them being chastised by health professionals for attempting to use what is seen as an "inferior" medication when their relatives are sick. What is misunderstood is that many households are located quite far from the hospital and the indigenous healer is the only resource available to them, especially at night. The condescending attitude and critical approach by health professionals creates a deep mistrust, with health professionals perceiving the patient as having used some form of "voodoo muthi" prior to coming to the health center. Because of this situation, people using these services opt for a veil of secrecy as they feel stigmatized, chastised, and ashamed of the indigenous health knowledge (IHK) they have sought and used prior to coming to the allopathic health center. In many ways, they feel silenced by the allopathic health providers who appear to be the knowledge holders on the issues of allopathic medicine and the power it exudes in the area on matters related to health. This conflict makes it appear that there is no will to accommodate other approaches to health care, including IHK, which is still widely practiced by this community. As the battle to take control of health matters by the allopathic health providers and to silence the people of this area of the IHK continues, within the Bomvane culture, there is a group of older women who see themselves as practicing healing from a standpoint of humility and without duress. They are the valued and valuable IHK practitioners. They have carried the traditions and knowledge from generations of their forefathers, and they practice a deep wisdom of knowledge that connects the environment with the health and well-being of its inhabitants.

Elite Older Women as Agents of Health and Care

I draw this proposition from an ethnographic study that explored the IHK carried out by the Bomvane older women in their home (Mji, 2013). This study revealed a wealth of health-related knowledge carried by the Bomvane older women in supporting their relatives when they are sick. It was further ascertained that these Bomvane older women, when their IHK strategies were not helpful in improving the health status of their relatives, went out of the home to consult other older women who are known in their villages for dealing with the type of illness that had afflicted their relatives. Mji (2013) classified these women as the elite older women. Elite groups comprise influential, prominent, and well-informed people who occupy important positions and whose behavior is associated with those positions. They are expected to hold the basis of expertise, valuable information, and an overall view of the social organization in their villages. I argue that the older people in indigenous communities such as KwaBomvana can become more powerful and autonomous in old age, taking on new roles and duties.

The elite older Xhosa women of KwaBomvana have shown excellence in the management of the health of the home by developing a bridge between natural indigenous herbs of their area and the home. They have strengthened the concept of "humility," health, and survival as a collective by sharing their knowledge of healing practices within their community. However, with the imposition of Western health knowledges, the voices of these older people, especially women, are rarely heard now in debates about health. Consequently, there has been little research that explores the ways in which the older women contribute to the health economy and social capital of their communities. In Bomvanaland, the "new knowledge" holders that have entered carrying their perception of a superior way of dealing with knowledge related to health, education, and religion have disrupted the quiet existence of the AmaBomvane people.

As a result, the education on matters of health and spirituality that has been delivered to the young by the Bomvane older women has been ignored and frequently criticized by the allopathic health care professionals in the area. Alongside this dismissal of the wisdom of these women, South Africa has a high prevalence of HIV and AIDS frequently related to the economic migration patterns of young adults living in rural communities. The high prevalence of HIV/AIDS and migration patterns has meant that many older people, specifically women, have become the pillars of their communities and carers for orphans whose parents were lost to AIDS.

Clough (1998) suggests that the talents of women have been carefully integrated into their day-to-day activities, so much so that these talents have been classified and simplified as part and parcel of "the role" woman are seen to fulfill in society, for example, terms such as "labour of love" are commonly and loosely used. Boneham and Sixsmith (2005) suggest that women's dual roles as caregivers, especially those caring for persons with disabilities, have been underestimated. They claim that a gendered evaluation of health and health care is more likely to position the older women in a more positive light and construct the older women as active agents in health matters, especially concerning their family. The role that the older women take on in fostering a spirit of belonging, participation, and identification of local assets, such as IHK, in their local community needs to be recognized by allopathic health providers and claimed by the community as a legitimate health resource. The women's contribution to the young in facilitating the unlocking of internal power and resilience through storytelling, which further builds character, deserves recognition by all.

According to the Bomvane older women, there is a strong relationship between relationships and sickness. They see nurturing relationships through respect, with older people respecting young people and vice-versa, as the cornerstone to good health with healthy homes making healthy villages. They see part of their contribution to healthy villages is to assist in nurturing the youth to be respectful individuals who understand the culture of AmaBomvane and participate respectfully in the activities of their villages. Like the Maori (Durie, 2004), by whom health was measured according to their participation in tribal activities, being included in family celebrations and the ability to make Bomvane beer for ancestral reverence served as a yardstick for wellness. Being healthy entailed being fully engaged in the functions of AmaBomvane people in a respectful culturally acceptable manner (Jansen, 1973; Bùhrmann & Gqomfa, 1981, 1982); Bùhrmann (1983, 1984, 1987). This participation in village activities was and is the yardstick that is used for measuring the health status of an individual in their villages.

Lately, the healing vocation and knowledges of the Bomvane older women are at risk of being lost because of the changing mores within their community. The migration of the middle generation of AmaBomvane families to the cities for economic security, with some dying of HIV and AIDs, has left the Bomvane older women having to change their roles. Previously, they were the educators of the young, and now they must undertake the heavy duty of caring for the home and their young grandchildren.

In view of the challenges that the Bomvane older women are currently facing, I have considered if the current (and Western) education systems in the area could assist with supporting the older people in these rural communities in managing the pressures, risks, and anxieties of this modern living? In other words, can there be a reciprocal sharing of resources and knowledge that can allow for a mutual exchange of wisdom. For example, can the social media resources of Snapchat, WhatsApp, and Facebook as mobile technologies that can deliver information and offer support networks, be of assistance for the older people in indigenous communities such as KwaBomvana? Can the existing allopathic health care systems and educational institutions in this area respectfully join hands with the older people of this community through a mutual enhancing of the health of the home? While there is also a possibility of doctors and health professionals trained in Western medicine working collaboratively with the elite older Xhosa women and indigenous healers. As part of decolonizing the curriculum, elite women could be integrated within the school system, teaching the youth of their culture and health remedies. One of the biggest challenge is that the carriers of indigenous health knowledge are dying with this knowledge system. Could the new technologies capture and transform the important role that is played by the older people as knowledge holders and reservoirs of experiential knowledge for future generations? These technologies could be used to capture oral history and stories as knowledge and evidence of health practices which could be used as reservoirs of indigenous health knowledges and used to decolonize the health science curriculum.

In the final section of this chapter, Lucia (a PhD student) and Lindsey (one of her two supervisors) discuss how they have worked together and learnt from each other. This journey of mutual learning was in many ways unexpected and has brought many rich rewards for both. Lucia has more confidence in her self-knowledge and thinking, and Lindsey is now less fearful of serious long-term mental illnesses, her own and those of the students and clients that she meets.

Learning from and with the Other

The supervision of a PhD project brings many rewards and challenges. As the journey begins, it is never clear how it will develop, and so many different factors can come into play in a process that can take between 4 and 8 years. To our knowledge, there has been a PhD thesis written about the experiences of students in a supervisory relationship (Kirkland, 2018), and a psychosocial understanding of the parallel dynamics that can occur in supervision alongside the topic (Jervis, 2012). In many ways, what Lucia and Lindsey are writing about is echoed in the seminal work of Casement, published in 1985, “On Learning from the Patient.”

In this section, Lucia and Lindsey look at what reciprocity means in their work together as supervisor (Lindsey) and PhD student (Lucia). The study is on trauma and psychosis, and Lucia has chosen an autoethnographic methodology that uses a psychoanalytic analysis of her lived experience of psychosis and recovery. Lindsey begins with her reflections on being a PhD supervisor, and Lucia continues the story with her experience of being supervised. The reason for Lindsey to “go first” in this section is to contextualize a pivotal moment in their relationship, which, before writing this chapter, neither Lucia nor Lindsey had fully recognized or discussed with each other!

Lindsey Writing About Her Relationship with Lucia

What has been essential, in my experience of postgraduate supervision, is a need for an authentic relationship between the student and the team of supervisors, and a genuine interest in the topic. To date, I have been very fortunate with regards to these “essential” elements. Each student and each topic have illuminated my knowledge and understanding of the subject, and all the research projects have endeavored to understanding human beings and their relationships with the world.

In a recent Times Higher Education (THE) article, Buitendijk (2021:2) suggested that “universities should partner with students instead of treating them like passive recipients of our supervisor knowledge.” These seemingly glib words, which echo much of the popular call for “student led” education, do not convey the wonder and delight that I can have experienced in learning with and from Lucia. It also does not express the deep fears I had as the PhD began about Lucia's well-being and the times when I have taken comfort from her discussions on the lived experience of her psychosis.

Meeting Lucia

In 2012, a university colleague, Professor Wendy Bryant, asked me if I could meet with one of her research assistants, Lucia Franco, who had written an account of her psychosis. In her essay Wendy had told me, she had mentioned Freud. "You know about that Lindsey," she said, and left Lucia and I to make contact. I read Lucia's account of her psychotic illness and her exploration of its origins. It was remarkable, Freud was indeed mentioned in it, and Lucia had written a description of a traumatic event that occurred when she was a young woman and followed on with an in-depth analysis of its long-term consequences. Lucia and I had many conversations over her writing style, not the content, and the following year Lucia had it published in a journal (Franco, 2013). Lucia asked me one day, "do you think I could do a PhD on the topic of how the unconscious layering of trauma could lead to psychosis (her hypothesis)?". "Absolutely," I answered. What I had not anticipated was the hurdles created to her registration by health science research committees that were afraid she would cause harm to others by exploring their experience of psychosis and that her methodology would not lead to empirical evidence. She was finally accepted by the social science faculty, whose senior researcher, Professor Dany Nobus, said he had seldom read such an eloquent and well-reasoned PhD proposal.

Lucia is in the final part of writing her thesis. We meet regularly and I enjoy our conversations. She never takes knowledge at face value and has read the original work of key psychoanalytic authors to make sense of their theories. She has seen links between Bion's work on thinking with Winnicott's formation of the "false self." She has read the work of Ferenczi (recently "back in fashion" in psychoanalytic thinking) and she has summarized and interrogated their work. She has explored the work of Searles and recently she and I read Bollas's description of his analytic work with people in the acute stage of their psychosis: "Catch them before they fall" (Bollas, 2012).

Lucia, having experienced many psychotic episodes, has recovered and returned to explore their meanings. She is a person whose experience is applied to theory, and not the other way round. She will argue that in her experience it is important to know the cause of a breakdown, not simply say "it cannot be known." She does not accept that all emotional vulnerabilities develop in childhood and her long-term goal is that health professionals should listen out for the experience of trauma which may be hidden within psychotic symptoms. Without this knowledge about the meanings of the symptoms, the illness may persist. All these things I have learnt from Lucia. I did not know them before. She has used theory to test it against her lived experience. At times, it seems to have given her validation and words to express her understanding; at times, it frustrates her because she knows something different.

There is a term used in the UK for people who offer educational programs insights based on their experience; they were previously called “service users” and now the term is “expert through experience.” I think that this too can be a glib term, unless like Lucia, they have used their experience in the service of further knowledge. Her methodology is autoethnographic and so she tests her experience against the published knowledge of others. She has said that doing much of this work has allowed her to recover.

Breaking Down and Breaking Through My Fear

There was a moment last year, when I had met Lucia to discuss her work, when I felt a wave of deep sadness pass over me. She had told me that with the work she was doing, many of her symptoms were receding and, with it, she was able to feel connected to others and could enjoy things again. I began to think this was more than surviving her illness but moving beyond it into a world of color and appreciation. I asked her “Do you feel joy now?”, “Oh yes” she said, “I have the full range of feelings now.” I began to cry, I could not stop it; Lucia smiled at me. I was pleased that she was well and remaining well, and at the same time, I was filled with a sadness that for many years she had suffered from an absence of recognition of her illness and, at times, outright discrimination because of her “diagnosis.” This discrimination was time lost, never to be recovered. Perhaps it was also my sadness that I could have done more, done better, if only I had known what I had come to learn from her about people who had psychosis. I had been afraid of psychosis because of the way the symptoms had been explained (taught) to me with an emphasis on medical language, e.g., “delusions of grandeur,” “paranoid features.” This medical model language does not describe or seek to understand the experience of that person, or their attempt to communicate with others. Now I see psychosis as a symbolic language, and an attempt by the person to communicate their distress and confusion, in other words, an attempt to connect with another mind that is willing to listen.

Lucia Writing About Working with Dany Nobus and Lindsey

One of the consequences of being diagnosed with paranoid schizophrenia is that suddenly you are not considered a valid and responsible human being. “What I say may not be real, I do not know what I am talking about.” Things are changing compared to 40 years ago when I was first diagnosed with paranoid schizophrenia; at the time, an old-fashioned psychiatrist said to me “You are abnormal now and you have to accept you will be abnormal for the rest of your life.” While I do not think anyone would say that to me now, I find that a little of this attitude is still in many.

Confidence and Self-Belief Building

When I started working with Lindsey, I did not believe it entirely when she complimented me on my work or my understanding. I had lost belief in myself, and it was hard for me to accept her words as real. However, Lindsey's initial work with me on an article I had written gave me the courage to try and publish it. I trusted that if she thought that my work was good enough to publish, then I had to try. I was also feeling more confident about her having helped me with the writing. Gradually, over the years, I was doing my PhD research, under Lindsey and Prof. Dany Nobus's supervision; I have become more confident, more able to believe in myself, in my abilities, and in my work. This confidence is something that I understand to be normal when doing PhD studies with regular supervision. In my case, however, my being taken seriously, my gradually realizing that I was indeed understood and valued by Lindsey, contributed greatly to my improving my mental health and, in turn, I believe, my academic work abilities.

That day, when I could see the tears in Lindsey's eyes, at my expressing my newfound ability to experience joy and other feelings, was perhaps the most crucial moment that told me that she had understood how my condition affected me and how much I was improving. My feeling understood by Lindsey has played an important part in my being able to feel connected to others. My alienation from people, which was a consequence of prejudice (mine and others) and my condition, started to diminish considerably after that event. That meant that my research felt more real and meaningful, but also my life with others became more meaningful. This shift happened gradually, but it came from feeling really understood.

I never felt a psychiatrist to be understanding when I spoke of my improvement, nor did I normally feel them believing in the self-analytical work I had been doing. I think that believing what people with psychosis say, and believing in their capacity to understand themselves, can contribute both to their mental health and increase other people's understanding, while reducing prejudice. It can also improve sufferers' abilities to achieve better work and status in society.

One aspect of my research focuses on how a false self becomes central in psychosis and how the true self remains hidden and unable to find expression. Researching other theorists has given me more insight into my psychosis that has allowed me to progress further in my recovery. The entire process of doing the research has helped in recentralizing my true self.

Continuing Prejudice and Discrimination

I once tried to publish in a journal that focuses on psychosis; one reason why I was rejected was that as an autobiographical article, it had to be shorter and only academic articles could be that long. I am still puzzled, as I thought that doing PhD research studies qualified me as an academic. Other journals give the reason for rejecting my papers, as they are not publishing auto-ethnographical works but focus on professional writings. I am still puzzled. I have accepted that this battle will continue. It has been the focus of my life to go against discrimination and prejudice. In my research, I try to make psychosis intelligible and not a crazy, meaningless phenomena.

Where the Difficulty Can Lie

When the university initially had difficulties accepting my research, I was not particularly affected by their attitude. This was not because the matter was not upsetting, but rather because, since my diagnosis, I have repeatedly encountered resistances from the whole of society from recognizing and accepting my skills and abilities. I have learned to live with it.

Society said, and largely still says, I am potentially dangerous, I cannot be relied on, and I cannot be trusted. The university was only following what the medical model has repeatedly said about schizophrenia. Society fears schizophrenia and often fails to see the human being behind the diagnosis. Who I am and what I am capable of was not in focus.

I am not advocating a total disregard of the knowledge provided by medical science concerning schizophrenia or psychosis, but I am advocating a more holistic approach where the individual is considered from its entire humanity, not only from the partial, incomplete view of one model of understanding. We still do not fully understand psychosis, and many of society's fears are fears of the unknown. An open attitude of wanting to learn from the other is necessary, rather than the defensive approach of a medical diagnosis, predetermined treatment solutions, and prognosis predictions that can prevent knowledge and understanding emerging from the coproduction of knowledge between patient and therapist.

Some Further Reflections

The PhD research has been a source of difficulties; I had a psychotic episode at one point and some of the writing on the topic I found contrary to my understanding in general. It is hard work to study and research, especially in the recent COVID-19 situation, where being isolated and not seeing my supervisors in person often felt discouraging and reduced my motivation to persevere in my research studies. It has also been a source of joys and rewards. I have overcome the difficulties with the help of my supervisors, and the joys and rewards have been made more possible by the relationship of mutual respect and understanding provided by the supervision relationships I have had.

Concluding Comments

In Saban's (2019) book "Two Souls Alas," a critical reflection on the work of Carl Jung, he quotes:

> For two personalities to meet is like mixing two different chemical substances: if there is any combination at all, both are transformed. In any effective psychological treatment, the doctor is bound to influence the patient; but this influence can only take place if the patient has a reciprocal influence on the doctor. You can exert no influence if you are not susceptible to influence. (Jung, 1929, para.163)' pg. 182.

This quote supports the emphasis in this chapter that to learn with and from the "other," there has to be an acknowledgment of vulnerability on the part of the "doctor," i.e., therapist, health professional, academic researcher, etc. In the field of disability studies, this reciprocity of vulnerability has been an ongoing concern since the "nothing about us without us" political slogan became an embedded philosophy in academic institutions and an ethic of care in all health care organizations. But here is the rub: many people in positions of power and privilege find it hard to forgo their sense of importance, even a belief in their omnipotence. What may lie behind this sense of ultimate authority is a projection of frailty, neediness, and vulnerability onto those who are seen as "other." Hoggett (2000) has described the "hatred of dependence" that is embedded in neoliberal cultures of individualism and competition with others. Vulnerability is seen as existing in others, not ourselves, and this view perpetuates the notion of "survival of the fittest," as Benjamin in her later work describes, only one can survive. What this way of thinking and being in the world does not recognize is how we are irreconcilably interdependent on each other, a world view encoded in the African term "Ubuntu," encompassing a value of our humanity being bound up in each other "I am because you are" (Archbishop Desmond Tutu). How then can we move beyond the binary positions of able and disabled, or as Benjamin (2018) puts it, of "doer and done to"?

We have proposed that by establishing authentic and reciprocal relationships, we can learn from and with the "other," which potentially creates new knowledges, and perhaps more pertinent offers health care providers and academic institutions with the emotional support to continue their work. This notion of establishing reciprocal relationships moves beyond the idea of work having an emotional cost or being an "emotional labour" (Smith, 1992). We have described the emotional gains and intellectual benefits of such partnerships; it is what we have termed "love's labour found."

To return to the work of Benjamin (1990), she has said that when the dynamics of opposition, oppression, and hatred can be survived, there can be an emergence of love and an appreciation of what the "other" can bring.

> Winnicott's thesis suggests a basic tension between denial and affirmation of the other (between omnipotence and recognition of reality) . . . The wish to absolutely assert the self and deny everything outside one's own mental omnipotence must sometimes crash against

> the implacable reality of the other. . . .When the destructiveness damages neither the parent nor the self, external reality comes into view as a sharp, distinct contrast to the inner fantasy world. The outcome of this process is not simply reparation or restoration of the good object, but love, the sense of discovering the other. (Benjamin, 1990, p.192)

The last 2 years of COVID-19 has shown us how much we need to rely on each other, from neighborhood schemes and support networks to check on vulnerable or shielding persons through to sharing worldwide research evidence and hopefully, very soon, the distribution of resources from countries who have an excess of vaccines to those who do not have enough. We, the authors, sincerely hope that by sharing our experiences and knowledges within this chapter, we will encourage all therapists, researchers, and persons with disabilities and their family members to form active and critical partnerships that extend what is known, understood, and communicated about (in essence) being human.

Leadership and Disability Studies: Inclusive Development

Contents

Abstract

There can be little doubt that sociology has played a key role in our understanding of the process of disablement. Yet most sociologists have ignored the onset of disability as defined by activists and organizations controlled and run by disabled people. As a response, the latter half of the last century saw the rise of a radical critique of conventional thinking and research on disability in universities and colleges. All of which ultimately led to the creation of a new interdisciplinary area of critical enquiry: that of disability studies. Consequently, this chapter traces the origins and subsequent activism of these developments with reference to world-leading protagonists in the United States of America (USA) and the United Kingdom (UK).

Starting with the onset of capitalism and its detrimental effects on disabled people, this chapter demonstrates how the re-interpretation of disability by disabled activists during the 1970s has had an important impact on the perceptions and analysis of disability within and beyond universities and colleges in the UK and the USA. Although these developments were to be welcomed – as it signified a growing recognition of the importance of the issues raised – it also, as

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_22

the chapter illustrates, needs to be treated with some caution. In particular, the recent and growing individualization of disability studies within the academy by some disability scholars signifies nothing less than a reaffirmation of traditional academic values and the effective de-politicization of the discipline with little relevance beyond the sterile confines of the university seminar room. Accordingly, the chapter argues it is a prerequisite that this stance is overcome and subordinated to the social model of disability in order to fully instigate a tangible sense of social justice/inclusion. Only then can the difficulties and obstacles facing disabled people be effectively opposed and overcome.

Introduction

There can be little doubt that sociology has played a key role in our understanding of the process of disablement. Yet most sociologists have ignored the onset of disability as defined by activists and organizations controlled and run by disabled people. In the latter half of the last century, for instance, this phenomenon generated a radical critique of conventional thinking and research on disability in universities and colleges. All of which ultimately led to the creation of a new interdisciplinary area of critical enquiry: disability studies. Initially, however, disability activists and writers working in disability studies played a crucial role in reshaping our knowledge of disablement. Nevertheless, such a state of affairs often resulted in an uneasy relationship between organizations controlled and run by disabled people and social scientists. By contrast, recent years have witnessed a significant deterioration of this antagonistic relationship and, as a consequence, raised serious questions about the future of disability studies and the struggle for a fairer and more just society (Barnes & Mercer, 2010; Oliver & Barnes, 2012).

Consequently, this chapter traces the origins of these developments with reference to the United States of America (USA) and the United Kingdom (UK). Most definitely, disability activism in these two countries has had the greatest influence on the development of disability legislation and services both nationally and internationally. That said, special emphasis is given to the UK as it is there “where both the social model of disability and the academic discipline of Disability Studies first developed” (Slorach, 2016:14). To begin with, though, this article looks at the challenge – dating back to the turn of the twentieth century – to orthodox thinking on the processes of disablement and the politicization of disability by disabled people and their organizations. In turn, the writings of disabled activists and their organizations, the emergence of disability studies, and its subsequent influence beyond academia will be examined.

The Politicization of Disablement

In the broadest sense, the politicization of disability can be linked to the rise of capitalism in the middle of the nineteenth century, working class activism, and the rise of the labor movement. Certainly, the accompanying “charity ethic” led to a growth of charitable organizations concerned with the welfare of the “handicapped”: notably the “blind,” “deaf,” and “crippled” (Topliss, 1979). Indeed, these groups were relatively successful in raising public awareness and encouraging the state to take some responsibilities for their welfare. However, these organizations were controlled by non-disabled people and so perpetuated the notion that disabled people were objects of charity and unable to take control of their own lives. In turn, this resulted in a growth of sheltered workshops for specific groups of disabled people and eventually the politicization of disability by disabled activists themselves.

A notable example of which is the *National League of the Blind and Disabled* (NLBD) which was an organization run exclusively by disabled people. Emerging out of sheltered workshops “for the blind” in 1893, the NLBD was affiliated to the Trades Union Congress (TUC) in 1902 and the Labour Party in 1909. By employing what today would be termed direct action, the NLBD went on to fight for employment rights and benefits. Under the banner “Justice Not Charity,” they organized a march of blind people from the north and south west to Trafalgar Square, London, in 1920. This action was the push that led to the introduction of the “Blind Persons’ Act” (1920). In many respects, this Act was the forerunner to legislation “making money available to assist disabled people.” Yet despite this apparent gain, they had to organize another march in 1933 against low wages and poor working conditions (Barrett, 1996:40).

These trends continued well into the twentieth century, and it was not until the arrival of Britain’s welfare state – with its principle of “cradle-to-grave security” (Beveridge, 1942) – that further changes occurred. This meant that the then labor government took complete control over state welfare provision for disabled people and their families. Although the government was theoretically responsible for all disability services, representatives of established charitable agencies were concerned that this undermined their role as service providers. In turn, this resulted in a complex mixture of provision by state-run local authorities and an expanding voluntary sector often subsidized and supported by the state. Prominent examples of which included *The Spastics Society*, started in 1952 (and re-named *SCOPE* in 1994), and *The Leonard Cheshire Foundation* founded in 1948 (Oliver & Barnes, 1998).

Despite the affluence of the post-war years, and the increase in public services, it quickly became apparent that disabled people and their families’ needs were not being met. And even where their needs were acknowledged, provision was often inappropriate and oppressive. Notable examples included the segregation of disabled people into long-stay hospitals for the “chronically sick and disabled” or residential institutions for “severely” disabled adults (Oliver, 1983) and the segregation of disabled children into “special schools” (Barton, 1986). There was also a growing awareness of the poverty and deprivation among disabled people and their families due to the escalating costs of living with impairment in a disabling society (DA, 1975). By contrast, growing disillusionment among service users generated a realization that if they wanted better services and benefits, they had to get involved in alternative provision and protest. This disillusionment prompted the rise of self-help and user-led organizations (Oliver & Barnes, 1998).

Conflicts between inmates and staff in long-stay hospitals and residential homes generated calls for community-based support (or “independent living” as it came to be known) alongside appeals from the “National Campaign for the Young Chronic Sick

(NCYC)" as many young disabled people were having to live in "geriatric hospitals" (Davis & Davis, 2019). To make matters worse for disabled people, the turn of the 1950s witnessed Britain recovering from the austerity and poverty of the war years, and the economy was beginning to boom. But for most disabled people and their families, it was "just as bad as it had always been" (Campbell & Oliver, 1996:52).

The campaign for a national disability income then emerged as a way of helping disabled people receive a share of the affluence emerging at that time. A major player in this campaign was the *Disablement Incomes Group* (DIG). Formed in 1965, DIG was important because – despite not being an organization strictly controlled and run by disabled people – it was led by disabled activists Megan du Boisson, Mary Greaves, and Peter Large. It also brought together other advocates with variety of differing impairments. Later, however, Peter Large and colleagues formed the *Association of Disabled Professionals* (ADP) in 1971. DIG, on the other hand, started in 1974 the *Disability Alliance* (DA) which was a broad-based coalition of organizations of and for disabled people in pursuit of a "comprehensive disability income" (DA, 1975).

Significantly, the formation of DIG brought together several disabled activists who would later become key figures in the formation of Britain's disabled people's movement. These key figures included Paul Hunt, Vic Finkelstein, Ken and Maggie Davis, and Rosalie Wilkins who quickly became disillusioned with the single-issue approach of DIG and the DA (Campbell & Oliver, 1996). Paul Hunt, a disabled resident in "Le Court" (the first "Cheshire") home, is widely regarded as the driving force in the development and politicization of disability in Britain during the 1960s and 1970s. As well as producing the first important book of essays by disabled people about living with disability (Hunt, 1966), discussed below, he inspired others by writing about disability in the popular press, disability journals, and newsletters. He also wrote numerous letters of encouragement to disabled people seeking advice and was pivotal in residents' struggle for control of their situation in the "Le Court" institution by organizing strikes and a management takeover (Hunt, 1966). In collaboration with others, he founded the *Union of Physically Impaired Against Segregation* (UPIAS) which provided the infrastructure and fundamental principles for future political representation for disabled people (Campbell & Oliver, 1996).

At the turn of the 1960s, the tension between those favoring the single-issue incomes approach of DIG and DA, and those inclined toward the more radical oppression approaches, had intensified. In response, Paul Hunt placed a letter in the *Guardian* newspaper which was instrumental in the formation of UPIAS:

> Severely physically handicapped people find themselves in isolated unsuitable institutions where their views are ignored, and they are subject to authoritarian and often cruel regimes . . .I am proposing the formation of a consumer group to put forward nationally the views of actual and potential residents of these successors to the workhouse. We hope to formulate and publish plans for alternative kinds of care . . .[we] would be glad to hear from anyone who is interested to join or support this project. (*Guardian*, 20th September 1972:no page)

Although Hunt received responses from a few disabled individuals, notable examples included Vic Finkelstein, Ken and Maggie Davies, Dick Leeman, and Rosalie

Wilkins, most responses came from charities and non-disabled people asking for more information. Consequently, he circulated the same letter to journals and newsletters of other disability organizations including the "Magic Carpet" newsletter of the apolitical *Disabled Drivers Association* formed in 1948.

Over its lifetime, UPIAS had around 141 members including 40% women and 60% men. Membership is probably being at its highest in the mid-1970s with around 50 members. Annual membership was £I or less for applicants who could not afford it and was only open to disabled people. Associate members could attend meetings, but not take part in policy discussions, nor vote or hold office. At the outset it was agreed that UPIAS was not a charity or a limited company. The group operated through a series of circulars in which all decisions regarding the election of officers, policy, and practice were open to discussion. Eighty circulars were produced between 1973 and 1990. And, in many ways, the content of these documents was like the conversation threads in the social media platforms of today (Baldwinson, 2019).

In response to criticisms that UPIAS was only concerned with issues relevant to people with physical impairments, Hunt sent a proforma to enquirers in 1975 which stated:

> We want to stress that the Union does not claim to represent or speak for other disabled people. On the contrary, we recognise that conflicting views exist amongst disabled people, and we wish to make clear what these differences are. (Baldwinson, 2019:9)

Widely regarded as a "think tank," UPIAS was the political vanguard that worked alongside non-members in various forums. Its involvement was considered important for adding clarity of thought to others' policies and campaigns: hence contributing to a further growth of user-led disability organizations in the 1970s. Important examples include the *Spinal Injuries Association*, 1974; *National Union of the Deaf*, 1976; and the *Liberation Network of Disabled People* (LNDP) in 1979. In 1975, core members Vic Finkelstein and Rosalie Wilkins were involved in the development of Britain's first television program, *Link*, which dealt purely with disability issues (Barnes, 1992).

Moreover, UPIAS members also became more aware of disability activism in other countries. Their records showed that Paul Hunt had been in ongoing correspondence with the *Anti-Handicap* project in Sweden and activists in Germany, New Zealand, and the USA (Baldwinson, 2019; 12). Of particular interest were alternative solutions to residential care. Examples included the *Fokus* project which started in Sweden in the early 1960s and subsequently spread to Denmark, Holland, and West Germany. The Fokus project involved the construction of wheelchair access to housing with 24-hour support staff for disabled residents (Ratska, 1996), and, when following its lead, this led to the development of Britain's first-ever user-led "care" attendant scheme by the Spina Injuries Association (SIA), a founding member of UPIAS, and the *Grove Road Integrated Housing Schem*e which opened in 1976 (Davis, 1981). Two years later, the *Disability Information and Advice Line* (DIAL UK) followed (Davis & Woodward, 1981). Both of the latter involved Ken and Maggie Davis.

By the late 1970s, UPIAS membership was in decline. Some members had become inactive; others felt that UPIAS thinking had become muddled and too theoretical and should pay more attention to policy instead. Non-members viewed UPIAS as elitist and male dominated. Further, UPIAS morale was dealt a bitter blow by the death of its founder, Paul Hunt, on the 12th of July 1979. He was only 42 years old. By 1981, however, United Nations (UN) held its first *International Year of Disabled People* (IYODP) which acknowledged the UPIAS idea that society needed to change in order to eliminate the exclusion of disabled people. When UPIAS proposed that the growing number of organizations controlled and run by disabled people should come together to form a national umbrella organization or council, it received widespread approval and support. On the 13th of June, UPIAS chaired a meeting of eight organizations controlled by disabled people to discuss this idea with five other organizations keen to be involved. It was agreed that this new umbrella organization should be called the *British Council of Organisation of Disabled People* (BCODP).

A steering committee was put together, and its first meeting was held 3 weeks later which produced a draft constitution. The establishment of BCODP triggered a further growth of user-led disability organizations. Although it was initially criticized for its failure to address questions of impairment, gender, racism, learning difficulties, and mental health, by 1995, it had 106 member organizations representing over 400,000 disabled people (Campbell & Oliver, 1996:182).

In 1981 the increasing politicization of disablement globally prompted the formation of *Disabled Peoples International* (DPI), an international umbrella for organizations run and controlled by disabled people. It emerged out of the anger of 200 disabled delegates at a two and a half thousand strong *Rehabilitation International* (RI) conference held in Winnipeg in 1978, Canada. They left because they were refused representation on the organizing committee for the forthcoming 1981 IYODP. Three BCODP delegates – Vic Finkelstein, Stephen Bradshaw, and Francine White – attended the DPI's first world congress (Driedger, 1989). Indeed, the relationship between BCODP and DPI lasted well into the new millennium (Oliver & Barnes, 2012).

Besides having a major impact on policy and practice across the world, disabled activists and their organizations generated a wealth of data with their books, policy statements, articles, and research reports. Even though much of this work had little impact on the social sciences generally, it did, nonetheless, form the bedrock of what would later become disability studies. Unlike developments in Britain, however, disability activism in the USA began in American universities. Consequently, we begin our discussion of the road to disability studies with events in America.

The Arrival of Disability Studies

Although there was an upsurge of disability activism during the "Great Depression" of the 1930s by the *League of the Physically Handicapped* in New York, its impact was limited by the onset of World War II. The post-war disability rights movement began with the admission of a polio survivor with quadriplegia, Ed Roberts, to a new residence program at Berkeley's University of California in 1962 (Slorach, 2016; 129). Inspired by the American civil rights movements, Roberts became a role model for other disabled people who joined him on campus. Together, they campaigned for self-advocacy and services with which to live independently. And on receipt of a grant from the US Office of Education, they formed the *Physically Disabled Students Program*. It was the first of its kind on a college campus and the beginning of the *American independent living movement* (ILM). By challenging the core American values of self-reliance and consumer rights, they demanded an end to medical professionals' control of disability policy and the incarceration of disabled people into institutions. The first center for independent living (CIL) opened in Berkeley California in 1971, providing peer support, referral services, general information, and advocacy training (Shapiro, 1994).

The rhetoric of independent living and the idea of CILs quickly spread across the USA. A major catalyst for the further development of these ideas was the 1977 White House Conference on Handicapped Individuals which attracted over 3000 delegates. This conference triggered the production of a host of books and articles on disability by academics and activists in the USA and Canada. Much of this work is linked in one way or another to structural functionalism (Parsons, 1951), role theory (Kasserbaum & Bauman, 1965; Gordon, 1966; Saffillios-Rothschild, 1970), symbolic-interactionism (Bowe, 1979; Davis, 1961; Goffman, 1961, 1963; Scott, 1969), and health.

Erving Kenneth Zola, also a polio survivor, made a substantial contribution to the development of disability studies in America. He was a trained medical sociologist at Harvard University, and his dissertation explored the different perceptions of pain and behavior when accessing medical help in three cultural communities: Irish Americans, Italians, and Jews in Boston (Zola, 1996). He was also chair of the medical sociology section of the American Sociology Association, the founder of *Disability Studies Quarterly*, and a founding member of America's *Society for Disability Studies*. As a scholar in the symbolic interactionist and pragmatist traditions, his later work focused on the experience of impairment and disability and "the universalising of disability policy" (Zola, 1989).

Nonetheless, the emphasis on rugged individualism, free market capitalism, and the American brand of democracy, which has remained remarkably consistent over centuries, continues to effect how disability is defined and responded to in the USA. Hence, disability is typically perceived as an individual medical problem "with which the disabled person must deal." Consequently, and with a few notable exceptions such as Davis (1995), Charlton (1998), and Russell (1998), American disability studies was "characterized by a general lack of historical sensibility and disconcerting insularity" throughout the 1990s (Albrecht, 2002:32–33). As a result, the root causes of established responses to impairment remained unchallenged and "untheorized" (Barnes & Mercer, 2010; Oliver & Barnes, 2012). Undoubtedly, this response is especially disconcerting given the politicization of disability internationally (discussed above) and the profound changes to our understanding of the causes of disablement generated by disabled activists in the UK, which date back to the early 1960s.

In fact, one of the first books to challenge the established "able bodied" orthodoxy on disability was *Stigma: The Experience of Disability* (1966) edited by Paul Hunt. It comprised of twelve personal accounts on living with disability from six disabled women and six disabled men. These were chosen from over 60 responses to Hunt's letter published in several national newspapers and magazines requesting contributions. The aim was to avoid "sentimental autobiography" or a "preoccupation with medical or practical details of a particular affliction."

In his chapter, *A critical condition*, commenting on the experience of disablement, Hunt argued that the "problem of disability lies not only in the impairment or function and its effects on us individually but more importantly on relations with 'normal' people." Disabled people "are set apart from the 'ordinary' in ways that see them posing a direct challenge 'to commonly held social values by appearing 'unfortunate, useless, different and sick''" (Hunt, 1966:146). On discrimination he noted:

> Employers turn away qualified and competent workers simply because they are disabled. Restaurants and pubs give transparent excuses for refusing our custom. Landladies reject disabled lodgers. Parents and relations fight the marriage of a cripple into their family—perhaps with more reason than with a black African, but with many of the same arguments. And it's not hard to see the analogy between a racial ghetto and the institutions where disabled people are put away and given enough care to salve society's conscience. (Hunt, 1966:156)

Following its formation in 1974, UPIAS published its first *Policy Statement* in which it introduced a radical redefinition of disability that breaks the link between disability and impairment:

> What we are interested in, are ways of changing our conditions of life, and thus overcoming the disabilities which are imposed on top of our physical impairments by the way society is organized to exclude us. In our view it is only the impairment that we must accept. (UPIAS, 1974:5)

A year later, four UPIAS delegates met with a corresponding number of delegates from the *Disability Alliance* (DA) to discuss the latter's invitation for UPIAS to join their campaign for a national disability income. As the lack of an income is a symptom and not the cause of disabled people's oppression, they declined the offer. They also explained how the DA's strategy would not address the root cause of disablism with reference to their definition of disablement. From the DA's perspective, impairment was linked to defective limbs or mechanisms of the body, but for UPIAS disability was:

> . . .the disadvantage or restriction of activity caused by a contemporary social organisation which takes no or little account of people who have physical impairments and thus excludes them from the mainstream of social activities. (UPIAS, 1976:14)

Subsequently, the restriction to "physical impairments" was dropped to incorporate all physical, sensory, and cognitive impairments. This was due to some conditions, both congenital and acquired, affecting all bodily functions, and in a disablist society, all impairments, whatever their cause, have to a greater or lesser degree negative physical and psychological implications. In addition, impairment-specific labels may well have relevance when accessing appropriate medical and support needs, but they are usually imposed rather than chosen and, therefore, socially and politically divisive (Barnes, 1985).

Thereafter, the UPIAS definition was adopted and adapted by national and international organizations controlled and run by disabled people. These included the BCODP and the DPI. Initially, with respect to linguistic differences across the world, the DPI adopted the terms "disability" and "handicap" (DPI, 1982). A decade later DPI Europe opted instead to use impairment and disability (DPI, 1994b). Moreover, BCODP and DPI's stated policy revolved around the promotion of grass roots organizations and the development of public awareness of disability issues in the struggle for equality. The slogan "nothing about is without us" has been embraced by disabled people's organizations around the world (Charlton, 1998).

Britain's first disability studies course, *The handicapped person in the community*, was conceived and developed by an interdisciplinary team at the *Open University* (OU) in 1975. Vic Finkelstein, a disability activist, member of UPIAS, and social psychologist, was a major influence on the development and delivery of this module. The OU was an appropriate location for this course as it signaled a new and innovative approach to distance learning in university education. In its first year, the course recruited over 1200 students.

As disabled people were increasingly involved in the production of teaching materials, the OU course was updated twice and renamed *The Disabling Society* in 1993 to reflect its wider content before its closure in 1994. The OU team generated a wealth of material that provided the basis for the development of a whole host of disability studies-related courses and professional training schemes at both the undergraduate and postgraduate levels in colleges and universities across the UK (Barnes et al., 2002). This material and other recently published works focusing on disability in Britain including *The Meaning of Disability* (Blaxter, 1976), *Poverty in the United Kingdom* (Townsend, 1979), *The Politics of Mental Handicap* (Ryan & Thomas, 1980), and *Disability: Whose Handicap* (Shearer, 1981) led Mike Oliver, a disabled activist and lecturer, to coin the phrase "social model of disability." This model was his contribution to a collection of five papers edited by a practicing social worker, Jo Campling, entitled *The Handicapped Person: A New Perspective for Social Workers*. Notably, UPIAS had been corresponding with the British Association of Social Workers (BASW) since 1977 (Baldwinson, 2019; 15).

Although not a UPIAS member, Oliver was teaching a module on disablement on social work courses at the University of Kent, whereas Campling's previous work had included *Better Lives for Disabled Women* (1979) and *Images of Ourselves: Women with Disabilities Talking* (1981). Both focused on women's experiences of living with impairment in Britain in the 1970s. Oliver's initial aim was to provide an accessible key to understanding the importance of the UPIAS definition of disability and its implications for policy and practice for social work students. The social model is, therefore, a "heuristic device" or aid to understanding which entails the adoption of the following key principles. First, it is not a denial of the importance or value of appropriate individually medical, re–/habilitative, or educational interventions. Second, it is a deliberate attempt to shift attention away from the functional limitations of individuals onto the problems caused by disabling environments, barriers, and cultures.

In short, the social model of disability is a tool with which to provide insights into the disabling tendencies of modern society in order to generate policies and practices to facilitate their eradication. For advocates, impairment may be a human constant, but "disability" need not and should not be. Although the social model has been linked to several sociological theories of disablement (Priestley, 1998), it is generally associated with materialist accounts (Barnes 2003; Barnes & Mercer 2010; Oliver & Barnes 2012). Moreover, following a presentation to an invited audience at an international 2-day conference entitled *Changing attitudes and the disabled: issues at stake* – funded by the World Rehabilitation Fund in September 1979 – Finkelstein published *Attitudes and Disabled People* (1980), the first materialist account of the creation of disability.

By adopting a three-stage evolutionary model of European history, he argued that disability, the oppression of disabled people, emerged as a direct result of the advent of capitalism and the exclusion of people with impairments from employment during industrialization, mass production, and wage labor. Pre-industrial economies were mainly cottage based and agrarian, and while disabled people were at the foot of the social hierarchy, they were not excluded from economic participation. He suggested that the then emergent post-industrial society would herald the emancipation of disabled people with the aid of new technology and work with others to achieve common goals.

Nevertheless, Finkelstein's analysis has been criticized for its oversimplification and mechanistic, "unscientific" account of social relations within the economy. Namely, he fails to acknowledge the oppression of disabled people prior to the industrialization and the positive role of professionals involved in their care and rehabilitation thereafter (Stubbins, 1979). Also, he was seen as overly optimistic about the role of technology in the empowerment of disabled people. Rather, technology can be both empowering and disempowering for disabled people (Sheldon, 2004). Even so, Finkelstein's monograph stimulated much needed further work on the creation of disability as a social construct.

A particularly important example is Mike Oliver's *The Politics of Disablemen*t (1990). He argued that definitions of disability and other social problems are related to both the economy and associate ideologies and cultures. He explained the rise of liberal utilitarianism, individualism, and the medicalization of impairment came about as result of capitalism's need for a workforce physically and intellectually able for the demands of industrialization. It is not only the changing economy but also the corresponding changing ideologies that precipitated what he calls the "personal tragedy theory of disability" (Oliver, 1990:27). Of particular poignancy, Oliver's argument centered on a) the role of ideology and its reflection in popular culture in the social creation of disability and b) medicalization as social control. More specifically, medical professionals rise to prominence in institutions for "sick and disabled people" (i.e., for those who could not or would not conform to the demands of the new factory-based system). This, in turn, gave rise to notions of the "able-bodied individual" (Oliver, 1990:79).

Likewise, the 1980s witnessed a host of activity on the disability front including the flowering of a burgeoning "disability culture." In 1975 the television program *Link* provided a platform for an emerging disabled group identity and culture which brought to light the unprecedented growth of disabled poets, musicians, artists, comedians, and entertainers. All of which provided stimulus for a range of newsletters and magazines produced by and for disabled people and groups (Morrison & Finkelstein, 1983). Examples included Liberation Network of Disabled Peoples' (LNDP) *In from the Cold* published between 1981 and 1987; *Coalition* the magazine of the Greater *Manchester Coalition of Disabled People* (GMCDP) first published in 1986; and DAIL (Disability Arts in London) the following year.

The first 2-day conference on disability culture, "Supporting the cultural expression of disabled people through the arts," was held at Lancashire College, Chorley, in September 1986 (Finkelstein, 1986). Despite constant funding difficulties, conferences, performance, and exhibitions continued into the early twenty-first century (Barnes & Mercer, 2010:203). 1986 also saw the launch of the first international academic journal for writers and researchers concerned with disability by Mike Oliver and Len Barton. Entitled *Disability, Handicap and Society*, and renamed *Disability and Society* in 1992, its aim was to provide a forum for alternative ways of thinking to the "personal tragedy theory of disability" which had hitherto dominated disability theorizing and policy (Oliver, 1996: 5).

Furthermore, the 1980s witnessed added intensification of the politicization of disability with, for instance, the 1980 publication of the *World Health Organization's* (WHO) first attempt to provide a universally acceptable definition of disablement. Produced by Dr. Philip Wood at the UK's Manchester University, this was a three-stage model like the one used for Britain's first national disability survey in the late 1960s (Harris et al., 1971), whereby "impairment" represented abnormalities of the body and mind, and "disability" is the functional limitations that flow from impairment, while "handicap" was defined as:

> . . .a disadvantage for a given individual, resulting from an impairment or a disability that limits or prevents the fulfilment of a role that is normal (depending on age, sex, social and cultural factors) for that individual. (WHO, 1980:27–9)

Clearly in contrast to the UPIAS (1974) and DPI (1982) definitions, this model is based on "able-bodied" assumptions of normality and impairment and/or disability and are the main causes of *handicap* as represented as disabled people's economic and social disadvantage (Oliver, 1990).

A year later "Project 81: Consumer directed housing and care" began operations. This project was a scheme developed by inmates at the Le Court Cheshire Home and local authority councilors in Hampshire. It provided indirect payments, in lieu of institutional services, to pay for personal assistants enabling disabled people to live independently in the community (Evans, 1993). In 1985 the *Derbyshire Centre for Integrated Living* (DCIL) produced an operational framework for service support which included the “the seven needs for independent living.” This framework involved information, counseling (peer support and advice), accessible housing, aids and equipment, personal assistance, and transport (Davis, 1990). By 1989, the *Hampshire Centre for Independent Living* (HCIL) added the needs for education, employment, income, and advocacy (Barnes, 1991a).

The growing demand for independent living prompted the British Government in 1988 to set up the *Independent Living Fund* (ILF) with a budget of five million pounds. This fund was distributed by a national agency that provided direct payments (DPs) to disabled individuals to run their own support services. But demand quickly outstripped government estimates, and it was closed to new applicants in 1993. It was replaced with the *Independent Living 1993 Fund*, albeit with restrictions on who could apply and the level of payments that could be made. Thereafter, support was only available with local authority approval as new applicants had to apply to their local authority (LA). Yet, LAs were not compelled to award DPs unlike the ILF (Oliver & Barnes, 1998). All LAs were legislatively required to do was to inform “would be” disabled applicants that they were eligible for DPs: hence access to DPs was commonly referred to as a “postcode lottery” (Priestley et al., 2007). In the interim, the ILF was scrapped in June 2015.

Parallel to the aforementioned developments, the campaign for legislation to outlaw discrimination against disabled people gathered at pace in the 1980s. In 1982, for example, *The Committee on Restrictions Against the Disabled*, CORAD, published its report. Chaired by the disabled activist Peter Large, the committee was set up in 1978. It located the problem of discrimination in inaccessible public buildings, housing, transport, education, and employment. In so doing, it made several recommendations including the need for legislation to secure human rights for disabled people. The newly elected conservative government and the “big disability charities” were unimpressed (Oliver, 1990). That same year the first attempt by a deaf Labour MP, Jack Ashley, to get an anti-discrimination law through Parliament was defeated. Over the next decade, nine other attempts to outlaw discrimination against disabled people were also unsuccessful.

Even so, in 1985, the *Voluntary Organisations for Anti-Discrimination Legislation* (VOADL) was formed. This formation proved to be an uneasy alliance between organizations run by disabled people, like BCODP, and those for disabled people, such as The Spastics Society, run by non-disabled people. As the latter were lukewarm about rights legislation, the campaign for ADL was led by the BCODP. The spread of *Disability Equality Training* (DET), a method of conscience-raising, by BCODP member organizations (Gillespie-Sells & Campbell, 1990) led to a further radicalization of large sections of the disabled population. Yet even then, it was not until the BCODP published *Disabled People in Britain and Discrimination: A Case for anti-discrimination legislation* (1991) that the conservative government and the big charities acknowledged that disablism was a major problem (Oliver & Barnes, 1998).

With funding from the Joseph Rowntree Foundation and Charity Projects, the BCODP research committee under the chair of Mike Oliver commissioned Colin Barnes to provide evidence of the extent of discrimination encountered by disabled people. Barnes, a special school survivor with a congenital visual impairment and disabled parents, had completed a PhD in sociology at the University of Leeds. His undergraduate 17,000-word dissertation “Discrimination against disabled people (causes, meanings and consequences) or the Sociology of Disability” was produced in 1985, and his PhD thesis was published in 1990 under the title *Cabbage Syndrome: The Social Construction of Dependence* (Barnes, 1985, 1990).

Following studies of racism and sexism in Britain, Barnes argued that discrimination against disabled people is “institutionalised in the very fabric of British society and supported by history and culture” (Barnes, 1991a:3). Hence, the BCODP study included a history of disablism in British society and substantive quantitative evidence, based on government statistics of the unequal treatment of disabled people in key areas. These included education, employment, benefits, health and social support services, the built environment, leisure, the media, and politics. It concluded by arguing for a comprehensive anti-discrimination policy and financial support for a nationwide network of organizations of disabled people “as it is these organisations that have put institutional discrimination on to the political agenda, and which are best suited to ensure its eradication” (Barnes, 1991a:232–33).

One thousand summary leaflets were produced and circulated to all BCODP member organizations for distribution (Barnes, 1991b). The findings were subsequently presented, by members of the research team, across Britain and Europe including the first *European Disabled Peoples Parliament*, Brussels, 1993 (DPI, 1994a). Moreover, as Barnes was teaching on a part-time basis in the School of Sociology and Social Policy, University of Leeds, while working on the BCODP project in 1990, the “school” became the home of the BCODP Research Unit. Nevertheless, the BCODP Research Unit operated independently within a wider university-based *Disability Research Unit* (DRU), established in 1992 and later the *Centre for Disability Studies* (CDS) in 1998 until BCODPs collapse in 2006.

By 1991, Mike Oliver ushered in a new approach to researching disablement known as “emancipatory disability research” founded on social model principles that placed disabled people and social model insights central to the research process (DHS, 1992). This approach was adopted by staff within the DRU/CDS who conducted research on a host of disability issues including “Disabling Imagery and the Media” (Barnes, 1992), on independent living and personal assistance, “Making Our Own Choices” (1993), “Cash for Care” with the Institute for Public Policy Research (IPPR) (Zarb & Nadash, 1994), “Measuring Disablement in Society” with GMCDP (Barnes, 1995), and “An Evaluation of Services Led by Disabled People” with the National Centre for independent Living (NCIL) (Barnes et al., 2001).

Likewise, in 1999 CDS was involved in a 2-year project with the Norwegian Association of People with Disabilities and the WHO Disability and Rehabilitation Team’s “Rethinking Care from the Perspectives of Disabled People” (WHO, 2001a, b), whereas in 1995, CDS conducted research on access to the built environment with the University of Malta and the Malta Federation of organizations of persons with disabilities (Prideaux, 2006). In terms of dissemination and teaching, all first-year undergraduate sociology and social policy courses at Leeds had included lectures on disability based on social model insights since 1990; it introduced Britain’s first fullblown disability studies program in 1992. It began with a 30-credit optional course, “An Introduction to Disability Studies,” open to all second- and third-year undergraduates across the university.

A post-graduate (PG) “Diploma/MA in Disability Studies” scheme followed in 1993/4. The PG courses were made available as distance learning options in 1998. These PG courses were open to anyone with a first or second social science degree, comparable academic qualifications, or relevant experience. Crucially, the latter qualifying criterion was especially important in recognition that mainstream education systems are generally not inclusive. And this was particularly evident in most of Britain’s colleges and universities (Harrison et al., 2009). Consequently, it was especially important these courses were open to disabled people wishing to study in higher education. Even though the university has no accurate figures before 1999, the PG disability studies program had attracted over 650 students, including 55 research students. Almost 50% were from outside the UK, and many were disabled (Westmorland, 2020).

The DRU was also a pioneer of online communication and social networking. A disability-research email discussion list server was established by PhD students, Mark Priestley and Emma Stone, in December 1994. It was the first global forum for the exchange of information among disability researchers and activists. It still has over 1300 subscribers. Early conversations focused on definitions and models of disability, drawing contributions from North America, Australia, and Europe as well as the UK (Priestley, 2020). Over the next two decades, the DRU hosted a series of groundbreaking conferences and seminars on disability issues and research for researchers and activists. Examples included “Exploring the Divide: Illness and Disability” (1995), “Doing Disability Research” (1997), “Disability and Development” (1999), and an *Economic and Social Research Council* (ESRC)-funded seminar series on implementing the social model. Topics included theory (2004), policy (2004), and Europe and the majority world (2005). Each of these events yielded an edited collection of articles published by the *Disability Pres*s.

Using previously generated research funding, the *Disability Press* was set up in 1995. It followed several unsuccessful attempts to get an edited collection of papers from the conference, *Exploring the Divide: Illness and Disability,* published by other publishers. From the outset, the main aim of the *Disability Press* was to reach as wide an audience as possible. All prospective authors were asked to avoid, wherever possible, unnecessary academic jargon and terminology, and all publications were produced in several formats. Items published between 1995 and 2000 were available in standard format, a large print version or a Braille copy produced by *The Royal Nation Institute for Blind*’s (RNIB) transcription unit and then housed in the university’s Equalities Unit. Subsequent publications were available in standard format and/or CD on request. The *Disability Press* ceased to operate in 2013.

Eleven of the sixteen *Disability Press* publications are now available to freely download via the *Disability Archive UK*. The archive was set up by the DRU in 1999. Its aim was to provide disabled people, students, and researchers access to the wealth of writings of disability activists, researchers, and allies whose work may no longer be accessible elsewhere. It contains over 600 items including books, research reports, journal articles, and gray literature (Barnes, undated). Indeed, the demand for a disability studies agenda across Europe began in 2002 due to a concern expressed by disabled people's organizations about the lack of European social model research. Thereafter, the European Commission funded a Europe-wide "Academic Network of European Experts" (ANED) in 2007. This involved universities and non-government organizations (NGOs) from 35 countries. It was led by CDS until the UK government's decision to leave the EU in 2017. The network published more than 500 research reports and developed a cross-national database of disability policies and statistics in European countries. It led to a new European journal of disability research and society, *Alter,* and an annual European conference (Priestley, 2020).

Since the turn of the new millennium, there has been a notable growth of interest about disability in universities across the world. There are now disability studies courses and specialist journals, conferences, and seminars in many countries. There are also networks of researchers studying a range of disability-related issues in Europe, the Nordic countries, the USA, and Australia. Similar networks are now appearing across the globe more generally and particularly in Africa, where CDS at Leeds played an integral role in developing disability studies programs in collaboration with Disabled People South Africa (DPSA) and University of Cape Town; South America; and Japan and Taiwan (two influential East Asian locations in which CDS undertook extensive lecture/activist tours between 2008 and 2010) to advocate for the application of studies based upon the social model of disability. All of which have generated an increasingly expansive literature from various perspectives including sociology, philosophy, history, cultural studies, social policy, psychology, and geography (Barnes et al., 2002; Goodley, 2017; Watson & Vehmas, 2019). Importantly, all this activity and greater awareness has raised poignant questions for those working in this area of enquiry. Not least of which is how has the growth of disability studies affected societal responses to people with impairments?

Disability Policy, Disability Studies, and its Future

There is little doubt that the combination of the growth of disability activism and disability studies has been a key factor in the development of policies to address the oppression of disabled people both nationally and internationally. Examples in the UK include the setting up of the ILF (1988), the introduction of the *Disabled Living Allowance* (1992), *The Disability Discrimination Act* (DDA) (1995), and the *Disability Rights Commission* (DRC) (2000). In addition, 1995 saw the then Labour Government Cabinet Office publishes the report *Improving the Life Chances of Disabled People.* By adopting an explicit social model approach, it promised much with reference to policies for education, employment, access, and support for local CIL-type organizations and the setting up of the *Office for Disability Issue*s to oversee their implementation (Cabinet Office, 2005:78). An amendment to the DDA in 2006 introduced the *Disability Equality Duty* (DED). Unlike previous policies, this was a proactive measure mandating all public organizations and institutions to produce plans to make the necessary changes/adaptations to facilitate disabled people's inclusion. These schemes were to be reviewed and amended every 3 years until equality was achieved (DRC, 2006).

Sadly, the rhetoric was not matched by practice. The DDA and DRC were both scrapped in 2006. The DRC was replaced by the *Equality and Human Rights Commission* (EHRC), while the DED was replaced by an *Equality Duty* and the *Equality Act* which was introduced in 2010. Both of which were intended to cover all forms of discrimination. So inevitably disability issues were no longer prioritized. Thenceforth, the leading organizations in the disabled peoples' movement were marginalized. On the other side of the coin, the BCODP's gradual decline began in 1992 when the campaign for ADL was joined by the big charities and compounded by the formation of NCIL and the DRC at the turn of the decade. To compound issues, changing government funding priorities for the voluntary sector meant that these organizations had been submerged into partnerships with the big disability charities. There was also a significant decline in the number of local user-led disability organizations operating across the UK as they were unable to compete with the government-sponsored voluntary sector for local service contracts.

The prospect of an improvement in the life chances of disabled people in the UK was dashed by the coming to power of the conservative government in 2010 (Ryan, 2019) following the global financial crisis that began in the USA in 2007 (Harvey, 2010). Their solution to the economic crisis was a drastic reduction in spending on disability benefits and services. There followed a decade of austerity which demonized disabled people as work shy and benefit scroungers. Newspaper coverage of this issue was reminiscent of that used by the Nazi party in Germany prior to the holocaust in the 1930s. Access to benefits and services was tightened with the introduction of a stringent new disability tests based on the WHO's *International Classification of Functioning, Disability and Health* (ICF) conducted by government-funded private-for-profit agencies and insurance companies (Jolly, 2013:1).

In 2015 the UN conducted research on state-level violations of disabled people's human rights in the UK. In 2017, its findings showed that the conditions for disabled people in Britain were tantamount to a human catastrophe. The UN concluded that the British state was failing in its duties toward its disabled citizens in everything from housing and employment to education and social security (Disability Rights UK, 2019; Ryan, 2019).

Elsewhere, the WHO launched the ICF in Geneva in 2001. Its aim was to provide a universally acceptable language and scientific tools for the measurement of disablement by bringing together the medical and social models of disability into one construct: "the biopsychosocial model of disability." Like its discredited predecessor the ICIDH, it is a concept that has three elements: "impairment," "activity," and "participation." Prominently, though, the terms activity and participation replaced "disability" and "handicap." But unlike the ICIDH, the ICF acknowledges that the entire disablement process is subject to environmental influences.

Nonetheless, it retained the assertion that impairment is the main cause of disabled people's disadvantage in its methodology, language, and title, "the biopsychosocial model of disability." Methodologically, far greater emphasis was given to measuring impairment than activity and participation, whereas the word "disability" was described as a negative term encompassing both a person's limited functioning and disabling barriers but is linked to individuals with the use of the phrase "people with disabilities": thus, the traditional assumption that disability is an individual rather than a societal problem was reaffirmed. In addition, if the environment influences all three elements of the ICF model, then surely the logical title should be the "socio-psycho-biological" (Barnes, 2011; Oliver and Barnes, 2012). Yet that is/was painfully not the case.

Moreover, despite its continued promotion by researchers, the WHO, UN, and World Bank and national governments, there are growing doubts about its usefulness for policy development and implementation. The incidence of disablement within and across nation states is historically, culturally, and situationally variable (Ingstad, 2001; Miles, 2001) and therefore a socio-political issue: an aspect that was sadly missing or deliberately omitted from the ICF model (Barnes & Sheldon, 2010). Therefore, the expressly "apolitical," "scientific" approach of the ICF "does not solve the problem the policy analyst needs to solve" (Bickenbach, 2009:120). Even so, the ICF was used for the WHO and World Bank's *World Report on Disability* (2011). Acclaimed as an "astonishing achievement" because it has the three pivotal insights of single-handedly shifting existing paradigms, making "utterly novel recommendations" and raising "issues never-before considered by people with disabilities" (Bickenbach, 2012:654). As indicated above, however, there was nothing new about the ICF apart from its spurious claims to political neutrality, the supposed novelty of its recommendations or even the issues raised.

What *is* astonishing is the way in which those involved in this report ignored previous attempts to address the problem of disability. The growing international interest in the oppression of disabled people can be traced back to the 1970s and the UN *Declaration of the Rights of Mentally Retarded Persons* (1971) and *the Declaration on the Rights of Disabled Persons* (1975). These declarations were followed by the UN's designation of 1981 as the *International year of Disabled Persons* and the pronouncements of 1983-1992 as the *Decade of Disabled Persons*, *The Asian and Pacific Decade of Disabled Persons* (1993-2002), *The African Decade of Disabled Persons* (2000-2009), and *The Arab Decade of Disabled Persons* (2003-2012) (Barnes and Mercer, 2010:254). Decisively, two further initiatives omitted from the WHO report. First, there was no mention of the UN's *Standard Rules on the Equalisation of Opportunities for People with Disabilities* (UN, 1993) which comprised of 23 rules to facilitate the inclusion of disabled people in all aspects of daily living. Second, the 36 recommendations of the WHO's own 2001 Disability and Rehabilitation Team report, as discussed earlier, were correspondingly and sadly missing.

It is also notable that the ICF has been widely accepted by disability studies scholars and researchers, some of whom were involved in the production of this report as a successor to the "outdated ideology" of the social model of disability (Shakespeare & Watson, 2001). Similarly, the principles of emancipatory disability research have been all but abandoned in favor of more academically acceptable social research methodologies such as critical realism (Watson, 2019). In conjunction with the advent of postmodernism and calls for bringing impairment back in

(Thomas, 1999; Tremaine, 2002), what now passes for disability studies reads more like the sociology of health and illness, rather than the discipline of its founders. Most discussion in today's disability studies takes place in colleges and universities. The majority of those involved write for expensive academic books and journals using language which is often impenetrable to a lay audience and with a content of little relevance beyond the academy, the very opposite of what is needed (Sheldon, 2006; Barnes & Oliver, 2012; Slorach, 2016).

A Final Word

This chapter has demonstrated how the reinterpretation of disability by disabled activists during the 1970s has had an important impact on the perceptions and analysis of disability within and beyond universities and colleges in the UK and the USA. While this is to be welcomed as it signifies a growing recognition of the importance of the issues raised, it should also be treated with some caution. The recent and growing individualization of disability studies within the academy by some disability scholars signifies nothing less than a reaffirmation of traditional academic values and the effective de-politicization of the discipline with little relevance beyond the sterile confines of the university seminar room.

In view of the enormity of the challenges facing disabled people in the coming decades, both nationally and internationally, this begs the question: what's the point of doing it (Barnes & Mercer 2006)? In this respect, it is noticeable that – for reasons still to be explored – the retirement of Colin Barnes in 2014 has left CDS in Leeds bereft of its early dynamic. As mentioned earlier, *Disability Press*, for example, met with its demise in 2013, the CDS "Disability Archive" contains only one informal presentation by Colin Barnes written in 2016 and one CDS briefing by Anna Lawson and Mark Priestley in 2021. Moreover, the groundbreaking CDS "off-site/overseas" Postgraduate Diploma/MA in Disability Studies via Distance Learning for international and/or disabled students has ceased for the foreseeable future, while the various "master" programs on disability have been suspended/abolished since 2020 leaving only one full-time university-based MA in disability studies. There will be no distance learning provision despite the desperate need for such provision arising from the onset of the COVID-19 pandemic.

Clearly, if those who claim to be working in disability studies continue to shy away from the root causes of disablement as defined, promulgated, and instigated by the discipline's founders and subsequent activists, then the struggle for a fairer and more just society and its future must surely be limited if not terminal (Sheldon, 2006). Indeed, the abovementioned decline in critical dissemination of the enlightening possibilities for disabled students (which is clearly becoming apparent) bears ample testament to the premature fatality of both the discipline and future activism before the aims, objectives, and desire to establish true, all-encompassing equality, inclusion, and human rights for disabled people are achieved.

Part V

Qualitative Research

Qualitative Research: Introduction

24

Paula Campos Pinto and Huhana Hickey

Abstract

Since the 1990s on, we have witnessed an explosion of disability qualitative research, recently boosted by the adoption of the Convention on the Rights of Persons with Disabilities and its call for participation of persons with disabilities in all spheres of life, including research (Flynn et al., *Qualitative Research, 21*(2), 234–250, 2020; Johnson, *British Journal of Learning Disabilities, 37*, 250–256, 2009). Qualitative researchers use a variety of methods to develop deep understandings of how people perceive their social realities and, in consequence, how they act within the social world. From diaries to open-ended questionnaires, from visual documents to participant observation and ethnography, these tools and methods enable rich accounts of the lived experiences of research participants, always complex and multidimensional, in ways that quantitative approaches can never do. This is the reason they are well suited to disability research. The aim of this section is to outline and discuss the epistemological, methodological, ethical, and practical issues that arise from doing qualitative research with persons with disabilities, in a variety of contexts, particularly those who are not part of the majority. In this introduction, after briefly presenting past and current debates on qualitative critical disability methodologies, we present the five chapters that compose this section.

In a 1992 well-known paper, Mike Oliver critiqued the traditional ways of doing disability research as "alienating" and claimed for new "social relations of knowledge production" in disability research. The change required the development of

what the author termed the emancipatory research paradigm, defined as research that takes account of disability as political rather than individual or social problem, and thus allies with disabled people in their struggles for power and inclusion (Barton, 2006). "Disability is not measles" would also add Marcia Rioux and Michael Bach (1994) to stress the importance of research that examines the social, economic, political, and legal constructions of disability, and thus positions disability as social status that needs to be problematized, instead of cured or eliminated. In these new research agendas, that abandon the singular positivist approaches of the past, "empowerment and reciprocity are central," and qualitative methodologies, although not the only possible research strategy, are "encouraged" (Rioux, 1994, pp.6).

Since the 1990s on, we have thus witnessed an explosion of disability qualitative research, recently boosted by the adoption of the Convention on the Rights of Persons with Disabilities and its call for the participation of persons with disabilities in all spheres of life, including that of research (Flynn et al., 2021; Johnson, 2009). Qualitative researchers use a variety of methods to develop deep understandings of how people perceive their social realities and, in consequence, how they act within the social world. From diaries to open-ended interviews, from visual materials to participant observations and ethnography, these tools and methods enable richer accounts of lived experiences, which are always complex and multidimensional, in ways that quantitative approaches can never do (de Groot et al., 2019). This is the reason they are well suited to disability research. An in the continuing journey to debunk structures of oppression and discrimination in the lives of persons with disabilities, making visible the invisible and audible the voices previously ignored or silenced, methodological innovations have not ceased to emerge in the field, creating new spaces and possibilities for research ownership, while granting "new horizons of theorizing" to disability knowledge production processes (Milner & Frawley, 2018). Inclusive research (Nind, 2017; Walmsley & Johnson, 2003; Walmsley, 2001) is, perhaps, one of the most recent and promising avenues being explored, as are research approaches that challenge dominant North-centered perspectives and engage with Indigenous knowledges and intersectional identities and experiences.

The aim of this section is to outline and discuss the epistemological, methodological, ethical, and practical issues that arise from doing qualitative research with persons with disabilities, in a variety of forms and contexts, particularly those who are not part of the majority.

To accomplish this goal, we invited a diversity of authors from the Global South and North, from different disciplines and different generations. With this diversity of contributors, we sought to bring together multiple perspectives and uses of qualitative methodological approaches that could enrich our exploration of the topic.

Moreover, in line with the goals of the edited volume, we looked for input from researchers with experience in applying qualitative methodologies that are grounded on the social and human rights model. We particularly sought for research that attempts to reach marginalized disability communities, such as Indigenous people, children, girls and women, and persons with intellectual and complex disabilities.

Tristram Ingham, Bernadette Jones, Paula Toko King, Kirsten Smiler, Helena Tuteao, Gabrielle Baker, and Huhana Hickey write a collective piece that explores the potential of Indigenous Māori research epistemologies and methodologies for disability research. Themselves a group of Indigenous Māori researchers with lived experience of disability, the authors introduce us to the Kaupapa Māori Research (KMR) paradigm, "an emancipatory, transformative paradigm" that draws on *pūrākau*, as a form of Māori narrative for storytelling that encapsulates lessons learned, and *wānanga*, as a form of creating knowledge from such stories and narratives. In quite an interesting way, the chapter itself is structured around this narrative framework, illustrating the potential and richness of these methodologies for gathering, sharing, and making sense of Indigenous disability experiences, while also challenging the ableism, institutional racism, and the enduring legacy of colonialism on research, as well as on the lives of disabled Indigenous Māori in Aotearoa New Zealand.

Jorge Manhique and Action Amos' chapter pursue this conversation, from the perspective of research exploring experiences of disability and mental health in the African continent. Two early career researchers, Manhique and Amos draw from their postgraduate research projects to reflect upon the crucial role of language more specifically as a framework that constitutes a significant part of that legacy. Language frames discourses and conceptualizations of disability and therefore in some sense, colonial power is perpetuated in much qualitative research on disability in the Global South when colonial languages are used "as tool to gather data" and "to 'describe' the experience of disabled subjects in journal articles." The authors thus provide examples of strategies they used to disrupt such power and create more inclusive and respectful research practices that further the interests of persons with disabilities, rather than contributing to their continuing oppression and exploitation.

Anne Marie Callus's piece describes the origins and development of inclusive research with persons with intellectual disability, bringing in some examples to illustrate its applications and potential. She delves into some of the challenges involved in doing inclusive research, particularly those related to nondisabled researchers providing adequate support to disabled coresearchers without keeping control over the research project and outcomes. Inscribing inclusive research in the larger paradigm of participatory and emancipatory research, the chapter emphasizes the promising prospects of inclusive research in supporting self-advocacy and the empowerment of persons with disabilities, including those with more complex needs.

Eduarda Pires' chapter, on the Mosaic approach, is the report of such an experience. For her PhD in sociology, Pires is conducting ethnographic research with children with multiple and complex disabilities, in the context of animal-assisted therapy sessions in two school settings in Lisbon, Portugal. The Mosaic approach involves a wide range of qualitative methods and tools (e.g., narratives, photovoice, drawings, paintings and crafts, games, classroom boards, and rag dolls, to mention a few) which taken as a whole enable a more comprehensive understanding of children's lives and experiences as they create spaces for the participation and the voices of children with various levels of abilities and needs. In describing the process of cocreation and application of these methods and tools, Pires discusses the ethical dilemmas encountered and the ways she dealt with them. Her chapter is a rich testimony of the potentiality of qualitative research to challenge notions of vulnerability and dependence, traditionally associated with disability.

Along similar lines, Xuan Thuy Nguyen, Claudia Mitchell, and Tammy Bernasky argue for the use of participatory visual methodologies as transformative approach to social justice. Drawing from a four-year project conducted with girls and women in Vietnam, the authors illustrate how these methods and tools can help transcend critical dialogues about disability rights in contexts of the Global South, while valuing girls and women with disabilities as knowledge producers and making their voice heard.

In short, the five chapters gathered in this section share some common threads. While exploring different approaches to qualitative research, they all join in emphasizing the potential of these methods to address power imbalances in the research process, empower persons with disabilities, including those more marginalized and invisible, and provide a platform for their "unknowing" voices (Milner & Frawley, 2018). Yet, as all authors also alert us, these are not simple processes. Rather they require a constant attitude of openness, self-reflexivity, dialogue, and responsiveness from researchers to tackle the complexities and address the many dilemmas and difficulties qualitative research is fraught with. Only then a transformative scholarship emerges, which truly aligned with human rights principles and practices, and can begin to understand and challenge the structures of oppression and wider relations of power affecting the lives of persons with disabilities in contemporary societies.

Abstract

Qualitative research methods show promise in building shared understanding of Indigenous experiences of disability and have the potential to address the power imbalances inherent in Western epistemologies methodologies, particularly (but not exclusively) when it comes to quantitative research.

This chapter explores indigenous Māori research epistemologies and methodologies for disability research in Aotearoa New Zealand. In particular, we highlight the methodologies of pūrākau (storytelling) and wānanga (workshopping) which serve as examples in the richness of Māori-centered understandings that both give prominence to and make sense of Māori experiences. We structure our discourse throughout the chapter within this narrative framework as an exemplar.

The chapter also provides indigenous perspectives from a Global South to identify the critical importance of understanding the ways in which colonization, coloniality, ableism, and racism have intersected in the lived experiences of indigenous disabled tāngata whaikaha Māori/whānau hauā.

Keywords

Qualitative research methodologies · Indigenous disability · Global south · Indigenous narratives · Māori · Pūrākau (story-telling method)

Introduction

> It appears that Māori in the ancient world who had impairment were people with god-like power and god-like status. They were known for the talents that they possessed, not for what they didn't have. As time progressed, this notion appeared to change... (Tikao et al., 2009, p.11)

Pre-colonization, Māori were inclusive of people with lived experience of disability and considered as whānau first or acknowledged as having particular gifts or contributions that added to the lives of the wider collective. However, the experience of colonization of Aotearoa/New Zealand brought with it different ideas and institutions that aggressively privileged Western ontologies and epistemologies (King, 2019). Alongside the proliferation of negative discourses surrounding disability, “Western hospitals” and similar institutional settings were introduced that were used to separate and punish people with lived experience of disability. Modern versions of these institutions based on the Western models of medicine perpetuated the violence to people with disability. They have also served to reinforce the invisibilization of tāngata whaikaha Māori and whānau hauā (Hickey, 2020).

Māori are the Indigenous peoples of Aotearoa (New Zealand) and make up around 16.7 percent of the total population (Stats NZ, 2020). Despite commitments made to Māori through Te Tiriti o Waitangi (The Treaty of Waitangi) in 1840 by the

British Crown, Māori health and disability inequities are "consistent, comprehensive and compelling" (Reid & Robson, 2007, p.3) and have been deemed as a breach of the principles of Te Tiriti o Waitangi by the Waitangi Tribunal (a permanent commission of inquiry) (Waitangi Tribunal, 2019). These inequities impact Māori with lived experience of disability (sometimes described as tāngata whaikaha Māori or whānau haua) although successive governments have failed to collect adequate data to be able to confidently quantify the unjust and unfair differences in outcomes (King, 2019). As a result, this Indigenous group is largely rendered "invisible," when it comes to disability identity discourse, the impacts of colonization, racism, ableism, and within the context of disability supports and legislation (Hickey, 2008, 2020; Hickey & Wilson, 2017; Jaffee & John, 2018; King, 2019; Velarde, 2018).

This chapter chooses to center the narratives of Māori researchers with lived experience of disability around their unique views of qualitative research. Underpinned by a Kaupapa Māori Research (KMR) paradigm, this chapter draws on pūrākau, a form of Māori narrative, and wānanga, a form of knowledge creation, to explore issues of ethically gathering and sharing Indigenous stories and knowledge and advocating for structural changes that address ableism, institutional racism, and the impacts of colonization and coloniality. Given this context, the chapter thus gives prominence to tāngata whaikaha Māori perspectives and interpretation.

The first part of the chapter provides an explanation of pūrakau and wānanga as Indigenous methodologies for sharing Māori knowledge via storytelling within a KMR paradigm. The second part of the chapter provides narrative extracts from the five researchers. This was both a chance for the researchers to share their lived experiences and perspectives in their own words and to build shared knowledge and understanding together. This process both validates and creates Indigenous knowledge and provides rich insights for Indigenous disability research.

Māori Methodologies: Pūrakau and Wānanga

Pūrākau has been described as a form of Māori narrative containing "philosophical thought, epistemological constructs, cultural codes and worldviews" (Lee, 2009, p.1). Researchers have highlighted how pūrākau have not only informed our uniqueness as tāngata whenua, but they are also a fundamental part of our identity (Pihama et al., 2019). The importance of pūrākau is in the teaching and learning of our tamariki and in the role of ancestral storytelling (Pihama et al., 2019). The term "pūrākau" relates to *te pū o te rakau* (the core of the tree) and specifically refers to the *pū* (base) of a *rakau* (tree) (Lee-Morgan, 2019). Pūrākau is a means by which "stories of the histories and traditions of *whānau*, *hapū*, and *iwi*, (families, subtribes, and tribes) were shared inter-generationally, including the formation of personal or tribal relationships, alliances, struggles and battles" (Pihama et al., 2019 p.140). Māori narratives have been described as containing life lessons with "deep, often hidden wisdoms that establish tikanga or principles that guide and shape behaviour" (Lawson-Te Aho 2013, p.64). Pūrākau are viewed by Māori as "fundamental to our sustenance and growth, as soil and water are to trees" (Lee-Morgan 2019 p.151).

As a Kaupapa Māori theory and methodology, pūrākau has been used in many ways. Pūrākau have informed "*kōrero ingoa* (naming stories) which are the meanings behind our names; how we choose, give, receive, change, and uphold our names throughout our lives" (Seed-Pihama, 2019 p.108). Pūrākau have been considered the ultimate paradigm for the conceptualization of mokopuna sovereignty rights to health and well-being in Aotearoa (King et al., 2018). Pūrākau have played a pivotal role in the recovering of mana wāhine stories providing "ritual maps that offer instructions toward inner-transformation and healing" (Murphy 2019 p.34). The ways in which tikanga and mātauranga are channeled in modern-day Māori contexts to provide safe and enriched approaches to childrearing and whānau well-being has been attributed directly to the use of pūrākau (Pihama et al., 2019). Pūrākau have also been used as a therapeutic approach to healing within the context of mental health and well-being, providing a medium through which whānau and individual challenges can be negotiated without using the vocabulary of psychiatry (Kōpua et al., 2019; Rangihuna et al., 2018). Stories are shared with tāngata whaiora and whānau via wānanga, contextualizing the challenges they face within their own lived experiences and emphasizing the transformational power of pūrākau through the privileging of Māori voices (Cherrington, 2003; Rangihuna et al., 2018).

Consistent with a KMR theoretical and methodological focus on politicized, culturally responsive, and transformative research, the authors recognize and acknowledge pūrākau as intrinsically pedagogical. In the embracing of Māori methodologies, pūrākau is the approach taken in this chapter to privilege voices of Māori with lived experience of disability within the context of wānanga as a process of creating knowledge. The Māori concept of wānanga emphasizes that, within Te Ao Māori knowledge is perceived to pre-exist in the world, rather than occur from the result of human output:

> The goal of the knowledge journey, therefore, is not so much the gathering of discrete pieces of humanly created knowledge but rather the 'cleansing of the lens of perception' whereby the world itself seems to speak (kōrero) to those who have the commitment and willingness to hear. . .knowledge and understanding arises in the consciousness of the individual contiguous with the progressive revelation of depth in the world. (Royal, 2011, p.5)

Just as our ancestors made sense of their experiential realities through the sharing of pūrākau (Pihama et al., 2019), so do the researchers who contribute their narratives and storytelling to the wānanga documented in this chapter. The researchers who share their voices in the next section are from a range of professional backgrounds, disciplines, and cultural origins, and all have lived experience of disability. They explore their legitimate perspectives of the challenges they face within an ableist and colonized society. Through the processes of pūrākau within the wānanga, each has undergone a creative process of the mind, resulting in a shift in awareness within themselves:

> *Ko ngā hua o te wānanga ko te aroha, ko te māramatanga.*
> The fruits of wānanga are *aroha* and *māramatanga*. (Royal, 2011, p.19)

Kaupapa (Purpose): Perspectives of Indigenous Researchers with Lived Experience of Disability

The following narratives are from five Māori researchers with lived experience of disability (refer to the appendix for their positioning) with four overarching themes providing an intersectional analysis of current and future disability research. These are 1) Tino rangatiratanga/self-determination over qualitative research, storytelling and sense making; 2) qualitative research and Māori ontologies and epistemologies, power, context, and connection; 3) challenges of qualitative disability research, paradigm clashes, status, barriers, institutional racism, and ethical issues; and 4) strengthening Indigenous disability research.

Tino Rangatiratanga/Self-Determination Over Qualitative Research: Storytelling and Sense Making

Huhana: I spent 17 years at Waikato University. In 2004, I started my research with Linda Waimarie Nikora and Ngāhuia Te Awekōtuku where we did disability support service research with Māori (Nikora et al., 2004). The recommendations of that research were simple – Māori should have tino rangatiratanga over their services. Research before and after this made similar recommendations, yet policy decision-makers have ignored the findings. I have been involved in research ever since. I have worked in qualitative more than quantitative research, mainly because I like the pūrākau or the story-telling aspect of qualitative approaches. In my PhD, I conducted interviews about pre-colonial views of Māori and disability (Hickey, 2008). I reached saturation quite quickly because they all said the same thing: “We did not segregate our whānau. We did not label them. We did not marginalise them. They were a part of our whānau.” It was that simple. From there, I have been dedicated to building a better understanding of who we are from a Māori perspective as [whānau] hauā, taking an empowerment view. Western ideology around [disability] identity is very deficit based, but Māori do not see us in that same way. Or rather, they didn’t. There’s a mixture of pre-colonial knowledge and bible knowledge which has impacted a lot of the knowledge around identity for disabled Māori. In my work I have been trying to expose, unravel, understand, and amend our thinking.

Kirsten: My long-term goal was not necessarily to become a researcher or academic, rather I wanted to do a lot of unpicking of what life is like at the “intersections.” I had a unique childhood; New Zealand Sign Language (NZSL) was my first and home language. In hindsight, it was a valuable experience; it gave us a differing orientation to the world. For me NZSL and Deaf culture was, and is, a way of being that belongs to my family and whānau. When I was younger NZSL was considered a bit “fringe,” not recognized by the speaking majority as a language; our family and whānau experienced the wider societal prejudices and discrimination as a consequence. It was a confusing place to grow up in. Society suggested we should be embarrassed by our differences, and yet my mother and her brother were proud of their language, community, and families. Growing up, I saw a societal shift in the status of NZSL especially after the NZSL dictionary affirmed the culture and language of our family, whānau, and community. Through their experiences, I learned the power of research, and how research can deeply impact people's lives across generations. As young children we were reminded about [how] our hearing privileges us and provides [us with] responsibilities to act as allies, to provoke, challenge, and seek justice. I wanted to unpick all these experiences more.

Up until my post-graduate study, I didn't see my experiences or the experiences of my family and whānau, reflected in any literature, nor could I find many people who could speak to that kaupapa with much authority, other than people from within the community who weren't in academic spaces, despite being very knowledgeable. It was sad that here were these really valuable and beautiful orators and philosophers, very intellectual people, whose knowledge was really just for those who understood the [sign] language. It was a real treasure, and we really needed to find ways for other people to access this wonderful knowledge. Like Huhana, I like the pūrākau aspect. I value NZSL, and qualitative research allows for the natural expression of perspectives and understandings which aren't necessarily represented in academia. NZSL is embodied in the moment (rather than in text); it's a dynamic experience. That's valuable to me and a main reason why I like qualitative research.

Helena: Having lived experience of disability is what attracts me to qualitative research. I do not have professional experience in qualitative research, but I am attracted to being a part of co-design and co-creation as a form of participatory research. That is what I am really attracted to: using stories, storytelling, collaboration, and co-creation.

Tristram: I started as an academic researcher working on a large cohort study, conducting quantitative epidemiological surveys and multicenter randomized controlled clinical trials (RCT). What I found in that context is that pure quantitative research, while it was good in many respects, really was not able to unpick the real-life barriers whānau were facing. That generated a strong interest and understanding of individual experiences and perceptions, and a move into more qualitative research, which is where I formed partnership with qualitative colleagues who I got to know quite well. For me, there are several aspects around qualitative research that are important. One is that it allows us to dive into intersectionality. The cumulative and differential impact of ethnic inequities and chronic health conditions and disability are related inequities; and qualitative research can put these complex paradigms into a true sociocultural context. This is essential for translating research into effective policy.

Bernadette: I started in quantitative research with my first research project and questioned why so few Māori were enrolled in the research; I wanted to know why we had not engaged with Māori researchers and why we had not engaged with Māori communities. There were even fewer tāngata whaikaha Māori involved in research, despite the project being about chronic respiratory conditions, which are in themselves disabling. I expressed my interest in designing our own qualitative studies, partnering with Māori communities, and finding out what Māori communities really wanted. I changed to qualitative research initially because the quantitative survey questions that existed were not validated for Māori. We found Māori participants did not understand a lot of the questions in the surveys, and largely these surveys only measured some of the gaps or inequities. They didn't provide explanations for why these inequities persisted or how the inequities could be eliminated. For Māori disability research, you have to start at the beginning and find out from tāngata whaikaha Māori themselves; you have to explore what they think the real issues are and what the solutions might be. This community perspective was in stark contrast to how we had been doing our non-Māori quantitative research.

Qualitative Research and Māori Ontologies and Epistemologies: Power, Context, and Connection

Huhana: We are told that without statistical analysis, research is not valid. But qualitative is broader than that. It's more personal. You can delve into history. It sits beautifully with Indigenous-based methodologies because you go beyond the evidence of data alone. If you want to know if something is black, brown, or white, quantitative data alone wont necessarily help, whereas in Indigenous methodology reflects that colour can be multiple shades. We look at things beyond what we see in often oversimplified data.

How do we know if Māori are accessing disability support services to the right level, and what is happening for those Māori who miss out on the supports? You can't find that out in quantitative data alone, you can't explore ideas further. With qualitative you can, and with pūrākau you can. You could find several rationales as to why Māori access health or disability services and importantly why they have not. That's the key difference for me around qualitative research; it sits within our oral histories. It sits beautifully within who we are as Indigenous peoples. We look beyond the basic evidence and delve into everything else that makes that person who they are.

Currently [for disability], we don't have an inclusive language. The only language is an impairment deficit-based language. If we had an empowerment-based model, like some Indigenous Māori researchers do, we [would] use terms such as "whānau hauā," "tāngata whaikaha," or "whānau whaikaha," and we know what we're talking about. Maaka Tibble once told me, there were over 200 words to describe blindness. They described their disability in a pūrākau, and everyone had a different experience of how they became blind. You might have had your eyes gouged out in a war and you'd have different words if you were born blind, or if you went blind with old age. Māori traditionally saw their impairment as a story and would talk about how they acquired [it]. "Ngāti Kāpō" is an umbrella term; it does not describe blindness to the fullness of all the blind Māori out there. "Whānau hauā" is an umbrella term to describe general disability, but within that people can self-identify. We coined a phrase "waka tūru" (moving chair), for people [with lived experience of] physical disability – a descriptive term rather than a literal translation. Indigenous people have the ability and the right to self-identify. I'm not just Indigenous but I'm also Māori, I'm disabled, I'm takatāpui, I'm a wahine. Non--Māori might say "I'm not Indigenous but I'm a wahine, I'm disabled and I'm Irish, and I'm straight."

I was born a month early and had difficulty with my lungs, but I survived, but I spent my childhood coughing up blood and I had chronic bronchitis. We know those terms today; they're the medical terms, but in the old days we would have talked about this baby came early, she was a taonga because she survived, and she survived with weak lungs. But then her journey is she became a runner, or she became this or that. It's all about the storytelling describing your abilities and who you are; it's not about your impairments. It didn't box you into an identity that was going to constrain and limit you.

Helena: My entry into qualitative research is in being part of a [community] co-design process. The leadership group was made up of equal numbers of disabled people, family, whānau, service providers, and local officials. But while it was equal in number of everybody sitting around the table, it was inequitable in terms of the barriers to participation and engagement that disabled people around the table had and also bearing in mind that they were the less resourced also. Disabled people needed resourcing to be able to contribute in a meaningful way.

The membership of the group was eventually changed to shift the balance toward disabled people and have fewer service providers involved. Processes were improved too, for example, giving tāngata whaikaha Māori the option of speaking first.

When we began to co-design the project, we knew that there were Māori who needed services but did not engage in the current system. We also knew there needed to be healing because of the traumatic process of us as Māori being divided by a deficit medical model and its system. The community had been fragmented over time by being separated and siloed into different impairment types because of how services were structured. We knew that we couldn't just go into the community and say, "Well, can you tell us what your good life looks like?". We had to start with healing. The good thing about co-design is that everybody is in the room. There are very different perspectives from lived experience. Officials and the service providers get to hear stories of lived experience as part of the process. These aspects of qualitative research generally and co-design specifically are very powerful.

Kirsten: Another strength of qualitative research is as basic as being able to use your language. Especially when your language is not represented in any academic texts, or you just don't see it in any media or public occasions. When you do qualitative research, there's a bit of a social performance that goes on. I think that in itself is a really valuable experience: just having a discussion in your first language embodying and exploring ideas. It is powerful and affirming for me as a researcher who wants to use NZSL, but also for the people I have had the privilege learning from. Through the process of people sharing knowledge, experiences, and understandings in their first language, you see the mana of language, affirming the connection between communities who use that language.

One challenge for me, as a NZSL user wanting to acknowledge the mana of the language, has been when it came time to "handle data." Qualitative filmed interviews in NZSL are often translated into a written language (usually English), and then we often rehandle the data in qualitative data analysis systems such as NVivo. Deducting or inducting from data using your memory or repeatedly watching recordings of visual language and then handling and triangulating this with the written translated text is a laborious and complex task. It raises questions about how we might dilute or misrepresent the content by altering the form of "data." There are also definitely tensions around how we should represent the qualitative data, so it can be understood by those who might need to be informed about a community's reality and perspective while meeting a community's expectations and being "visible" in the process.

Bernadette: I made the shift over to qualitative methodologies because the quantitative research was very much informed by a Western paradigm. It didn't allow for a Māori lens or influence. I'm thinking about a community partnership project where we went out to a local marae and started from the beginning by asking the local Māori kaimahi to tell us what issues the community identified as priorities and how they wanted this project to be designed and run. The qualitative approach allowed for that flexibility. We were also able to adapt the study as we went. I was taken out with the kaimahi in the area and shown how they work with whānau. Allowing that project to be shaped by the tāngata whaikaha Māori community permitted more inclusion of processes that were familiar to whānau, including tikanga embedded approaches led by whānau. It gave them the options of where they wanted interviews either in their homes, or on a marae, or a place of their choosing. "Mainstream" academic institutions were not "whānau friendly," which is one of the reasons Māori said research wasn't very accessible. Applying a Kaupapa Māori Research lens to this qualitative research made it more inclusive. For us, inclusion of key kupu te reo (Māori words) made participation in the research more familiar along with other cultural aspects such as providing space for karakia (prayer) and shared kai (food).

I think after nearly 20 years of research, I see the in-depth qualitative aspect as essential to inform robust quantitative research or any type of research. A mixed-method approach for tāngata whaikaha Māori combining qualitative research, followed by quantitative methodology, also is very effective. But you must do the qualitative part first, and you get the right questions from a tāngata whaikaha Māori perspective, so the survey questions are correct.

Tristram: In Aotearoa, the fundamental and overarching constitutional framework we collectively live, and work, under is that of Te Tiriti o Waitangi (Te Tiriti). This needs to shape and guide, certainly much more than it currently does in "mainstream" New Zealand, our approach to healthcare, service design and delivery, policy development, and establishing/maintaining genuine community partnerships. Considerable work has been done in Aotearoa about building a Kaupapa Māori Research paradigm (Smith, 2012). It started in education but has really moved across into health and other aspects of medicine and social sciences. It's really an emancipatory transformative paradigm. There's a lot of relevance of that principle-based paradigm that aligns really well with the intents of both the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) and the Declaration on the Rights of Indigenous Peoples (UNDRIP), insofar as both prioritize the individual or collective rights of individuals or whānau and the requirement for the system to partner with those groups in determining the way that services and community functions are undertaken. I think exactly the same is true in research, as in Te Tiriti, where tino rangatiratanga, or self-determination, is a critically important part of the research process.

What I really like is the richness of the qualitative aspects, particularly when using a Kaupapa Māori paradigm which is really principle based. It's been said that the journey is as important as the destination. As an emancipatory paradigm, it's important that the research itself is not taking away from whānau, that it is a positive contribution, one where the journey (the process and participation) is as important as the destination (the research outputs). So, qualitative interview styles, and other qualitative methodologies that we have used (e.g., pūrākau, phenomenology, interpretive phenomenology, photovoice), really allow whānau to self-define what is of importance and relevance for them and to steer the conversation in ways that makes sense to them. Even from a purely health literacy perspective, it makes sense to scaffold the questioning based on the understanding of the person.

We have seen this recently with trying to design quantitative questionnaires for disability, where we may use the Washington Group Short Set questions as a very rough proxy for impairment, but those questions do not cover the sociocultural context for disability and the process of disablement (Stats NZ, 2017). They certainly do not cover the intersectionality of culture and disability – where racism and ableism can have parallel and summative disadvantage. There is no single established kupu or word that is universally recognized and understood as representing disability. Even in English, it means different things to different people. In Te Ao Māori disability is not a concept that is natural to the population. It comes from a Western deficit paradigm and one that does not sit well for from a Māori world view.

That really alters the likelihood of someone affiliating with the term. We know from research, for tāngata whaikaha Māori or whatever term you use, on the whole we identify as Māori first, disabled second – if at all! It becomes very difficult to generate question sets that really understand and can demarcate the differences in disability experience, cultural paradigm, and world view of people that could represent the diaspora of lived experience. Those kinds of issues make it very difficult to design and validate quantitative questions; and yet these are areas where qualitative research can really have a rich kōrero around. The process of going through that kōrero can itself be a way of healing. A number of whānau have told us that actually just having a safe space to be heard and to feel listened to was in itself a positive intervention for them on that journey to healing.

Kirsten: On the topic of terms or kupu, usually we are told we need to frame research questions by asking “What does the literature say?”. Academic processes typically demand we investigate academic literature to consider the validity of processes, evidence, findings, and discussions – all of which is presented in written English and sometimes te reo Māori. For me this is challenging because sometimes I understand research questions and problems as they are expressed to me by NZSL users, and then I have to frame them using a literature base which is all written in English. I am constantly triangulating and synthesizing across languages and thinking mindfully about how to engage with people who 1) don't engage with that literature base and 2) don’t have shared terminology. So, as a researcher, I’ve had to go into these community spaces and think, “What is the question and how do I engage and frame or try and stimulate discussion?” Because they [Turi] don’t understand the issues and the problems in the same way that people who are writing the literature do.

That’s been really challenging to navigate but also rewarding, because through that process, NZSL users often guided me in building understanding. I also often find that if you give space to understanding issues from a NZSL perspective, solutions to problems are embedded in the language. The example I often use to people is the term “intervention.” When I was doing my PhD thesis looking at “early intervention” (Smiler, 2014), I had to use that term because it was what was written in the academic literature, but it was in sharp contrast to terms used by NZSL users, who often told me it was offensive.

Challenges of Qualitative Disability Research: Paradigm Clashes, Status, Barriers, Institutional Racism, and Ethical Issues

Bernadette: There are huge challenges when trying to get any disability research funded. The funding model has basically been developed and built on a biomedical, ableist, research paradigm exclusive of tāngata whaikaha Māori methodologies. Qualitative research has often been seen as a soft option for collection of data and as an evidence base for innovation and translational research. Mātauranga Māori (Māori knowledge) hasn’t been valued by non-Māori until more recently. Many funders don’t fund disability research, and often “disabled” Indigenous researchers are not valued or supported compared to others. Institutional racism was the basis for most of the research that I was first involved with. It was essentially racist in its design and non-inclusive of Indigenous disability perspectives. It’s only in recent years and with increased willingness from non-Māori colleagues that some of those racist approaches and biases have been slowly recognized and replaced.

The perceived status of qualitative research also has an impact on us beyond funding. “Gold standard” research is still largely seen as the RCT methodologies. This is what largely matters to funders and policymakers. For tāngata whaikaha Māori, RCTs are not the only approach that we can use. Government agencies still value the hard data collection, but as we have seen with the last census, those results were catastrophic and largely unusable (Kukutai & Cormack, 2019).

Huhana: What Bernadette says is spot on – the real lack of support. This is actually Western ideology versus Indigenous ideology – it’s that simple. There’s no flexibility in funding to really allow for a cultural lens fully. When I did my applications around my post-doc[toral research], ironically the university expected me to provide biscuits and tea, but not a meal. You don’t turn up with a packet of biscuits to a Māori household and expect that to be adequate. That’s not creating conditions for engagement, nor is it recognizing and valuing their time, their expertise, and their information. I insisted and won the right to take kai to every interview for a meal. That was me saying that I value you as a whānau and we’ll talk over a meal. That brought a lot of buy-in. It wasn't an inducement – which is what the Pākehā call it; it was manaakitanga and whakawhanaungatanga; and those are concepts around mātauranga Māori, something that our Pākehā institutions don't recognize.

There's also the lack of support for disabled academics to do the job, but we are expected within a university environment to fit within their ableist parameters. As a disabled academic I failed to fit and that's why I didn't get tenure and that is simply because they would not accommodate anything, other than provide a lift and make sure I had an accessible loo [toilet]. There's no real accommodation if you are disabled or if you're Indigenous when it comes to Pākehā institutions and funders understanding that there's specific ways you work with Māori and there's specific ways you don't. You must recognize those ways. We are having to accommodate under a Western lens when we are trying to explore Indigenous research topics.

Helena: What is happening with the new [New Zealand Health and Disability] System Transformation (Ministry of Health, 2021) is again trying to fit Māori into the box. What they [government] are doing is transforming a Western system. I wonder about how transformative the system is going to be for Māori. Also, given the outreach and the knowledge our communities, that our tūhono Māori (connectors) already have and how much time that took. Māori are just not accommodated. I think that is a real limitation when we are looking at "system transformation." I wonder where in all of this the partnership aspect is. It also feels like we spend time continually educating government agencies, who are meant to be implementing this, when they don't have the knowledge to be able to do it effectively.

Kirsten: I also want to talk about professional development and the relationship between major funders and training institutions. They both have a really important role developing qualitative researchers in this space. [Funders] have a lot of work to do in terms of supporting and resourcing these careers. I would really like to see [them] do something substantial or dramatically different in their commitment to this space. I think without them and their commitment, we won't see it grow in the way that we need to.

Tristram: I have encountered pragmatic and ethical issues. Firstly, through my academic experience particularly societal and/or academic and funding biases that exist. I have sat on several assessing committees for health research funding agencies and written a number of grant funding applications myself. I can see that it's not a limitation inherently of the research approach, but one that often makes it harder to get funded. There tends to be biases against genuine co-design, partnerships, and community participatory research in academic research practice. Whanaungatanga (relationships) that researchers have with communities take a long time to build and that genuine consultation and engagement takes resourcing which is never covered by the grant funding (as to be genuine it must predate the application) and is seldom directly supported or recognized by the research institution. There is a significant opportunity cost for Māori and tāngata whaikaha Māori communities who engage with researchers – and these communities frequently lack sustainable resourcing and are already overstretched. Furthermore, that engagement and genuine interest rightly builds an expectation on researchers to deliver to the community aspiration with respect to funding bids, despite not having control of funding success. I hate going back to our communities and apologizing for not having been able to secure the funding we sought despite good science and genuine community need. It feels to many like a further process of racist or ableist trauma.

Meanwhile, we see colleagues in other research areas who do not invest the same amount of time these community relationships or translational activities and instead prioritize polishing their application or push "sexy scientific questions" over genuine community need or favour high-impact international over local or open access publications and community presentations be rewarded at all stages of the current system. Secondly, in terms of crafting funding applications to oversubscribed, Western-dominated, non-disability aware research funding agencies, we and colleagues have experienced difficulty getting grant assessing panels to accept the perceived "risks" of co-design projects insofar as the implicit tension that exists between prescribing enough of the research processes and outcomes to permit evaluation for scientific rigor while retaining space to intentionally co-construct the research agenda with those community partners as the research unfolds. There is an inherent bias toward known risks versus unknown risks. Funders are gradually getting more sophisticated in being able to understand that, but as said, there is a lot of room still to improve there. I want to challenge research to push into translational activities. In my experience, I found that qualitative research is good for highlighting the issue, generating media interest, and putting a face to an issue. But it does struggle sometimes with policy or decision-makers to leverage specific policy changes. It comes across as a barrier when policymakers struggle to see the scale of the issue in relation to evidence that's presented in a qualitative manner. Frequent discussions around generalizability come up, even though we recognize that qualitative research does not aim to be generalized.

The other issues I wanted to talk about are the practical or logistic ones. KMR and a lot of community-based research involving Māori tends to favor kanohi-ki-te-kanohi (face-to-face). As a researcher with a lived experience of disability, and a power wheelchair user, the logistics and accessibility of field work is difficult. There is very limited support for disabled academics to have their access and reasonable accommodation needs met to be able to undertake research. It's not something that is on the radar of academic institutions. Although we have moved through the COVID-19 pandemic to embracing digital technology, significant inequities exist for tāngata whaikaha Māori in access to digital resources and digital technology and adaptive technology. Even the assessments to actually use technology, even if it were physically and financially available to many, are not funded in Aotearoa – so many tāngata whaikaha Māori have real difficulty accessing adaptive technologies. I think the digital divide is an increasingly important barrier in this space.

Strengthening Indigenous Disability Research

Bernadette: I would like to see direct efforts from funders to support capacity and capability of tāngata whaikaha Māori, whānau hauā, and whānau whaikaha Māori as researchers in their own right. We need resourcing to apply to the major research funders, as only very small amounts of funding go to Māori disability research. I note that tāngata whaikaha Māori expertise is generally missing on the research assessing committees, so the issues are not well understood by people making the funding decisions. I have always seen one of the strengths of qualitative research for tāngata whaikaha Māori as being a transformative methodology. We have been able to build on the principles of KMR [but] KMR hasn't been designed by, nor has it particularly focused on, tāngata whaikaha Māori, and I think there's still some gaps and quite a lot that needs to be done to include tāngata whaikaha Māori paradigms.

Māori with [lived experience of] disability may to some extent internalize being disabled, just as some of us have internalized racism because of the influences of a racist society affecting our internal thinking that we're not good enough. While there are some Māori researchers with lived experience of disability, there's not a large body of these researchers who have had the opportunities, capacity, or the support to evolve KMR methodologies using a tāngata whaikaha Māori lens. We need to support Māori in developing and disseminating some of these methodologies. There's a big gap there, and we need to build on work that tāngata whaikaha Māori researchers have done.

Kirsten: There needs to be changes to how funding applications are assessed. A while ago [New Zealand Health Research Council], processes changed and applicants were asked to respond specifically around the impacts of their work for Māori and research relationships with Māori communities and so on. Assessing committees were given clear guidelines on how to respond to this, and non-Māori researchers quickly learned that they had to critically engage with Māori in order to respond to commitments outlined in Te Tiriti, but also they simply wanted to be successful in gaining funding. These changes ought to be created to give effect to the rights of disabled people and in order to provide the scholarship needed to develop the health and disability sector. This is an urgently needed action point: fund more people with lived experience of disability to develop work and lead in this space. More specifically, turning to language again, I have always wanted to see NZSL (or signed languages in general) and te reo Māori visible in academic literature bases and forums. It is as basic as that: we need to see and experience our knowledge in these spaces. That's one thing that I would like to see happen in my lifetime.

Helena: I also think there should be more room for tāngata whaikaha Māori to be researchers. In Aotearoa, we are also considering changes to the structure of the health and disability system which includes some kind of Māori Health Authority to give Māori more control in decision-making and policy. This Māori Health Authority structure needs to play more of a part in making space for tāngata whaikaha Māori too and ensuring disability input from the beginning. For tāngata whaikaha Māori, there needs to be clarification or delineation between health and disability. We definitely need more research, and it needs to be done by tāngata whaikaha Māori, and also in terms of capacity and capability development, we need another lens put over it, because the current system is all about disabled people Māori – tāngata whaikaha Māori – being recipients rather than leaders. My belief is that Te Ao Māori is inclusive of everybody. I think that everybody would benefit from research, which kind of begins in this space, from the knowledge that Te Ao Māori is inclusive of everybody.

Tristram: I really tautoko (support) the points made by everyone on strengthening qualitative research. I come back to intersectionality and tāngata whaikaha Māori. There are international and national obligations toward disabled people and Māori, but there is almost complete invisibility of that intersection, which we call tāngata whaikaha Māori. Within disability rights discourse, Māori are seen as a "minority" issue. Within Indigenous rights discourse, disability is seen as a "minority" issue. Even where there is acknowledgment of this intersection, the scale of issues is not well understood in part because of lack of data and research. In my view, this is unacceptable – because the obligations are very clear. Article 31 of the UNCRPD talks about the requirement for state parties to have research evidence and statistics on disabled people. I guess you would say that the UNDRIP doesn't have such a clear parallel; Article 15 of UNDRIP talks about Indigenous peoples having the right to their own ways of learning and knowledge systems, which I think is relevant here. So, I would like to see greater recognition of the intersectionality of these fields.

I would also like to endorse earlier comments about more genuine capacity development. This necessarily means development of researchers outside the academy. Academic biases against community leaders and people with lived experience of disability mean they are not deemed to be researchers in their own right. Their contributions are not valued because they cannot describe it on an academic curriculum vitae. It saddens me to hear of Māori community leaders not considering themselves researchers in the pure sense because of that Western paradigm that conforms to an academic model. I think the problem with our system to date is that it has not really embraced and recognized the genuine value of communities.

Another thing to address going forward is ensuring partnership in participatory research. To genuinely undertake co-design is to come to the table as equals. Yet, our frameworks in academia, in the health [and disability] system and in government, do not really allow for genuine partnership and genuine shared decision-making. It is clearly a power imbalance and that comes from historic inequities in capacity development. I would really like to see capacity development, for communities to prioritize their own research agendas and seek out academics rather than the other way around. Finally, I think there is a real need for both policymakers and health [and disability] system designers to build evaluation into system design and implementation, in the implementation of all policies and interventions, to a far greater extent. And, that would build a space for qualitative research, as an essential component of evaluation, which seeks to understand implementation barriers and organizational issues when implementing policies.

Huhana: Intersectionality is a very big part of our identity because we are forced into these labels and stereotypes, when in Te Ao Māori we live on a continuum. Yet, in reality, everyone lives in a continuum. Western science and ideology and thinking tells us, however, that we must be compartmentalized. But if we were to look pre-colonially, there's just some fantastic stories out there, around our Mana Turi, Ngāti Kāpō, our Waka Tūru whānau: our whole whānau. They were leaders. They were gods. Going forward, universities need to stop seeing us as being part of the problem and create safe and supportive space to employ us. What we do is great as community researchers, but the question now and into the future is how do we survive and thrive in that toxic environment known as a university? We can't do it without each other. Interdependency, co-designing, intersectionality, and all of those things are part of who we are.

My last point is really for disabled Māori researchers in the community. Never underestimate the value of what you do in the community. Even if you are not part of an academic institution or an "academic," your connections, your relationships are all very much a part of what makes your research valuable, because you get in where a lot of academics cannot even think about getting to.

Conclusion

This chapter serves as an example of how pūrākau and wānanga can be used to explore the richness of Māori-centered understandings to both give prominence to and make sense of Māori experiences. While each researcher participating in the wānanga came with their own lived experiences of disability, and their own experiences of qualitative research, the layering of their pūrākau within the context of wānanga allowed for new knowledge to emerge. Qualitative research methods show promise in building shared understanding of Indigenous experiences of disability and has the potential to address the power imbalances inherent in Western epistemologies methodologies, particularly (but not exclusively) when it comes to quantitative research. This chapter also highlights the critical importance of understanding the ways in which colonization, coloniality, ableism, and racism have intersected in the lived experiences of tāngata whaikaha Māori/whānau hauā. These intersections have also impacted the languages that are used and considered "vaild" and "credible" in a research context and those that have been invisibilized (including NZSL and te reo Māori). Additionally, practical logistics and the challenges faced in the context of tāngata whaikaha Māori/whānau hauā led qualitative research, including a lack of dedicated funding have been emphasized. Genuine partnerships involving equitable funding from funders, universities, and other research institutes are critical to creating the space for Māori and other Indigenous researchers with lived experience of disability to self-determine their own research agendas and to connect with their own ontologies, epistemologies, and methodologies, in turn opening up new ways of knowledge creation, making, and meaning.

> Any approach is valid if it's aligning with tikanga Māori and its working, as long as the right people are leading it. We don't want to be constrained by Western academic methodologies. We do it because it's culturally acceptable for Māori. (Bernadette)

Glossary of Māori Words

Aotearoa	the original and indigenous Māori name for New Zealand
Aroha	love, compassion, empathy
Atua	deity
Awa	river
Hapū	kinship group, sub-tribe, sub-nation, to be pregnant
Hauora	healthy, well
Hine-nui-te-pō	name of a deity
Iwi	extended kinship group, tribe, nation, people, bone
Ingoa	name
Kai	food, meal
Kaimahi	worker
Kanohi-ki-te-kanohi	face-to-face
Kāpō	to be blind
Kaupapa Māori	Māori agenda, Māori principles, Māori ideology – a philosophical doctrine, incorporating the knowledge, skills, attitudes, and values of Māori society
Koha	gift, offering
Kōrero	speak, speech, address
Kupu	word, vocabulary
Mana	spiritually sanctioned or endorsed influence, power, and authority
Manaakitanga	showing and receiving care, respect, kindness, and hospitality
Māori	Indigenous peoples of Aotearoa
Marae	courtyard – the open area in front of the wharenui, where formal greetings and discussions take place. Often also used to include the complex of buildings around the marae
Mārama	lucidity, transparency
Mātauranga	knowledge, wisdom
Maunga	mountain
Mokopuna	grandchild, grandchildren, descendant
Ngāti	prefix for a collective, tribal group
Pākeha	non-Māori; foreign
Pū	base
Pūrākau	ancient/historical narrative, story
Rākau	tree
Takatāpui	Māori who identify with diverse genders and sexualities including (but not limited to) lesbian, gay, bisexual, trans, intersex, queer
Tamariki	children

Tāngata whaikaha Māori	term used to describe Māori with lived experience of disability
Tāngata whenua	people born of the land – of the placenta and of the land where the people’s ancestors have lived and where their placenta are buried
Taonga	treasure, anything prized
Tautoko	support, verify
Te Ao Māori	the Māori world
Te Tiriti o Waitangi	the Māori version of the Treaty of Waitangi; forms the foundation of the contractual relationship between two internationally recognized sovereign nations – Māori, as tāngata whenua (people of the land), and the British Crown
Tikanga Māori	customary system of values and practices that have been developed over time and are deeply embedded in the social context
Tino rangatiratanga	absolute authority, sovereignty, self-determination
Tīpuna/Tūpuna	ancestors
Tūhono	to join, bond, attach, connect
Turi	to be deaf
Tūru	chair
Wahine/Wāhine	woman/women, female, feminine
Wairua	spiritual, spirit, soul
Waka	canoe, vehicle, conveyance
Wānanga	to meet, discuss, deliberate, consider, workshop
Whakawhanaungatanga	relationship building
Whai Ora	seeking wellness, consumer, service user
Whānau	to be born, extended family, family group
Whānau hauā	term used to describe Māori with lived experience of disability
Whāngai	to feed, nourish, bring up, foster, adopt, raise, nurture
Wharenui	meeting house

Acknowledgments The authors (TI, BJ) wish to acknowledge their time was in part supported by a contract from the Health Research Council of New Zealand.

Appendix – Ko Wai Au?/Who Am I? Positioning Ourselves in Connection to the Kaupapa

Helena *Ko Taupiri te maunga, ko Waikato te awa, ko Ngāti Mahuta te hapū, ko Tainui te iwi, ko Poihākena te marae, ko Helena Tuteao ahau.*

I was born in Wellington and moved to Auckland when I was 3, where I grew up in South Auckland and moved to Hamilton about 13 years ago, where I now live with my two beautiful children.

Kirsten *Ko Ōkahuātiu te maunga, Ko Waikākāriki te awa, Ko Takitimu te waka, Ko Te Whānau a Kai te iwi.*

On my dad's side our whakapapa is to various marae around Tūranganui-a-Kiwa. My paternal grandfather grew up in Waituhi, and my paternal grandmother grew up in Manutuke. They grew up in communities which were about 20 minutes out of Gisborne and so that wasn't too far for my grandparents to find love. My dad was whāngai (adopted) to his father's sister and raised by her. That was a blessing for us to have more whānau and have those relationships. Through my maternal whakapapa, I connect to Scotland. My grandparents came to Aotearoa during the 1950s, my grandmother from Aberdeen and my grandfather from Alloa.

I have two beautiful children. Ko Wairongo te mātāmua, Ko Raukura te Pōtiki. Through their paternal whakapapa, I have connections to Te Āti Awa, Ngāruahine, and Ngāti Porou. My whakapapa to this kaupapa is through my mum and her brother who are profoundly deaf; New Zealand Sign Language (NZSL) was our home language growing up, and through them I was socialized in the NZSL, including Ngāti Turi (Māori Deaf community). NZSL was an important part of our family, whānau; I like to make that known to people and acknowledge that.

Tristram *Ko Takitimu te Waka, Ko Ngaruroro te Awa, Ngāti Kahungunu ki Heretaunga Ngāti Porou oko Iwi, Ko Goddard raua ko Broughton oko whānau* tipuna. Ko Tristram Ingham ahau.

I was actually born in the United Kingdom (UK), but to a New Zealand father, and my mother is from the UK. I moved here at a very young age and grew up in Tāmaki Makaurau (Auckland), before moving to where I live now which is the capital Te Whanganui-a-Tara (Wellington) where I live with my lovely wife. I have three beautiful stepchildren and two amazing mokopuna who are under 2. My connection to this kaupapa is through a genetic neuromuscular condition inherited through my mother's side; so I, along with other members of my whānau, have lived experience with physical disability, since birth.

I studied medicine as an undergraduate, and I completed a medical degree at the University of Otago. I spent my first postgraduate years in clinical practice, as a hospital-based physician doing internal medicine. I was struck from a personal perspective that there was no academic teaching around disability in medicine; there was no visibility in the health and disability system, nor disability responsiveness in that system. There was very little opportunity for reasonable accommodation of disabled people to be heard either within our professions or in clinical services themselves. The whole concept was invisibilized.

From a professional perspective, given that Aotearoa New Zealand is a country that prides itself on being a relatively wealthy first world OECD nation giving a fair deal for all, I was surprised that significant inequities are faced by Māori and other ethnic minorities within the population. My decision to move into academic research was really to better understand the inequities that I saw existing for people with chronic health conditions and disability that led to acute presentations that could have been easily prevented with better primary healthcare and/or a holistic approach to care.

Huhana *My name is Huhana from the Waikato. Born and raised though in Taranaki under Te Maunga Taranaki. He's my wairua maunga. Whenever I need him he's there. I'm from Wereroa, Pukarewa, we're Ngāti Tahinga on the West Coast. We are Whakatohea.*

My nanny of about six generations ago married a Scotsman called John Alexander McGregor, and that's it. That's the only Pākehā. Then my great grandfather is Aboriginal. My grandfather was Navajo and my father is Sami. I have got two sons. My youngest is half Caribbean, and I have a Filipino grandson and two grandsons in total. So, a mixture of the earth from E Ngā Hau e Whā,[the four winds] from the four corners of the earth is my whānau.

I have MS (multiple sclerosis) which is progressive, and now I have lost all mobility. In the last few weeks [the doctors] don't know what's going on, is not easy. But that's life. It's the future and we've just got to embrace it and go with it. I've been involved in research for years, but I am struggling more and more with the written elements of things. It's really great to be able to participate in a kōrero and share stories and thoughts this way.

Bernadette *Ko wai au? ko Kurahaupō te waka, ko Ruapehu te maunga, ko Whangaehu te awa, ko Kauangaroa te marae, ko Ngā Wairiki, Ngāti Apa te iwi, ko Maraea Huatau, te tupuna.*

I was born and bred in Whanganui-a-Tara (Wellington). I'm a mother of three beautiful adult children, I'm delighted to be a nana with two mokopuna. I trained at Wellington Hospital then spent 20 years as a registered nurse in Sydney. I returned to New Zealand following a permanent work-related injury and had to change my career. I moved into research which I had resisted all my nursing career, because I liked the contact with people, and I thought I wouldn't get that in research. Strangely enough, I've been more motivated and feel like I can do far more as a researcher than I did as an intensive care nurse.

At the beginning of my research journey, I was one of only two Māori disabled researchers in my institution, and it was really challenging to learn and work in that situation. It's that "double jeopardy" impact of being both Māori and disabled that I really struggled within an unsupported academic environment. I wanted to work in a university that was Hauora Māori-based so I would have more support both culturally and academically. Part of my stubbornness working within a disabling institution and my understanding of both Te Ao Māori and the Pākehā world meant that the challenge was to stay there and challenge the "status quo." I wanted to bring other colleagues on-board and increase that understanding, because, if I didn't do it, who was I going to leave it to? If I wasn't willing to make the changes, I couldn't step back and expect someone else to do it. I was just lucky that I had the support of my husband, who without him it would have been a very lonely place to work.

I studied for a master's degree, and my experience was a very isolating, cultural experience, because the university didn't provide someone who had both Kaupapa Māori expertise and a knowledge of my disability research. My solution was to bring on whānau with that expertise, however, that was denied. Institutionally, it was seen as far too great a risk for a university to have whānau supporting a Māori researcher with lived experience of disability. He was allowed to do all the mahi (work) and provided me with the support I needed, but he couldn't get any formal acknowledgment. Whānau expertise was not valued, and without that support, I would not have completed my master's degree. This was institutional racism. We have challenged many of the "mainstream" academic approaches, and it's only in recent years that we have had the support of senior managers who have been addressing some of the institutional racism. That's been a very slow process, but it's slowly changing and it's good to see.

Role of Culture and Legacy of Colonialism in Qualitative Research Methods with Persons with Disabilities in the Global South

26

Jorge Manhique and Action Amos

Contents

Abstract

In this chapter the authors reflect on the ability/possibility of qualitative research methods to enable persons with disability in the Global South to conceptualize disability and reflect on their lived experience. Disability studies theorists have recognized the importance of qualitative research methods in empowering persons with disabilities by lifting their voices. In this chapter we reflect on how research on disability in the Global South has been done. The chapter focuses on the case of persons with epilepsy and psychosocial disabilities (in Malawi) and

persons with disabilities more generally (in Mozambique). Based on our own work as early-stage researchers, we reflect on our experience of engaging persons with disabilities as informants. The chapter highlights the role of culture and the legacy of colonialism as issues that researchers must deal with to ensure that disability studies in the Global South is at the service of those with disabilities and cease from engaging in predatory practices.

Introduction

Qualitative research methods have been considered important in lifting the voices of communities traditionally marginalized by mainstream society. As feminist and Black studies, disability studies have embraced qualitative research in part for its potential to enable those with disabilities to speak up and challenge the hegemony and control that experts and medical professional had, for so long, over their bodies, minds, and lives.[1] Guided by the rights paradigm, disability studies using qualitative methods have the potential to challenge power relations (Stone & Priestley, 1996). Despite this potential, disability studies have not lived up to its promise for the 80% of persons with disabilities from the Global South (Goodley, 2015). Disability studies theory and models used to examine disability issues in the Global South have been described as inadequate (Meekosha, 2011) and as representing a “new form of colonialism” (Bezzina, 2019; Grech, 2009; Meekosha, 2011). This chapter discusses the ability/possibility of qualitative research methods to enable persons with disabilities in the Global South to conceptualize disability and reflect on their lived experiences.

The first part of this chapter briefly reviews the models that have informed research on disability, and how these theories have influenced the understanding of disability, mental health, and epilepsy in the Global South. The chapter proceeds to reflect on empirical research on disability in the Global South. Critically, the authors observe that research on disability in the Global South has, at the best, been extractive and contemptuous. The third part examines the role of culture and more specifically language when applying qualitative research methods. It calls for greater consideration of the role that language and the legacy of colonialism play when conducting research with persons with disabilities in the Global South, to ensure that epistemic violations are not perpetuated and effectively reframe the Global South spaces as spaces of agency, that is, where vernacular ideas and knowledge of people with disabilities prevail and is equally valued. The chapter draws on reflections from ongoing research projects that the authors are separately involved in as early-stage researchers in Malawi and Mozambique and the review of relevant literature.

---

[1] This is not to say that quantitative research methodologies are unable to address issues of power. It is more to emphasize the ability of qualitative research methodologies to enable participants to analyze and communicate their perspective on the material conditions they are in.

Despite the controversies that surround the term, the authors of this chapter use the term "Global South" consciously to refer to countries that have in common past experiences of living under colonial domination (Grech, 2015).

Review of Models/Theories of Disability

This section focuses on some of the most significant – in terms of policy influence – approaches to/models of disability, namely the individual model (also known as medical model), the social model, the normalization model, and the human rights model.

Briefly, the medical model refers to an approach which regards disability as essentially an individual problem, "steaming from functional limitation or psycho-social losses" (Oliver, 1996, p. 32). The medical model treats persons with disabilities as objects that need to be fixed to fit within the societal structure designed for "able" bodies and minds – usually white middle-class men. As such, medicalization became the dominant form through which disability issues are addressed. Rehabilitation and vocational programs are conceived to fix the person to be able to function in society without recognizing societal values, attitudes as well as the environment that are discriminatory and inaccessible. Two implications result from the application of the medical model to policy design and implementation, namely that "(i) disabled persons need to have shelter and welfare and (ii) impairment can foreclose legal capacity" (Degener, 2016). This approach to disability is founded on the notion that people with impairments are incapable of meeting social expectations such as working, acquiring an education, or determining where and with whom to live, among other things (Aguilar, 2017).

In contrast, the social model of disability focuses on "society rather than on the individual" (Degener, 2016). Although there are multiply versions of the social model (Lang, 2001; Shakespeare, 2006), scholars generally agree that the dominant kind has been the one developed by the Union of the Physically Impaired Against Segregation (UPIAS), documented in the Fundamental Principles of Disability published in 1975, and subsequently developed by Mike Oliver (1990), Finklestein (1980), and other prominent scholars, predominantly white male with physical disability (Shakespeare, 2006). Nevertheless, "common to all variants of the social model is the belief that, at the root, 'disability' and 'disablement' are socio-political constructions" (Lang, 2001, p. 2). The social model makes a clear distinction between disability and impairment (Shakespeare, 2006, p. 13). Impairment refers to "a condition of the body or the mind," and disability refers to "a situation, caused by social conditions, which requires for its elimination" (UPIAS, 1975, p. 3). In addition, the social model rejects the predominance of experts in the lives of disabled people, instead arguing for independence and full control of their own lives (Oliver, 1996). Thus, by emphasizing the manner in which disability is socially produced and issues of power – over disabled people – "the social model gives precedence to the importance of politics, empowerment, citizenship and choice" (Lang, 2001, p. 4).

Critical disability study theorists have disputed many implicit and explicit assumptions that underpin the social model of disability. Those include the fact that the social model concepts and theory are not appropriate to understand the lived experience of persons with disability in the Global South (Meekosha and Shuttleworth, 2009; Grech, 2015). Meekosha (2011), for example, proposes that the phrase "social suffering" be used instead. The social model's limitations have also been highlighted by critical disability theorists, such as the dichotomy of impairment and disability, the "downplay of pain and suffering" (Hall, 2019; Shakespeare, 2006; Meekosha, 2011), and the excessive focus on disability identity, excluding other identities from the analysis of persons with disabilities' lived experiences (Goodley, 2017). Further, critical disability theorists critique the exclusion of the voices of the large proportion of persons with disabilities (80%) who live in the Global South (Goodley, 2017).

The normalization principle emerged from Scandinavia, in particular from Sweden and Denmark (Perrin, 1999). Scholars trace its origins to the development of the modern social welfare societies, especially in Sweden in the late 1930s and 1940s, with its emphasis on principles of equality and the right of all human being to be guaranteed a good standard of living. In particular, the normalization principle places specific obligation on the "state to provide social services, if necessary," to guarantee good standard of living (Perrin, 1999, p. 181). Primarily applied in relation to persons with psychosocial and intellectual disability, the normalization principle was later expanded to include other groups of persons with disabilities. Accordingly, normalization means making available to all persons with disabilities, "patterns[2] of life and conditions of everyday living which are as close as possible to or indeed *the same as* the regular" (Perrin, 1999).

In the disability rights field, the human rights model is often referred to be in opposition to the medical or charity approach to disability and sometimes confused with the social model of disability (both described above). An important moment for the affirmation of the human rights model of disability was the adoption of the Convention on the Rights of Persons with Disabilities (CRPD) by the United Nation General Assembly in 2006. The significance of the CRPD lays in the fact that it introduces a paradigm shift in the way disability and persons with disabilities are considered (Degener, 2016). Paradigm shifts matter because they "mark the moment when traditional frameworks became ineffective, and when existing social theories no longer sufficiently explain social realities" (Collins, 2019). The CRPD considers persons with disabilities as subjects of rights and capable of exercising their rights. The CRPD embraces the concept of equality of opportunity by recognizing the need to create an enabling environment by adopting the principles of universal design, a

---

[2] Normal patterns of conditions of life can be viewed in terms of eight different elements: 1. A normal rhythm of the day. 2. A normal rhythm of the week. 3. A normal rhythm of the year. 4. The normal experiences of the life cycle. 5. Normal respect for the individual and the right to self-determination. 6. The normal sexual patterns of one's culture. 7. The normal economic patterns and rights of one's society. 8. The normal environmental patterns and standards in one's community (Perrin, 1999, citing Nirje, 1993).

set of supports, and reasonable accommodation when needed to ensure that all persons with disabilities can participate fully in social, cultural, political, and economic life, on equal basis with others. Different from the previous models discussed in this chapter, the human rights model "values impairment as part of the human diversity" while acknowledging other identities (Degener, 2016), in clear recognition of the heterogeneity of disability and intersectionality.

In the field of disability and development, the human rights model has helped to inform what is known as the Human Rights-Based Approach (HRBA) to disability and development. Broadly understood, the human rights-based approach to development is a process where development and human rights merge and become "conceptually and operationally inseparable parts of the same processes of social change" (Uvin, 2004. p. 175). According to Uvin (2004), there are two implications that result from the adoption of the HRBA to development. The first is that the "goal" of development work changes, as it focuses on claims and not charity. By shifting the focus to claims, the development process is "deeply political" and not technical or legal. In this sense, a HRBA to development is not about "asserting the existence of legal claims" [. . .], "but about political struggles, in which human rights are tools that crystalize the moral imagination and provide power in the political struggle" (Uvin, 2004, pp. 176). Secondly, HRBA also changes the way development programs are implemented (the process). In this sense, development agencies must look inward too and conform their processes with human rights standards.

Critiques of the human rights model often suggest that human rights norms are mainly Western-centered, hence more effective in Europe and the United States than elsewhere in the world (Katsui, 2008; Uvin, 2004). The CRPD is the case in point. While the negotiation process has been hailed as participatory, driven by the organizations of persons with disabilities including a significant presence of African organizations of persons with disabilities (Viljoen & Biegon, 2014), it is important to consider the knowledge production context in which the CRPD was negotiated. In Europe, the USA and Canada, the field of disability studies emerged in the 1970s – 50 years ago (36 years before the time of adoption of the CRPD by the UN General Assembly in 2006). The social model of disability was established in 1970/80 (UPIAS, 1976), and in Scandinavia the normalization principle emerged in the 1960. The USA had its own American with Disabilities Act (ADA, 1990). This gave OPDs from the West a knowledge backing for the CRPD negotiation process, and the outcome document, it can be argued, still reflects the dominant Western view of human rights, which is based on a strong recognition of individual rights, individual autonomy, and the perspective of various models developed in the West: the social model of disability, the normalization principle, and key concepts such as reasonable accommodation.

Linked to the previous point, critics also question the idea of "universality" embedded in the human rights model and how it is operationalized in practice. They argue that the idea of human that underpins the human rights discourse is largely inspired by European ideas of humanity (Mutua, 2001). Human rights are conceptualized on the basis of a European image although with universalistic ambitions (Mbembe, 2017). Because of that, "new voices are raising to proclaim that [*the idea of]* universal human either does not exist or is limited to what is common, not to all men [*and women*], but only to some of them" (Mbembe, 2017, p. 28). In the field of disability, scholars have denounced that while the CRPD may be benefiting mainstream persons with disabilities, indigenous persons with disabilities are still being excluded, due to the failure of the drafters to recognize and consider the intersection between disability and indigeneity (Hickey, 2020).

The CRPD Committee has recommended, under article 32 of the CRPD, all African countries[3] reviewed after 2018 to consider ratifying the Protocol to the African Charter on Human and Peoples Rights on the Rights of Persons with Disabilities in Africa (hereinafter, African Disability Protocol) adopted by the African Union in 2018. While the CRPD Committee does not articulate how and why the African Disability Protocol relates to article 32, it can be argued that it gives further guidance to State parties on how to mainstream the rights of persons with disabilities in development cooperation programs in the African context. By recommending the ratification of the African Disability Protocol, the Committee seems to be recognizing the importance of contextualizing human rights, in this case the rights of persons with disabilities. For instance, while both the CRPD and the African Disability Protocol contain the right to an Adequate Standard of Living (CRPD Article 28 and African Disability Protocol Article 20), which are similar in substance, the right to access justice, which is key to ensure that the right to an adequate standard of living is claimed and enforced, differs significantly in both instruments (CRPD Article 13; African Disability Protocol 13). The right to access justice contained in the African Disability Protocol makes references to customary law, which is a distinctive feature of African justice systems. The African Disability Protocol also contains rights that are not explicitly expressed in the CRPD, such as the right to self-representation, the rights of youth and older people with disabilities, among others. These issues reflect the unique African context, namely the fact that Africa has the youngest population in the world – 20% aged 15–24 (UN Economic Commission for Africa, 2017), but also increasingly an aging population, which is expected to increase threefold – from 58.7 in 2017 to 225.8 in 2050 (UN Economic and Social Affair, 2017, p. 5), and their exposure to neglect and violence.

What the above review suggests is the limitation of traditional disability models (generated in the Global North) to account for disability experiences everywhere, despite claims of universality (Perrin, 1999, p.182). The application of these models is essentially top down, paying little attention to local contexts (Katsui, 2008). In this sense, their application is a new form of colonialism (Bezzina, 2019). Critics call for "grounded realism," one which gives priority to "socio-cultural, political, historical and economic nuances of different contexts" (Grech, 2009). This poses an epistemological challenge, one that puts northern theories, models, including the "universal" standards of human rights, in dialogue with local ways of staying and being, history and the whole contextual environment (Ife & Tascón, 2016; Stone, 1999).

[3] See the Concluding Observation of Rwanda, Senegal, and Niger.

Conceptualizations of Mental Health

As disability, the conceptualizations of mental health have been derived from various perspectives across history and continue to evolve (Misra et al., 2019). There are conceptualizations that focus on sociological or sociocultural factors while others focus on medical or biological aspects (Aneshensel et al., 2013; Seeker, 1998). Some emphasize the absence of psychopathological symptoms and others link mental health to constructs such as well-being, happiness, and self-realization (Jeste et al., 2015; VanderWeele et al., 2019). Fernando (2012) suggested that the Western notions of normal behavior, health, and psychopathology are quite different to conceptualizations of mental health of communities in the Global South. Three examples that come out clearly from you research illustrate this distinction.

The first is cultural and spiritual. Many participants stated that mental health is dictated by the causes of "illness," the most prevalent of which are witchcraft or demonic possession, both of which require spiritual cleansing. Mental health was portrayed as "retribution (punishment) from the creator," "a curse that comes your way by coincidence," and "generational ill actions (payment for evils done by forefathers)" in the response. Molelekoa (2020) confirms that in Africa, mental health is understood in terms of its causative form, which is supernatural in nature and requires spiritual intervention from God or ancestors.

The second is behavioral. Some individuals recognized behavior as a crucial symptom of mental instability. Participants highlighted things like "aggressiveness," "senseless speaking," "eating from bins," and "not meeting an acceptable degree of normalcy." It was widely assumed that if a person did display inappropriate behavior, they would be labeled as mentally ill. As such, one of the most crucial signs of mental illness, according to some participants, is one's behavior. The causes of behavioral symptoms in the Global South are generally linked to bewitching and demonism, just as they are in cultural and spiritual understandings of mental health.

The third is medical. Participants also characterized "sound" mental health as the absence of psychopathology, favoring medical-model-biased approaches as defined earlier in this discussion. Rapp (2007) argued against the medical model method, claiming that it encourages the impacted to be passive by considering him or her as a patient or client with no further participation to the study process. Patients' views are frequently ignored in the Global South due to a perceived lack of competence to speak up (Amos, 2021).

According to the World Health Organization, mental health is "a state of well-being whereby individuals recognise their abilities, are able to cope with the normal stresses of life, work productively and fruitfully, and make a contribution to their communities" (WHO, 2003, p. 7), and yet, understanding sociocultural variation in operationalizing this concept remains of profound importance – this can influence the way in which mental health challenges are best addressed in a population (Seeker, 1998).

To design effective policies or interventions to improve mental health, it is necessary to know and understand the conceptualizations and perspectives held by the community of interest to successfully address mental illness and well-being in the specific cultural context (Huppert, 2009). This is especially relevant in lower-middle income countries (LMIC) that receive support from developed countries to design and implement mental health policies (Cox & Webb, 2015). Similarly, when undertaking qualitative research, one of the main challenges is to balance or adopt a contextualized definition, coherent with the understanding of the people affected.

Several studies, as in many other Sub-Saharan African nations, have underlined the importance of taking cultural factors into account when undertaking mental health research or programs (Woods-Jaeger et al., 2017; Yoder et al., 2016). For example, in Malawi, there exists overlap between spiritual, biomedical, and psychosocial explanations for mental health problems (Samuels, Jones, & Bassam, 2017; Skylstad et al., 2019). This has not been a key consideration when implementing mental health programs in Malawi. This explains the stigma associated with mental health in this cultural context. Stigma decreases the likelihood of patients living in Malawi to be included in all aspects of life. Many in Malawi, due to their understanding of mental health, instead of getting medical services support prefer the consultation of traditional healers and religious leaders (Yoder et al., 2016). However, mental health policies – which largely endorse a medical approach – do not incorporate these different mental health perspectives and do not engage with the different agents validated by the community as mental health promoters, such as religious or traditional healers (Akol, Moland, Babirye, & Engebretsen, 2018; Skylstad et al., 2019; Yoder et al., 2016). In fact, Corbin and Miller (2009) suggest the biggest challenge in this area is integrating Western concepts of psychosocial healing with non-Western concepts. Such an approach must be based on research that genuinely engages with the voices of persons with psychosocial disabilities in the Global South and vernacular ideas and conceptualizations of mental health and disabilities, in ways that traditional disability theories and models have not. This points to the role of language in qualitative research methods in the field of disability in the Global South, and the legacy of colonialism, all discussed below.

Disability Studies Models and Research Methods

Since its onset, disability studies have been suspicious of traditional research methods and tenants in social science research, much like feminist and Black studies (Rioux, 1994). Disability scholars have denounced the predatory and exploitative nature of theories and paradigms informing earlier research on disability (Stone & Priestley, 1996). In the name of objectivity and operating under positivist understanding of knowledge, research on disability served to advance researchers – mainly non-disabled – academic carrier with little impact on the material condition of the lives of persons with disabilities (Stone & Priestley, 1996).

However, this is not specific to disability studies. The roots can be traced to modern epistemology underpinned by enlightenment tenants, which has been denounced by both decolonial and post-development scholars (see Esteva, 2010; Santos, 2018). The “commitment to rationalism” – the belief in human reason which accord them superiority over nature and other animals; the “belief in fundamental dualisms, such as reason versus emotion, mind versus body, culture versus nature, absolutism versus relativism, and objectivity versus subjectivity; the assumption that there is an ontological divide between humans and nonhuman animals and nature; and universalizability as a criterion for assessing the truth of ethical and epistemological principles" (Warren 2015, cited by Santos, 2018, p. 304) have all contributed to the hegemony of Western knowledge with the support of Western military superiority and economic power. Critically, the "hegemonization" of Western knowledge occurred at the detriment of other – non-Western knowledge – bringing about "epistemicide" – described as the "destruction of an immense variety of ways of knowing that prevail mainly on the other side of the abyssal line – in the colonial societies and sociabilities" (Santos, 2018, p. 8). Therefore, "the economic and political injustices that characterize the world order today result in, and are sustained by, the cognitive injustice that exists at the core of the production of knowledge since the beginnings of the modern colonization of the world" (Barreto, 2014, p. 397).

We similarly argue that qualitative research on disability in the Global South has been used in extractive and contemptuous ways. It is extractive in the sense that it concentrates on what fits within Western paradigms and ideas of disability. Contemptuous in the sense that it dismisses what does not fit into those models as irrelevant, frequently classified as "traditional beliefs, harmful habits, and preconceptions," and, hence lacking epistemic importance. For instance, in Amos study on epilepsy in Malawi, participants highlighted a list of foods that are advised by the witchdoctor as to be avoided as key contributing elements to increased seizures. However, because of the lack of understanding of this reality by traditional researchers, this is commonly rejected and considered as a myth. Some participants indicated that avoiding these foods has helped them to have stability in their condition. In fact, in our experience, the design of leading questions in qualitative research, such as "Tell us the most widespread beliefs/myths regarding epilepsy/mental health," already directs respondents to discuss something they may not believe is a myth to satisfy the researchers preconceived assumptions. Understanding the meaning of mental health in the context of the research is critical since the people who are affected respect their traditional or cultural understanding and their lives and well-being is informed by their tradition and culture.

As observed by Shakespeare (2006) in relation to social model theorist "because most non-British disability research has not been based on the impairment/disability distinction and has not adopted the strong social model version of the social-contextual approach, it has conveniently been ignored or rejected as inadequate or mistaken" (Shakespeare, 2006, p. 10). Additionally, the concept of Disability Inclusive Development (DID), that has recently animated INGOs and donors, is disconnected from local narratives of what development, participation, and other related concepts mean for those with disabilities (Rodríguez, 2021).

We further argue that careful consideration of the ways that disability is understood and lived in the Global South is of paramount importance, not only to develop a local robust understanding of what it means to be a person with disability in these spaces, but also to ascertain a position of strength which would enable a fair dialogue with more established theories and ways of understanding disability in other parts of the world. By doing so, research on disability will contribute to "reframe the Southern space(s) and subject as one of agency" (Grech, 2015, p. 13). But, to do this, researchers need to confront the legacy of colonialism which continue to shape the condition (of exclusion and marginalization) under which persons with disabilities live today in the Global South (Grech, 2015). In the section that follows, we reflect upon the element of language as a particular legacy of colonialism and what it means for qualitative research methods.

Language in Qualitative Research

Qualitative researchers adopt an epistemological position described as interpretivist in the sense that it "stresses the need to understand the social world through an examination of the interpretation of that world by its participants" (Bryman, 2012), and an ontological position described as constructivist which implies that social properties are outcomes of the interaction between individuals, rather than phenomena "out there," separate from those involved in its construction (Bryman, 2012). It proceeds from this that language is an important tool to describe the social world.

The quest to understand disability in the Global South must take into consideration the legacy of colonialism (Grech, 2015). Language represents a significant part of that legacy in the sense that qualitative research on disability in the Global South has been done with recourse to colonial languages, on the one hand, as tool to gather data and, on another hand, to "describe" the experience of disabled subjects in journal articles.

As early-stage researchers currently conducting research with persons with disabilities, we have been experiencing first-hand the impact of colonial legacy. As part of the fulfillment of his PhD program, Manhique is in the early stage of conducting research on the inclusion and participation of persons with disabilities in development programs. The objective of the research is to identify and explain the factors that determine the inclusion and participation of some groups of persons with disabilities and the exclusion of others, from the design and implementation of international cooperation development programs. Specifically, his research focusses on European Union funded projects in the domain of gender-based violence and social protection in Mozambique. Semi-structured interviews and focus group discussions are being used to gather stakeholders' perceptions about inclusion and participation of persons with disabilities.

As part of a Master program, Amos undertook a review of best practice research on epilepsy (Amos, 2020) and evaluated the ethical practice of NGOs in mental health research (Amos, 2021) using participatory methods. In his review, it became evident that medical and western approaches and concepts dominated research in mental health, ignoring local or cultural context in all aspects such as language and what was to be accepted as the norm or myths.

In the first research (Manhique's study), informants were asked to reflect on two key concepts used in the study, namely: development and participation; and were encouraged to use words/expression in local languages that could best describe those concepts. The responses and reactions of the informants reveal in one hand the struggle, particularly among youth with disabilities, to communicate and/or express in local language. On another hand, it reveals how, for utilitarian reasons – namely the need to fit the world designed by others (colonial masters) – encourage those with disabilities to switch from using and expressing in local languages to using colonial languages. As noted by one of the informants:

> "I used to speak changana[4] when I was a child, but when I lost my hearing capability, I gradually lost the ability to communicate in changana as I needed to learn sign language and in school they only teach in Portuguese"... "if you don't know how to speak Portuguese, you will have problems to learn... Learn Portuguese was important to remove the barrier to education."

On another hand, research reports published in journal articles are written in colonial languages making them inaccessible to the audience they are supposed to serve and support – persons with disabilities.

In recognition of this legacy, in our research we deployed different strategies. First, the research project was presented to OPD leaders in the language that they are more comfortable with. They had opportunity to comment and propose changes to the research project – for instance in one of the consultation meetings, it was suggested to include the concept of disability among key concepts to be discussed/defined. Second, when selecting research informants, we were cognizant of the heterogeneity of the disability movement and the fact that within the movement there are groups that are more marginalized than others (WFD, 2019). Previous research has mainly enabled established groups – usually urban men with physical disabilities – to participate (Bezzina, 2019; Goodley et al., 2019). Those are usually war veterans that became disabled fighting in the colonial war.

Third, to engage potential informants, it was important to create the conditions that enable each of them to participate. This means addressing barriers created by their (lack of) material conditions. As such, support for transport, meals during the focus group/interviews or workshops, and small fees to ensure they have something to give their family that day when they return home. In defining the amount, we made sure that "participants are not unduly induced to participate" (Grischow et al., 2021, p. 171) and that the amount was appropriate for that context (urban, rural, cost of living). These arrangements enabled people such as Maida,[5] a woman with physical disabilities from the Mandimba district in Niassa Province, to participate. Maida is the leader of local OPDs involved in sports for persons with disabilities. She is aware of how important it is for women with disabilities like her to participate in community meetings and activism. However,

[4] Local language of Southern Mozambique.

[5] A pseudonym.

Maida, who is a single mother of three, faces economic difficulties in participating. She has been a beneficiary of the basic social security benefit ($8/month) since 2012. With this amount, and small savings, she managed to open a small stall at the local market where she sells tomatoes. Participating in community meetings often means difficult decisions, between going to the market to sell and ensuring livelihood for herself and her children and/or participating in such meetings. As she explains:

> "If I had a husband, we could split up: I would go to the market, and he would go to the field (to grow corn). But this way, I must divide myself between the farm and the business so that I can survive with the children and send them to school. So, I would like God to help me to become a civil servant."

She further explains:

> ". . . there are meetings that I usually go counting on the meeting's subsidy. . . But there are other meetings where you just have lunch, go home and regret: 'Oh, if only I'd gone to the market'. But you have to learn, it's not just money."

In turn, in Amos epilepsy and mental health research, two tactics have been used to ensure that culture is ethically recognized and that imposed conceptualizations are avoided.

First, study participants are engaged as active research assistants or researchers, which replaces the affected participants' passiveness. The author is such an example as he is a person with epilepsy. Second, research participants' opinion is valued. Their notion of mental health or epilepsy, for example, which was rarely examined in traditional research, was considered in the study. This solves the problem of imposing a foreign approach to research informants (Amos, 2020). Finally, researcher reflexivity was important in dealing with the often considered researcher's prejudice immunity. Many researchers are unable to accept responsibility for their personal opinions, which can sway the outcome of a study. Previous research reveals that understanding, detecting, and counteracting the influence of stigma between researchers and participants necessitates knowledge of one's own preconceptions or prejudices (Goodman et al., 2017).

While we acknowledge the competing researchers' interests – academic promotion, activism, social justice, and so on – researchers engaging in disability studies in the Global South must be cognizant of their "ethical responsibility to research alongside disabled persons, to research with disabled persons, and not to engage in predatory research practices that advantage the research without reciprocation" (Castrodale, 2017, p. 46). Furthermore, discussion about the legacy of colonialism in the practice of disability studies in the Global South must occupy center stage to ensure that epistemic "violations and subjugations are not maintained" (Grech, 2015). Only then, qualitative research methods in the practice of disability studies can be put at the service of persons with disabilities and cease to engage in oppressive and predatory practices (Stone & Priestley, 1996).

Conclusion

While promising, the use of qualitative research methods in research on disability in the Global South has not contributed to the emancipatory promise of disability studies. This is because researchers applying traditional disability theories, briefly presented above, have not engaged critically with local cultures, and have not taken into consideration the legacy of colonialism when conducting research on disability in the Global South. We argue that researchers conducting research on disability in the Global South using qualitative research methods must be cognizant of the role of language and the legacy of colonialism in perpetuating epistemic violence and subjugation and adopt strategies that promote greater involvement and participation of persons with disabilities in research. Drawing from our ongoing research, we highlighted strategies applied that can contribute to this goal. These include: engaging persons with disabilities as active research assistants or researchers and equally valuing their opinion; grounding research in local language and encouraging research participants to reflect on their local language rather than using colonial language; being cognizant of power inequality in society including within the disability community and provide support to ensure marginalized persons with disabilities can meaningfully participate; and finally, developing researcher reflexivity to ensure researcher's own preconceptions do not sway the research outcomes.

Inclusive Research: Doing Participatory and Emancipatory Research with People with Intellectual Disabilities

Anne-Marie Callus

Contents

Abstract

This chapter discusses the origins, principles and practices of doing inclusive research with persons with intellectual disability as co-researchers. The relationship between inclusive research on the one hand and participatory and emancipatory research on the other is considered together with the link to self-advocacy. The chapter also provides examples of inclusive research and discusses the methods that are mostly used in inclusive research. The role of academic researchers and co-researchers with intellectual disability is also discussed, both in conducting research and in writing about the research carried out.

Keywords

Inclusive research · Self-advocacy · Intellectual disability

Introduction

Although the slogan "nothing about us without us" did not originate with the disabled people's movement, it has been used by disabled activists to such an extent that it has become practically synonymous with this movement (Charlton, 1998). Its premise – that nothing about disabled people should be done without their direct involvement – holds for the development of legislation and policies, for service provision, and also for conducting research. It also holds for all disabled people, including persons with intellectual disabilities (referred to as persons with learning difficulties/disabilities by British authors).

It is through inclusive research that persons with intellectual disabilities are directly involved in carrying out research. Inclusive research borrows from the principles and practices of emancipatory disability research, participatory research, and self-advocacy to create a unique approach to doing research. This chapter first traces the origins of inclusive research and then discusses some examples of inclusive research projects. It then considers the conceptual framework of inclusive research and the research methods that are typically used. Following this, the chapter discusses issues related to the provision of support for persons with intellectual disability to engage in research and how inclusive research is written about, before concluding by drawing together the main issues discussed.

The Origins of Inclusive Research

The term "inclusive research" was coined by Jan Walmsley in an article published early this century on "a range of research approaches that have traditionally been termed "participatory" or "emancipatory," broadly speaking research in which people with learning difficulties are involved as more than just research subjects or respondents" (Walmsley, 2001, pp. 187–188). Walmsley identifies normalization (later known as social role valorization) (Wolfensberger & Tullman, 1989 cited in Walmsley, 2001) and the social model of disability (Oliver, 1983) as two main influences on the emergence of inclusive research. The ideas underpinning the theory and practice of normalization and the social model have also contributed, albeit in different ways, to substantial improvements for people with intellectual disability in many countries to enjoy their rights and experience a better quality of life.

One of the most significant developments has been the realization of the perspectives of persons with intellectual disability. "Realisation" is here being used in two senses: in the sense of people working and living with people with intellectual disability realizing that the latter's perspectives were valid and that it was important to take them into account in their work; and in the sense of taking steps to make the articulation of these perspectives a reality. In research, the first step entailed involving persons with intellectual disability as research participants. In itself, this was a significant step given the long history of doing research about persons with intellectual disability without their perspectives being taken into account (Walmsley &

Johnson, 2003). One wonders if these persons even knew that they were the subject of research. Works which presented their perspectives – one of the earliest being Bogdan and Taylor (1982) – were therefore a very important development.

The second step built on this development through research projects including persons with intellectual disability in *all* stages of the research process and therefore also as researchers. Apart from the influences mentioned above, another influence on inclusive research was self-advocacy (Walmsley, 2001; Walmsley & Johnson, 2003). As Sutcliffe and Simons (1993) report, self-advocacy means speaking up for yourself and others, making choices and acting on them, speaking with people and holding meetings, and making things happen. All of these aspects of self-advocacy are compatible with conducting research, and inclusive research can be seen as a specific way of doing self-advocacy. In fact, Bigby, Frawley and Ramcharan (2014) link the development of self-advocacy in Australia with the development of inclusive research.

A very important aspect of self-advocacy is that persons with intellectual disability are provided with support from others, usually nondisabled persons. The parallel in inclusive research is that of professional (often academic) researchers providing support to coresearchers with intellectual disability. Discussions about inclusive research also refer to participatory research and emancipatory disability research as having had significant effects on the development of inclusive research (see Walmsley, 2001; Walmsley & Johnson, 2003; Nind, 2014). In line with participatory research, inclusive research involves those who are usually the subject of research as researchers in their own right. In fact, in North America it is referred to as a form of participatory action research (see McCulloch, 2011; Ward & Trigler, 2001). The links between the two are further reinforced by references to Paulo Freire's work by many of those writing about inclusive research, including Walmsley (2001), Stevenson (2014), Nind (2017), and Embregts et al. (2018). This article uses the term "inclusive research" since it refers to the specific way in which persons with intellectual disability are involved as coresearchers.

One particular characteristic of inclusive research is that it also builds on the principles of emancipatory disability research. In fact, in line with these principles – as set out by Barnes (2002) – in inclusive research, researchers hold themselves accountable to persons with intellectual disability, use a social model understanding of the nature of intellectual disability (and therefore focus on socially constructed barriers), address such barriers in research by using methods that are accessible, privilege the perspectives of persons with intellectual disability and their experiences, and use research as a tool for improving the lives of persons with intellectual disability. As Barnes (1992) writes elsewhere, "researchers must put their knowledge and skills at the disposal of disabled people. They do not have to have impairments themselves to do this" (p. 122). Inclusive research is an excellent example of how this can happen.

In her first article on inclusive research, Walmsley (2001) notes that inclusive research was at risk of being marginalized. Fourteen years later, she describes being "amazed to see it blossom into an international phenomenon" (Walmsley, 2015, unpaged). In fact, since the first projects carried out in the 1990s, inclusive research has become a well-established approach to doing research. Some examples of inclusive research projects are discussed in the next section.

Inclusive Research Projects

In her 2001 article, Walmsley felt the need to create a new term to reflect the uniqueness of this research approach when compared to other ways of doing research, including participatory and emancipatory disability research. It is, however, not unique in the sense of comprising one way of doing research which is replicated by all those doing inclusive research.

Some of the first research projects that adopted inclusive approaches focused on telling the life stories of persons with intellectual disability. One example *Women with Intellectual Disabilities: Finding a place in the world* which, as the editors say, "is written by, with and about women with intellectual disabilities" from Australia, the Czech Republic, England, Iceland, New Zealand, Norway, Slovakia, and the USA (Traustadóttir & Johnson, 2000, p. 9). Other examples of this type of inclusive research are the accounts of the lives of persons with intellectual disability in Flanders, Belgium, compiled by the self-advocacy organization Onze Nieuwe Toekomst (referred to by Roets et al., 2005), and the personal stories in some of the chapters in Mitchell et al.'s (2006) *Exploring Experiences of Advocacy by People with Learning Disabilities: Testimonies of Resistance*. The majority of the authors with intellectual disability who contributed to this volume are members of self-advocacy groups, mostly but not all in the UK – an attestation of the close links between self-advocacy and inclusive research at least in the early stages.

These and similar publications build on what was achieved by work such as that by Bogdan and Taylor in their presentation of the life stories of Ed Murphy and Pattie Burt, which they reconstructed from hours of recorded open-ended interviews. As mentioned above, Bogdan and Taylor's (1982) book was groundbreaking in presenting the lives of two persons with intellectual disability from their own perspective. What the contributors to books such as the ones by Traustadóttir and Johnson (2000) and Mitchell et al. (2006) did was to support persons with intellectual disability to write their own life stories and have them published in their names with the nondisabled people who provided support listed as coauthors. The result is that "[t]hey present to the reader an active and assertive group of people that counters the passive image of people with learning disabilities that is so often portrayed" (Mitchell, 2006, p. 7). Furthermore, by presenting the perspectives of persons with intellectual disability in pieces written (or cowritten) by the persons themselves, these and similar publications also show how they are capable of reflecting on their lives and articulating their perspectives.

Another development was for persons with intellectual disability to conduct research about the lives of other persons with intellectual disability. One of the first such studies, reported on by Sample (1996), was conducted in the USA and focused on the recreational and leisure needs of adults with developmental disabilities. Very often, such research is conducted by self-advocacy groups in partnership with academic researchers, a clear indication of the similarities of inclusive research to participatory and emancipatory disability research. One study, conducted in the 1990s by the Bristol Self-Advocacy Group, was aimed at finding out about how other self-advocacy groups work (Williams, 1999). Self-advocacy has continued to be linked closely with inclusive research. McCulloch's PhD thesis is built on the use of participatory action research with four Canadian persons with intellectual and developmental disabilities "to practise being self-advocates" (McCulloch, 2011, p. i). More recently, Central England People First carried out inclusive research about the group's own history (Walmsley & The Central England People First History Project Team, 2014).

Inclusive research has also been conducted in various countries about different subjects that are of interest for persons with intellectual disability. Taylor et al. (2007) present the results of research carried out with service-users with intellectual disability in the UK. Frankena et al. (2019) synthesize the results of inclusive health research projects carried out in Ireland, Northern Ireland, and The Netherlands. Vega-Córdova et al. (2020) report on an inclusive research project on "the cognitive accessibility of public spaces and services in a Chilean city" (p. 318). Other research subjects include independent living in a study carried out in Catalonia, Spain (Coll et al., 2016), and overprotection in a study carried out in Malta, a study that I carried out with a coresearcher with intellectual disability (Callus et al., 2019). For these studies, ad hoc research teams were created. There are also research teams whose members remain more or less the same from one project to the next. These include the Building Bridges Research Group in the UK which is part of a nongovernmental organization (Building Bridges Training, 2020) and two inclusive research networks based at a university, one in Ireland (Trinity College Dublin, 2020) and one in Australia (Centre for Disability Studies, 2021).

The publications cited in this section provide some examples of the type of inclusive research projects that have been carried out in various countries. While they attest to the variety of topics researched, research team set-ups, and methods used – as seen also later in this chapter – one of the characteristics that they share is that, while the projects are situated in different continents, the countries mentioned are almost all placed in the Global North. There are examples of participatory research in the Global South, such as the video project with disabled people in Burkina Faso by Bezzina (2019). Any developments in the area of inclusive research itself would need to grow organically within the context of different countries. They would also need to take into account the issues faced by disability researchers in the Global South, especially the risk that researchers from the Global North carry out this research from their own epistemological standpoints and without regard of the socioeconomic and cultural context in which the research is being carried out. Rioux et al.'s (2016) reflection on their experience of doing research in Global South countries highlights the reasons why sensitivity to this context is essential. Another issue is the dominance of researchers from the Global North in research projects situated in the Global South – as attested, for example, by Hanass-Hancock, Chetty and Myezwa (2019) in the African context. As Katsui and Scwartz (2021) write,

> The great heterogeneity of disability and its contexts, as well as its evolving nature, mean that we must all think deeply about interconnectedness, relationality, and continuity of disability with other phenomenon across different time and space. (p. 205)

Naturally, this observation is valid for all countries – regardless of their socio-cultural and economic contexts.

The Conceptual Framework of Inclusive Research

In her book on inclusive research, Nind (2014) says that she prefers referring to "doing research inclusively" than to inclusive research (p. 92), arguing that this term avoids an idea of inclusive research as being either monolithic or static. However, despite the varied and ever evolving ways in which inclusive research is carried out, there are kindred practices and conceptual underpinnings to the type of research projects mentioned in the previous section which make them identifiable as being inclusive. The practices and research methods used are discussed in the next section, after an exploration of the conceptual framework informing inclusive research in this section.

The most important concept underlying inclusive research is an understanding of disability as being something other than the sum total of one's impairment. Within this framework, the nature of disability is understood in different ways: as standing in clear opposition to impairment as with the social model of disability (Oliver, 1983); as being in relation with impairment as with the social relational model of disability (Thomas, 2004); or as being a concept that needs to be critiqued alongside the notion of impairment as with critical disability studies (Vehmas & Watson, 2014). These and other models of disability complement each other by distinguishing between disabling barriers and impairment, even if the nature of the two and the relationship between them are contested to different degrees and in different ways. What is important is that the distinction is made and applying it to intellectual disability enables addressing the contextual barriers that persons with intellectual disability encounter in the research process, rather than attributing the cause of the difficulties they experience solely to the presence of cognitive impairment. This is not to say that the presence of impairment and its potential effects are ignored. On the contrary, it means that measures are put in place to cater for impairment-related limitations. Thus, persons with intellectual disability are conceptualized as being able to engage in all stages of the research process – from planning through to implementation and onto dissemination of results – once the required support is in place.

In this regard, the concept of "relational autonomy" can be seen as an inherent component of the conceptual framework of inclusive research, even if it is not used explicitly by those writing in the area. Davy (2015) calls for a conceptualization of autonomy "as enabled relationally, through a network of relationships that require support and advocacy, rather than as a status or psychological attribute" (p. 146). The relationships forged in the process of conducting inclusive research fit very well within this concept, since persons with intellectual disability are provided with support to engage directly and actively in the research process and barriers to their doing so are addressed. As Davy (2015) explains, relational autonomy “captures the notions of interdependence and ongoing support” (p. 146). These notions apply to inclusive research as well – the different actors involved in such research are dependent on each other as they engage in different and complementary roles, with the academic (or other) researchers providing support to coresearchers with intellectual disability in the process of conducting research together. In fact, Nind and Vinha (2014) place support, negotiation, and interdependence at the center of inclusive research.

Another important concept underpinning inclusive research is that of knowledge being (at least partly) experiential in nature. The knowledge that persons with intellectual disability bring to inclusive research, which they have acquired through their lived experience, thus plays an essential part in inclusive research. In fact, coresearchers with intellectual disability are referred to as “experts by experience” by some authors (see Embregts et al., 2018; Vega-Córdova et al., 2020). The lived experience of coresearchers can – and should – inform all the stages of the research process, starting from the choice of research topic. From my own experience, I appreciated the importance of this when – in relation to the research on overprotection mentioned above – I first discussed with my coresearcher what we should do our research on. She immediately mentioned overprotection, a subject that I had not thought of but which is important for her and other persons with intellectual disability that she knows.

The dynamic nature of inclusive research, the attention given to socially constructed disabling barriers, and the importance placed on expertise gained from experience and on the relationship between those involved in conducting research place inclusive research within the interpretive research paradigm. As explained by Corbetta (2003), in interpretivism, reality is seen as knowable through the meanings attributed to it by different individuals. Consequently, what is seen as researchable is not the objective nature of a particular reality, but the subjective interpretations attributed to that reality by those who live it. Given these ontological and epistemological standpoints, the research methodologies used are ones that promote interaction between researchers and researched. As with participatory research, inclusive research goes even further by adding a researcher role to those (or at least some of those) who are researched.

Inclusive Research Methods

The interpretive paradigm in which inclusive research is situated means that it is qualitative methodology that is usually employed. There are some exceptions where quantitative methods have been used within projects that have been conducted inclusively to different extents. For example, Walmsley (2015) reports on research by Emerson et al. (2005) in which adults with intellectual disability helped to develop methods and questioning techniques that were accessible and also to ensure that the results of the survey conducted were presented in an accessible manner. The research that Sample (1996) reports on used a mixed methodology.

Most other inclusive research projects use a qualitative research methodology, thus involving meetings with people. The types of meetings and the people concerned vary according to the nature of the project. For example, many of the projects mentioned earlier in this chapter through which persons with intellectual disability were supported to construct and write their life stories entailed meetings between these persons and those supporting them. There are also other projects – including some referred to above as well as others such as the one reported on by Mooney, Rafique and Tilly (2019) – in which the persons with intellectual disability involved were both coresearchers and the research participants themselves. In other projects, the research participants were not the researchers with intellectual disability and they were involved in different ways – for example, meetings with self-advocacy groups (Williams, 1999), interviews (Frankena et al. 2019), and focus groups (Callus et al., 2019). The input of persons with intellectual disability and other researchers in these studies varies. Bigby et al. (2014) identify three types of involvement of the former: as advisors, as the ones leading and controlling the research, and as part of a collaborative team.

In the research on overprotection, the coresearcher and I worked as a team in all stages of the research. At the planning stage, we both made suggestions which we discussed. We also carried out the fieldwork, transcription, and analysis together. I took care of the literature review and applying for ethical clearance. There were also areas where I provided guidance for the coresearcher, for example, in how to conduct the focus groups, do the transcription, put together the analysis, and present the research. We carried out this research collaboratively after working together on other projects in which I was more in control. Moving from one type of involvement to the other can therefore also be an evolutionary process as those involved in inclusive research gain more skills and experience.

Providing Support in Inclusive Research

An essential part of inclusive research is making the different stages of the research process accessible to the researchers who have intellectual disability. Providing accessibility in this context broadly means that the members of the research team who do not have an intellectual disability provide support to those who do. In fact, inclusive research poses challenges for those providing support to persons with intellectual disability to find the right balance between ensuring that the necessary support is provided without taking control of the process themselves.

An important area where support is needed is to ensure access to information. Since most publications are not written in easy-to-read language, persons with intellectual disability do not have direct access to information and are therefore rarely in a position to decide which information is relevant and how to make it accessible. It is left to those who can read and understand such information and, very importantly, know where to look for it, to decide what to render in an accessible format and how. Cobigo et al. (2019) discuss access to recruitment letters and consent forms for persons with intellectual disability. While their focus is on the latter as research participants rather than coresearchers, what they have to say is also relevant for inclusive research. They note how they decided what information to include in the accessible versions of these documents and what to leave out. The process therefore inevitably entails interpretation. In fact, Williams (1999) observes how as an inclusive researcher she often acted as an interpreter for the self-advocates she was doing research with. Furthermore, even when written information is provided in an easy-to-read format, access for all persons with intellectual disability cannot be automatically guaranteed since many of them may still need support in understanding what is written (Oldrieve & Waight, 2013).

Persons with intellectual disability also need support with devising a research plan and implementing it, analyzing data, and writing up and presenting research results. One of the most important issues is that those supporting coresearchers with intellectual disability need to be wary that they provide guidance where it is needed without exerting control, even if unwittingly. On a personal level, I find Hanna's (1978) image of the balance-beam – in relation to providing support in self-advocacy groups – very useful as it depicts how one must find the right balance between providing the right kind and the right amount of support that is neither too little nor too much. As I argue in Callus et al. (2019), being reflexive in the practice of inclusive researcher, being attentive to questions that need to be asked, and seeking answers to them are very important.

The issues that these support needs give rise to have been well discussed in the literature on inclusive research since its inception. For example, Williams (1999) discusses her role as academic researcher providing support to the Bristol Self Advocacy Group. She is honest about her own influence over the group (for example, being the one to suggest that they do research) and her access to information which is often beyond the reach of persons with intellectual disability. As she writes,

> most of us do have the advantage of being able to read research journals, books and other literature. We also go to conferences and meet other researchers; we might work in centres where other colleagues can be consulted quite easily. (Williams, 1999, p. 49)

Williams also discusses the method used for data analysis, pointing out that making this process accessible means that more time than usual is needed for this stage. The issue of needing more time to carry out inclusive research is also mentioned by Embregts et al. (2018). Stevensons' (2014) article about the process of analyzing data in a collaborative manner with coresearchers with intellectual disability is a clear example of how this process can be facilitated once there is enough time allocated to it.

Issues regarding data analysis do not rest only with how it is done and how long it takes. The process of discussing the data beyond the immediate experience of the researchers with intellectual disability is also considered. Williams (1999) argues that persons with intellectual disability do engage in such processes:

> If a theory is broadly taken to be a model that helps us to understand why things are as they are, then self advocates do engage in theory building incessantly. For instance, the theory that labelling influences people's thinking is a very powerful one. (p. 51)

This position is also taken by Roets et al. (2005) in their discussion of how self-advocates could reflect on their life experiences and consider social factors impacting those experiences. Labeling is one such factor, and they quote Patrick Scheflhout, a self-advocate:

> I find the word 'mentally retarded' a pityful [sic] word. It's made up by them to put a stamp on your head – you're simply not able to do one thing. I don't think they are right. I find out it only is a label – to make you stay where you are. (Roets et al., 2005, p. 106)

However, there are also levels of theorization that are inherently difficult for persons who have intellectual disability to achieve because of the cognitive limitations experienced (Schalock et al., 2021). This situation creates dilemmas for academic researchers. For example, Walmsley (2001) draws from her own experience of working together with other academics and with women with intellectual disability on a book about the women's life stories. The academics wanted to bring in feminist and disability theories to bear onto these stories, whereas the women with intellectual disability "wanted the stories to speak for themselves" (Walmsley, 2001, p. 198). While this group of researchers were able to compromise, others find it difficult to do so especially when persons with intellectual disability are involved in research projects which are also the PhD project of the researcher providing them with access and support. This was the case, for example, for Williams (1999), Björnsdóttir and Svensdóttir (2008), and McCulloch (2011). Walmsley (2001) also makes the point that not engaging in theoretical discussions about the findings generated by inclusive research project can risk holding back its development.

The ways in which the issues and challenges discussed here are tackled to ensure that inclusive research is carried out effectively depend to a large extent on the competencies of those involved. In this regard, the research by Embregts et al. (2018) is very useful because it throws light on the competencies that are needed for people with and without intellectual disability to engage in inclusive research. Some of the competencies are needed by both – building a mutual relationship, communicating, and being adaptable and flexible. Then, those who do not have an intellectual disability need to be able to respond to the support needs of persons with intellectual disability. The third set of competencies are relevant for persons with intellectual disability, including the ability to learn and develop and the ability to ask questions and to reflect.

This last set raises a perennial issue faced in inclusive research – the tendency for the persons with intellectual disability involved in it to be ones who are articulate and do not have high support needs. The inclusion of persons with severe levels of cognitive impairment is a challenge that has yet to be taken on. One of the main challenges is that of communication. Even involving persons with communication difficulties as research participants can be challenging (Nind, 2008; Valade, 2004).

This is not to say that there cannot be other ways of doing inclusive research that are better adapted to those with communication difficulties. But it certainly is an area that needs to be developed.

How Inclusive Research Is Written About

There are potentially as many publications presenting the results of research projects conducted inclusively as there are publications discussing how the research was conducted and written about. Broadly speaking, the latter tend to be written by academic researchers for peer-reviewed publications, including a significant proportion of the publications cited in this chapter. The former tend to be cowritten with persons with intellectual disability and published in easy-to-read formats as research reports. This twin track responds to the dilemma discussed above about keeping writing accessible – and therefore outside what is usually expected for an academic publication – and developing inclusive research and its output conceptually within academia – with the result of making it largely inaccessible for those who have intellectual disability. Publishing inclusive research findings accessibly and discussing inclusive research methodology academically are a way of dealing with these two demands.

Academics working within the inclusive research paradigm are well aware of the paradoxical situation they find themselves in when they do not write in an accessible manner (this chapter being itself one such instance). For example, Walmsley and Johnson (2003) explain why their book on inclusive research is not targeted at persons with intellectual disability. They felt that they needed "space to air arguments and debates before attempting to "translate" them into accessible formats" (p. 15). Williams (1999) and Björnsdóttir (in Björnsdóttir and Svensdóttir (2008)) both tackle the issue of not being able to make their PhD work accessible because of academic requirements.

There are also collaborative writings in academic publications. For example, Björnsdóttir's coauthor is a self-advocacy group member. Other examples of such collaborations cited above are Roets et al. (2005), Walmsley and The Central England People First History Project Team (2014), Callus et al. (2019), and Mooney et al. (2019). With the exception of the latter, the lead author in these publications are academics. Such publications usually also have a section describing the different roles played by the authors in the writing process. They are then often complemented by non-peer-reviewed publications where the lead author is a person with intellectual disability. To return to the example from my own work, the coproduced article published from the research on overprotection in an academic journal (Callus et al., 2019) has a parallel more detailed report of the research findings written in a more accessible manner as well as an easy-to-read summary (in both Maltese and English) (see Bonello and Callus (2017) for the report in English). A similar strategy was also used by Nind and Vinha (2014), two academic researchers who, apart from the peer-reviewed article, also published the full report on their analysis of doing inclusive research (Nind & Vinha, 2012). Apart from having the advantage of allowing for both accessible and academic types of writing, this practice enables researchers with intellectual disability to take the lead in some of the publications and provides documentation that is accessible for other persons with intellectual disability. Much of this documentation is published online, and in this regard, the Internet has made it possible for accessible research reports to be published and disseminated widely since they are also open-access. Moreover, this enables the publication of research reports in much greater detail than is ordinarily possible in peer-reviewed articles.

There are also articles written in easy-to-read language in peer-reviewed publications. One notable example is Docherty et al.'s (2005) chapter in Goodley and Van Hove's *Another Disability Studies Reader?* Another is the 2012 special issue of the *British Journal of Learning Disabilities* on "Research and work of people with learning disabilities and their allies and supporters" in which not only are the articles coauthored with persons with intellectual disability, but also the peer-review team that edited the issue was comprised of academics and researchers with intellectual disability.

Conclusion

The development of inclusive research is strongly tied with the disabled people's movement, especially self-advocacy. Within academia, it is connected with the evolution of participatory research and emancipatory disability research, which have enabled those who were once the passive (and even unwitting) subjects of research to set research agendas and carry out research themselves.

Inclusive research has developed into a unique way of doing research, especially through the way that professional researchers support persons with intellectual disability while simultaneously conducting research with them. Inclusive research operates within a recognizable conceptual framework which sits well within the interpretive paradigm of social science research. Most inclusive researchers use qualitative methodologies, with variations in the types of methods used and the respective roles of researchers with and without intellectual disability. One of the issues faced by the latter is how to provide the necessary support for coresearchers with intellectual disability without exerting control over the research process, especially since they are the ones with access to the relevant information and with professional experience in conducting research.

When it comes to publications, those involved in inclusive research seek a balance between publishing in a nonacademic accessible manner and using an academic nonaccessible style. Quite often, this balance is found by having research reports using plain language (usually published online) and peer-reviewed publications which usually discuss the processes used to conduct the research. Researchers with intellectual disability usually take the lead in the former.

Since its beginnings in the 1990s, inclusive research has developed considerably. There are also continuing challenges for it to deal with, most notably the involvement of persons with intellectual disability who have communication difficulties or high support needs and the use of inclusive research methods in the Global South. The fact that inclusive research has a coherent conceptual framework while at the same time affording a high degree of flexibility in how it is conducted augurs well for developments that can meet these challenges in an authentic manner.

Whose Vulnerability? Challenges in Conducting Participatory Research with Children with Multiple and Complex Disabilities

Eduarda Sousa Pires

Contents

Abstract

Research on disabled children with complex and multiple disabilities is still recent. In the quest to reach out these children voices researchers have turned to participatory research and to the mosaic approach.

The advantages of exploring the Mosaic approach are to grant researchers with multiple and flexible tools which can intentionally be designed and adapted to reach each children voice enhancing their agency. However, in this process and when pursuing inclusiveness, researchers face some additional challenges. This chapter will bring into discussion some of those challenges found in the practice of researching with 52 children with multiple and complex disabilities, during a program of Animal Assisted Therapy sessions held at four different school settings.

During the ethnographic research, the challenges associated with the practice of researching in this context of mix (dis)abilities showed that children participation, namely, on tool design, turned out to be a process of co-researching.

It is suggested that a better understanding of the process and the procedures of co-researching with children with multiple and complex disabilities, and in contexts of mix (dis)abilities, should consider the different dimensions of vulnerability enacted by the research situate encounters.

Keywords

Participatory Research · Disabled children · Mosaic Approach · Research tools · Animal Assisted Therapy · Reflexivity · Vulnerability

While research on disabled children is still recent (Stafford, 2017; Wickenden & Kembhavi-Tam, 2014), there is a growing body of literature drawing from children's voices and perspectives about their own lives (Rogers & Boyd, 2020). However, most of this research addresses children from the perspective of their specific impairments. Contemporary *childhood disability studies* (Goodley & Runswick-Cole, 2011) call attention to the fact that children with complex and multiple disabilities are not a homogenous group but rather present a diversity of identities. The fact that they are almost absent from research increases their invisibility, which is compounded by a general perception about their lack of agency and inability to perform an agentive citizenship (Wickenden & Kembhavi-Tam, 2014).

There is an increasing recognition of the need to bring the diversity of disabled children voices into research and to include their perspectives alongside of those from the ones of other children. By capturing their agency and individuality (Goodley & Runswick-Cole, 2012), research will be enriched by their disability-specific experiences and views (Wickenden & Kembhavi-Tam, 2014). Still, for the purpose of enabling these children's voices, researchers need to use innovative methodological approaches which is inspiring researchers to make use of participatory methodologies.

Participatory research has, indeed, been central to multimethod qualitative research (Mockler & Ground-Smith, 2015; Raffety, 2015; Coyne, 2018) and largely adopted by researchers wanting to focus and understand children as social agents and experts, while acknowledging their voices and forms of expression (Goodley & Runswick-Cole, 2012).

Hereby, in the process of conducting a research co-constructed with children with multiple and complex disabilities, the researcher has resorted to the Mosaic approach – a participatory research method, with the aim of capturing the representations and meanings of disability and exploring if the context of Animal Assisted Therapy (AAT) sessions could enact children's different (un) becoming's (Davies, 2018).

The Ethnographic research took place in four school settings, with four different groups of children involving a total of 42 children aged 9 to 16 years old. The empirical data was produced over a 9-month period, in the context of an Animal Assisted Therapy (AAT) program designed to offer therapeutical and educational skills support to children with multiple and complex disabilities.

In the process of researching, several factors were found to be key regarding the access of children's voice and their voluntary and meaningful participation. Thus, the aim of this chapter is to highlight and discuss some of those critical elements that challenged the design and practice of the research, as well as describing the handed processes in dealing with them. The discussion will start from the description of the research participatory approach, the tailoring of its methodological tools as a co-creative process, to the key challenges faced during the research course and how researchers delt with them through reflexivity and a reflexive practice. Discussion will engage into the concrete research examples and some of its ethnographic episodes. By doing so researcher expect to foreground the challenges faced during the research course but, at the same time, to bring an understanding lens from the situated process of co-researching with children and from where knowledge was extracted from. This lens will also bring into the discussion the multiple dimensions of vulnerability observed while researching.

Overall, the discussion here presented is expected to contribute to a better understanding on the process and procedures of co researching with children with multiple and complex disabilities in contexts of mix (dis)abilities.

Edging up the Mosaic Approach for a Participatory Research

The Mosaic methodology is better described as an approach as it encompasses a set of multiple methodological tools that enable qualitative data production. Since it is intentionally designed to enhance children agency and voice, it presents an opportunity to the inclusion of children in participatory research.

The advantages of exploring the Mosaic approach (Clark, 2011b) grant researchers with the possibility of using multiple flexible tools for the participatory research with disabled children. Bearing in mind that disabled children make sense and think about experiences in diverse ways, taking the Mosaic approach into practice provides a way to pursue research inclusiveness – where participants can become co-researchers, be experts, and make meaning out of the experiences of their own lives (Clark, 2011).

The variety of qualitative methods and methodological tools can include narratives, physical or visual expressions, and others, which in the end are brought together to create a whole meaning picture (Rogers & Boyd, 2020). And, the access of children's perceptions and views is determined by the research contexts (Greenfield, 2011; Wilkinson and Wilkinson, 2020, p.7).

During the process of the research here reported, the methodological design included a variety of flexible tools drawn out from the Mosaic Approach (Clark & Moss, 2005; Clark, 2011). Data was also produced through ethnography – involving participant observation and fieldnotes, writing and analyses, as well as photo capturing, and a multi-method data production approach was followed.

The Animal Assisted Therapy sessions took place once or twice a week in the special education classrooms. Group composition were as follows:

Group 1: six boys – 9 to 10 years old. Children impairments include autism, Down syndrome, cognitive deficit, with one child being nonverbal and two others being semi-verbal.

Group 2: three girls and three boys – 11 to 14 years old. Children impairments include Down syndrome, severe cognitive deficit, severe cerebral palsy; Prader Willy syndrome, with two children being semi-verbal.

Group 3: six girls and eight boys – 12 to 16 years old: Children impairments including autism, Down syndrome, cognitive deficit, Prader Willy syndrome, with one child being semi-verbal and one nonverbal.

Group 4: six girls and nine boys – 12 to 15 years old: Children impairments including autism, cognitive deficit; severe cerebral palsy; Lobstein disease; Down syndrome, with one child being semi-verbal and one nonverbal.

The literature drawing from the Mosaic approach draws from data produced through several resources with no predefined path available (Clark & Moss, 2011), a process requiring researchers to engage in a reflective process when developing the methodological design of their studies. As so, the Mosaic approach allowed the present research with the possibility to develop and include a repertoire of tools, flexible enough to address the practice of a participatory research facing children's diversity and needs as well as their complex and multi disabilities. These tools were aimed to create experiences that could elicit children's voices, either individual or in group. Children's feedback about their experiences regarding the use of the methodological tools was incorporated on its adjustments and often gave place to an interactive process of co creating multiple new tool formats.

The initial period of research served as a period of familiarization helping both parties – children and researcher – to get to know and understand each other. Following the opportunities to voice children's ideas – individually or in group – were progressively shaped through an open selection of tools: Wall Journals; Accessible Reading Books; Crafts; Talking cards; Story Games; Photovoice; Photo Descriptions; Photo captions; Crafts | Drawing | Painting; Rag Dolls; Play-based Dog Training Activities; Tournaments; Board Story Making; Group Puzzles; Tangrams; Emojis.

Overall, the design and the implementation of the Mosaic methodological tools was a profound relational experience. The process of research tool selection and (re) design was a continuous learning process and research also resulted from a mix of the field observations, the dialogues, and the ethnographic encounters between children and researcher. Ensuing is a presentation of the methodological tools which attracted the most of children interest and participation during the research sessions:

Photovoice: children revealed a great understanding of mobile phones and their use as photo cameras. This was a well-accepted activity that provided lots of information about children's views, feelings, and experiences on the world around them. Children's voice(s) were elicited by asking them to take photos about: "your friends and things they can do"; "how you feel when you are with us"; and "what's the best thing about being here"; and then by talking through the photos with them so to understand their meaning of the photos. Looking at the photos after they have been taken was also a moment for a "I – you" (children to children or children to us) communication.

The following are excerpts from the typical dialogues that would emerge:

Fig. 1 Photovoice

R *What are you taking photos of?*
Mauro *My girlfriend!*
R *Oh I didn't new Teodora*[1] *was you girlfriend!*

Fig. 2 Photovoice

---

[1] To preserve confidentiality and anonymity all names used in this chapter are pseudonymous.

R	*How do you feel when you are here with the dogs? AH!! Like that? Wow!!! Happy? And is that because of Sam (dog)*?
Dennis	*No, it's because of him, I'm playing with him (pointing to his friend).*

(Fieldwork diary | District School 05.21)

Photo Descriptions and Captions: visioning photos brought by the researcher to the session was another activity with great acceptance among children. This tool allowed for some brainstorming and dialogues around disability and the representations of their self-disabilities.

This is better understood following this passage of the researchers field diary and illustrated by Fig. 3.

Fig. 3 photocaption

> Today children from this group were showed some photos of other group of children that are unknown to them but were playing the same dog games as they usually do. They were asked to identify what were the other group of children doing. Then followed another photo and the presentation of a single unknown child: "This is João and he is from a school in Cascais. He does not speak verbally so who can guess how he has asked the dog to sit?" And this granted the exploration of dialogues around children's ideas about disabilities.
>
> "(. . .) Machal (ASD, 15 YO) - I like pittbulls!

R	Do you?
Machal	yes!
Teacher	we are not talking about dogs we are talking about a child!
R	Yes, a boy! His name is Pittbull or PIPO! He is in the Autism Spectrum Disorder. Nuno follows his Chanel on Pipo TV.
Machal	He is autistic?
R	Yes? How is it to be autistic, Machal?
Machal	It's someone who is crazy!
Bianca (Lobstein disease 15 YO)	No, it is not!
Teacher	So. . .so Machal, are you crazy?
Machal	Me? No! Not me! And Autistic people are mean people!
Bianca	No, they are not!
Machal	Yes, they are, I've heard about it!
Teacher	Then are you mean? You are in the ASD! You and your best friend, Rodrigo! (. . .)

Bianca	Autistics are not mean. . . they just. . . are not . . .
Machal	. . .they are not aware of what is going around them!
Bianca	In my other school there was a boy that was always hanging around in the playground. I used to ask my mother why and she explained me that ASD children prefer to live in their world.
Teacher	Very well, Bianca!
Bianca	They are not aware of what is going around them! Once that boy gave me a slap.
R	And here your ASD friends, how are they?
Bianca	they are not mean people! They like to live in their world! Nobody here remembers Joca?
Teacher	Ah. . . Joca? From a few years ago?
Bianca	Joca was from their (Machal and Rodrigo) class. He had a hand which was always swollen because he bit his hand here (pointing to pulse)! He was not aware of what he was doing, he only wanted to be left alone!
Teacher	Yes, but now we have other ASD children here! Look here at Machal!
Machal	I'm not autistic (strongly said)!
Bianca	Some autistics don't speak!
Teacher	Yes, Joca didn't speak!
R	Machal, you are not autistic because you can speak?
Machal	Yes. . .. but sometimes I don't say anything!"

> By the end of the session, I told one of the teachers that it was interesting to listen children's opinions about disability and she confessed herself extremely admired as children had never had that kind of conversation, especially in such an open manner, with them.
>
> (Field Diary | Valley School -.12.21)

So, this methodological tool – presenting children's photos and asking them to produce their descriptions or captions – were able to elicit relevant and detailed information, rich descriptions, and to develop group discussions.

The dialogues were also promoted via other means, for instance games, as in the following example: "Let's all close our eyes. David, would you like to be the one describing this photo? (Then, David had some time to describe the photo to his peers) Now, open your eyes! From these five photos find the one that fits David's description!" In other occasions, the researcher could be the one describing the photo over a hide and seek game.

Talking Cards: A wide selection of card images showing scenes from different topics, were produced during research with the aim of making children "talk" about themselves – for example, their wishes, likes and dislikes, how they felt in specific situations, what would they prefer to do if able to be left home alone, and so on.

Fig. 4 Talking cards

Succeeding children visioned and selected significant cards thus generating individual and group discussions and brainstorming’s by – pick a card and answer: e.g., if I lived alone with Sam (the dog) I would: CARD – dress myself alone; CARD – I would like to go to school alone; CARD – go on holidays with friends, and so on.

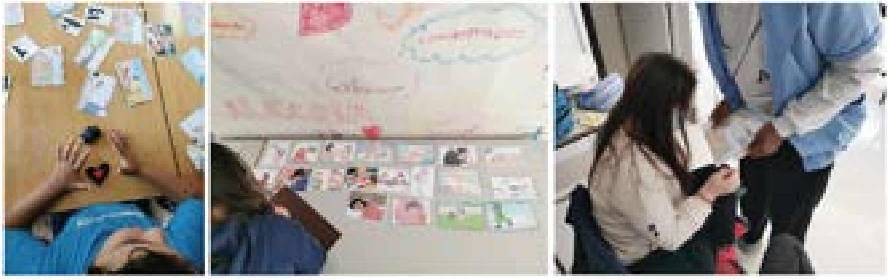

Fig. 5 Talking cards

Reading books: Group reading of cognitively accessible books – books in braille, with pictograms, audiobooks – allowed children to talk about their perceptions about impairments and differences.

Fig. 6 Reading books: group reading of cognitively accessible books – braille, pictograms, audio – allowed children to talk about perceived differences. There were no blind children in any of the groups we worked with, so we used the exploration of Braille to elicit discussions about who are the people that see with fingers? What is it to be different? Do you know any one different in your school?

Fig. 7 Superheroes

Superheroes: This tool were set up by gathering of a collection of popular superheroes images to sparkle children discussions about themselves. In all school contexts, the AAT sessions were regularly co performed with the help of three dogs. Children identified a superhero with one of the dogs and engaged in discussion prompted by questions such as: “What’s your favorite superhero?” “What superpower he/she has?” “When you are with dogs in the sessions, which superhero are you?” “Choose a superpower for you and one for the dog. What would you do with that superpower?” These and similar questions enabled discussions with children, as exemplified by the following examples:

> (. . .) I want to be invisible, and I want to cure people(. . .)

R Why do you want to be ladybird? Maggie: Because I want to fly and go outside! (Pointing to the window)

R And where is outside? Maggie: Outside away from here, this classroom! I want to go outside of here! (. . .)

> In today’s sessions all children said they would like to have the power of flying!(. . .) (Fieldwork Diary | P. School |- .03.21)

Fig. 8 Classroom boards

Classroom Boards: After a few sessions, children were asked to evaluate the routine session activities. Usually doing so by selecting appropriate emojis (happy | not happy) that would express their feelings. In these routine, children came out to be ready to co-plan the next sessions expressing what activities they would like to perform and repeat. This elicitation of children’s voices could also be done by asking them to pick up cards, showing them pictograms, and stimulating verbal discussion, among others.

Fig. 9 Rag dolls

Ragdolls: To bring the topic of difference forward and onto conversation researcher combined the use of rag dolls with other existing games. The interaction with the rag dolls could differ depending on children characteristics and needs, children groups, and the school contexts. Altogether children would be asked to choose and name a rag doll and to imagine how would it be being like – "that rag doll." Questions could come around: "Do you know someone like this rag doll? Is any of your friends like this rag doll? How do you think the blind rag doll feels like?"

Rag dolls supported researchers' exploration around children's perceptions on their lived experiences and understandings of disability and difference, as these excerpts from Valley School AAT sessions activities show:

> (. . .) Today we all went outside! Following the game explanation and the Dolls (Rag Dolls) presentation each group of children were asked to choose and name one. Nuno is always taking care of Joca (wheelchair user) and has chosen the wheelchair ragdoll! Joca after observing the doll was very happy and smiling. I asked him: are you choosing this one because Joca is in your group? Nuno said: Yes! Nuno always does this – if Joca has the wheelchair braked he goes directly to release him so he can move and be able to join session activities by himself! All children choose and elect a favourite ragdoll and I noticed that the blind doll was not chosen and was actually put aside. Initially, I thought this would be a favourite one because it included a guide dog with the doll. I asked Machal: Do you want this one? Machal replied: No, not that one! I asked another child: Lia, and you, do you want this one (picking up the blind ragdoll) Lia responded: No! I don't want it too! Curiously, none of the children choose the blind doll. Later on the phone with the coordinator teacher, whose husband is blind, I mentioned this – "Children choose all the rag dolls even the one with the wheelchair . . . but they did not choose the blind doll! She said: Well, we all know this, don't we? Everything that is different, we already know how people react to that. . . (. . .). (Fieldwork diary | Valley School. 04. 21)

> (. . .) There you are, now you have a ragdoll! Now you can have someone to talk to! Said Luisa (staff – education helper). I asked: She doesn't have anyone to talk to? Luisa explained: She sleeps a lot and cries a lot . . . and this wheelchair is heavy, so she doesn't have anyone to talk to!(. . .). (Fieldwork diary | Valley School. 04. 21)

These ethnographic conversations around ragdolls were able to produce rich data adding new insights that helped to get to know and understand better the reality of these children's lives.

Story Making | Secret Friend: Classroom boarding games were able to promote group focus and discussions around a topic. Because children were always so interested in dogs, discussions were primarily elicited by talking about dogs. The game could be asking a child to volunteer and leave the classroom. The children remaining in the room would select and identify a dog feature, which would be written down on the board. Then the volunteer returned and a find out game would be starting. For example, someone could say: "Sam likes to eat and knows how to do a lot of tricks, but he cannot go between legs, which dog is it?" Next, children would be asked to describe a selected peer.

Fig. 10 Story Making

Story Making: Story making as a good source of information about children perceptions of the different situations of their daily lives: routines; difficult situations, favorite things and so on. In some stories, the characters had an impairment so to try to elicit children's views on how it is to handle impairments in daily life situations. This instrument enabled the creation of narratives bringing out issues around disability perceptions, as this following note reveals:

> (..) Today's story was interesting! A girl lost her shoe, and she would like to find it but she could not run because she could not see well. It's very interesting how blindness always emerges as "the disability" (. . .)! (Fieldwork diary | P School 05.21)

Fig. 11 Crafts

Crafts | Drawing | Painting – Craft making, drawing or painting created moment (s) for the researcher to join in group talks and listening to and asking questions to the children. Drawing material was always at hand for children spontaneous use. The focus was on getting children's discussing their work and to achieve a co-constructed interpretation, as this dialogue with Sandro a 13 years old boy from P School illustrates:

> (. . .) R: Wow you did a dog! Is it a dog, Sam? Sandro: No. . . it's my dog! R: Oh, how nice! And your dog only has one eye? Sandro: Yes! He is disabled!! R: Ah! And how is it to be disabled? Sandro: So. . . it's to be special! (. . .). (Fieldwork diary | P. School 05.21)

Fig. 12 Painting

The activities were also an opportunity for children to express their opinions as this field note demonstrates:

> (. . .) Today Bianca came in late. She joined us painting Sam silhouette. After seeing her choosing the blue colour I told her - that's blue! This dog is Sam and he is brown and white! Bianca: Yes! But I paint as I wish and with the colour I like! R: Yes, that's true, and you like blue? Bianca: No, I just like painting as I wish! When we were finishing the teacher asked me: How did it go? I said: Very well! Bianca even told me she liked painting as she wishes and likes. The teacher was extremely surprised saying: - Wow! She usually never says anything on her own behalf! (. . .). (Fieldwork Diary | Valley School Valley School | 02. 21)

Fig. 13 Dog Training Games

Dog training tournaments – dog training games and dog training play-based activities was the more accepted activity in AAT sessions, and were transformed in a methodological tool. Throughout the AAT sessions children learn how to train dogs to perform a sit, a stay, weave between one's legs, play dead, and a few other behaviors. Training dogs served as a milieux for play-based interactions that could simultaneously develop skills (e.g., motor coordination; communication; body balance) targeting therapeutical goals and at the same time engage children in tournaments or play-based activities consenting researcher to ask, observe, and generate discussions as, for instance: asking children to choose a team, then to characterize its members, and to elect what each one would like to train related to their impairments and skills, enabling new insights into the research questions as the following passage of the fieldwork diary can demonstrate:

> (...) Today I gathered children by groups and asked them to choose a dog and a name to their groups! Then I asked them to say what special things their dogs could do and what special and different things they can do (...). It was an extremely well accepted activity! The children discussed how they are and negotiated their meanings between peers. Bianca said: "Rodrigo said he is strong like Sam (the dog) but he is not strong! He does not help anyone at lunch time! (...)". (Fieldwork Diary Valley School | 05. 21)

Children's relation with the dogs was a lens to observe the interactions and inform the research with discussions upon topics of autonomy, self-representation of disability, and difference.

Challenges of Participatory Research

The research context – the ATT sessions – was extremely important to the research and to implement and (re)design methodological tools. AAT sessions were deeply appreciated by children and provided researcher with the opportunities for interactions in a play base mode thus easing up the process of gaining trust and of achieving a close relationship with them.

Nevertheless, when implementing the participatory tools of the Mosaic approach into already existing contexts, researcher needed to face some challenges that modulated and drove the course of the research, namely: how to open the field and how to address the challenges associated with researchers positionality; how to negotiate the observation and children's participation; deciding how and when to implement the mosaic approach; the challenges created by the gatekeepers and the impact of researchers double role as therapist and as a researcher.

Thus, this discussion will in what follows focus and detail these challenges trying, at the same time, to show how throughout the research process researchers reflexivity helped on dealing and responding to them. Also, bringing into problematization the different dimensions of vulnerability that occurred during the research process.

Opening the Field and the Challenges of Our Positionality

Ethnographic Research took place, simultaneously, at the four different sites and was shaped by the different school experiences, the local actors, and the local contexts where children interacted (Schuelka, 2014). In the beginning, the researcher spent a small time-period just doing observation to get to know the children and their significant others in the classroom – the teachers and the staff providing classroom support. Taking the double role of researcher and AAT staff, positioned the researcher between an insider and outsider role, in an "in-betweener researcher position" (Chhabra, 2020, p.315) and therefore researchers first challenge was to learn about children's characteristics and to earn their interest and voluntary participation in the activities.

Given that the research context was the school environment, the first approach to children had to take place through gatekeepers. As AAT sessions, goals are supposed to produce therapeutical improvements, accessing children's clinical files had to be considered. Researchers first knowledge about these children was thus influenced by teacher's understandings, who mostly offered behavioral narratives framed by an educational and medical perspective. In some cases, children's individuality was reduced to a concise taxonomy of personal impairments, which were summarized in expressions like "he is very neurotic" or "she is very obsessive." Other times teachers tried to influence the AAT sessions design suggesting researcher with standard approaches for activities that they deemed would best fit children's impairments.

The complexity of children's disability experience was thus reduced to just a few dimensions, focused on body functionality (e.g., "These children (autistic) are sensorial, you need to bring activities that (. . .)"). Hence, medical diagnoses provided the researcher with the initial reference frame to figure out the type of participatory tools to use and how to adjust them to the mix of (dis)abilities in each group of children. However, to acknowledge the complexities of designing inclusive research tools researcher needed to understand children's abilities and at the same time overcome the teachers' deficit lens as their representations of children's (dis)abilities seemed to be locking them in a contextualized version of their vulnerability.

It was by gaining closeness to children that researcher became more knowledgeable about their communicative skills. Throughout the research process and by a constant reflexivity, researcher has understood that accessing children's participation and voice required a continuous process of refining the methodological instruments in order to adjust them to children's characteristics and needs, such as – Hugo is autistic and nonverbal but he is also an individual, so Hugo is shy and prefers a "I-you" communication, so I listen or watch him and then I verbalize it and ask him back: - Is this right?

Thus, researcher was required to do a continuous process of critical examination of the decisions made over the methodological adaptations and at the same time to scrutinize either its own or "others" representations, beliefs, and the ideas about disability and about children's (in)capacities, and that in some sense might interfere in the (re)designing of the methodological tools. In this point, either reflexivity and a reflexive practice were a valuable tools for research.

Coupling Methodological Tools to the AAT Sessions

Deciding how and when to implement the mosaic approach and how to obtain children voluntary and meaningful participation were key issues to the research. After a few sessions of observing children dynamics in the AAT sessions and having noticed their motivation to interact with the dogs, researcher took the decision to couple the implementation of the methodological tools with the activities of AAT sessions. Thus, a diversity of tools drawn from the mosaic approach and aiming to bring children's voice was integrated as a regular part of the AAT sessions, either as playful activities or as play-based interactions around dog training.

The interactions with the dogs served as a milieu of cooperation, among peers and with the dogs, reducing children's resistance, enacting and encouraging their participation and agency. Throughout the months, children became more and more proficient on dog training behaviors – a well-admired feature by other peers and adults and an area of these children's expertise. Considering the mix of (dis)abilities in each group and to grant each child the ability to communicate, we favored multiple and alternative modes of expressing. Children then developed informal and alternative ways of expressing themselves, using different tools and picking up the best ones for himself/herself, resulting in a self and a mutual knowledge and among participants.

Despite the (mix)abilities challenges, the research context created a socialization and friendship opportunity. An environment of similar abilities, a sense of "being with" where participants could cope with communication differences, profiting from similar experiences in an equitable space (Svendby & Dowling, 2013; Ajodhia-Andrews, 2016b). By implementing the methodological instruments integrated with the dog training play-based activities, we were able to promote independent voice, ability to take charge and to make choices, agency and autonomy, and at the same time to capture children's interests and gain their voluntary participation. As time went by, children gained confidence to choose and evaluate activities and co-plan the "next sessions activities" with the instructor.

Presenting the Mosaic methodology instruments as inclusive practices requires imaginative thinking and overcoming the strain of not knowing beforehand whether the adaptation of instruments was to be successful. Close listening to children's reactions, exploring their opinions about sessions (e.g., "Did you like to draw?" "Do you like to use the emojis?" "Next session shall we repeat this?") was a profound relational experience, offering support for the tool selection and design, which then emerged from the dialogues and the encounters in the field. In this sense, children contributed to the creation and improvement of the methodological inclusive tools proposed by the researcher and aimed to capture their experiences.

Understanding children's perspectives revealed to be critical for assessing their voice. By requesting children to share research decisions like planning next session routine, choosing the instruments, and evaluating session dynamics by using emoji's, the researcher could select meaningful tools in a process of co-researching, in which the children's expertise informed the methodology. In this sense, the adoption of participatory methods changed the nature of the relationship's adults-children and the power status of both the children and the researcher, leading the researcher to face the challenges of the gatekeepers.

Gatekeepers' Challenges

While the adoption of participatory methods changed the nature of the relationship and power status, creating greater balance between researcher and children, the researcher had still to face the challenges created by the gatekeepers. These were the special education teachers and the support staff that were present during the sessions. Quite often, their impact delayed access to children's voices, often (re) introducing power imbalances that affected children voluntary participation. At the different research sites, and throughout fieldwork, gatekeepers kept acting on different forms. Next, we present two passages from our fieldwork diary that illustrate some of the gatekeeper's exertions:

> (. . .) Today, again, it was impossible to ask children to take pictures. The teacher didn't allow it. He/She took the mobile phone and erased the pictures, saying: "If you want to take pictures, then take a pic hugging the dog! I'll take the pic! (. . .)" and then turning to me the teacher said: "Why do you give them the mobile phone? They can't take valuable pictures! (. . .)". (Fieldwork Diary | 03.21)

> (..) Children are always very enthusiastic when we arrive! They did some nice biscuits for the dogs. I said: "Wow! Thank you so much!" Maggie, whose fingers are small, accidently dropped one biscuit and she was trying to pick it up. The teacher said: "Maggie, biscuits are for the dogs, they are not for you!" All the teachers laughed! (4 teachers and 2 support staff)! "Look now she even picks dog food from the floor!!!" Maggie stopped, gave me the biscuit, and sadly went away from the group and did not re-joined us for the rest of the hour! Tito kept looking at her, also sad. I asked him: "Are you worried about Maggie?" Tito replied: "Yes, she is sad!" (. . .) (Fieldwork Diary | P. School | 04.21

Often gatekeepers interfered with children's participation by attempting to translate their voice ("What he wants to do is to comb the dog!") or controlling our information and/or interactions with the children, as in the examples below taken from our fieldwork diary:

> (. . .) Rui does not come to our sessions often. Today he asked to join the dog training game. Every time he managed to have the dog doing a behaviour, he screamed "Yeeha!" Teacher Bento came nearby, and I told him: "He is very happy because he can teach the dog!" Bento replied: "I've told you about him! He has severe cognitive deficit and a lot of problems with his peers in his regular class. He is a narcissistic and he likes to show off in here, but when he's with his peers he achieves nothing! His regular classmates do not accept him and there he can't do any task at all!" I asked: "What do you mean?" Bento replies: "Here everything is

> easy and that’s why he is showing off to the others! (. . .)”. (Fieldwork diary | P School. 05.21)

> (. . .) The teacher always interferes with the sessions, e.g., by saying things such as “put your hand here!” “Seat here!” “Hold the dog!” “Comb this way!” I think that then Francis avoids re-joining the interactions. In opposition to other children who cry, he just sits there, doing nothing and stares at the window outside. (. . .) The teacher said: “You see? All autistics are like this! They don’t answer properly and have these non-functional behaviours. (. . .)”. (Fieldwork diary | District School. 04.21)

Sometimes, teachers even attempted to control whose children got included and excluded from participating in the sessions, as these diary notes illustrate:

Fig. 14 Team games

> (. . .) The teacher asked: “Is William there?” William had been seating in the back of the classroom alone and watching his peers doing a Tangram. I replied: “Yes, he was doing nothing, and I asked him if he would like to join us and he joined this team”. The teacher said: “You can’t do it like that! You don’t know what you’re doing, he is very dangerous! He can’t join others like that!!!” I said: “Oh, I’m sorry. He looks so calm all the time. . .” T: Yes, but he explodes! R: Oh . . . so sorry I just thought he could join in and be happy to

> participate! Actually, we are almost finished, and he did it ok all the time . . . he played . . . communicated calmly . . .T: You were lucky ! You don't know how he is! (. . .). (Fieldwork Dairy | P.School | 04.2021)

> (. . .) I was not in the last session. The teacher asked Lara to split the group of students into 3 plus 3, each having a 30 min session. I asked Lara – "Why so?" She told me that the teacher argued that the group should be divided according to children's skills and disabilities. One group should have children that can achieve only sensorial information, and another one for whom we can prepare more difficult activities. (. . .). (Fieldwork diary | District School. 12.20)

Researcher have found that by increasing children's skills to interact with the dogs through dog training play-based activities, the gatekeepers' interference was reduced. As only children knew how to handle and train the dogs, the AAT sessions promoted a frame where gatekeepers were less able to interfere. This was only possible due to researcher double role in the field: as researcher and therapist.

Researchers' Double Role

Undoubtedly, researcher's double role in the research site – as researcher and therapist impacted the research. Primarily thought out as a difficult challenge to overcome it ended up being actually a facilitator and allowing to come closer to children. Our deep understanding of dog handling and dog behavior teaching during session activities helped to attract children's interest for participation. The fact that the researcher was also the AAT sessions instructor contributed to increase the acceptance of its presence, embedding participant observation on cooperation, active listening, and trust gaining (Gerard-Forsey, 2010), while reducing possible perceptions of power Imbalances and the gatekeeper's interference. Moreover, it opened up the chance to engage in co-constructed conversations by seating next to a child in a "I-You" 5 min talk, where researcher was able to capture the children's individual voices, allowing these moments and experiences to inform research practices and tools adjustment. The researcher–researched relationship was thus negotiated in the cooperative learning environment of dog training AAT sessions.

Reflexivity

Embracing a reflexive practice was useful to critically examine our decisions about the methodological design adaptations (Ibrahim et al., 2021). A central idea in Participatory Research is that participants are empowered, affecting the balance of power relations, which is therefore expected to shift (Ajodhia-Andrews, 2016). Reflexivity and a reflexive practice were significant procedures in the path to ethical decisions, as well as in trying to scrutinize representations of disability, beliefs, and ideas of children (in)capacities, that emerged either from researchers, gatekeepers or any significant others, and which could also influence and shape the research process. Furthermore, reflexivity was greatly necessary when facing the challenges that emerged from co-researching with the children, considering their (dis)abilities and diversity of ways of participating, and guided the process of constantly verifying how accessible and suitable the participatory instruments were. Disability interacts in a multifaceted way (Watson, 2012) and the researcher needs to problematize the complexities involved. Researchers' self-reflexivity helped to understand the intersections of power, researcher's role, and to address issues of vulnerability.

Reflexivity led to realize how the research practice and experience enacted vulnerability through different dimensions, not just due to the methodological challenges but also due to the interference of gatekeepers.

Whose Vulnerability?

The research field of severe and multiple disabilities presents the researcher with additional challenges related with vulnerability. Researcher initially thought to be addressing issues of vulnerability by pursuing a research praxis grounded upon informed consent and voluntary participation as ethic standpoints. However, researcher came across different dimensions of vulnerability affecting children and its ethical decisions, understanding that vulnerability could be an opaque category cross-cutting research and research subjects (Mellstrom, 2016). The inner version of vulnerability coming out of teachers' narratives about their children impairments showed that the context where individuals might be considered vulnerable can influence their becoming's. Considering the example of Teacher Bento's narrative presented above, this becomes evident:

> (. . .) Bento: Rui (cognitive deficit 16 Y.O.) is a narcissistic and likes to show off in here but when he is with his peers, he is not able to do anything! His regular class does not accept him and there he can't do any task at all! R: what do you mean? Bento: here everything is easy (. . .). (Fieldwork diary | P School. 05.21)

In Teacher Bento's words (and social representations), Rui falls outside of the categories of his peers and AAT sessions are not recognized as a context for an emancipatory participation. Rui's experience is not considered a contextualized experience, but rather a reference for judgments about his (lack of) competence, thus becoming a site for disability identification (Runswick Cole and Goodley, 2015: 9). The medical and educational deficit lens draws aspects of a vulnerability version, supporting the teacher's interpretations and disabling the child.

Another example of this came up when, by the end of a session, we saw one of the children – Manuel – with his mother walking in our direction:

> (. . .) Teacher: There goes Manuel! It's incredible as he seems to have no impairments at all when he is with his mother and outside school! (. . .) A few months before I had another conversation with the same teacher about Manuel: "R: Manuel is so sleepy today! Teacher:

> Yes, he has a new medication today... yesterday he had a big crisis he did not want to be at school he is very difficult to deal with! (...)". (Fieldwork diary | P School. 07.21)

Children's vulnerability can endorse a vision of children within a homogeneous category (Underwood, 2014; Aldridge, 2015) intercepting their visibility.

Researchers positionality and double role in the field implied a close relation researcher–researched and leading to a reflection on the nature of vulnerability (Tang et al., 2020) and how it was enacted on and by the research. Vulnerability seemed to intersect children experiences in multiple ways and dimensions, as well as researcher's decisions and research fieldwork. In the beginning of the fieldwork, teachers expressed their concerns around children vulnerabilities suggesting that researcher needed to respect children given their impairments and incapacities. "(...) This children with extreme ASD are only sensorial! You need to bring out only some sensorial activities (...)" (Fieldwork diary | District School | 12.20)

As research progressed, it became clear that refining methodological tools to be inclusive was a continuous process of giving attention to children's individual preferences for participation. This showed that the contexts where children are considered vulnerable influence their opportunities to participate in research and impact their (in)visibility. The participatory research via the Mosaic approach, tools design, and implementation created a situated knowledge experience (Haraway, 1998; Simons & Watson, 2015), shading a new light on the intersections of the different dimensions of vulnerability: vulnerability as an invisible category holding back children's opportunities to unbecome vulnerable; vulnerability as the product of the context where the research took place; vulnerability as a consequence of participatory research; vulnerability as the persistence of medical and educational gazes; vulnerability as an inner space of understanding between selves (researcher and researched).

Researcher would therefor argue that vulnerability can account for dimensions of subjectivity – happiness, joy, fear, empathy, and so on – occurring in the interactions and through the research process where children are subjects-selves, and not research subjects. Attention to vulnerability is attention to the tensions of the research practice and how these shape field interactions in the process of knowledge co-production. Taking vulnerability as a research data, resource can account for what has happened in the situated encounters between researcher and children (Abadía, 2021), the subjectivity of the relations, and how tools refinement makes a way through it:

> (...) I have to give special attention to this ... I really like Maggie. Maybe I pay her more attention and I'm more sensitive when teachers make jokes about her. (...) I guess I found a way to communicate with Vitor – he is shy and for me that's easy to understand. (...)
>
> (Fieldwork diary | P School. 03.21)

Concluding Remarks

In the process of conducting research with children with multiple and complex disabilities researcher found central aspects of participatory research. The challenges of facing the research subjects mix (dis)abilities led to search and understand how qualitative methodology could create opportunities to voice children's ideas, namely, how to shape tools and engage in field encounters.

Researcher have understood that perceiving children (in)capacities was just a small part of the overall decision path of tool adjusting for participatory research. Drawing inclusive tools was possible by taking the time to know and understand children's individualities and vulnerabilities and to pay attention to the researcher vulnerability too.

This was an open process where tool selection and design emerged from the dialogues, the encounters, and the relational experiences in the field. There were many advantages in coupling the mosaic approach with the dynamics of the AAT sessions: Enacting an opportunity to apply and develop the mosaic approach in an environment of cooperation, based on the AAT dog training activities, and where the researcher's double role made a way into children's interests – interacting with dogs, bringing forward children voluntary participation. The Mosaic approach turned the AAT sessions into a privileged research context, "outside" gatekeepers' surveillance and changing its standard nature where children are seen as passive recipients of care and of therapeutical interventions.

Reflexivity and a reflexive practice were also valuable tools. Considering gatekeepers attempts to readjust the sessions course and relationships in the field led researcher to reflect on the nature of vulnerability. How are narratives of vulnerability a lens, shaping the perceptions of children agency – as vulnerable beings and passive recipients of care – as depicted in gatekeepers' voices? How can vulnerability visions hide demeaning representations and social constructions of disability? Participatory research and the mosaic approach challenged the visions of vulnerability granting children's autonomy practices built out of their own interests.

These outcomes strongly suggest that future research directions in AAT should continue to explore the Mosaic approach and improve sessions practices by emphasizing children's active role as co-creators of their own "therapeutic interventions," outside the traditional medical approach that views them as less then or in need of being cured or fixed. This study further suggests that there is an advantage for qualitative researchers in considering vulnerability complexities and intersections occurring during research as important data. Exploring the different vulnerabilities enacted by the research, challenges researchers to unveil the dominant discourses associated with the social representations of disability.

Qualitative Visual Methods in Research with Girls and Women with Disabilities in the Global South

29

Contents

Abstract

This chapter examines how Participatory Visual Methodologies can be used to create more inclusive and accessible spaces with disabled people in the Global South. Drawing on a 4-year research project, funded by the Social Sciences and Humanities Research Council of Canada (2016–2020) with girls and women with disabilities in Vietnam, we argue that a decolonial Participatory Visual Methodology (PVM) approach is critical for centering the perspectives of girls and women with disabilities in spaces where they may have previously been excluded. This work is important for disability rights because it creates a more transformative approach to social justice in communities in the global South.

Participatory Visual Methodologies · Decolonial · Girls and women with disabilities · Rights

Introduction

It is estimated that nearly 20% of women and girls worldwide have a disability (United Nations Population Fund, 2018). Of the world's one billion people living with a disability, approximately 80% live in the Global South, and of those 60% are women and girls (Dowse et al., 2016).

Women and girls with disabilities in the Global South experience marginalization and exclusion in all aspects of life. With lower rates of school attendance and heightened rates of bullying and violence (Women Enabled, n.d.), girls with disabilities face specific challenges to accessing education due to the intersections of gender, poverty, and disability. This includes a lack of accessible toilets, parental fears that they will be sexually abused by people in positions of power (teachers, assistants, bus drivers), and a feeling that girl's education is less valuable which is further compounded by negative perceptions of disability (Price & Goyal, 2016). Women with disabilities are excluded from work and economic activities, they face continued stigma if they want to marry or have children (Price & Goyal, 2016), and experience multiple barriers to accessing justice (Dowse et al., 2016; Bernasky, 2022; United Nations Population Fund, 2018).

Importantly socio-political contexts impact the daily experiences of women and girls with disabilities. For example, post-colonial Vietnam has centered rapid socio-economic reform; emphasizing neoliberal practices of decentralization and privatization of such services as education while also ensuring that the state continues to control and monitor the population. Furthermore, despite its rights-based language, Vietnam's Law on Persons with Disabilities has taken a medicalized approach to disability with their ranking of disability from mild to exceptionally serious, effectively formalizing the medicalization of disability within the laws and policies (Nguyen, 2016). The medicalization of disability by levels of severity also decides who gets access to services. For example, while people with "exceptionally severe" disability (*người khuyết tật đặc biệt nặng*) and those with "severe disabilities" (*người khuyết tật nặng*) are entitled to the government's social assistance, those with "mild disabilities" (*người khuyết tật nhẹ*) do not receive such benefits (Socialist Republic of Vietnam, Decree 673/VBHN-BLĐTBXH, 2019). This creates power imbalances among disabled people, thereby making it difficult for them to engage in discourses about their rights and leaving significant gaps in knowledge about the exclusion and marginalization of women and girls with disabilities in the global South.

In theory, the rights of women with disabilities are covered by all international treaties. In practice this is not the case. In a response to this historical neglect, Article 6 of the CRPD specifically addresses women and girls with disabilities (United

Nations, 2016). It also includes gender in other general rights provisions (CBM, 2013). The Committee on the Rights of Persons with Disabilities General Comment No. 3 recognizes that,

> International and national laws and policies on disability have historically neglected aspects related to women and girls with disabilities. In turn, laws and policies addressing women have traditionally ignored disability. This invisibility has perpetuated the situation of multiple and intersecting forms of discrimination against women and girls with disabilities. (United Nations, 2016, p. 1)

Conventions may lead to changes in national laws, but they do not guarantee changes in everyday living conditions for people with disabilities (Lindqvist, 2015). While the CRPD is unique in recognizing that women and girls with disabilities are at greater risk of discrimination and abuse (United Nations, 2012), addressing rights obligations under the CRPD needs be more comprehensive and reflective of their experiences (Women Enabled, 2013) that are impacted by their socio-political contexts.

In order for women and girls with disabilities to achieve their rights to education or the labor market, or to justice, they must know what their rights are, and they must also be able to recognize and express when their rights are violated. While there are different approaches to empowering women and girls with disabilities to claim their rights, in this chapter we argue that working with marginalized women and girls with disabilities is crucial to raising awareness about their rights. Furthermore, community participation and involvement of people with lived experience in ways that recognize the diverse experiences and embodiments of women and girls with disabilities in the global South is critical for their participatory engagement and empowerment.

As a post-colonial, socialist country, Vietnam has emerged from long-term struggle against colonial and imperialist wars, which impacted the ways in which the country's disability rights agenda has been developed. Specifically, while the country's post-war period was associated with a rehabilitative approach for war-wounded soldiers, this approach continued to be reinforced within the country's period of social and economic reform in late 1980s and has been morphed into the new Law on Persons with Disabilities in 2010 (Socialist Republic of Vietnam, 2010). The law, which came into effect in 2011, draws on some of the CRPD principles regarding equality and non-discrimination, inclusion, participation, and accessibility to public spaces. Additionally, the state developed social assistance plans to assist people with disabilities in health care, education, and employment. This approach, however, fails to recognize the socio-political dimensions of disability in relation to the social and political contexts which produced impairments.

Girls with disabilities have been left out of this legal consideration. While the right to education is recognized for all children, girls with disabilities encounter multiple barriers to inclusion because of their class, gender, disability, and ethnicity (Nguyen & Mitchell, 2014). Their experiences with oppression are intersectional and multi-layered, reflecting the challenges of delineating the causes of their exclusion.

Furthermore, while feminist and disability organizing has been mobilized across transnational and national stages, girls with disabilities in some of the most disadvantaged communities have been marginalized from the disability movement. Indeed, while international organizations have started to document the rights of girls with disabilities (Pearce et al., 2016; Leonard Cheshire Disability, 2017; DAWN, 2020), these approaches are usually adultist-driven and have failed to engage with the perspectives of girls with disabilities themselves.

In this chapter, we critically examine how women and girls with disabilities in the global South can use participatory visual methods to claim their rights. We draw on a 4-year research project, funded by the Social Sciences and Humanities Research Council of Canada (2016–2020) to examine the ways in which women and girls with disabilities used arts-based, community-engaged, decolonial and participatory visual research to claim their rights. We argue that in order for research on disability rights to be meaningful for women and girls with disabilities in the Global South, there is a need to engage with the lived experiences of women and girls with disabilities in their local contexts in relation to their advocacy agendas. Participatory visual research provides an important way for reframing disability rights within the context of the Global South.

Participatory Visual Methodologies

Our work with women and girls with disabilities builds on the specific area of qualitative and participatory research referred to as Participatory Visual Methodologies (PVM). These are research approaches that employ the use of visual and arts-based tools such as photovoice, participatory video and cellphilming, digital storytelling, and drawing to engage participants and their communities in eliciting their perspectives on particular social issues affecting them (Mitchell et al., 2017). Taken as a whole, they are “methods that actively engage participants in creating and analyzing visual media (e.g., photography, video, or drawings) as part of the research process” (MacEntee & Flicker, 2019, p. 352). Often framed as supporting the idea of “research as intervention” (D’Amico et al., 2016), Participatory Visual Methodologies are multi-faceted in they can act as (1) modes of inquiry, (2) modes of representation through which participants can speak out and speak back on issues that they see as critical, (3) modes of knowledge production through the co-creation of knowledge, and (4) modes of knowledge mobilization within the research processes (Mitchell et al., 2017; Mitchell & Sommer, 2016).

On the one hand, these participant-led tools and approaches contest many of the typical power relations between researchers and communities that exist in more traditional research methods and tools such as interviewing or focus groups, and as such are particularly relevant to working with girls with disabilities. How might the various media forms used (especially photovoice and video production) ensure visibility in a context where disabilities = invisibilities? On the other hand, the use of PVM approaches raises new questions about who can participate and under what circumstances. What are the physical or other barriers to engagement? We explored this in the Monitoring Rights for Girls with Disabilities (MRGD) project where girls and women with disabilities in Vietnam participated in drawing and photovoice activities related to how they see exclusion. As Mitchell, De Lange, and Nguyen (2016) argue, in a chapter exploring the ethical issues attached to this work, many of the typical ethics processes attached to photovoice (ranging from who manages the visual data to what counts as anonymity) were challenged in a generative way in the study.

The above mentioned chapter drew attention to the fact, for example, that while our Ethics Board insisted that the research team must ensure any visual data circulated have no identifying information, the girls participating in the workshop were using their cellphones to photograph themselves doing photovoice work with the cameras that had been provided. In essence the circulation of the images was potentially a concern. Interestingly, although we had discussed issues of confidentiality with the girls and their family members early on in the photovoice workshop, the girls themselves were empowered to use their cellphones to document the process and possibly share the data on Facebook. The question of power and access for the girls, then, seemed more important than the research protocols developed under very different circumstances. Our team also came be more critical of some of our own photovoice protocols such as “no faces” (Mitchell, 2011). In many of our training sessions we often will engage participants in a discussion about what they could take pictures of besides people’s faces, especially if people outside of the project participants are “in the picture.” However, we began to re-think what counts as identifiable information:

> It was only in preparation for these workshops that we began to question the limitations of a ‘no faces’ approach. First of all, why a ‘no faces’ approach [. . .] ? Where does the anonymity of the body reside? What if a participant or a photo subject is in a wheelchair? Participants might avoid taking a picture of someone’s face but the wheelchair may be a much more recognizable and identifiable marker (Mitchell et al., 2016, p. 249).

Re-evaluating research ethics protocols within the context of the research environment is critical and necessary especially as it relates to ethics in working with communities of people with disabilities.

The area of PVM has been highly generative in relation to adaptions to expand the potential for the meaningful engagement of participants, and in so doing addressing some of the various challenges, particularly around ethics and especially the ownership of the productions. The widespread access to cellphones of young people, including many girls with disabilities as we note above, has led to the idea of cellphilming (cellphone+video) (Dockney & Tomaselli, 2009) which has now been applied to a variety of contexts (Mitchell & De Lange, 2013; MacEntee et al., 2016). The refinement of tools of reflexivity and the idea of “speaking back” has expanded the possibilities for the critical engagement of participants (Mitchell et al., 2017) beyond simply making a cellphilm or taking a series of photos. The use of methods such as Participatory Data Analysis (Liebenberg et al., 2020), means that the interpretation of the data can increasingly be done through the eyes of participants and not just by the research team. As Mitchell et al. (2017) describe in their work on the development of exhibition catalogues, and composite videos and digital dialogue tools, the visual data lends itself to "repurposing" so that researchers (often in collaboration with participants) are creating video productions and digital stories as ways to reach audiences. These innovations lend themselves to the enhancement of this work as central to knowledge mobilization.

The Use of Participatory Visual Methodologies in the TDKRA Project

Transforming Disability Knowledge, Research and Activism (TDKRA) is a collaborative, community-engaged, decolonizing, and participatory research project funded by the Social Sciences and Humanities Research Council of Canada. TDKRA aims to tackle the absence of knowledge on girls with disabilities in the global South by engaging them in claiming their rights and advocating for their inclusion. We partnered with Disabled People's Organizations (DPOs) in each community to engage the DPOs in participatory research, fostering their leadership and activism, and enhancing their roles within their communities. Using PVM, in-depth interviews, and focus groups, we engaged with women and girls with disabilities in three disadvantaged communities in Vietnam – Binh Thuy and Ninh Kieu (Can Tho City), A Luoi (Thua Thien Hue Province), Bac Tu Liem (Hanoi City).

While PVM has been useful in shifting power relations between the researchers and participants, as indicated in the previous section, the use of PVM has not always embodied a decolonial perspective. In TDKRA, we use PVM as a part of our decolonizing and emancipatory approach that engages with the social, cultural, and historical conditions in the Global South (Nguyen, 2020). As Nguyen (2016, 2020) argues, a decolonial PVM approach would reframe disability in post-colonial contexts from the standpoint of the colonized. We applied PVM in each stage of the TDKRA research process to engage with participants' perspectives on inclusion and exclusion, as well as to convey their messages to their friends, teachers, families, community members, and policymakers. While some girls had experience with photovoice from their participation into our pilot project in Bac Tu Liem (Mitchell et al., 2016; Nguyen et al., 2015), many had little or no experience using PVM to produce knowledge or foster activism with their communities.

In our research, tensions arose between a rights-based approach embedded within the UNCRPD and a decolonial approach which centralizes the voices and perspectives of participants in the global South. We found that although the DPOs with whom we worked had mobilized disability rights in their activist agendas, the language of rights was not always accessible to girls with disabilities and their community members (Stienstra & Nguyen, 2020). Participants tended to express their basic needs, such as employment and livelihoods, as well as what they want to change to have their needs met, rather than considering what rights they thought they should have, and how to claim their rights. While this may reflect their historical exclusion from rights-based discourse, it reveals a challenge of transnational disability rights movements in engaging with the socio-political and epistemological foundations upon which social relations in the global South are framed. This requires us to decolonize the Western framing of human rights that, when applied to specific contexts in the Global South, usually fail to engage with Southern epistemologies and praxis (de Sousa Santos, 2014).

To tackle the tensions between a rights-based and decolonial approach, we engaged with the local knowledge on inclusion and exclusion as a way of re-framing rights from the participants' everyday experiences and create participatory spaces for the participants to claim their rights. Between 2017 and 2019, the research team conducted 3 participatory fieldwork visits with the girls and women in each of these communities. We also supported our local teams, including the DPOs, in the organization of 3 additional local workshops in Year 2 and Year 3 to build relationships with the girls and women and to ensure that the participants could strengthen their networks. The first stage (2016–17) included a five-day training workshop with women with disabilities along with a two-day participatory workshop with the girls with disabilities in each community. The second stage (2017–18) began with in-depth interviews and media analysis, followed by a four-day workshop with the use of photovoice, community-asset mapping, and reflections on their narratives. We also worked with a group of local film-makers and all the girls and women to create a documentary film, *Our Journey* (TDKRA, 2019). The film highlighted the voices and participatory engagement of the women and girls, as well as DPOs, in TDKRA. The final stage (2018–19) focused on community engagement activities, public film screening in the transnational, national, and local spaces, and re-imaging their leadership as part of their activist agendas.

In total, we worked with 54 girls and 31 women with disabilities. Criteria for inclusion and exclusion of the girls include: (a) aged 10–18 years old; (b) having experienced some forms of discrimination in and by the educational system; (c) having one or more disadvantages associated with their disability, class, gender, and ethnicity; and (d) experience of barriers to education and community. The DPOs used the recruitment procedures and criteria to recruit participants in their local communities. At the same time, we draw on the DPO's recommendations for recruiting participants in their communities. We also sought to ensure that our research is relevant to and respectful of the local practices. We did not restrict the age level of the women with disabilities.

The fieldwork included both training and data collection. Under the support of the trained women, the girls produced drawings, photos, and cellphilms, as well as engaged with their community members through an exhibition that displayed their arts and cellphilms. Here, we draw on data produced from photovoice and drawings to reflect perspectives of girls and women with disabilities about inclusion and exclusion, as well as their activism for their rights to inclusion.

The Process

We used drawings and photovoice to engage the participants in "picturing" their perspectives on inclusion and exclusion and to express their view of change. The drawings served as a way of engaging in conversation with the girls, especially with those who have language barriers. In a drawing workshop, participants were invited to think about issues such as "What is it like to be a girl with disabilities?" or "Girls with disabilities and the community." Participants used their drawings to tell stories about their space of living, schools, and communities. For the photovoice project, we used a number of prompts such as "Inclusion and exclusion," "Disability and diversity," and "Participation." The participants worked in groups of 3–4 girls. In each group, women with disabilities worked with the girls to support their engagement. The women were trained with basic steps in participatory visual methods. Each group took 6 pictures on inclusion and exclusion. They worked together to discuss their topics, including what they would photograph and how they would do it. One girl was assigned the role of camera person while the others staged the scenes. The women facilitated the participatory process by, for example, helping the girls to position the cameras or providing them with suggestions for how to enact their scenes.

The participants created their art productions in each fieldwork site. Interview data were collected in the second year. We triangulated our fieldnotes and observations, along with interview data and visual artefacts such as drawings and photos, in order to make sense of the participants' stories. Our methodology does not mean to verify the truth of their stories, but rather, to understand how participants used participatory visual methods as a way of empowering themselves to shape their narratives.

This collaborative process enhanced the engagement of the girls and women with disabilities. For example, in one case, we saw a woman supporting a girl with a visual impairment to take a photo by describing to her the landscape through their camera. This enabled the girl to imagine her photo through her blindness. We used cellphones with accessibility functions in Vietnamese to make this work more accessible to visually impaired participants. Some participants prefer using traditional cameras as accessibility functions designed by cellphone producers are not always easy to operate.

The participants were then asked to create what Mitchell (2011) refers to as a poster-narrative using the photos they took. The main purpose of creating a group narrative is to create a space of engagement where the girls would work together to develop their narratives. The participants were encouraged to be creative by using whatever forms or materials were available to represent their ideas (see Image 3 & 4) A caption was written to convey the girls' stories to the audience. In case language was not accessible to the girls due to their use of ethnic minority languages, the girls were invited to explain in their own languages. Two interpreters were hired to translate ethnic minority languages to Vietnamese and English.

In the drawing workshop, we engaged the girls and women with disabilities in each community in conversations about their homes, families, communities, schools, and friends. We used drawing as a method of seeing and understanding the participants' concerns and developing a reflexive and dialogical approach through their engagement. Our primary focus was not on the technical issues, but rather, on cultivating participants' thoughts and reflections through their arts. This approach was highly accessible for girls with different impairments. In the case of girls with visual impairments, a woman or peer worked with them to draw what they described or holding their hand to work together.

In what follows, we illustrate the outcomes of this participatory process through a number of individual and group products which were produced by the girls.

Findings

Representations of Inclusion and Exclusion Through PVM

Participants expressed their experiences with inclusion and exclusion through a variety of visual methods. Their experiences are vividly expressed through the visuals; through the drawings, images, colors, and captions, reflecting what might be most closely associated to their daily lives. For example, in her drawing, Vành Khuyên used bright colors to sketch her experience with schooling (Fig. 1). Located in the middle of the drawing is a one storey-house, which appears to be her school. Some girls are waving their hands to the right side of the drawing. To the left side of

Fig. 1 Drawing created by Vành Khuyên, aged 12, in response to the prompt: What's it like to be a girl with disabilities? Hanoi, 2017

the drawing is a tree with clouds and the sun rising on top of the drawing. Her caption reads: “Friends, please play with me!”

As a girl with intellectual disabilities, Vành Khuyên did not always find it easy to express things in verbal language. She remained largely silent during her interview due to the inaccessibility of verbal language. Thus, if the project had relied only upon interviews and focus groups, we would not have been able to learn about Vành Khuyên’s experiences and feelings about school. She was offered an alternative way to express herself through PVM and she actively participated. Interestingly, while the drawing seems to convey a hopeful message about her schooling through bright and colorful images, her caption suggests that the girl in her drawing is feeling quite lonely in school. Through the interview, we did learn that Vành Khuyên was usually teased and hit by friends. When asked why she was hit, she believed it was because of her disability. What may be inferred through her picture, then, is that although she loves being in school, she did not always enjoy her right to play and be included due to being excluded by her peers. The drawing, at the same time, expressed her desire to participate in the social aspect of schooling and to belong here.

Clearly then, despite a desire to belong in school, marginalization is a common issue expressed by the girls through their drawings (Fig. 2). This culture of exclusion is also reflected through Hạnh Phúc’s drawing:

Fig. 2 Drawing created by Hạnh Phúc, aged 15, in response to the prompt: What’s it like to be a girl with disabilities? Hanoi, 2017

As a girl self-identified as having intellectual disabilities, Hạnh Phúc was a Grade 8 student in a neighborhood school in her community. Her family is described as "normal" meaning that they are a working-class family. In her interview, she said that studying is "hard" but she enjoyed learning civic education and technology, and playing badminton in school. The picture shows three girls skipping rope while the girl to the left was marginalized from playing. Her conversation with the facilitator about the drawing reflects her experience with disability and gender-based violence in school:

Facilitator:	What do you want to say through your drawing?
Hạnh Phúc:	I want to be included with other children.
Facilitator:	Hạnh Phúc, is there anyone who teases you? How did they tease you?
Hạnh Phúc:	They spoke ill about my family.

In her interview, Hạnh Phúc also revealed being bullied by a boy in her class: "He scolds my grandparents and my parents." When asked how she felt about being bullied, she said she felt "sad" because "they do not respect me." Interestingly, while both Hạnh and Vành Khuyên reveal similar experiences with marginalization from play, the triangulation between visual and interview data reveals a challenging narrative of girls with intellectual disabilities: the extent to which these girls encountered disability and gender-based violence was significant and this requires action to be taken to tackle these forms of violence in schools (see also Nguyen et al., 2015).

The girls went beyond telling their individual experience to shape their collective stories using creative arts-based methods. For example, one group in Hanoi created a piece of art that represent their feeling of being discriminated against. The group used dry leaves in the school where we held the workshop along with colored pencils and the photos they took as the main materials for their art (Fig. 3).

In this poster, the group created two contrasting sections: the one with bright colors represents the feeling of inclusion and one in dark grey colors represents the feeling of exclusion. There were diverse representations of a girl with Down Syndrome and a Deaf girl in the photos. In her presentation about this art, Phuong, a group member described her group's photo narrative:

> This side (to the left), it is dark color, and in this side, light color. In this side [to the right], it shows that girls with disabilities are not included with others. The dark clouds stand for kind of being discriminated against. And the rain drops stand for our tears. And the withered leaves and trees are our sadness.

This art demonstrates the girls' creativity and imaginative visions on what inclusion and exclusion looks like using arts to express their feeling. The art was produced through their collective work where each girl demonstrated that they had a role in the creation of this project. Another group in A Luoi created their photo narratives by presenting the cultural activities in their communities such as singing, using a flute made with leaves, flowers and trees in their communities (Fig. 4).

Fig. 3 A poster-narrative as part of a photovoice project created by girls with disabilities in Bac Tu Liem, Hanoi, 2018

Fig. 4 A poster narrative as part of a photovoice project created by girls with disabilities in A Luoi district, Thua Thien Hue Province, 2018

This poster narrative, created by a group of ethnic minority girls and women in A Luoi district, is quite distinct from the previous narratives because it does not reflect their suffering experiences with human rights violations. Rather, they focus their collective efforts in community building by envisioning different types of cultural and social activities that they see themselves as capable of contributing to their communities. For example, in the middle of the poster is the self-representation of a woman with disabilities playing a leaf-made flute – a musical instrument traditionally produced by ethnic minority groups in Vietnam. She said that her grandfather taught her how to use this instrument since her childhood, and yet, this cultural activity was generally disappearing in her community as she grew up. The woman expresses her desire to sustain this cultural life through the caption: "blowing flute – Women and girls with disabilities contribute to demonstrating and maintaining the national identity of Ta Oi's peoples."[1]

The participants demonstrated their engagement in art-making as a way of re-imaging their individual and collective stories (see also Nguyen et al., 2015). A girl with disabilities responded to the question we raised in a local workshop: "How can the community listen to the voices of girls and women with disabilities?" by proposing strategies for mobilizing their knowledge and creating opportunities for their participation:

> I would like to respond [that] using media and sharing [it] in online community in order for other people to know our feelings, our desires for equality, inclusion, and development of people with disabilities in general, and girls and women with disabilities in particular. Bring pictures and videos to family and friends to have better understanding of their children in particular and the disabled community in general. When having an opportunity, we will show our works at the seminar, program related to people with disabilities (Be Mit, Knowledge mobilization workshop, Hanoi, 2019).

We argue that the strength of PVM lies in its arts-based, community-engaged, and decolonial approach to disability studies. By bringing communities together to share their collective experiences and responses, the girls make their voices heard loudly and clearly.

Discussion

As a party to the United Nations Convention on the Rights of Persons with Disabilities, the Vietnamese government has taken steps in implementing the CRPD into its domestic laws and policies (e.g., Socialist Republic of Vietnam, 2010, 2012). The institutionalization of the Vietnamese Law on Persons with Disabilities and related policies show that although the government has sought to

---

implement some aspects of the CRPD into law, Vietnamese social policy has maintained its biomedical and welfarist regime based on categories and levels of impairment, which defines who is eligible for social support (UNDP, 2020). The narrow application of anti-discrimination laws, along with the lack of access to substantive rights such as education, health care, social protection and services, and access to justice, have continued to hamper the progress of rights-based legislations in Vietnamese social policy.

However, as Meekosha and Soldatic (2011) argue, the CRPD's failure to address the global production of impairment in colonial and imperialist contexts has been a major drawback of this international convention. The transnational justice approach implicated in the CRPD ultimately rests on nation-states' interpretation and implementation of rights, thus failing to recognize that the state is both the granter and violator of human rights. Reflecting on the possibilities for participatory engagement with women and girls with disabilities in Vietnam, Stienstra and Nguyen (2020) contend that in order for disabled women and girls in Vietnam to claim their rights, researchers must engage with their voices, perspectives, and subjectivities because they challenge us to reframe, reposition, and ultimately, redebate the ways in which Western theories and frameworks may be ineffectively applied to particular social locations in the Global South.

As Stienstra and Nguyen (2020) argue, despite Vietnam's participation in various transnational frameworks such as the CRPD, Vietnamese cultures, histories and political structures have not been aligned with the deliberative democracy upon which the rights-based framework has rested upon. Post-colonial histories in Vietnam have been driven by different rehabilitative approaches in search for a cure of bodies who were impaired by its lingering wars with the French and United States imperialism (Nguyen, 2015). This necessarily sets a unique socio-historical context for thinking about the transnational dimensions of social justice and the global production of impairment which the CRPD has sidelined (see also Soldatic & Grech, 2014).

One important aspect of Participatory Visual Methodologies is the potential to create more inclusive and accessible spaces for engaging participants by empowering them to frame their stories from their own perspectives. This approach was particularly useful for decolonizing the Western framing of rights as abstract values and principles which, from our observations, have been less meaningful to participants. Instead, it enabled the participants to tell concrete stories about their inclusion and exclusion based on their ways of seeing. For example, while we asked the girls with intellectual disabilities about their experience being hit in schools, we usually got silences or inconsistent responses during their interviews. However, with the use of visual images produced by the girls themselves, they were able to recollect their memories based on their own ways of seeing and with minimal guiding questions by the facilitators. While we believe that the language of rights framed within the CRPD has been less useful for the participants in these communities, the use of PVM enabled them to frame their rights to participation and inclusion (Pinto, 2011) in a more concrete, embodied, and culturally relevant approach which sets a stage for their grassroots activism.

Furthermore, the use of these methodologies enabled participants to tell their stories that otherwise would be difficult, if not impossible, to explain in words. Indeed, we found that most girls were much more engaged in the creative aspects of PVMs than other traditional methods such as focus groups and interviews. While these methodologies were not entirely accessible to all girls, especially those with visual and intellectual impairments, this approach creates participatory spaces for disabled girls who would otherwise be excluded from research. This work is important for disability rights because it creates a more transformative approach to social justice by unsettling the traditional boundary between research and activism (Nguyen et al., 2019).

Conclusion

In this chapter we frame the use of participatory visual methodologies in our fieldwork in Vietnam with girls and women with disabilities as a way to approach a critical dialogue about disability rights in transnational contexts. As we have highlighted, these approaches have been key to centering the perspectives of girls and women with disabilities, in spaces where they may have previously been excluded. They have also been key to developing strategies for reaching audiences such as parents and other community members and policy makers. For example, the participants engaged in public screening and photo exhibitions of their visual products that were located in their own communities. This ensures that they not only participated but also mobilized their own knowledges. A key approach of our decolonial knowledge mobilization approach has been to mobilize the knowledge *with* the girls and women, ensuring that the participants can take ownership of their productions and use them as a tool for political activism. These participatory and decolonial strategies mobilized their rights to participation and inclusion through the entire research process.

Disability Studies positions people with disabilities as experts on their own lives and as such emancipatory research has been embraced by researchers in this field (Kanter, 2011). Oliver (1997) describes three elements of an emancipatory research project on oppression of people with disabilities as reciprocity, gain and empowerment: asking what do the participants get out of the research, who gains from it and can it be empowering? In the TDKRA project, the women and girls have been invited into a space to tell their stories and to be given a platform to have their concerns heard. This benefits not only the women and girls who participated in the project, but also their communities and families. Empowerment, in this context, has been seen in ways in which the women and girls have been able to take ownership of the visual productions and in their decision to share these productions with their communities, families and policy makers. For women and girls with disabilities in the Global South to be empowered, however, there is a need to recognize their distinctive contexts as well as reciprocal relationships among these girls and women in claiming their collective voices. Through the use of participatory visual methodologies, the women and girls have been able to position themselves as valued knowledge producers and articulate their desires for change.

The results have been inspiring both in relation to "shifting the boundaries of knowledge" (Mitchell, 2015) and in addressing the idea of whose knowledge matters. At the same time, this work has been illuminating in relation to implications for further fieldwork and new conceptualizations of participatory spaces for these girls to reclaim their ways of seeing, challenging us to think more critically about what it means to do decolonial research with girls and young with disabilities across Southern spaces (see, for instance, the ENGAGE research project, n.d.). How, for example, do we conscientize the various audiences so that the girls and women with disabilities do not feel in any way tokenized? Or perhaps more generatively and less from within a protective and paternalistic framework, how do we make sure that there is a decolonial space for the participants to critique audience responses?

Part VI

Intersectionality

Intersectionality: Introduction

30

Nirmala Erevelles and Marina Morrow

Contents

Abstract

Intersectionality has been taken up uncritically in contemporary scholarship via an additive model where disability is merely added to other categories of difference, with an emphasis on a limiting essentialized understanding of identity. In this introductory chapter, we carefully delineate our understanding of intersectionality as a conceptual framework before we apply this understanding to critical disability studies. Drawing on Kimberlé Crenshaw's classic essay, *Mapping the Margins: Intersectionality, Identity Politics and Violence against Women of Color*, we argue that deploying an intersectional framework foregrounds the epistemic erasure of disability by other discourses of social difference and the epistemic labor of disability when it is constitutive of other categories of difference. In the final section of this chapter we showcase contemporary scholarship on intersectionality and disability.

Introduction

Critical analyses of disability as a historical, social, political, cultural, and materialist category of difference eschew simplistic binary understandings of disabilities as either biomedical phenomenon or social construction. Instead, a critical disability studies approach focuses on the complex network of ableist structures that constrict/exclude/oppress disabled bodies/minds forced to exist within oppressive normative society. For disability studies to maintain its critical edge, the analytical tool of intersectionality is a crucial intervention precisely because of its assertion that systemic and structural oppression can only be understood through an interrogation of the complex, intersecting, and overlapping ways in which power operates via the social axes of difference, namely, race, class, gender, disability, age, sexuality, ethnicity, and nationality, mediated by the exploitative and oppressive workings of settler colonialism and transnational capitalism.

Intersectionality, however, has been sometimes taken up uncritically in contemporary scholarship via an additive model where disability is merely added to other categories of difference, with an emphasis on a limiting essentialized understanding of identity. In this introductory chapter, we therefore, want to carefully delineate our understanding of intersectionality as a conceptual framework before we can apply this understanding to critical disability studies. It is for this reason that we revisit one of Kimberlé Crenshaw's (1991) classic essays, *Mapping the Margins: Intersectionality, Identity Politics, and Violence against Women of Color*, to foreground the often-ignored key interventions Crenshaw makes to expose the epistemic erasure of Black women in legal discourses addressing violence against women. Utilizing similar maneuvers from Crenshaw's essay, we then describe how deploying an intersectional framework within critical disability studies not only foregrounds the epistemic erasure of disability by other discourses of social difference but also maps out the epistemic labor that disability is called to do when it is constitutive of other categories of difference (Erevelles, 2011, 2022). We argue that this intersectional recognition of both the epistemic erasure and the epistemic labor of disability offers a more nuanced understanding of both intersectionality and critical disability studies.

The final section of this introduction will then showcase contemporary scholarship included in this section on theory, activism, and lived experience that is committed to the process of examining and revealing the multiple and complex ways in which power operates to disenfranchise people with disabilities living at the intersections of difference within both settler colonialism and transnational capitalism. Contributors locate their work broadly in critical disability studies and disability justice and engage with intersectionality as both a theoretical framework and activist strategy within the domains of lived experience, policy, and activism. Each of the contributors pushes the boundaries of how to interpret, engage, critique, and survive the oppressive structures of ableist racialized heteropatriarchy, including offering constructive (re)imaginings of alternative frameworks of being and becoming that are committed to disability justice articulated and lived by grassroots communities of disabled activists embodying intersectional praxis. The chapters in this section also identify how power relations operate transnationally to reify settler colonial and capitalist practices and, in an act of refusal, propose anti-capitalist and decolonizing practices that are rooted in Indigenous knowledges and disability justice. Showcased here are the works of both senior and junior scholars/activists who bring their diverse perspectives based on their geographic location (global south and north) and social positioning via the axes of gender, race, class, ability, age, and sexual orientation resulting in a much-needed transgenerational conversation on ableism, intersectional embodiment, mad studies, the carceral state, and disability justice.

Intersectionality's Intellectual Roots and Theoretical Framings

Intersectionality is a conceptual theory that traces its intellectual roots to the activist work of Black women, Indigenous women, and women from the global south during the second wave of feminism (Combahee River Collective, 1977; Hill-Collins, 1986; Anzaldua, 1990; Lorde, 1984; Davis, 1981; hooks, 1984; Mohanty, 1984; Disabled Women's Network, 1988; Jamieson, 1979; Two-Axe Early, 1994; O'Sullivan, 2016; Hill-Collins & Bilge, 2016). Critiquing naïve notions promulgated by white women of shared "sisterhood" based on gender, these scholars/activists sought to highlight the ways in which women's experiences were shaped by racism, colonialism, imperialism, heteropatriarchy, ableism, and exploitative class relations. The term *intersectionality* was coined somewhat later by critical race theorist and Black feminist legal scholar Kimberlé Crenshaw (1989, 1991) to address the experiences of Black women/women of color/immigrant women in the context of domestic and sexual violence and anti-discrimination law. The impetus for Crenshaw's conceptualization of intersectionality was to expose how the violence that Black women/ women of color/immigrant women have historically experienced within intersecting communities and social structures is rendered invisible in both law and social policy. Crenshaw insisted that though violence against women is a universal and an oppressive possibility for most women, the actual experience of and social response to this violence are mediated by where women are located within social contexts structured by race, class, gender, sexuality, ethnicity, and immigrant status. Thus, for example, Crenshaw described how the legal system conceived of Black women as protected only to the extent that their experiences reflected those of either Black (men) or (white) women, not recognizing that their discrimination occurred at a unique confluence of multiple structures of oppression and identifications with multiple communities.

Crenshaw described *structural intersectionality* as the "intersectional subordination [experienced when] . . .the consequence of the imposition of one burden. . .interacts with preexisting vulnerabilities to create yet another dimension of disempowerment" (1991, p. 1249). Thus, for example, Crenshaw pointed out that shelters serving poor women of color/immigrant women fleeing domestic violence not only needed to provide temporary shelter but also had to contend with "other multilayered and routinized forms of domination" arising out of these women's cumulative experiences of gender and class oppression such as poverty, lack of childcare, few job skills for well-paying jobs, and/or their immigrant status. By failing to consider the intersecting structures that render these women vulnerable to multiple exigencies, all attempts to enable their empowerment remained inadequate.

Along with structural intersectionality, Crenshaw identified *political intersectionality* as another means of explaining why multiply marginalized women get short shrift. In this context, Black women get caught between the competing political agendas of antiracism and feminism, and because a non-intersectional politics evokes only one axis of subordination, these competing agendas cancel each other out leaving Black women vulnerable at these intersections. This is because, Crenshaw explains, without considering political intersectionality, anti-rape and antiracist agendas are "incapable of developing. . .solutions to the compound marginalization of Black women victims, who, yet again, fall into the void between concerns about women's issues and concerns about racism" (p. 1282). On the one hand, even the most race-sensitive anti-rape policies have only attended to how Black men have often been stereotyped as dangerous aggressors of (white) women (e.g., the myth of the Black rapist) and, as a result, experience the full brutality of the carceral state. Here, the racism experienced by Black men is foregrounded, and so, Black women are often cautioned to act in solidarity with Black men in these contexts. On the other hand, when Black women have been victimized through rape and/or sexual assault, there has been a tendency to dismiss the cases brought by Black women as unfounded based on perceptions of poor Black women as "transient, uncooperative, untruthful or not credible as witnesses in court" (p. 1282). Furthermore, Black women are often reminded that bringing accusations against men in their community only reinforces the stereotyping of Black men as rapists and, as a result, are exhorted to not put their entire community at risk. As a result, the "race- and gender-based devaluation of Black women" is naturalized and rendered invisible (1281).

Crenshaw added *representational intersectionality* to her explication of intersectionality as a problematic repercussion of political intersectionality as the earlier discussion intimated. According to Crenshaw, the problem of representational intersectionality describes "how the production of images of women of color and the contestations over those images tend to ignore the intersectional interests of women of color" (p. 1283). Using as an example the obscenity prosecution of the rap group 2 Live Crew in Florida, Crenshaw described how the arguments pitting the misogyny in rap music lyrics against the racialized stereotyping and targeting of Black male rappers as proponents of sexual violence was dependent on Black women being admonished into silence and located outside the pale of discourse. Here, Black women were expected to uncritically rally around misogynistic politics, racial profiling, and heteropatriarchal values and were thereby compelled "to serve as vehicles for the achievement of a 'liberation' that function[ed] [problematically] to perpetuate their own subordination" (p. 1293).

We have taken time to carefully explicate Crenshaw's conceptualization of intersectionality because much of this discussion has relevance when disability is admitted into the fray with other historical/social/political categories of difference. In the lazier conceptualizations of intersectionality (Watermeyer & Swartz, 2022) that have been so ubiquitous in the last few years, what has sometimes been passed off as an intersectional analysis has been the add and stir approach where disability has been added to the other categories of difference in a hierarchized litany that, though inclusive, engages identity categories as wholly essentialized and monolithic in their appearance. In the past decade, many critiques of intersectionality have sought to portray it as an overused concept that is past its prime. Labelled the "intersectionality wars" (Nash, 2019), some of the "standard criticisms" of intersectionality have included arguments that describe intersectionality as dependent on an identitarian framework where identity is wholly focused on Black women and/or solely including issues of race and gender to the exclusion of other categories of difference (Carbado, 2013). Some of this critique rings true based on simplistic interpretations of intersectionality by scholars eager to cover all their bases in abeyance to citational formalities. Additionally, the neoliberal academy and other state institutions, eager to showcase their liberal commitments to multiple difference, have appropriated intersectionality as a tool to demonstrate a problematic endorsement of diversity which then serves to deflect critique of the consistent institutional violence of the state. Claiming a post-subject post-humanist framing, Jasbir Puar (2005), for example, offering similar critiques pointed out that intersectionality can no longer address the complexity of difference in contemporary times. Puar (2005) wrote:

> As there is no entity, no identity to queer, rather queerness coming forth at us from all directions, screaming its defiance, suggests to me a move from intersectionality to assemblage. The Deleuzian assemblage, as a series of dispersed but mutually implicated networks, draws together enunciation and dissolution, causality, and effect. As opposed to an intersectional model of identity, which presumes components—race, class, gender, sexuality, nation, age, religion—as separable analytics and can be thus disassembled, an assemblage is more attuned to interwoven forces that merge and dissipate time, space, and body against linearity, coherency, and permanency. Intersectionality demands the knowing, naming, and thus stabilizing of identity across space and time, generating narratives of progress that deny the fictive and performative of identification: you become an identity, yes, but also timelessness works to consolidate the fiction of a seamless stable identity in every space. (p. 127–128)

While Puar's critique hits the mark regarding how intersectionality has been deployed in neoliberal contexts, it is unclear how her utilization of assemblages as a substitute for intersectionality offers a more radical take on the complexity of addressing multiple axes of difference. Moreover, there appears to be a misreading of Crenshaw's argument that offers a more complex reading of subjectivity than much of the liberal scholarship that utilizes intersectionality indicates. As our discussion of Crenshaw's work demonstrates, intersectional analyses may not be reducible to essentialized identity categories nor to stable subject positions. Rather, Crenshaw and fellow proponents of intersectionality make clear that identity categories are not distinct but are instead "always permeated by other categories, fluid and changing, always in the process of creating and being created by dynamics of power… [emphasizing] what intersectionality does rather than what intersectionality is" (Cho et al., 2013, p. 795).

Based on Crenshaw's analyses, what intersectionality does is to foreground the processes (e.g., structural, political, and representational) by which feminist and antiracist discourses (in her specific example, but not limited to it) have impacted the epistemic erasure of Black women. The nuance in intersectional analyses has been acknowledged in later writing by Puar (2012) who now argues for "thinking through the intertwined relations of intersectionality and assemblage…[because] it can… [more] fully understand relations between discipline and control" (p. 63). Taking this discussion into account in the next section of this introduction, we will discuss how disability makes its disruptive entrance into intersectional frameworks to foreground both its *epistemic erasure* and its *epistemic labor* alongside other categories of difference. In this epistemic space, disability is not reducible via the additive model to an essentialized identitarian category of difference but, rather, serves as an epistemic intervention via intersectional theorizations of difference.

Critical Disability Studies and Epistemic Interventions via Intersectionality

Intersectionality and its deployment within disability studies coincide with the rise of critical approaches in understanding disability and more specifically through feminist theorizations of disability (Garland-Thomson, 2002; Wendell, 1989; Morris, 1993; Shildrick, 2009, 2012; Thomas, 1999; Erevelles, 2011; Silvers, 1995; Hall 2017; Goodley, 2013; Kim and Schalk, 2021; Schalk, 2018, 2021; Pickens 2019; Kittay et al. 2001, 2002; DAWN-RAFH 1988, 2013). Critical disability studies, in its turn, emerged as an interdisciplinary response to changing social and intellectual developments, including post-structural theory (Goodley, 2013; Shildrick, 2009, 2012). That is, prior to its emergence, the primary focus of disability studies had been on the development of a social model of disability and on the material needs and the material effects of ableism (e.g., Oliver, 1990, 2004; Barnes, 2012). Critical approaches arose in part to expand analysis from the social model and Marxist materialist approaches in disability studies (Goodley, 2013) to include more cultural approaches to disability that engaged alternative/radical disability embodiment (Mitchell & Snyder, 1997; Snyder & Mitchell, 2006; Garland Thompson, 1997; Siebers, 2008, 2010; Sandahl & Auslander, 2009; Davis 2002). These approaches to disability have drawn on various strands of critical theory – including feminist, decolonial, Marxist, human rights, antiracist, intersectional, queer, and post-structural theories (Shildrick, 2009, 2012; Sherry, 2004; Titchkosky, 2007; Tremain, 2006, 2017; McRuer, 2006; McRuer & Wilkerson, 2003; Garland-Thomson, 2005; Kittay, 2019; Silvers, 2009, Wendell, 1989; Schalk, 2018, 2021; Pickens, 2019; Piepzna-Samarasinha, 2018; Bailey & Mobley, 2019; Miles, 2019, Kafai, 2021, Wong, 2020, 2022). What these critical approaches have in common are their challenge of the categorization of disability as only a biomedical phenomenon or social construction; their focus on how embodiment and complex intersectionalities are lived; their use of disability as a creative cultural force; and their commitment to work for more just social arrangements where disabled people can access all the rights of citizenship and live free of discrimination and violence.

However, notwithstanding the progressive turn in critical disability studies that foregrounds conceptual continuities with other theorizations of social difference along the axes of race, class, gender, and sexuality, disability (as a social category of import) continues to languish at the fringes of intersectional theories of difference. This is because disability's disruptive potential does not support the lazy additive tendencies of uncritical intersectional theorizing, and as a result, an explicit attention to ableism and the political embodiment of disability has been neglected in intersectional activism and scholarship (Bailey & Mobley, 2019). Feminist disability studies scholars of color have described how even though white feminist disability scholars/activists had historically looked at the intersections of gender and disability, they often ignored the implications of class and race beyond superficial inclusive gestures (Erevelles, 2011; Bailey & Mobley, 2019, Schalk, 2021; Mingus, 2017; Kim and Schalk, 2021). Similarly, scholars of Black disability studies have pointed out that while disability has always been present implicitly in intersectional analyses in the work of Black feminists (e.g., Nash, 2019; Schalk, 2021; Bailey & Mobley, 2019; Pickens, 2019), the field has often failed to make explicit its intersectional analyses with disability (Erevelles, 2011; Kim and Schalk, 2021; Pickens, 2019). As a result, disability studies have often been criticized for its "Whiteness" (Bell, 2006), and feminists fighting ableism who are Black, Indigenous, and people of color have called out their colleagues for not including disability in their analyses (Bailey & Mobley, 2019; Moore, 2015, 2017).

In the United States, Chris Bell (2006) made explicit the occlusion of race in what he called "White Disability Studies" while at the same time demonstrating disability studies scholarship as tied to Whiteness by enacting the epistemic erasure of disabled people of color communities. Similar to how Crenshaw described the epistemic erasure of Black women, Bell pointed out that:

> Far from excluding people of color, White Disability Studies treats people of color as if they were white people; as if there are no critical exigencies involved in being people of color that might necessitate these individuals' understanding and negotiating disability in a different way from their white counterparts. (Bell, 2006, Note 1, p 282)
>
> [Additionally, the other misconception is] that the disabled community is a monolithic one, struggling against the same oppressors, striving for identical degrees of dignity, recognition, and cultural representation. Such a characterization is a limited one that does not consider or address the rich diversity within disability communities—racial and ethnic diversity, for example. (Bell, 2006, p. 276).

Here, Bell cautions against the additive model of disability, where disability is added to the equation of other categories of difference to offer a more nuanced and complex analysis that very rarely questions how disability functions not merely as a social category of difference but also as a materialist intervention into the constitution of social difference in the first place. Bell's critique of White Disability Studies' "tendency to whitewash disability history, ontology, and phenomenology" (p. 275) can thus be read as a clarion call for an intersectional analysis that marks the *epistemic erasure* of disabled subjectivities living within multiply marginalized communities.

At the same time, including disability (which in our analysis includes psychosocial disability/madness) alongside other categories of difference has historically been a troubled enterprise. This is because disability is not merely a social category of difference; it performs a problematic form of *epistemic labor* in that it is deployed to structure the other categories of difference as Other by marking their deviation from a fictionalized norm. While the social categorizations of race, class, gender, and sexuality are largely conceived of as social constructions, disability has historically been located within the medical model as the embodiment of pathological deviance thought to be manifested via recognizable physiological/cognitive/neurological/mental differences. Here, the difference associated with disability is deemed biological (rather than a social construction), and as a result, the social category of disability, now perceived as the "master trope of human disqualification" (Snyder & Mitchell, 2006, p. 127), serves to justify the most oppressive aspects contained in the social constructions of the other social categories of difference. These pathological discourses of disability are used to justify the oppressive binary cultural constructions of normal/pathological, autonomous/dependent, competent citizen/ward of the state, as well as exploitative social divisions of labor (Erevelles, 2011). Put simply, multiply marginalized communities therefore feel compelled to disassociate/isolate from disability to demonstrate that their constitutive differences are social constructions and therefore fictive.

In fact, Crenshaw (1989) in "*Demarginalizing the intersection of race and sex*" uses the analogy of basement to explicate her theorization of intersectionality in ways that are instructive to the argument of the epistemic erasure of disability in discourses of intersectionality. Crenshaw writes:

> . . .[I]magine a basement which contains all people who are disadvantaged on the basis of race, sex, class, sexual preference, age and/or *physical ability* [my emphasis]. These people are stacked-feet standing on shoulders-with those on the bottom being disadvantaged by the full array of factors, up to the very top, where the heads of all those disadvantaged by a singular factor brush up against the ceiling. Their ceiling is actually the floor above which only those who are *not* disadvantaged in any way reside. In efforts to correct some aspects of domination, those above the ceiling admit from the basement only those who can say that "but for" the ceiling, they too would be in the upper room. A hatch is developed through which those placed immediately below can crawl. Yet this hatch is generally available only to those who-due to the singularity of their burden and their otherwise privileged position relative to those below-are in the position to crawl through. Those who are multiply-burdened are generally left below unless they can somehow pull themselves into the groups that are permitted to squeeze through the hatch.
>
> As this analogy translates for Black women, the problem is that they can receive protection only to the extent that their experiences are recognizably similar to those whose experiences tend to be reflected in antidiscrimination doctrine. (p. 151–152)

We quoted this argument in full to recognize that though "physical disability" is mentioned in the quote, the material conditions that would enable disabled people to clamber up the hatch make it next to impossible to do so. Moreover, for the most part, those who are non-disabled will most likely utilize the shoulders of those at the bottom to climb out. As such, not recognizing the geography of the basement as inherently ableist marks not only the epistemic erasure but also the epistemic labor that disability does to secure the liberation of other multiply marginalized communities.

Thus, as just described, the material effects of these ableist (dis)associations result not just in epistemic erasure but also in the overt erasure of disability even within social practices that claim to be liberatory. In fact, the very conditions for inclusion of disabled people within mainstream as well as multiply marginalized communities insist on their social assimilation (via special education, rehabilitation, assistive technology, and/or psychiatric treatment), failure of which results in their removal (via segregation, institutionalization, incarceration) or their complete annihilation, (eugenics policies, abortion of disabled fetuses) (Erevelles & Minear, 2010; Erevelles 2011, 2014a, b). Here, disability is conceived of as negative pathology as per the medical model, and therefore, the emphasis is on cure rather than care. Claiming that these pathologized bodies are located outside the boundaries of humanness, the violence that is done to them is justified because they are seen as the state of exception existing within the zone of bare life (Agamben, 2005). This then triggers the deployment of a necropolitics that casually consigns such pathologized bodies to what Achilles Mbembe (2019) has described as "death worlds" and/or "slow death" (Berlant, 2007). In this context, the epistemic labor that disability is called to do situates it as "the boundary condition that resides just on the other side of hope. . .the condition one must escape rather than improve" (Ferguson, 1987, 63) or as a marker to what Mel Chen (2012) has described as the structuring of animate life or animacies.

Additionally, following on Cho, Crenshaw, and McCall's (2013) exhortation to focus on "what intersectionality does rather than what intersectionality is" (p. 795), drawing on a materialist feminist disability studies, Erevelles (2011, 2022) has argued that disability exceeds simplistic identitarian politics because it is not just a condition of "being" but of "becoming," where this "becoming" occurs in a historical materialist context where multiply marginalized bodies "become" disabled via an intersectional analysis at the locus of multiple difference (Erevelles 2011, 2022). It is for these reasons that Jampel (2018) has argued for theorizing disability as a process that includes the interaction between the *social construction* and the *social production* of disability. She writes:

> The process of disablement is the interaction between the *social construction* [our emphasis] and the social production of disability. By social construction, I mean the ways in which language and culture, such as social norms, shape ideas about what bodies and minds are 'normal' and the ways in which ideas about the normal lead to social conditions in which people are disabled by their environments. . . Societal and cultural constructions include built environments, educational opportunities and ideas about independence. By *social production*, I mean the ways in which historical processes, ranging from human reproduction and genetic variation to the development of industry, have led to the diversity of human bodies and minds: material differences. . . Socially produced material differences include the physical pain of aching joints following years of labor, the effects of radiation exposure on a

> growing fetus, the changes in brains exposed to different levels of lead and the emotional distress that results from prolonged poverty. . ..[Here] disablement [is viewed] as a simultaneously material and discursive process. (p. 3)

Most critically, disability here is not an apolitical construct, the embodiment of natural difference. Instead, here, disability is a historical materialist construct – its production occurring amidst what disaster specialists term “complex emergencies,” which include “mixtures of civil strife, famines, genocidal activities, epidemics, and large-scale displacement and movement of refugees” (Carrigan, 2010). Thus, Carrigan argues that:

> These experiences are centrally implicated in the production of disability, which in many post-colonial states is a constitutive feature of community life. Not only do physical and psychological disabilities proliferate in disaster zones, but people with disabilities also represent one of the highest risk categories in terms of vulnerability to disasters—a point that is especially true of economically under- privileged postcolonial states in which medical care and institutional support networks are often lacking. (255–256)

If scholars were to refuse the epistemic erasure of disability in intersectional analyses, then it is essential that critical scholarship on race, indigeneity, class, and queer theory also recognizes that the historical legacy of the actual act of colonizing an inhabited continent, slavery, indentured labor, Jim Crow laws, and the involuntary commitment of Indigenous people to boarding schools and reservations has produced physical and mental trauma that has persisted over multiple generations (Spillers, 1987; Smith, 2005; Erevelles, 2011). For example, Indigenous activists and scholars have taken up the concept of intersectionality in multiple ways but with a distinct focus on the impact of colonialism and with a historical understanding of how Indigenous communities understood multiple categories of gender (Monture-Angus, 1995; Clark, 2016; Hunt, 2013). It has also been observed that Indigenous communities, as a direct result of colonial settler violence, are more likely to have disabling conditions (Durst & Bluechardt, 2004; Durst et al., 2006). Clark (2016) in her work on Indigenous girls in Canada argues for a “red” intersectionality that

> “. . . provides the tools to theorize not only the past but the current forces of colonialism as found within reserve politics, lateral violence, and identity politics. Red intersectionality recognizes the importance of local and traditional tribal/nation teachings, and the intergenerational connection between the past and the present, while also recognizing the emergent diversity of Indigenous girlhood and the geographic movement off and on reserve, and the construction of Indigenous girls through the Indian Act” (pg. 51).

Additionally, scholars and activists of disability have approached colonialism from their unique geographic and political histories, often challenging the dominance of Anglo-centric disability studies and its claims to universality by taking on the power and politics of knowledge production itself (Meekosha & Shuttleworth, 2009). Grech and Soldatic (2016) argue that the omission of disability from (post)-colonial scholarship and the hegemony of the global north in disability studies have done much to undermine both fields of study and activism. In the first instance, the absence of disability in (post)-colonial scholarship " continues to limit theoretical engagements with other fields such as disability studies and sociology of the body, which could contribute much to developments in postcolonial theory" (Grech & Soldatic, 2016, p. 2), and in the second instance, disability studies, "As a field of inquiry grounded within the epistemologies of the global North, it has rarely engaged with the 'colonial' beyond the realm of descriptive metaphor" (p. 2).

In contemporary contexts, undocumented workers cross the US/Mexico border dodging vigilantes, enduring dehydration and other heat-related diseases, and risking rape and sexual molestation to end up as laborers in fruit and vegetable farms, cattle ranches, chicken factories, and formal/informal service work for the lowest wages, unsafe working conditions, and little to no medical care (Holmes, 2013). Toxic industrial and nuclear waste is dumped in rivers and/or buried underground in landfills in low-income rural areas where residents acquire illnesses and disabilities that persist intergenerationally (Spears, 2014). Lack of access to affordable healthy food in inner-city neighborhoods, high employment, run-down housing, high crime rates, and inadequate access to medical care have also led to the proliferation of preventable illnesses that result in disabilities (Erevelles, 2022; Kim & Schalk, 2021). And lest we forget, the everyday indignities of racial profiling, bullying, job discrimination, police brutality, homophobia in the school and in the workplace, domestic violence, and sexual abuse, among so many others, also contribute to mental and physical health conditions that can bring one into the disability community. Here, a historical materialist analysis refuses the epistemic erasure of disability produced at the intersection of anti-Blackness, class, settler colonialism, transnational capitalism, and anti-queer politics.

Disability studies scholar Kelly Fritsch (2015) drawing on Jasbir Puar's (2009, 2012, 2017) conceptualization of debility situates this discussion within the context of neoliberal biocapitalism where the Foucauldian conceptualization of biopolitics is linked to the Marxist critique of political economy such that "individual and collective subjectivities and citizenships [are] both shaped and conscripted by . . .[bio] technologies that concern 'life itself'" (78). The biotechnologies that Fritsch is referring to include not just the technologies that debilitate bodies as described earlier but also those that capacitate bodies via processes such as "genetic therapies, surgeries, supplements, prosthetic enhancements, and healthism" (p. 27). Speaking specifically in the settler colonial context of Palestine in relation to the state of Israel, Puar describes vividly how, on the one hand, the colonial state produces disabled bodies via technologies that claim the "right to maim" while, on the other hand, other technologies are deployed to develop capacities for bodies that can be brought into the neoliberal economy for the realization of profits. Puar's conceptual shift in nomenclature from disability to debility thus marks the shift from "regulative normality that cures or rehabilitates to ongoing biological control, [to] where bodies are to be capacitated beyond what is thought of as the able-body" (p. 26). Here, Puar blurs the distinctions between disabled subjectivities and non-disabled subjectivities urging an attentiveness to "the ways in which differential inclusion functions, . . . to who gets to have grievances, how neoliberal biocapitalism capitalizes on those grievances, and the ways in which disability activists and scholars are implicated in their (re)production" (Fritsch, 2015). In these arguments, disability is not considered a predominantly oppressed identity category or form of embodiment of lacks or abnormality. Rather, we examine what it means for disability to be caught up in processes of both debility and capacity. Karen Soldatic (2011) in her work on neoliberal workfare restructuring in Canada, the United States, and the United Kingdom examines this tension and illustrates how it has resulted in new classes of disability – from the “really” disabled to the “just disabled” – and shows how social policy access flows from this: that is, who is “deserving” of welfare and who is designated to work in precarious labor markets. Such arguments thus also demonstrate the epistemic labor that disability is called to do at the intersections.

Crippin’ Structural, Political, and Representational Intersectionality

Having made the case for the epistemic erasure of disability even while appropriating disability’s epistemic labor, in this section, we work through how the three central elements of intersectionality – the structural, the political, and the representational – play out from the standpoint of disability. Bell’s critique of White Disability Studies articulated earlier maps out the analytical importance of structural intersectionality, where Bell’s insistence on the simultaneous recognition of ableist and racist structures can refuse the epistemic erasure of disabled people of color living in multiply marginalized communities. A good example of the deployment of structural intersectionality from a critical disability studies location has been the conceptualization of DisCrit (disability studies and critical race theory) as described by Subini Annamma, David Connor, and Beth Ferri (2013) in the specific context of education. According to Annamma et al.:

> A DisCrit theory in education is a framework that theorizes about the ways in which race, racism, dis/ability and ableism are built into the interactions, procedures, discourses, and institutions of education, which affect students of color with dis/abilities qualitatively differently than white students with dis/abilities (7)....DisCrit seeks to understand ways that macrolevel issues of racism and ableism, among other structural discriminatory processes, are enacted in the day-to-day lives of students of color with dis/abilities. (8)

A focus on structural intersectionality renders visible how students of color experience epistemic violence in educational contexts. Shifting from colonial practices to carceral education, in seemingly liberal spaces like public schools in the United States, low-income students of color are indiscriminately labeled behaviorally disabled, language disabled, mildly mentally retarded [sic], and emotionally disturbed and are then confined to segregated special education classrooms/alternative schools/juvenile detention centers; often medicated; and punished more harshly than their white counterparts (Artiles et al. 2010; Annamma, 2017). Within the United States and Canada where free public education shapes the social futures of every child and which has been (and continues to be) the battlefield on which issues of social justice via educational segregation, carceral practices, and the constitution of “spoiled” identities (Goffman, 1963) are distributed, the occlusion of disability within structural analyses of schooling needs to be remedied. This occlusion is problematic since the very logic of public education depends on the epistemic labor of disability to fulfill its functional mandate of sorting students on the basis their capacity to demonstrate able-ness/sanity and eschew all other differences. And yet, notwithstanding (or perhaps because of) this epistemic labor, disability experiences epistemic erasure except for its problematic hypervisibility in segregated educational space. It is here then that conceptual articulation of DisCrit – the intersection of disability studies and critical race theory – becomes significant (Annamma et al., 2013). Educational research has demonstrated DisCrit focuses on ways that the forces of racism and ableism circulate interdependently, often in neutralized and invisible ways, to uphold notions of normalcy. DisCrit, therefore, values multidimensional identities and troubles singular notions of identity such as race or dis/ability or class or gender or sexuality and so on. Additionally, DisCrit emphasizes the social constructions of race and ability while at the same time recognizes the material and psychological impacts of being labeled as raced or dis/abled, which sets one outside of Western cultural norms. The authors argue that DisCrit privileges voices of marginalized populations, traditionally not acknowledged within research. DisCrit considers legal and historical aspects of dis/ability and race and how both have been used separately and together to deny the rights of some citizens. DisCrit recognizes whiteness and ability as property and that gains for people labeled with dis/abilities have largely been made as the result of interest convergence of White, middle-class citizens. DisCrit requires activism and supports all forms of resistance (p, 19).

When disability is included in an intersectional analysis, it exceeds representational politics to also perform epistemic labor in the constitution of other categories of difference. On the one hand, as per Crenshaw's articulation of structural intersectionality, ableism intersects with other oppressive intersecting structures to impact social policy as well as the lived experiences of multiply marginalized communities as a tool to structure social difference. In fact, as many disability studies scholars (McRuer, 2006; Kim & Schalk, 2021; Erevelles, 2011; Schalk, 2021; Pickens, 2019) have pointed out, disability serves as a mode of justifying the social oppression of other categories of difference. This recognition of disability within the context of structural intersectionality thus explains the vexed relation disability has with other categories of difference – in that disability becomes the category to avoid rather than with which to build an alliance. Here, disability as structure marks the distinctions between "valued" and "devalued" life. In fact, it is only through the epistemic erasure of disability that other categories of difference can make claims to their own freedom. And in doing so, they effect the erasure of Black, queer, Indigenous, poor, gendered disabled, and mad people since there is little space in the discourse for them.

Echoing Crenshaw's foregrounding of the intersecting structures that render women vulnerable to multiple exigencies, Kim and Schalk (2021) in their Crip of Color critique also identify how ableist violence operates alongside and through heteropatriarchy, capitalism, and white supremacy and thereby demonstrate how feminist-of-color disability studies explores "unexpected points of affinities that might build coalition across categories (137)." And yet coalition is resisted because as Bailey and Mobley (2019) point out, Black people cannot afford to be disabled when they are required to be "phantasmically abled" in a white supremacist society (Bailey & Mobley, 2019, p. 22), This is because as the work of Leroy Moore (2017) and the Harriet Tubman Collective (2017) among others have pointed out, white disability uses disability as metaphor in arguing for their continued oppression. For example, an oft-quoted phrase articulated by white disability rights activists goes something like this: Black people fought for the right to not sit at the back of the bus, but disabled people cannot even get on the bus. Following up on this logic, disability studies scholars have challenged dominant ideologies of impairment/disability as being inherently negative and in constant need for amelioration/cure/elimination. Fiona Kumari Campbell (2019) calls this "de-centering the ableist imaginary." Here, Campbell identifies ableism as a structural system of oppression analogous to structural racism and argues for an epistemological and ontological inquiry into the formation of naturalized understandings of what it means to be fully human. Thus, Campbell foregrounds the ableist assumptions that support the habitual association of disability with a diseased and deficient pathology.

Campbell, nevertheless, falls into the familiar habit of reading ableism as analogous to racism, rather than theorizing racism and ableism as constitutive of each other. One problem with the analogy is that there is the assumption that disabled subjectivities are not racialized and racialized subjectivities are not disabled. Using as an example McRuer's (2006) deployment of the concepts "critically queer" and "severely disabled" as analogous, Kaul (2013) points out that the analytic power of the analogy fails to account for how historical representations of homosexuality as disability connects with the material consequences of queer bodies being incarcerated as "perverts" as well as the contradictory politics of including "gender dysphoria" in the DSM V – an inclusion that simultaneously pathologizes trans identities even while this inclusion enables trans-persons gain access to appropriate medical care. This then makes political intersectionality attuned to the inclusion of disability in discourses pertaining to difference.

Moving on to discussions of *representational intersectionality*, on the other hand, within communities of color, it is impossible to claim disability pride when disabled people often become disabled because of the violence of structural intersectionality. So, then it becomes a difficult space to engage with disability pride in communities of color when state apparatuses – prisons, police, schools, and welfare systems – rarely support the most precarious classes of people and, in fact, regularly brutalize those who are poor, undocumented, Black, Brown, disabled, trans, and/or gender non-conforming. Such apparatuses often operate as instruments of mass disablement that disproportionately target Black and Brown populations. How then does one represent one's disability at the intersections of difference? Bailey and Mobley ask us to:

> imagine a Black life that is more than just survival and more than able-bodied utopia. What does liberation look like if disabled Black bodies are allowed in our futures? Would we be better able to hold Disability Studies accountable for its erasure of raced and gendered bodies? (Bailey & Mobley, 2019, 34)

Kim and Schalk (2021) respond via their queer feminist-of-color disability analysis that aims to:

> demonstrate how disability is in fact central to the gendered and sexual management of women and queers of color. Instead of centering state-sanctioned understandings of disability, a feminist-of-color disability studies would prioritize considerations of state violence attending to the intersection of disability politics with abolitionist and anticarceral frameworks. . ... Indeed, Mingus, Piepzna-Samarasinha, and others like Leroy Moore, Patty Berne, Eli Clare, Stacey Milbern, and Nomy Lamm have come to . . ..insist on a movement that decenters those who can gain access to rights through a legal-based framework. They call this new framework disability justice. Feminist-of-color disability studies aligns politically and intellectually with this approach, allowing disability justice activism to inform feminist-of-color disability studies scholarship. (p. 16)

Intersectionality and Policy

Feminist scholars working in the context of health equity and public policy have championed intersectionality as an analytic lens and theoretical tool for policy development and analysis (Hankivsky, 2012; Hankivsky & Zachary, 2019; Morrow, 2022). These scholars critiqued domestic and international gender-based analysis frameworks and gender mainstreaming for solely foregrounding gender in their analysis and thus obscuring the lives and experiences of women, men, and transgender people situated at the nexus of multiple social positions (Hankivsky, 2012, 2022; Bacchi & Eveline, 2010). In some jurisdictions in the global north (e.g., Canada), the state has made a commitment to the policy framework of GBA+ as an approach to policy development (https://women-gender-equality.canada.ca/en/gender-based-analysis-plus.html), and some local governments have more explicitly adopted intersectionality (e.g., the Ontario Human Rights Commission in Canada, 2001). GBA+ in this context followed the adoption of GBA policy frameworks in Canada in the early 2000s onward (CIHR, 2012, 2018; Pederson et al., 2003; Salmon et al., 2006) and is an attempt to account for diversity among women and men. However, as discussed earlier, some have argued that GBA+ falls into the trap of the additive model of intersectionality, as it has yet to fully embrace the theoretical richness of intersectionality and what it can offer to policy analysis (Hankivsky & Hunting, 2022). As Hankivsky and Hunting (2022) demonstrate, to date, the dominant approach to adopting intersectionality is to attempt to integrate it into already existing approaches to gender inequities, and this has resulted in a misuse and misunderstanding of intersectionality, where gender is always foregrounded over other forms of oppression (Hankivsky & Hunting, 2022). Further, observations have been made about the uptake of GBA and gender mainstreaming and doubts cast as to whether it has resulted in any kind of transformative change (Hankivsky & Hunting, 2022). Emerging in this context has been the development of Intersectional Based Policy Analysis (IBPA) (Hankivsky, 2012). IBPA draws on the work of Bacchi's (2012, 2016) *What's the Problem Represented to Be?* (WPR) methodology which is informed by the post-structural practice of "problematization," that is, that social problems are not knowable to policy makers outside of their social embeddedness in practices of language and representation – or in other words, that social problems are not found but made. IBPA builds on this methodology but amplifies the social justice aims of the "problematizing" method by proceeding from a set of normative values and by introducing reflexivity (a key tenant of intersectionality) into the methodology itself (Hankivsky, 2012). Applying IBPA can help to surface the underlying values and assumptions that underpin policies and policy decisions and can also explicate the workings of power as it is manifest in state practices related to mental health and madness (e.g., Joseph & Morrow, forthcoming; Josewski et al., forthcoming).

Historically, international human rights approaches also relied on "gender-first" or "single-axis" approaches in enforcing legal provisions (Truscan & Bourke-Martignon, 2016). However, increasingly, there is a call to apply intersectional approaches in national and international human rights covenants. Researchers have highlighted that the UN Convention of the Rights of People with Disabilities (UN CRPD) puts forth intersectional approaches to policy and programming (e.g., Buettgen et al., 2018; Paré, 2019; see also UN Committee on the Rights of Persons with Disabilities, 2017, 2018). As such, increasingly, it is understood that the aims of the CRPD cannot be pursued without the use of intersectionality as an analytic lens that examines ableism in its intersections with sexism, poverty, racism, heterosexism, and gender-based discrimination (Buettgen et al., 2018; Bernasky et al., 2020; Bartlett, 2017; Judd et al., 2008) and colonization and indigeneity (Durst et al., 2006; Durst & Bluechardt, 2004; Fem Net North, 2016; Gillespie et al., 2016). While it is promising to see that intersectionality as a policy paradigm is beginning to take root, its use in the context of disability is still evolving, and much must be done to resist simplistic additive models (Buettgen et al., 2018; Bernasky et al., 2020).

Embodying Intersectional Analyses: Thinking Through the Chapters in This Part

> I imagine a world where our organizing and activism is less segregated, where our movements and communities are accessible and don't participate in the isolation of disabled communities. I imagine places where we fight for whole and connected people, families, and communities. Mia Mingus, *Leaving Evidence*

The five chapters that make up this section on disability and intersectionality are unique in their approach to intersectionality and disability justice. The authors take up the ways in which the experience of disability is intricately connected to systems of power based on racism, sexism, transphobia, transnational capitalism, and ongoing settler/colonial relations. Authors from the global south use intersectionality as a way to interrogate state systems of terror and torture in relation to how madness and sanity are socially organized (Kazemi & Karah); others in the global north (Shanouda & Langdon) use intersectionality as a tool to understand both oppression and resistance when they examine power as it manifests in nursing home care and the legal system. Hillier and Vostermans center indigeneity in their examination of how disability is taken up in relation to settler colonialism in the global north. Verlinden reads the trope of "monstrosity" through the lens of intersectionality to understand racialized, trans, disabled bodies. Wong, Deerinwater, Ho, and Thompson use conversation as a way of discussing the embodiment of intersectional social positions, how power operates in multiple overlapping ways, and the role that activism plays in continually challenging disability scholarship. Individually, each author makes a unique contribution to the scholarship of intersectionality and disability, and collectively, the chapters speak to our theme of the ways in which the epistemic erasure of disability by other discourses of social difference operates, but also maps out the epistemic labor that disability is called to do on the ground in real lives, in embodied activism and scholarship.

The first chapter is based on Erevelles and Morrow's two roundtable discussions with prominent disability justice scholar activists working in the context of the United States – Alice Wong, Jen Deerinwater, Sandy Ho, and Vilissa Thompson. Their piece entitled, "A Conversation on Disability Justice," grounds this section in the lived experiences of activism and the ways in which activists mobilize their own embodiment of multiple intersections of colonialism, sexism, racism, poverty, heterosexism, and ableism to undergird and inspire their social justice work. In their conversations, Wong, Deerinwater, Ho, and Thompson make visible the epistemic labor required to ensure that disability is not erased and that it is understood in a truly intersectional way. Much of their focus is on social activist movements (for Indigenous land and cultural rights, Black Lives Matter, queering disability activism, etc.) and the key importance of cross-movement learning and solidarity to achieve social justice. Among the many themes of our conversations were reminders of the power that the academy and especially scholars who embody social privileges have in defining what gets understood with respect to disability and therefore whose lives and experiences are foregrounded. Intersectional approaches demand a reflexivity that can unsettle power relations, and the conversations we had with Wong, Deerinwater, Ho, and Thompson stand as a reminder to academic disability scholars of the importance of grassroots activism involvement in theory development and strategies for change at the political level.

Chapter 2, "Mapping Intersections of Disability and Indigeneity," by Sean Hillier (a queer Mi'kmaw scholar from the Qalipu First Nation) and Jessica Vorstermans (a non-disabled White settler who grew up in an intentional community of people with and without intellectual disabilities just north of Toronto) takes the reader on a journey to understanding how indigeneity, disability, and disablement are experienced through shared processes of colonization in the settler states of Canada, Australia, New Zealand, and the United States through land removal and relocation to reserves, residential schools, violence, and the child welfare state. Their chapter begins with how disability was understood in Indigenous communities prior to European contact, and this knowledge is drawn on later in the chapter in discussions about reconciliation and healing. Hillier and Vorstermans center the dispossession of Indigenous land in the production of disablement and land reclamation by Indigenous peoples as key to disability justice.

In ► Chap. 33, “Madness as Response-Ability Against State Terror: A Case Study from Iranian Revolution,” Sona Kazemi and Hemachandran Karah, both racialized scholars situated in the global south, offer us an examination of the implications of state violence in post-revolutionary Iran. Through interviews with exiled political prisoners from the 1980s, they explore the ways in which madness and sanity are socially organized and imposed via state systems of torture and imprisonment. Kazemi and Karah note the resilience of their interview subjects and speculate as to how madness might be the “bodymind’s” response to the brutality of prisoner experience and a method of survival. Their transnational disability analysis “defetishizes” (Erevelles, 2011) disability, situating madness squarely within the social and political context of Iran.

In ► Chap. 34, “Monstrous Intersectionalities,” Jasper Verlinden explores the effects of the “sticky” web of signification (Ahmed, 2004) that “monstrosity” and the “monster” in their age-old representation of embodied difference have when understood intersectionally with attention to disabled, trans, and racialized bodies. Verlinden uses the case of Layleen Polanco, a Dominican trans woman who died in 2019 at the Rikers prison in New York, to highlight the material consequences of monstrous discourses for racialized, trans, and disabled bodies. Verlinden offers an intersectional analysis of monstrosity and the use of the monster itself as an intersectional analytic in order to “avoid either rendering the monstrous body into a mere sign without a referent or casting it as a dehumanized subject in need of rehabilitation” (Verlinden, this chapter).

In the final chapter of this section, “Black-Abundance, Fat-Revolt, and Crip-Desire: Intersectionality as Interference in the Life and Death of Rohan Garfield Salmon,” authors Fady Shanouda and Terri-Lynn Langdon honor the life of Rohan Garfield Salmon who died in 2019 after losing a prolonged legal battle with a senior living home and the corporation that ran it. Their chapter stands as an indictment of the nursing home industrial complex (Tremain, 2021) by grounding their analysis of Salmon’s experiences in the relationship between disability, race, and size. While highlighting the gross negligence and failures of the nursing home care system, their intersectional analysis also points to Salmon’s agency and resistance, which forestalled the state from exercising its force for several years. Ultimately, they argue that constricting forces from dominant understandings of fatness, Blackness, and disability can exist even as “fat/Black/disability becomings” (Shanouda & Langdon, this chapter) can act as forces that can disrupt the status quo and speak powerfully to oppressive forces.

Abstract

Disability Justice as a concept and an activist practice was developed in 2005 by the Disability Justice Collective, a group that included disabled queers of color in the San Francisco Bay Area, Patty Berne, Mia Mingus, and Stacey Milbern, along with the founder of Krip-Hop Nation, Leroy F. Moore, Jr., and disabled trans activists Eli Clare and Sebastian Margaret (Kafai, 2021). Conscious of how the mainstream Disability Rights Movement and its academic arm, Disability Studies, had effectively erased the life experiences of poor, queer, trans, disabled communities of color, and instead centered the experiences of white disabled activists and scholars, the Disability Justice Collective was formed to counter this erasure. In her 2021 book, *Crip Kinship*, Shayda Kafai (2021) describes Disability Justice as "a movement building framework… [that] not only responds to gaps in the mainstream Disability Rights Movement but also offers principles framed in wholeness and persistence… to formulate strategies of survival for all our disabled queer of color bodyminds" (pp. 22–23). In 2015, Patti Berne, a co-founder of Sins Invalid, a grassroots arts activist organization, worked with disabled, queer, trans of colour communities, and fellow artist-activists to establish a written record of the key principles of disability justice that were published first in a blog post (www.sinsinvalid.org), and later in a manual entitled, *Skin, Tooth, Bone: The Basis of the Movement* (2019). The ten key principles of Disability Justice include: (i) a commitment to *intersectional frameworks*; (ii) relying on the *leadership* of those most impacted by disability justice; (iii) adhering to an *anti-capitalist politic*; (iv) a dedication to *cross-movement organization*; (v) and *cross-disability solidarity*; (vi) recognizing that *each person is full of history and experience and has worth* outside of the commodification of capitalist relationships; (vii) working towards the *sustainability* of on-going justice and liberation; (viii) meeting each other's individual and collective needs via *interdependence*; (ix) a dedication to *collective access* for brown, Black, and queer-bodied disabled people to be in community with each other; (x) and a commitment to *collective liberation* with no body/mind left behind (Skin, Tooth, Bones, 2019).

Disability Justice as a concept and an activist practice was developed in 2005 by the Disability Justice Collective, a group that included disabled queers of color in the San Francisco Bay Area, Patty Berne, Mia Mingus, and Stacey Milbern, along with the founder of Krip-Hop Nation, Leroy F. Moore, Jr., and disabled trans activists Eli Clare and Sebastian Margaret (Kafai, 2021). Conscious of how the mainstream Disability Rights Movement and its academic arm, Disability Studies, had effectively erased the life experiences of poor, queer, trans, disabled communities of color, and instead centered the experiences of white disabled activists and scholars, the Disability Justice Collective was formed to counter this erasure. In her 2021 book, *Crip Kinship*, Shayda Kafai (2021) describes Disability Justice as "a movement building framework… [that] not only responds to gaps in the mainstream Disability Rights Movement but also offers principles framed in wholeness and persistence… to formulate strategies of survival for all our disabled queer of color bodyminds" (pp. 22–23). In 2015, Patti Berne, a co-founder of Sins Invalid, a grassroots arts activist organization centered on queers of colour disability justice worked with disabled, queer, trans of color communities, and fellow artist-activists to establish a written record of the key principles of disability justice that were published first in a blog post (www.sinsinvalid.org), and later in a manual entitled, *Skin, Tooth, Bone: The Basis of the Movement* (2019). The ten key principles of Disability Justice include: (i) a commitment to *intersectional frameworks*; (ii) relying on the *leadership* of those most impacted by disability justice; (iii) adhering to an *anti-capitalist politic*; (iv) a dedication to *cross-movement organization*; (v) and *cross-disability solidarity*; (vi) recognizing that *each person is full of history and experience and has worth* outside of the commodification of capitalist relationships; (vii) working towards the *sustainability* of on-going justice and liberation; (viii) meeting each other's individual and collective needs via *interdependence*; (ix) a dedication to *collective access* for brown, Black, and queer-bodied disabled people to be in community with each other; (x) and a commitment to *collective liberation* with no body/mind left behind (Skin, Tooth, Bones, 2019).

From the above formulations, it is apparent then that Disability Justice frameworks understand ableism and the systems that sustain and support the oppression of disabled people as integrally connected to other forms of oppression as well as the social and systemic processes that prop up discriminatory practices and state violence. It, therefore, follows that Disability Justice centers the lives of people who experience intersecting forms of oppression based on race, citizenship status, gender identity, sexual orientation, age, gender, class, sanism, and the ongoing violent effects of colonialism (Piepzna-Samarasinha, 2018). Disability Justice activists have called for a conversation that moves beyond a sole focus on rights to better encompass the many overlapping and systemic forms of oppression that impact people with disabilities (Mchangama, 2015). As such, Disability Justice is a movement that is dedicated to transformative ways of thinking about oppression, one that sees the interconnections between fighting against police racist violence and the carceral state, environmental degradation and climate justice movements, the liberation of Black people, and the work towards decolonization and land repatriation for Indigenous peoples. It recognizes that the violence that is experienced by queers of color and transgendered people is intricately linked to the lives and experiences of people with disabilities. In other words, Disability Justice is, in fact, explicitly intersectional.

In 2021, we (Nirmala Erevelles[1] and Marina Morrow[2]) sat down on two separate occasions with four of the most renowned Disability Justice activists in the USA – Jen Deerinwater, Sandy Ho, Vilissa Thompson, and Alice Wong – to have a conversation about disability justice and intersectionality. Our conversations were wide-ranging and touched on themes related to disability activism, how disability is lived through the intersections of colonialism, sexism, racism, poverty, heterosexism, and ableism, and how the power relations that sustain oppression are being challenged and transformed. In our conversations, we also discussed the ways in which the disability activism that most often receives attention is that coming from disability scholars and activists who hold positions of relative power or who embody social privileges that allow their version of disability struggles to be heard over those of disabled people whose lives are marginalized through intersecting oppressions related to sexism, racism, sanism, and poverty, among others. These conversations, therefore, also include a critique of the role of the academy and privilege in shaping narratives about disability and the uses of the concept of intersectionality. What emerges from the insights shared are the ways in which intersectionality is embodied and how this has shaped each activist's intellectual and political contributions to disability justice. More importantly, each of these activists has foregrounded the key intersecting issues that shape Disability Justice politics and praxis, as well as their hopes and dreams for a future that will transform the ways in which we think about disability and intersectionality in a more socially just world.

The interviews were edited for readability and the flow of ideas.[3]

Introducing the Disability Justice Activists: Meet Alice Wong, Sandy Ho, Vilissa Thompson, and Jen Deerinwater.

We asked Alice, Sandy, Vilissa, and Jen to introduce themselves, highlight current projects, and tell us about their relationship to activism within the intersectional disability justice movement. We also supplemented what they said with information

---

[1] Nirmala Erevelles is a Professor in the Social Foundations of Education and Instructional Department of Education Leadership, Policy, and Technology Studies at the University of Alabama. She publishes about various topics related to disability, in particular the ways social oppression is pervasive due to differences in race, socioeconomic status, and bodies.

[2] Marina Morrow is a Professor in the School of Health Policy and Management at York University. Her research uses critical mental health, Mad Studies, and intersectional frameworks to understand the social, political, and institutional processes through which health and mental health policies and practices are developed and how social and health inequities are sustained or attenuated for different populations. Marina strongly supports public scholarship and the work and activism of the Mad movement and Mad scholars.

[3] We would like to thank Abraham Joseph for his support in transcribing the interviews.

that we obtained from their websites and other Disability Justice Organizations that have benefitted from their leadership and insights.

Alice Wong is the director of the Disability Visibility Project – an online community whose central project is to design, create, share, and amplify disability media and culture. Wong is also a co-partner in three other projects: DisabledWriters.com, a resource to help editors connect with disabled writers and journalists, #CripTheVote, a nonpartisan online movement encouraging the political participation of disabled people with co-partners Andrew Pulrang and Gregg Beratan, and Access Is Love with co-partners Mia Mingus and Sandy Ho, a campaign that aims to help build a world where accessibility is understood as an act of love instead of a burden or an afterthought.

Wong has earned bachelor's degrees in English and Sociology from Indiana University at Indianapolis, and a master's degree in Medical Sociology from University of California, San Francisco.

Wong has made critical contributions in the areas of popular culture, media, politics, disability representation, Medicaid policies and programs, storytelling, social media, and activism. She has been published in the *New York Times*, KQED, Vox, Radiolab, PEN America, Catalyst, Syndicate Network, *Uncanny Magazine*, Curbed SF, Eater, Bitch Media, *Teen Vogue*, Transom, Making Contact Radio, and *Rooted in Rights*. Her activism and work has also been featured in the CNN original series *United Shades of America* (Season 3, Episode 4), *Huffington Post*, WNYC's *Death, Sex, and Money* podcast, KQED's *Truth Be Told* podcast, *Wired*, *The Hill*, Autostraddle, WNYC's *Werk It: The Podcast*, *The Guardian*, Roll Call, WBUR radio, Al Jazeera, *Teen Vogue*, Bitch Media, Rewire, Vice, *Esquire*, CNET, and Buzzfeed.

Wong has won many awards for her service and activism at the local and national level. She received the Beacon Award by the San Francisco Mayor's Disability Council in 2010 and the Disability Service Award by the University of California, San Francisco, in 2011. From 2013 to 2015, she served as a member of the National Council on Disability, an independent federal agency charged with advising the President, Congress, and other federal agencies regarding policies, programs, practices, and procedures that affect people with disabilities. Wong is the recipient of the 2016 AAPD Paul G. Hearne Leadership Award, an award for emerging leaders with disabilities who exemplify leadership, advocacy, and dedication to the broader cross-disability community. In 2018, she was featured in the Bitch 50, a list recognizing the most impactful creators, artists, and activists in pop culture by *Bitch Media*, and in Colorline's 20 × 20, a group of transformative leaders reimagining what it means to advance racial justice. In 2020, she was named by *Time* magazine as one of 16 people fighting for equality in America. Along with 19 other disabled artists, Wong was named a Disability Futures fellow, a grant by the Ford Foundation and the Andrew W. Mellon Foundation administered by United States Artists. Wong also received the Indiana University Bicentennial Medal for her contributions to disability justice and broadening the reach of IU around the world. In 2021, she was named a changemaker by Marie Claire magazine, and in 2022, she was included in Gold

House's A100 List, a list honoring 100 Asians and Pacific Islanders who had the most impact on culture and society over the past year.

Alice Wong is the editor of *Disability Visibility: First-Person Stories from the Twenty-First Century* (2020), an anthology of essays by disabled people and *Disability Visibility: 17 First-Person Stories for Today*, an adapted version for young adults (2021). Her debut memoir, *Year of the Tiger: An Activist's Life*, is available now from Vintage Books. *Disability Intimacy*, her next anthology, will be out in 2024.

Sandy Ho is a community organizer, disability policy advocate, and resource mobilizer with a longstanding commitment to grassroots disability activism and advocacy. She is the founder of the Disability and Intersectionality Summit – a biennial national conference that uplifts and celebrates the lived experiences of disabled people of color. Most recently, she has been a disability policy researcher at the Community Living Policy Center at Brandeis University, where she coordinated disabled-led research to strengthen and improve practices to keep people with disabilities in the community. While working with Thrive, the Easterseals mentoring program, Ho created a program that matches young women with adult female mentors who have disabilities in order to help the mentees develop leadership skills, learn to advocate for themselves, and set goals for their future. Through its social media component, the Letters to Thrive project, Ho has asked the mentors and young women to write to their younger selves with words of advice or life lessons they have learned. This popular blog has now gained currency globally.

In 2021, Ho was a distinguished Longmore Lecturer with Ryan Easterly and Bridgit Antoinette Evans, and in 2015, she was recognized as a White House "Champion of Change." In 2022, she received a Disability Futures Fellowship supported by Ford Foundation and The Andrew W. Mellon Foundation. Currently, she is also the director of the Disability Inclusion Fund at Borealis Philanthropy. You can follow her on twitter @NotYourAvgHo101.

Sandy is completing her master's degree in Public Policy at the Heller School for Social Policy and Management. In summarizing her work, Ho says, "I think that my relationship to activism is making sure that we are having space for multiple marginalized disabled people to present on habits and their passion and joy and issues that are that are important to them, to better our community."

Vilissa Thompson is the Founder & CEO of Ramp Your Voice!, an organization focused on promoting self-advocacy and strengthening empowerment among disabled people, and a senior fellow at American Progress. Thompson has been consistently on the front lines of ensuring discussions of race and gender are inclusive of the experiences of disabled people on various issues. In 2016, she launched #DisabilityTooWhite, a hashtag that offered an important critique of media coverage, community leadership, and public policy that centered whiteness, as opposed to those who are most affected by the intersections of racism, sexism, homophobia, and ableism. This led to Thompson's construction of the groundbreaking Black Disabled Woman Syllabus with its focus on women's health, carceral reform, body positivity, and mental health. In recognition of her advocacy work, she appeared in *Essence* magazine's 2018 "Woke 100 Women." Thompson has also appeared on MTV, Healthline, The Hill, NY Times (2017/2020), Black Women Radicals, Huffington Post, Buzzfeed, Bitch Media, Upworthy, Daily Dot, Daily Beast, and The Atlantic. She acted as a consultant for Sen. Elizabeth Warren's 2020 Presidential campaign, where she assisted in the development of the Disability Rights & Equality policy plan.

Thompson received her B.A. in psychology and her Master's degree in social work from Winthrop University. She is a Licensed Master Social Worker (LMSW) from Winnsboro, SC. As a member of the National Association of Black Social Workers, Thompson continues to educate her peers in the social work field to look beyond the medical model of disability.

Thompson describes her activism as follows: "I am a social worker, activist writer, speaker and consultant, and I created my business Blog called Ramp Your Voice in 2013 as a way to bridge the identities that I have, both professionally and personally as a Black woman who's a social worker, and who lives a very intersectional experience that has influenced the way that I view the world and the way the world engages with me. Some of my body of work like... #disabilitytoowhite really brought forward the conversation about racism and exclusion... as well as really engaging intersectionality in a way that allows for conversation to be had in certain communities, particularly the Black community... Especially when it comes to how do we talk about the Black experience in its wholeness, in its fullness and not exclude disabled Black people... who have made tremendous contributions to the community. And I also talk about the racism and anti blackness within a community where we may not always feel welcome in that space due to ableism and sanism in that space. So I am really talking about how both communities can do better to be safe havens for Black people and what does that look like."

Jen Deerinwater is a bisexual, Two Spirit, multiply disabled, citizen of the Cherokee Nation of Oklahoma and an award-winning journalist and organizer who covers the myriad of issues hir communities face with an intersectional lens. Jen is the founding executive director of *Crushing Colonialism*, a non-profit Indigenous led multimedia organization, and a 2019 New Economies Reporting Project and a 2020 Disability Futures fellow.

Jen received a B.A. from the University of Southern California in Gender Studies and Political Science with an emphasis on American Federal Government, a Graduate Certificate in Women in Politics and Public Policy from the University of Massachusetts-Boston, and an M.S. in Communications Management from Simmons College.

Jen is a contributor to Truthout, and hir work has been featured in a wide range of independent publications, including Bitch, Rewire, News, In These Times, and New Now Next. Jen's writing is included in the anthologies Disability Visibility: First Person Stories from the Twenty First Century (2020), We Organize to Change Everything: Fighting for Abortion Access and Reproductive Justice (2022), Property Will Cost Us the Earth: Direct Action and the Future of the Global Climate Movement (2021), and the forthcoming Crip Authorship: Disability as Method

(2023). She's the co-editor of the anthology Sacred and Subversive (in process) and is currently hard at work.

Deerinwater describes her many activist roles as follows: "I'm a citizen of the Cherokee Nation of Oklahoma. I grew up between rural areas of my nation's reservation in Oklahoma and in Abilene, Texas. So, I've mostly been living in large cities, and... urban areas... since I left home for college, and I now live on occupied Piscataway land known as Washington DC. Let's see what else... so I'm also bi and two spirit, and I'm the founding executive director of 'Crushing Colonialism.' I am a freelance journalist, I'm a writer, a photographer. I do a little bit of the arts and media and then along with that, community organizing which I've been doing for 20 years now. I also feel like it's important to mention that I worked in politics, off and on, for about a decade. And, in particular, I worked a lot for the Democratic Party. I ran political campaigns, and I worked in... liberal advocacy organizations rather than justice-based organizations. And it was partially being in that world and doing that work that actually pushed me so far to the left... I am multiply disabled. I have chronic pain, I have some chronic illnesses, autoimmune issues. And I also have complex PTSD. I don't think of that though as so much as an illness, but rather [as a] perfectly rational response to traumatic experiences that should have never happened. But I feel like it's really important to say that because it is something that I struggle with partially because of who I am and the way the world treats people like me and the way that those identities and those oppressions just keep layering and piling on. In terms of Disability Justice, I didn't really start coming to it, until my 30s. You know, like for example I spent a lot of my 20s doing pro-choice work and the longer I was there, the more I went... nah... I think reproductive justice is what we need, you know, and that's kind of the direction I've shifted to with all my politics. But it really wasn't till my 30s that I got involved with Disability Justice. And I think there are a lot of reasons that I waited until my 30s. Up until my 30s I had mostly been able to kind of hide my disabilities. I think I struggled... between my own internalized ableism, and just the abuse and the discrimination that I encountered as a disabled person that I hid it for as long as I could."

Thinking with and Through Embodied Intersectionality

NE & MM: Can you give us narratives of how your lived experiences both as individuals and as activist communities embody intersectionality?

Alice Wong

My embodied experience is intersectional. I don't like to use the word to describe that lived experience because it just is, and I feel like this word, and this concept by Dr. Kimberle Crenshaw, and other Black feminist scholars and other sisters is so overused. It's been misappropriated, and it just... it rings hollow for a lot of people. It's just a buzzword now, and it's often misunderstood. And it's used oftentimes as a replacement for the word diversity. But it's not about diversity. And I find that troubling. I really find that disturbing as well because… it's not just my own experience, but it's about this larger system which has a space of oppression… which is different than our individual experiences. But the fact that people are asking. "What's it like to be an Asian-American and disabled and a woman?" How do I answer that? You know, I find those questions to be not helpful. And not useful, you know? And I feel like as a marginalized person that it kind of says more about the people that are asking these questions of a study, they are just reducing me down to these check boxes. You know, I think our experiences are very messy, very full of nuance. To separate experiences that are deeply intertwined, right? Ableism, racism, sexism, other forms of oppression. And you know, I just feel very tired at this point to be asked these kinds of questions. And I feel like it's a very kind of simplistic way of talking about diving deeper into intersectionality.

I think for me, where I'm at right now as a 40-something activist, I think I'm getting a little bit, you know, impatient and a little bit salty about this, and I think it's good to feel salty because so much of this work is white people's work, and in particular, white scholars, or white disabled scholars in disability studies, or any scholar in academia. The disability justice movement is inherently intersectional. So, we should just call it the intersectional disability justice movement. It just is. And this is another kind of education and understanding – that disability justice was forged primarily by disabled people of color.

Sandy Ho

I very much agree with what Alice was saying… the start of the response regarding the redundancy of that question around like… what is the relationship around intersectionality and disability. I think that the question also kind of presumes that we had a choice to begin with, which many, many more marginalized people of color, and women in our movement who are doing this work, who are doing not just the community activism but also making sure that we're taking care of one another. It is like, well, that's just how we live our lives… But, in terms of my activism and in terms of intersectionality, part of the reason for why my friends and I who are also disabled people of color started D.I.S., The Disability and Intersectionality Summit, was because we saw that a lot of, for instance, Ted Talks, and other presentations, and other conferences, were giving platforms, and microphones to white disabled people, … most of whom… were, coming from an upper socio-economic class … had obtained the credentials that made them acceptable to the Academy, or to other professional institutions and were framing disability around, and telling narratives around disability that just did not resonate with the community that I know… so we're like where's the… conferences and the places for us to tell our own story?… I think that when Kimberle Crenshaw established this framework, it was also about working for where power is most held. And so, it is then unsurprising that one of the principles of the Disability Justice framework is leadership by those most impacted… And so, I think, that intersectionality is not just like a guiding principle, but it's something that we really hold to align ourselves closely with.

Vilissa Thompson

My very existence is intersectional… I've always been aware of what it means to have multiple identities as a Black person from the south, dealing with racism – understanding the history of racism in our country and understanding the history of white supremacy in our country, understanding how Black people are impacted in general, and then breaking it down as a Black woman. It wasn't really until I began doing this work where disability shifted from being a medical understanding to a cultural identity. Now understanding that nuance is there. And also combining that as a Black disabled person… specifically as a Black sane woman. What do all these histories mean for my existence? What do all these histories mean for my understanding of self? In a lot of my work when I talk about intersectionality along with privilege and biases, I encounter a lot of white folks, both disabled and not disabled, who want to challenge me on privilege. And somebody asked me about my own privileges, and as a Black sane woman, I am fully aware of my privileges. Some of that is being a light-skinned Black woman that some consider racially ambiguous – even though I don't see that but when I go out in the world and I am asked… am I, anything other than Black, then it makes me know that oh, I do not just exist as a Black person, I exist in this othering of blackness because of my lighter complexion. Having educational privilege, being somebody with a master's degree… I know that those things allow me to get into a certain room and get certain connections easier than some other people of color. When I go out into the world (being here in South Carolina), some people don't care that I'm Black, but some people care that I'm in this wheelchair. People may not care that I'm in this wheelchair, but they care that I'm Black. But people may not care about that wheelchair or [about] me being Black, but they care about me being a woman. And some people care about all three. So, the embodiment of intersectionality is something that I don't really have to think about, it just… this is my life. In doing this work as an activist… one of the things that really struck me when I became more engrossed with the activism part of disability spaces, was the failure to understand how we all embody these identities in… different ways… But as Alice has said, and I think Sandy has, we know that this work (on teaching about intersectionality) is really for white folks… We're not the ones that need to be taught here. It's like the white sane folks and the white scholars… and white people in general, they need to be taught these things because they don't have to think about it…

Alice Wong

Just building on what Vilissa just said, which is so true. I spend a lot of my time on Twitter… I still see… white disabled people using the hashtag #disabledlivesmatter. Which is completely inappropriate. You know, cooptation of #blacklivesmatter… And I see this conversation again, and again and again… So why does a disabled person do this? "We're the most oppressed… Disabled people are always the last to be included, or disabled people have it worst or just disabled people are, you know, are always like forgotten." . . . And then disabled people of color will usually gently or firmly say, "Hey uh, you're definitely forgetting or erasing or harming disabled people of colour." . . . And then there's all this fragility and defensiveness. "You don't know how hard I've had it. . ." This is quite true that we don't want to say they haven't been through things. All of us have struggled. All of us have gone through difficult things. But that is often used as a defense for not listening to why disabled people of color have. . . different hardships. . . I see other issues where white disabled people try to really center themselves, but they should not be centering themselves. You know, I am talking about police brutality and the fight for Black lives or disabled Black and Brown disabled people and how Indigenous people should be at the center. . . And yet, white disabled people have very little problem thinking about themselves and thinking about their experiences with law enforcement or just all these other things.

Vilissa

And especially jarring, because I think with disabled people, centering ourselves is kind of what we do when it comes to our bodies and experiences. We have to be mindful. I know that for me I need to be aware, particularly somebody with brittle bones, how people lift me and how people pick me up and engage with me. . . So, in some ways, this self-centeredness is bred unconsciously because we always have to be aware of our bodies and our minds and [our] interactions. . . And this self-centeredness particularly with white disabled folks fail to look beyond. . . themselves because white people don't have to. Whiteness is the culture. Whiteness is the definition of everything. And white disabled people fail to see that when they talk about [their] disability issues, white experience is the standard. Their faces are the standard here. When we have these telethons, when we have representation in the media, it is [usually] white people. So, they are never going to be left out. In some ways, it's over saturated with whiteness and disability. . . And I think that's one of the most frustrating things is seeing white disabled folks try to do #disabledlivesmatter, or question the work that we do if we're looking just to highlight, disabled voices of color. Because white people are never going to be erased. They are always going to be considered important. Why can't you just allow space and room? And in some ways, pass the mic for those of us who never get heard, who are always invisible, who always have to fight to even get some type of crumb. . .?

Jen Deerinwater

. . . I knew that once I came out as disabled, I would never work in politics again. . . I felt like if I came out as disabled, I wouldn't be supported by the Democratic Party. I felt like voters wouldn't be interested in me, especially, you know, already being Native and bi, a woman, and all of these other things. So, I hid it for a very long time. And 1 day I just, I couldn't hide it anymore, and I didn't want to fight it anymore. It was like. . . physically, I couldn't hide it. And I just didn't want to anymore. . . Why did I have to hide something about myself and be ashamed of it, when I'm not the problem? The system is the problem. The Democratic Party is the problem. The Republican Party, you know, is [the problem]. . . So, I think, it was, a lot of that, that kind of pushed me in the direction of justice-based movements, but also kept me out of them for a while. I also just never really saw space for myself in a lot of movements, you know. Up until really. . . the #NODAPL (Dakota Access Pipeline Protests) at the Standing Rock Reservation, most non-Natives had no interest in working with Native people. They didn't care about Native issues. They didn't care, and I still think a lot of people don't care. . . . I didn't see myself in that way, you know, in the larger queer community as a bisexual and a two spirit. I didn't really see myself being welcome. . . I feel more comfortable in Disability Justice spaces but [in the] disability community, as a whole. . . I don't feel seen as a Native person. You know, so. . . that's also been a problem. It's not just the liberals or the moderates, or the right. It's our own communities, you know, doing that disconnect and, you know, sort of keeping our people apart.

. . . In the so-called United States (and I say so-called because this is not the United States, this is Indigenous land, whether it's recognized as such or not), when you look at who is the most likely to be disabled. You know it's Indigenous people. Native people have the highest rates per capita of disabilities in this country. We have horrible rates of chronic illnesses. And a lot of it is perfectly preventable. We are not genetically predisposed to diabetes. Diabetes really came up in our communities in the last 100 years or so, and a lot of that is because we were removed from our lands. Or our lands have been poisoned over the years. Or our food sources were taken from us through things like. . . the bison slaughter, for example, for our relatives out west, or the damning of rivers, which then stops the natural flow of salmon. Things like that have disconnected us from our foods in our traditional ways of life. And that's part of why we have such high rates of diabetes. We are disproportionately impoverished. We have higher rates of food insecurity and starvation. And so, I guess I also sometimes feel a little disconnected, in some disability spaces where people have this pride about being disabled. And I think that that's really amazing. But for me, when one is a chronic pain sufferer, it's hard to feel pride in a body that is attacking me and making my life so much more difficult. But how am I also supposed to feel pride when I'm looking around at illnesses and disabilities within my community that are absolutely a result of genocide, of colonization, of the climate crisis, and environmental degradation? You know, that's not something I feel pride in, and so I still sometimes feel kind of out of place in disability community and Disability Justice spaces, but I guess I feel like there's enough room for all of us and all our voices need to be heard, so I just keep trying to show up.

You know I don't always feel comfortable in all of my communities. I mean, oftentimes with Native community, I have to be like, "Hey, there are queer Natives. We exist, you know. There are disabled Natives. Can we talk about this?" I think another part of the disability and Indigeneity piece that I think is really important and something I'm still learning about is a lot of Indigenous cultures, nations, and communities didn't have words like disability. You know, "disability," "being deaf" – those things that could have been something completely different. You could have been seen differently. You could have been treated differently. You weren't necessarily going to be seen as a burden on the community, you know. So, I think that that's one important aspect to being disabled and Indigenous, but also at least within the so-called USA, there is also a long history of state governments coming in and saying that native people are disabled or ill or mad, when we're not. You know, if you look at the Hiawatha Insane Asylum for Indians, for example... that is part of that colonization piece, you know. It's a way of disconnecting us from our people. In the State of South Dakota, a lot of Native children get labeled as disabled because the state of South Dakota gets more money from the federal government if they have more disabled children. Prior to the passing of the Indian Child Welfare Act (ICWA) in 1978, studies found that 25–35% of all Native children were removed from their home by state child welfare and private adoption agencies. Of those, 85% were placed with non-Native families, even when good homes with relatives were available. In the State of South Dakota, for example, many of the Native children stolen from their tribes are labeled as disabled because the South Dakota government is given more money from the federal government if the children in foster care are labeled as disabled. The Supreme Court of the United States held a hearing on November 9, 2022, that could overturn ICWA, meaning not only could more Native children be stolen from their communities, but the entire right to exist as sovereign nations go away.

And so, a lot of Native children are in foster care, being stolen from our communities when there's absolutely no reason for them to be separated other than genocide. And then they'll label them disabled whether they are or not, so that they just keep getting money... So, I sometimes think some Native people are very afraid of being called disabled, and partially because of that... I think we're also a very insular community with very real trust issues. For very obvious reasons, we have trust issues. So, I think many of us are still in this place of constant fear of being murdered. And you don't want to expose your weaknesses, and if your enemy knows, oh hey like you've got x, y, and z health problems or disabilities, that can be used against you. So, I think sometimes we don't like to talk about it and own that as Indigenous people because we're still being killed, you know genocide hasn't ended for us.

Disability Justice: Key Issues

NE & MM: As activists in intersectional disability justice movements what are some of the key issues driving these movements?

Sandy Ho

I think... there can be an understanding that disability community issues are rarely prioritized until we see them in the headlines. And by then, you know it's too late, right. Like, by then, people have already died. And I'm thinking about, of course, the pandemic. And I'm thinking about police violence and brutality. And we know that these issues have existed long before Twitter or... long before "mainstream disability organizations" themselves started making their #BlackLivesMatter statements. And I think these are some of the key issues driving these movements.

I would also personally look to what are the principles in the disability justice framework... I think the founders already named and recognized what are the key issues that normally are the ways that ableism is cross-cutting and the ways that ableism and the violence of the systems of capitalism are intertwining, and you know feed off one another. And so... it's kind of hard to twist off like housing, transportation, climate change...Yes, those are all key issues that are driving our movement, but what it boils down to is how these issues are systematically oppressing multiple marginalized people. And then how these movements are also collaborating or not collaborating with folks who had been doing this work.

Alice Wong

If we want to bring it down to an issue, I will say, you know, within the last few years that the abolition of prisons is a key issue. You know, we can think about... the school to prison pipeline. If you think about... carceral spaces, for example. You know that the disability community is still trying to fight to live in the community. And here we are (more than a year into the pandemic) where so many people have died in carceral settings. This is not liberation; this is not justice. This is not a world built and centered on disability justice. Because if it was, we would find ways to create care and give care to the best of our ability, within the community, with all of our capacity. This is one of the principles of interdependence... just because we have lots of high needs, like myself, as a ventilator user, somebody who requires total help. I know that this is not just me. I'm not just a list of all my needs. I think that liberation is when we see the wholeness in each other. Then we can really be interdependent with one another and create communities that are centered on care and love. Which may sound cheesy, but it's not. This is a world, if you really have a wild imagination, we can create it. We can create a world without prisons and without nursing homes. It is only until you dream this that we can get to that place. You need to have these dreams, and disability justice has always been about dreaming and about imagination. And that's how we get free... that is how we get free.

Vilissa Thompson

I think for me, in centering key issues, some of the most rewarding work that I've done has been in Black spaces, because Black spaces get intersectionality already. The worker's movement organizers... understand that the Black experience is not a monolith. They understand that the Black experience is very diverse within itself based on region... They are very transparent in understanding that their work hasn't been inclusive of disability, and they want to be more intentional about that, and they want to learn about disability rights disability justice and the disparity within certain issues like education, housing, healthcare, transportation, access, and so forth. So, for me, being in spaces where people already have a framework of intersectionality makes the work a little easier to do. It makes the work more fulfilling, particularly when I'm in these spaces where the people themselves are disabled. And I think that's something we don't talk a lot about, how many people outside of our – outside of disability community spaces, have these disabled bodies and minds. But they don't self-identify, and there are cultural reasons as to why many people don't self-identify that I don't think we give a lot of room for this with the disability spaces. As a social worker, the way that I engage with a lot of folks comes from that lens which is not necessarily from the activist lens, and as a social worker, we have a phrase called "meeting people where they are." And, when I encounter Black folks who are clearly disabled. Clearly, I mean, they talk about their mental health, they talk about their chronic illnesses to talk about the physical disabilities... But you see that detachment for them from the identity part. It's not my job to criticize them for that distance you know, it's my job to understand what created that space for distance. What created this disconnect, and how to be a part of the connection for them – so that a reconnection can occur... Some of the key issues aren't always the issues that we always talk about; some of the key issues are internal. Acceptance and understanding of our bodies occurs in a very ableist, white supremacy, racist society, and that impacts our understanding of who we are in our fullness... And I don't think that many of us, as disabled activists, do a good job of centering the internal work. We're always talking about the issues, and the issues are so important, but the internal work matters just as much... so that, we have more honest conversations about ableism in certain communities. We have more honest conversations about the disparities that disabled people experience in general, and then it's broken down by race and other identities. That internal work matters so much, and that's what matters to me at this time in my work, and seeing the evolution of it is going from the external to talking about these big issues, but really bringing it home for people so that they have a lens and verbiage to really get an idea of where they fit.

Jen Deerinwater

I feel like I see the most glaring, just lack of collaboration, is between the climate movement/environmental movement, the decolonization land back Indigenous communities, and the disability community. These communities are not coming together the way they need to be coming together. You know, within the disability community, there's a little bit of talk about the climate crisis and how that impacts disability. You know, obviously environmentalists and Indigenous people are working together, albeit sometimes not in the friendliest of ways. There's still a lot of tension, but there is some overlap, and now you try to get all three of those things together, and there's not a lot of collaboration there.

All of the disability rates that I could find for Indigenous people on a global level were anywhere from like 20%, up to a little over 50%. You know, I mean that's staggering and that kind of goes back to what I said earlier. No one is just genetically predisposed to becoming disabled on a group level like that. And so, this is clearly a by-product of genocide and colonization, and all these things. And for Indigenous people, a lot of that is connected to environmental degradation. I'll use my reservation as an example. You know we have issues with large scale chicken farming on our reservation now, so large-scale chicken farming is polluting our waters. And we're already in Oklahoma, which likes to boast about being, you know, the pipeline crossroads of the world. We've got so many gas and oil pipelines connecting throughout the state. I don't think we're still the most seismically active at this point, but for quite a bit of the late 2010 decade we have been the most seismically active state in the continental USA because of the wastewater injection wells in the ground from fracking and gas and oil production. Our largest earthquake in the state was in 2016. It was actually over Labor Day weekend when the dogs were let loose on our people at Standing Rock. That same weekend was the largest recorded earthquake in Oklahoma, and the Osage Nation had to declare a state of emergency. I grew up with tornadoes. I grew up with ice storms. I didn't grow up with earthquakes. That is not normal for where I am from. That is absolutely because of environmental degradation. I look at communities in Canada – so-called Canada, I should say... because that is Indigenous land. But in so-called Canada, for example, the city of Winnipeg... I read this great book, it's just a very small thing, but it's like full of information, it's called Aqua duct, and it's all about how municipal water happened in Winnipeg, and it was the lake Shoal community... all of their water, the government came in, took their water, and routed it down to Winnipeg so that the mostly white urbanites of Winnipeg would have water, but now the people of that community don't have water. As you know, a lot of the reserves in Canada are under boil water advisories.

... I talked to Kera Sherwood O'Reagan. And she's Maori. She does a lot of work around climate and Indigeneity and disability. They have a lot of coastal erosion and you know rising waters that they're dealing with in Aotearoa or New Zealand, as it's called... and she talked to me about how dairy farming was a big part of local industry down there. And we know dairy farming contributes to greenhouse emissions, yet people can't live off the land anymore the way they used to, so they have to take those kinds of jobs. You know, when I talked to relatives down in southern Louisiana, the tribal lands down there, or throughout the area, are called cancer alley. It is a very similar thing there; they can't live off the land anymore. You know, fishing... those sorts of things. I's getting harder and harder to make money that way. You can't really feed your immediate family off that. Like, literally go and catch the food and bring it home. So, a lot of them are being pushed into oil and gas. You know, it's like one of the very things that's killing them is also the only way they can feed themselves. So, I don't know. To me, I just don't understand why these movements aren't working together. Well, I guess I do understand why they're not working together. It's ableism, racism, and colonialism. But they should be working together.

Also, I've been thinking about the United States' Trust and Treaty responsibility and how they are not meeting that responsibility and how that has put us in a situation where we've had the highest rates of COVID contraction and death. We are still getting sick and dying. This is still happening, I know people who are still losing loved ones, even though 71% of Natives live in urban areas. There's been a huge push to vaccinate our relatives on our land, on the reservations and tribal villages, but there's been very little work to vaccinate us in urban areas, even though this is where most of us live. You know, and that is a Trust and Treaty responsibility the United States government has in relation to us. Like, the Indian Health Services is a Trust and Treaty responsibility. It is not free health care; it is health care that our ancestors negotiated through the loss of land and life. You know, whether I am on my reservation or I'm sitting here in DC, I still have a right to that health care. I still have a right to all of these services and things, but they're not happening. And I've been thinking how all of these different issues go together. I've done some, webinars and talks on transportation, and on disability accessibility, and I've been thinking about how do you have paratransit or disability accessible transit on lands that don't even have roads? How do you offer telehealth, if you are in lands that don't have telecommunications infrastructure? You know, even for urban Natives. How do you access telehealth, how do you access distance education or work, if you can't afford a smartphone, a laptop, you can't afford internet? One of our urban centers in Baltimore... it's called Native American Lifelines. They actually had to set up a room in their office after COVID, and we had to start quarantining. They had to set up a specific office for our relatives to come in and do telehealth appointments because not everyone had internet or phone service to do that in their own homes. And because libraries and community centers closed.

Disability Justice and the Academy: Activist Critiques

NE & MM: What critiques can your activism offer to academics of Critical Disability Studies as well as to the disability rights movement?

Alice Wong

I'd just like to say that one of my particular dreams issued to the readers of the audience of this piece... they're clearly academics. You know, I think there's a lot of research that happens by scholars that are not part of that community, and... oftentimes they justify it or split those communities. It is research, as a destructive process, that jeopardizes the work of community-based scholars, people in the movement, people in the local communities that don't consider themselves a scholar, but they are somebody with that lived experience and a lot of knowledge... but not the kind of knowledge that is traditionally thought of as knowledge. A more porous academy that really does partner with and center people who have all kinds of experiences that doesn't require a PhD, to be honest. And I think there's a long way to go to really respect the knowledge production that takes place outside of the academy and to honor and bring in people, to partner with them respectfully, in order to create better work. And I think this is what's really necessary. Because the academy needs to be transformed as well. It is not a place of liberation. It is not accessible. It is an ableist house... that's why I did not finish my PhD. I just want to put that out there because I do believe that there is hope, and you know, it does take, I think, knowledge with the privilege, to use that privilege, right? For those that do know better, for them to really make sure that they ensure that people with all kinds of experiences and knowledge are part of that process.

Sandy Ho

As somebody who has had the experience of also co-teaching disability studies and disability policy classes, whenever a student cites, you know, whether it's a "Ramp Your Voice" blog post or a DVP (Disability Visibility Project) podcast or an intersectionality YouTube video, I get excited, because that's saying, you know, that we are transforming knowledge and how it is carried through our community and shared... As the academy is looking to do better, it can also look inwardly at the multiple marginalized, disabled scholars, who are trying to do the work. I'm thinking about folks who are in the academy and within the system who are trying to push their peers and colleagues to do better. And not just produce, not just through the work that they produce but in the practice as well and how they teach and how they are trying to prepare students of this generation and future generations... It doesn't need to be as manic and harmful as it was for some of these folks who did go through a process of getting their PhDs. In that process, we are all trying to achieve collective liberation.

Vilissa Thompson

I'm not in academic at this time. I do plan to go back for a PhD in a couple years, but in the space that I'm in (as far as social work), I've been seeing a shift in conversations about the way we discuss numerous things, particularly being more inclusive of the disabled experience within the curriculum. I went to grad school 2 years ago for my Masters and remember some of the outdated language that we were using at that time. And how I understood that, when it came to working within social work that I will have to find jobs that are more accommodating or make my own power. Which is what I did with the latter. And that's due to limited access, when we think of traditional social work, we think of case managers and the like. And a lot of those jobs require you to be out in the field. And the field is not always accessible for people who are using wheelchairs, or those who may not be able to drive due to certain disabilities, and other transportation limitations that our community faces. So, within this scope of work, it's been very impactful to see not only colleagues, within academia and outside of academia, but also the students themselves, really wanted to be more intentional as to how they can become better social workers for the community, regardless of the type of work that they do. I was talking to students at a university last month, and March was Social Work month, and they wanted to know how to be better out in the field. And, how to be supported if you are a disabled social worker, a disabled student in the profession. And how to be more impactful within your program in what you need as a student, but also what you leave behind, once you graduate.

And I think that the shifts, within academia and outside academia, are so important, particularly for the areas where disability can be encountered. A lot of people in our community do have horror stories about social workers and therapists and other members of the helping profession as well as within the medical profession. And these are the realities that we face. And those are the stories that I bring to my colleagues, because again, as I said earlier, that's the privilege that I have. To be able to be loud and outspoken about the harm that is being done. . . So I think that for me, I take it very seriously. The responsibility that I have to utilize my platform in whatever space that I am in. To really get people thinking about things like I was saying earlier, the internal versus external, which is really the micro versus macro and really showing the bridge of the two. I think this is very important. And I think that's for me been a defining moment in the work, showing and creating these bridges. Showing how we have always been connected to each other. That, no matter what movement space that you're in, there have always been disabled people there. Whether they've been able to be loudly disabled or outwardly disabled, they have always been there.

Jen Deerinwater

I feel like I should preface it by saying that I have never taken a disability studies class, and to the best of my knowledge that was not anything that was offered at any of the universities I went to for undergrad and grad school, just like Native or Indigeneity studies, were not offered. So, it's something I'm still new to, and I haven't been in academia in 10 years either. So, you know that's not a world that I work in and I'm not a student anymore. And so, I feel like I'm not the person to answer that. But I think that there are a lot of opportunities there, and I am just kind of waiting to see what happens. I am also, at times, very leery of academia. You know, from my own experiences of sexual harassment, gender-based retaliation, blatant ableism, and anti-Native racism – like, I've experienced it all firsthand in my own experiences in academia. And then, we also have to remember who funds, academia, like who's funding it? You know where is the money, where's the money and resources coming from? Whose stolen land are universities on? How many stolen ancestors and sacred items are in university collections the world over? So like I'm very skeptical of academia, in general, I feel like it's education as part of enforcement of institutional oppression, and so I'm very leery of academia, and I'm a big book nerd though, and I am just intellectually curious and I think education is important, so I'm still trying to hold on to some hope there. . . . Also, I think sometimes, you know, these sorts of buzzwords, like intersectionality and decolonization, they start off in good places; they come from grassroots movement folks. They come from the people firsthand experiencing this, and then they just slowly get co-opted over time. Land acknowledgments. Amazing example. I can't speak to anywhere but the USA. The so-called USA on this one, but no one was doing land acknowledgments pre-Standing Rock here. No one was doing that outside of the Native community. Honestly, I haven't seen any land acknowledgments in disability advocacy spaces. Disability Justice there has been some, but like, the larger disability community? I've never seen it at anything. So, I mean like right there, the disability community hasn't even got to that point of meaningless grandstanding in my opinion.

But for me, I mean you know like a land acknowledgment... great your university acknowledges that you're on x Indigenous land... but are you giving that land back to the people? Are you giving it back to the tribal nation? No. How many of our ancestors are sitting in a university collection somewhere? You giving those back? How many of your museums have our artifacts? Our sacred items in them? Are you giving that back? You know, there's a big push to try to get Harvard University to hand back our stolen ancestors to our people. You know, and this is unfortunately not just something Indigenous people suffer. This is something Black, brown, people from across Asia, you know, Indigenous like the world over have suffered and still suffer. So, I don't know if there's really a way to make academia de-colonial. I don't know if that's possible. Just because of the inherent nature of the way it operates. The way that it is funded. The way people choose to go to school, how you fund your education...I think that there could be some good individuals... there are good individuals doing good work, but that systemic level, it goes back to, like: Is there a way to reform the US government? Nah. It's always been based on genocide and enslavement and imperialism and all these awful things, so I don't know. I would like to think there is, but I don't think there is. Now I think there are absolutely ways people can educate themselves and educate others in their communities without having to be in academia.

The Future of Intersectional Activism for Disability Justice

Alice Wong

I would say going back to the principles that were founded by Sins Invalid. There's a whole disability justice primer that I hope that the whole round table will include as a footnote as homework for people... and I would say that liberation is the goal, the liberation of justice, and I think that you know, that's an issue, it's what we're striving for...

Jen Deerinwater

So for me, I'm just like there are so many opportunities across movements to be working together. Yeah, so like when I think about, as an Indigenous person, when I think about decolonization that to me means everything. That doesn't just mean land back. It means the end of ableism, the end of colorism, and sexism, you know. All of these messed up values that have been forced upon us. Like, we have got to get rid of that. That is what decolonization is for me. It's getting rid of these toxic ideas of who we are as people and who other communities are as people and starting to work together and working to repair the hundreds of years of toxicity and genocide that have occurred.

I think there's absolutely room for disabled and Indigenous people to work on things like the eugenics movement. For example, it's still legal in this country on the federal level to sterilize disabled people against our will. While the US government has also for a very long time been sterilizing or forcing people on too long-acting birth control, who are Indigenous, Black, or brown. You know, there are just so many opportunities for us to be working together, but I think it also takes us all understanding a justice-minded framework. And I think you can see right now where communities and movements are splitting just over things like the police. Some people want reform, and some of us are like: Hell no! No more cops! Defund now! I think that that's where there's also a disconnect in not understanding the true large scale insidious nature of all of these isms and phobias and oppressions, and that it's not just one or two bad politicians or one or two bad cops. Know it's a system. It's a system that was created to work exactly like it is. Like it's not broken. It's working how it was intended to work. And I think a lot of people still haven't caught up to that. And I think a lot of people don't understand why someone like me, for example, is so goddamn angry and fed up. Like, I'm done asking for crumbs, I'm taking what's mine, and I think that's also where we have disconnected movements. It's just that some people with a little more privilege don't seem to understand how you just reach a point one day where you're like, enough is enough.

Vilissa Thompson

When it comes to these conversations, people have to be comfortable with being uncomfortable. People have to be comfortable with being de-centered. People have to be comfortable with not being in the spotlight and moving out of the way and being a backdrop. And I think that a lot of that de-centering is a lot of ego. There is a lot of taking stock of privilege and an over-visibility, versus under visibility and really seeing what we can do now in the present so that 50 years from now I want disable people of color to be at the front, I want us to be seen. I want us to feel safe. I think that's the thing that a lot of Black civil rights activists, activists like myself, always say: We don't feel safe in any community, because there is no safe point. And I really want the disabled activists of color that are nipping at our heels to feel safe 15 years from now, or safer than we do now. . . I leave this legacy to where those who are coming up can take that baton and take it further than I can even imagine that any of us on this call can imagine right now. And really re-shape what it means to be disabled and of color, and you know, in my case, what it means to be disabled and Black, and really having these conversations that we're not able to have because we're doing things one by one, and we can barely get to one or two. And really create this vision and hope and care and love that is missing in this space that we're trying to create today, but I hope becomes reality. Fifty years from now, 100 years from now, for our community and those within them.

Disability and Disablement in Settler Colonial States: Indigenous Perspectives of Disability Since Time in Memorial

32

Sean Hillier and Jessica Vorstermans

Contents

Abstract

This chapter is a journey of learning, focusing on the experiences of Indigeneity, disability, and disablement in the settler colonial states of Canada, Australia, New Zealand, and the United States and how we collectively can work on healing or reconciling. We start by taking up colonization, which for many settler states share numerous elements and functions (removal from land and forced relocation to reserves, residential schools, and removal of children to "care" by the state). We take up three main periods of time: First, learning about notions of disability prior to widespread European contact. Second, using an intersectional lens, we will learn about the initiation of colonization and ongoing processes of colonization impacting Indigenous Peoples in settler states, using the life span as a way to organize this section. Finally, we conclude with our journey toward healing and knowing by discussing the lived and imagined futures that return to Indigenous ways of being, knowing, and relationality that resist Western and settler-state productions and reproductions of disability and disablement.

Introduction

Kwe (Hello), we welcome you on this journey of learning and healing with us. The journey we are embarking on through this chapter will focus on learning the experiences of Indigeneity, disability, and disablement in settler colonial states, Canada, Australia, New Zealand, and the United States, and how we go about healing (or reconciling). We will bring you along the process of learning about colonization, which for many settler states share numerous elements and functions (removal from land and forced relocation to reserves, residential schools, and removal of children to "care" by the state). In order to do this, we will take up three main periods of time: First, learning about notions of disability prior to widespread European contact. Second, using an intersectional lens, we will learn about the initiation of colonization and ongoing processes of colonization impacting Indigenous Peoples in settler states, using the life span as a way to organize this section. Finally, we conclude with our journey toward healing and knowing by discussing the lived and imagined futures that return to Indigenous ways of being, knowing, and relationality that resist Western and settler-state productions and reproductions of disability and disablement.

Natalie Clark (2016) argues that Indigenous intersectionality, what she terms red intersectionality, has been ignored in the wider body of literature on intersectionality. She tells us that "this knowledge of the interlocking arteries of colonialism has always been part of our truthtelling" (p. 49). That as far back as 1883, Indigenous activists like Zitkala-Sa and Winnemucca were struggling against violence "on the land and the body" (p. 49) that took up ways that this violence is enacted in particular gendered and aged ways. We work from this conception of intersectionality and add to it the category of disability, in order to further deepen our understanding of the experiences of Indigenous Peoples in colonial states. Importantly, we must also understand that an intersectional lens must take up Indigenous Peoples' connection to, and at times displacement from, their traditional lands. We also cannot talk about intersectionality without recognizing the inherent sovereignty, and resulting power dynamics, that Indigenous Peoples have to the places in which they are located that impact their relations with and to one another, whether they be Indigenous relations or settler ones. This chapter troubles, or problematizes, Western conceptions of disability and works to center ways that disablement is produced through colonization and its attendant violent practices, and ways that Indigenous Peoples are reclaiming conceptions of disability, and the centrality of land and sovereignty in Indigenous struggles against disablement.

We come to this work with our own ideas, worldviews, and lived experiences. As such, instead of locating oneself within the research to identify biases, Bastien (2005) and Lavallee (2009) argue that we do so in order to connect with community and to understand our own way of knowing which may differ from that of the community or peoples we are researching. It is for this reason that we position ourselves as writers of this paper but also as the readers of the works listed herein. Dr. Sean Hillier is a queer Mi'kmaw scholar and registered member of the Qalipu First Nation and grew up on the southwest coast of Newfoundland. However, he has been residing in Toronto for the past decade. Sean's collaborative research program spans the topics of disability, aging, living with HIV and other infectious diseases, and antimicrobial resistance, all with a concerted focus on policy affecting health-care access for Indigenous Peoples. Dr. Jessica Vorstermans is an able-bodied white settler who grew up in an intentional community of people with and without intellectual disabilities just north of Toronto. Jessica's research uses critical disability theory and the lens of intersectionality to complicate North-South encounters engaging impairment and disablement. Her work engages community-based research, centers the perspectives and desires of those in the South, and takes up equity, critical care in community and North-South relations.

We, the writers of this work, are located in Toronto, Canada – also called Tkaronto. This land has been care taken by the Anishinabek Nation, the Haudenosaunee Confederacy, and the Huron-Wendat. It is now home to many First Nation, Inuit, and Métis communities. We acknowledge the current treaty holders, the Mississaugas of the Credit First Nation. We must preface this work with the understanding that while Indigenous Peoples across Canada and other settler colonial states have shared experiences, ontologies, and understandings of the world and our relationship to and with it, we are also diverse among and between ourselves. The information that flows through this chapter is put forth in a good way and is not meant to represent Indigenous Peoples widely (or pan-Indigenize), but instead we rely on specific examples from our own experiences and what has been previously published to provide you a narrative description of Indigeneity, disability, and disablement. Specific understandings of disability from one nation may be at odds or run counter to the teachings and understandings of another and all run counter to Western understandings of disability that have become normatively embedded within mainstream settler society.

Disability Prior to Contact

To start our journey of learning together, we detail the contextual aspects of disability prior to contact, the ways "disability" was constructed, responded to, and imagined. Guiding you through the first part of this journey, Sean contextualizes through a short story of his own learnings in relation to disability as we start our discussion in Canada.

As a Mi'kmaw person, when I was completing my master's degree in Critical Disability Studies, I struggled not having any Indigenous faculty. A gap in my knowledge became apparent as I started to work on my major research paper, which took on a critical discourse analysis to understanding mental health and additions within First Nations in Ontario, Canada. It became apparent quickly that I lacked the key understanding of how my people, or Indigenous folks elsewhere, viewed and represented disability. This lack of knowledge drove me to books and peer-reviewed articles, where I found many non-Indigenous voices explaining "Indigenous disability" within a Western worldview. During this time, I was living in downtown Toronto and want to take up the responsibility of discovering this knowledge; however, it seemed insurmountable given my circumstances. However, after searching, I was able to meet with a Mi'kmaq Elder in Toronto. During our meeting, I ask how the Mi'kmaq view and understand disability; after a long pause, they started talking – this is the only question I ask. They never once use the word "disability"; instead, they tell me several stories. I listen patiently and absorb all I can. I reflect for a week on what I have learned, and while the Elder's answer was not a direct response to my question, I was left with much richness from our connection. Today, I take the learning from that day, and the other teachings I have, to understand disability in a multitude of ways. First as Mi'kmaq, we believe in living a good and balanced life. We do this by living in harmony with all people and creatures; we are one with the earth we inhabit. Living a balanced life means respecting and protecting one other. I have come to understand that the creator has created us all with gifts we bring to our families, communities, and the world. I place this understanding with the teachings of a symbol that represents the Mi'kmaq people, our national flag, with its wapék (white) backdrop, denoting the purity of creation. I have come to understand the birth of all people of creation as pure: that we have responsibility for each other. People born and living with disabilities are gifts of creation, and we have a responsibility for and to them and in ways their gift brings us all together in their care and protection.

Similarly, in Manitoba Canada, the Cree use the word *kakanaticichek* meaning "the gifted ones, the special people," with there being no word in the Cree language for disability, impairment, or abnormality. "The Creator put these people here for a purpose so that we will learn from them; they are our teachers. No one is considered abnormal in our culture" (Shackel, 2008, p. 37). We have accounts from different First nations across Canada related to traditional understandings of disability. For Wiebe and Johnson (1998), they note in their book, "The old man said, to have been born imperfect was a sign of specialness... The old man explained carefully that in the old days, if a child came with a hare-shorn lip, it wasn't a terrible thing or a hurtful thing; it meant the child's soul was still in touch with the Spirit World" (1998, p. 243).

When examining the Australian context, the Aboriginal Peoples of those lands note there is no word for disability within their language and was therefore not something they were familiar with using. This is not to say that there weren't specific words for different impairments, but there was no broader word for disability; this was because people who had impairments were not separated from the rest of their community for any difference they may have had. For in traditional Aboriginal communities, people with disabilities were not generally excluded or stigmatized within their communities. Independence was not seen by many communities as a major issue, and communities rallied around those who required greater help, as the collective welfare of the community was seen as a responsibility for all. Traditionally, some communities may have viewed people with disabilities as something special or perhaps this was the result of a past wrongdoing (First Peoples Disability Network Australia, 2020). Accordingly, a person may have been named after their impairment, such as a person who was missing a leg being named "one leg." However, the primary ideals are that people were loved and accepted by their communities, and the "limitations" we may label today were something the community supported and nurtured.

The Māori Peoples of New Zealand also have traditional approaches to viewing disability. Māori teachings emphasize respect for the whole person and for all living beings, including teachings that uphold dignity and promote values such as nurturance, hospitality, and inclusivity (Bevan-Brown, 2013). Huhana Hickey, a disabled Māori activist, notes that "Māori with disabilities were traditionally cared for by their whanau (extended family)" (Senier & Barker, 2013, p. 126). Senier and Barker (2013) explain that in cases in which traditional communities perceived impairments as distinct, they sometimes regarded particular impairments as especially valuable; for instance, kāpo (blind) Māori were held in high esteem, as were Navaho people who might now be labeled as autistic. Māori in the ancient world who had a vision impairment were people with the power and status of deities. They were known for the talents that they possessed, not for what they didn't have. They also held great knowledge and shared that knowledge with others (Bevan-Brown, 2013).

For Indigenous Peoples in the United States, what constitutes a disability, causes of disabilities, and appropriate interventions vary widely depending on the respective culture. In the Navajo culture, the emphasis is on the cause of the disability and traditionally focused less on the symptoms influencing the choice of interventions. Traditionally, for many Native Americans, there was no word for disability within their language; instead, they place emphasis on their sacred foundations as explanation for all experiences and folks born with body and mind differences which were accepted as gifts from the creator (National Association of Friendship Centres, 2006). This has a direct relation to the non-acceptance by some communities of external causes of impairment. Melissa Tantaquidgeon Zobel, Medicine Woman for the Mohegan Tribal nation of Connecticut, says: "traditionally, disability is not seen as such [because pre-colonial societies] had established means of caring for and absorbing disability" (Senier & Barker, 2013, p. 126). This is also exemplified by the Hopi people who believe that a person born with a condition that inhibits mobility but can still contribute to the functioning of the community is not seen as being disabled. However, since colonization, a person consuming alcohol is seen as being disabled due to their inability to contribute to the overall welfare of the community and may be shunned (National Association of Friendship Centres, 2006).

There is no one answer to traditional approaches to understanding or viewing disability. We know there was great diversity for how disability was viewed and responded to. However, an underlying facet for all was the idea that Indigenous Peoples did not label disability as they do today. And in almost all circumstances, it became the responsibility of the community to assist people in bringing forth their gifts, if they were unable to do it for themselves. However, for some communities, the initiation of colonization has all but destroyed the traditional knowledge necessary to come to understand their traditional approaches to disability. There may be Indigenous communities who still use these approaches and understanding within their communities. However, we know that this not the case in many Indigenous communities, where settler colonialism has permeated deeply, forcefully stripping away traditional teachings and work to counter intersecting oppressions. Therefore, it is more important than ever that settlers continue to center Indigenous Peoples' knowledges and ways of knowing and being so that they can continue to pass this along to the next generations.

Initiation of Colonization

We continue our journey of learning by examining how disability has been re-imagined and reconstituted through state-led processes of colonization. This section should be read through a lens and understanding of the non-negotiable rights of Indigenous nations and the sovereignty they possess and the centrality of land in understanding ways that the violence perpetrated by colonization has been and is structured, as articulated through a framework of red intersectionality (Clark, 2016). I, Jessica, a settler, enter into this journey with care and in a humble way. I write about colonization as an ongoing process that perpetrates violence and trauma on many bodies constructed as different, less than, unruly, subhuman, and not worthy. I write from within and against this system that I benefit from as a settler. I write from the complicity of my whiteness. This journey will take up experiences of intersectional violence across the life span, emphasizing ongoing violence and trauma of colonization, not as history but as ever present and ongoing in the lives of Indigenous Peoples in settler states (Canada, Australia, New Zealand, and the United States), with a particular focus on the Canadian experience.

Colonization in settler states has many points of similarity and departure (Wolfe, 2006). Settler colonizers across states operated, and operate, in hauntingly similar ways: using disease to disable, maim, and kill Indigenous Peoples, the violent stripping of Indigenous Peoples from their land, the apprehension of Indigenous children into state custody, and the exertion of control over reproductive and familial domains. This is all rooted in anti-Indigenous racism, ideas of inferiority, and sub-humanness which disables all Indigenous Peoples and produces impairment in many different ways (Hollinsworth, 2012). Indigenous conceptions of interdependence and relations as rooted in sacredness are violently pushed aside, leaving "soul wounds within the minds, spirit and bodies of Indigenous peoples as well as within whole communities, soul wounds that continue to be felt from one generation to the next" (Norris, 2014, p. 73).

The racism, violence, and trauma of colonization have built a deep system of disablement for all Indigenous Peoples, regardless of whether or not they have an impairment (Hollinsworth, 2013; Meekosha, 2011). Ethnographic research with disabled Indigenous Peoples in Australia asserts that racism enacted by the state has constructed disability and disablement (King et al., 2014). Disablement can be understood as the processes of (neo)colonialism, (neo)imperialism, and capitalism that create the material conditions and social relations of disability in particular ways for particular bodies (Gorman, 2016; Grech & Soldatic, 2016). The centrality of the destruction and dispossession of land as central to the disablement of Indigenous ways of knowing and being in the ongoing projects of colonization in settler states has to be understood and centered in any analysis and engagement in this area

(Jaffee & John, 2018). Using the lens of red intersectionality (Clark, 2016), the ways in which Indigeneity and disability are intertwined and constructed make it impossible to parse out the oppression built around each separate identity. Hollinsworth (2013) explains: “it is not possible to extricate Indigenous experiences of ‘having a disability’ from the often-disabling experiences of being Indigenous in ‘white’ Australia” (p. 603). The mutually constructive nature of oppressions must be highlighted, as we are unable to parse out where oppressions begin and end but instead how they work in mutually constitutive ways. The intersections of racism, ableism, and disablement are painfully made known when we take up lived experiences of Indigenous People living with impairments. The experiences of racism, ableism, ageism, cisheteronormativity, and disablement are the lenses through which we can understand lived experiences of Indigenous Peoples in settler states, and Indigenous People’s resistance to these oppressions.

This part of the learning journey works to center how oppression and marginalization operate at the intersections of Indigeneity and disability over time and space in settler states. Oppression deeply structured in settler-state policies and practice of eugenics are an ongoing chilling example of ableism and racism working to eradicate Indigenous Peoples through the control of Indigenous People’s reproduction and Indigenous children: the construction of Indigenous women as less than, feeble-minded, unfit to parent, discourses of mental disability, and ways that the state enacts control. This sexism has been a central part of settler colonialism and can be traced from contact to current times with the huge numbers of Indigenous women, girls, and 2SLGBT folks who have gone missing and murdered in Canada (National Inquiry into Missing and Murdered Indigenous Women and Girls, 2019) and the apprehension of Indigenous children into state care. The residential “industrial” school system in Canada was administered by Christian denominations, mainly Catholic, Anglican, Methodist, and Presbyterian, where 150,000 children were forcibly “educated” from as young as 4–5 years old to 18 or 19 years old (Woolford & Gacek, 2016). Physical and sexual abuse was rampant, and children worked menial labor to upkeep of the schools; they were carceral spaces and “often deadly environments” with a minimum estimate of 6,000 children dying in the system (Woolford & Gacek, 2016: p. 404). However, with the ongoing discovery of mass grave sites at residential school locations across Canada in 2021, this number is likely to be significantly higher (Lee, 2021). The extreme disablement and trauma of what Woolford and Gacek (2016) identify as genocidal circularity are felt in generations of Indigenous families in settler states.

Research with Indigenous Peoples living at various intersections reveal the compounding ways in which violence structures their lives. The ways in which Christian dogma organized the violence in Canadian residential schools and worked to restructure two-spirit identity, which went against the long history of Indigenous communities embracing the nonbinary nature of gender and the fluidity of sexuality (Taylor & Ristock, 2011 in Ristock et al., 2019). The shift in this identity, from being valued within Indigenous culture to this value being destroyed through colonial violence, is complex and lived intimately in bodies, forcing them to migrate, often leaving them open to situations of compounding violence. The layers of structural, state, and more intimate experiences of violence are a complex web that structure the lives of two-spirited Indigenous People in settler states, and understanding this complex web of violence must be embedded in an analysis of colonialism and anti-Indigenous racism (Ristock et al., 2019). The rate of HIV infection in Indigenous Peoples in Canada is disproportionally higher than the general population, impacting both women and two-spirited queer folks. High HIV rates in communities are being directly associated with being a "gay problem" that communities must address, reflecting deeply entrenched Christian moralistic trans/homophobic views that are now subjecting queer folks to extreme violence and the further disabling/pathologizing of their bodies (Hillier et al., 2020).

Western ways of identifying, labeling, and organizing impairment are often at odds with the ways Indigenous communities engage with impairment, where difference is not pathologized; instead, balance is sought, with balance being an expansive concept including the mind, body, and spirit; and balance may mean learning to live with a bodily difference, not an attempt to eliminate the difference (Lovern, 2008). An impairment is not a disability if lived in community and one's needs are taken care of by one's kin and understood from a holistic framework, which sits in opposition to diagnostic and measuring tools of settler states (King et al., 2014). Indigenous communities are diverse and construct disability in many different ways: what is labeled as disability in one community might not be in another. Complications arise when health and disability systems label Indigenous patients as "non-compliant" in their interactions, when the reality is that Indigenous Peoples are operating in a system that does not honor traditional ways of knowing, being, and doing (Hollinsworth, 2013). In qualitative research with Indigenous Peoples in the settler states of Australia and New Zealand and the non-settler state of Mexico, Rivas Velarde found that disability was not an identity claimed by participants but instead was forwarded as "Western or 'doctor's' language" (2018: para. 25). Mexico is a non-settler state, because "in settler colonial states, the settler population constitutes the majority and thus dominates institutions. When discussing Mexico, the prevalence of intermarriage between settlers and local tribes-peoples led to a new group of people called the Mestizos, and it is this group who constitute the majority and control local institutions" (Rivas Velarde, 2018: paras. 17–18). When using settler-colonial measurements of disability, the data in Canada shows that there are higher disability rates among Indigenous Peoples than non-Indigenous, with Indigenous women more likely to have multiple disability labels than non-Indigenous women and experience what are labeled as "severe disabilities" more often than non-Indigenous women (Hahmann et al., 2017). The social organizing categories of health and disability are much more mutually constitutive for Indigenous Peoples and are not mutually exclusive as much disability work in the West/North theorizes. For example, studies on experiences of pain with Indigenous Peoples in Canada and the United States have shown higher prevalence of pain felt in the body, as compared to those in the non-Indigenous population (Jimenez et al., 2011 in Hahmann et al., 2017). When Western disability theorizing focuses primarily on the social and political forces of disablement, the impacts on the body are erased or marginalized. Studies like these allow for a deeper understanding of the embodied impacts of disablement and racism and ways in which structural oppressions are lived in certain bodies.

Disability Across the Life Span: Intersecting with Indigeneity

When we take up the intersection of Indigeneity and disability in settler states, we see specific ways that the construction of disability and production of disablement take shape in different but connected ways across the life span. These larger socially produced processes live in specific bodies in specific ways. For example, in Alberta, Canada, between 1929 and 1972 when eugenics was state policy under the *Sexual Sterilization Act*, we see Indigenous Peoples as over-represented in those who were sterilized, making up 6% of those sterilized while representing 2–3% of the overall population. Further analysis shows that the stated reason for sterilization as "mentally defective" was made in 77% of the cases of Indigenous patients, as opposed to the same reason for 46% of non-Indigenous patients (Grekul et al., 2004). The state continues to pathologize and control Indigenous bodies in 2021 with government social service agents, responsible for the care of young folks, forcing them to undergo painful procedures for the insertion of intrauterine devices (IUDs) in children as young as the age of 10 (APTN, 2021). Similarly, residential schools, across settler states, were created for the purpose of eradicating the "savage" from the child, whereby the "savage," or the Indigenous body, was viewed as and articulated to be a brutal, viscous, uncontrollable, and violent one.

Anishinaabe scholar Nicole Ineese-Nash (2020) reminds us that a social determinant approach to health positions Indigenous identity as being an "at-risk" category for a higher burden of diseases and negative health outcomes. A critical disability lens re-orients the problem as one of anti-Indigenous racism, ableism, and ongoing colonialism by settler states, states rooted in genocidal projects enacting violent trauma that constructs the disablement of Indigenous Peoples. Through this approach we understand how the production of both disablement and impairment are intertwined and cannot be understood separately. Systemic institutional and environmental racism has produced impairments in Indigenous communities, through environmental poisoning and contamination, unclean water, food insecurity, and lack of access to health services including safe maternal health (Hollinsworth, 2013). Intergenerational trauma, stemming from ongoing centuries of violence, has manifested in physical and mental health distress, chronic and infectious diseases, and depression and substance use (Bombay et al., 2014; Wilk et al., 2017) and continues to disable Indigenous Peoples. Those who experienced direct traumas and violence and those in their families who were born after this era still continue to experience ongoing health impacts and impairment.

Childhood and Early Intervention

There exists an inherent tension between Indigenous worldviews, many of which view children as gifts from the creator, and Western systems that focus on early intervention, pathologization, and a medicalized view of disability (Underwood et al., 2019; Ineese-Nash, 2020). Mainstream Canadian disability services are not designed to be culturally safe for Indigenous Peoples, and many Indigenous cultural service spaces do not provide disability services. Therefore, families are left to choose between accessing services that are not culturally appropriate, which typically dislocates them from their community through forced migration or not accessing services at all. This is the "choice" the Canadian settler state offers to Indigenous families. This produces the conditions that place Indigenous children at increased risk of apprehension by the state. The historical roots of Indigenous child apprehension run deep in settler states, through the residential school system, to the adoption and fostering of Indigenous children into non-Indigenous homes that continues today. At the start of the 1970s in Canada, one third of Indigenous children were separated from their families, communities, and culture and adopted or fostered into non-Indigenous homes. This has created ongoing mistrust and fear of settler-state social services and well-founded fears that children will be removed from families if they seek services and supports for the needs of their children (Sinclair, 2007).

Ineese-Nash (2020) foregrounds Indigenous relationships to difference as radically different to the ways the colonial project constructs difference as negative and therefore systems of oppression are built around those who are different. She shows how disability services in childhood promote assimilation, a goal of the colonial project, working to have Indigenous children labeled with disabilities and move closer to settler normativities, denying their culture and ways they live in relation to others and an erasure of seeing differences as gifts. Developmental normativities around independence and self-sufficiency that are embedded in disability services, early childhood services and education are often at odds with the ways Indigenous communities view development and therefore work in a way that is contrary to Indigenous ways of being and knowing (Durst, 2006). Early intervention (EI) in the lives of disabled children, most prominently through health systems, is seen as an important tool to ensure and protect "optimal development" and is utilized and accepted widely, including being enshrined in international human rights law. The Convention on the Rights of the Child (CRC) and the Convention on the Rights of Persons with Disabilities (CRPD) together outline the right to early intervention and obligations of states to ensure compliance (Brown & Guralnick, 2012). But the systems of EI can further the logics and functions of colonization, isolating disabled children from connections to family and ways of knowing and being (Underwood et al., 2019: p. 21). EI logics are antithetical to Indigenous ways of childhood development, where priority is often placed on relational and experiential learning and often take place in environments that do not match their home and cultural environments. Indigenous belief systems are typically centered around the importance of land in health and development, and this is not reflected in EI systems, making them contrary to the needs of disabled Indigenous children and their families (Underwood et al., 2019).

In *Across the Lifespan: Apprehension, police wellness checks and carceral institutions*,

Sinclair (2016) reminds us that the Canadian state has been removing Indigenous children from their homes for generations, from placing them in residential schools to the "sixties scoop" (Sinclair, 2007), to the current shockingly disproportionate number of Indigenous children in the child welfare system, and shows how racial bias and the legal system uphold this racist practice. Indigenous children make up

7% of the child population in Canada, but disproportionately 48% of foster children are Indigenous (Statistics Canada, 2011). Indigenous children are apprehended by the state for intersecting factors around socioeconomic conditions, trauma responses rooted in colonization, racism, and labels of cognitive impairment (Gough et al., 2005 in Sinclair, 2016). Similarly, ostensibly neutral health policy, such as the Residential Southern Placements in the North West Territories, Canada becomes enacted as a violent intervention of erasure that specifically targets Indigenous adults and children with cognitive disabilities through long-term and, at times, lifelong dislocation from families, communities, and land (McKee & Hillier, 2020). Apprehension happens under a justice system that weaponizes a "best interests of the child" test that is stepped in racist and ableist normativities and serves non-Indigenous interests (Sinclair, 2016).

It is also critical to also give voice to the intersections of police violence, disability, and Indigeneity in North America and the responses from community. One of the ways we see oppression in the intersecting identities of disability and Indigeneity is the over-representation of Indigenous Peoples in the state carceral system (La Prairie, 2002) and in police-involved deaths (Stelkia, 2020). In Canada, Indigenous Peoples make up 4.8% of the population but are horrifically over-represented as 30% of the federal prison population, with Indigenous women making up nearly 50% of women incarcerated in federal prison (Government of Canada, 2021). Many Indigenous Peoples who are incarcerated have psychiatric disability labels. Historically, the creation of "lunatic asylums" removed Indigenous people from their communities and exerted settler-state control over specific bodies (Burch, 2016; Oikawa, 2000). Furthermore, Indigenous Peoples are ten times more likely to have been shot and killed by a police officer in Canada since 2017 than a white person (CTV News, 2020; Global News, 2020). During a 3-week period in the summer of 2020, three Indigenous People were killed by police when they called for "wellness checks" (CBC News, 2020). The term "wellness check" is associated generally with situations when police officers check in on someone whose mental health or well-being is of concern. The Centre for Addiction and Mental Health noted that "Systemic racism, including anti-Black and anti-Indigenous racism, has gravely increased the risks associated with experiencing a mental health crisis. These tragic deaths also have a history rooted in Canada's long-standing inadequate investment in mental health." It is important to note that "experiencing a mental health crisis is not a crime, and the response must be a health-care response, not a law-enforcement response" (CAMH, 2020). The situation of policing mental health and addition issues is even more complex given the disproportionately high rates of mental health and addition issues within Indigenous communities resulting from the ongoing effects of colonization.

Older Indigenous Adults

Older Indigenous adults have valid reasons to not interact with the medical and disability services sector, with the navigation of bureaucratic forms and with racist staff being named as barriers (King et al., 2014). This hesitancy to interact with the system has to be understood in the context of historical and current racism, trauma, violence, and institutionalized policies that cannot meet the needs of Indigenous Peoples. Settler-state support for Indigenous Peoples in old age is divorced from Indigenous conceptions of healthy aging, does not address impacts of colonization, and does not attend to cultural and social aspects of Indigenous conceptions of aging and living well (Hillier & Al-Shammaa, 2020). Indigenous older adults are generally removed from their communities, where medical care is limited, and sent to southern urban centers for end-of-life care, where they are separated from their family, communities, and culture before they journey to the spirit world. At both ends of the life cycle, we see disablement manifest in similar ways: Indigenous worldviews are not integrated or centered in state social supports, and interactions with health and care services are harmful and reproduce trauma and do not meaningfully engage with Indigenous ontologies that view life cycles as holistic, rooted in relationality and living well in ways that honor all parts of one's journey, inclusive of impairment without moving to erase or pathologize difference. Part of the ongoing processes of colonization that permeates all social, economic, and political spaces has been through the production of knowledge of disability and impairment from the Western, settler-colonizer standpoint. We will take up the responses to this from Indigenous and non-Indigenous scholars and activists to decolonize knowledge production, theory, and ways of knowing in the next section.

Re-imagining Disability in Indigenous Communities

The last part of our learning journey will be focused on healing and reconciliation. In this section we will take up ways that Indigenous communities are re-claiming disability and resisting disablement. Much of the research centers on or pulls out Indigenous ontologies that support, nurture, and affirm the value of each person, providing the fertile and rich traditional ways of knowing and being that support re-claiming disability and inclusion. Pre-contact ways of being will never sit outside of colonization and the world that has been built post-contact; we have to engage with the complexity that Indigenous Peoples live in our currently constructed world.

Despite the overwhelming oppression and disablement experienced by Indigenous Peoples in settler states, we see the social organization of impairment as embedded in an understanding of difference as positive and as being tied to spirituality. Rivas Velarde's interviews with Indigenous people from Australia, New Zealand, and Mexico reflected this, with a participant explaining, "I remember there was a wee boy who was born and lived for maybe seven years and he was seen as a gift to his *whanau* [family] but his mum would say he was always meant to be here for a reason" (2018: para. 25). This preservation and survival of worldview, of culture, of ways of being and understanding the world are despite the overwhelming violence and trauma of colonization and attempts to break this sovereignty. This is a powerful truth that needs to be centered. Claiming Indigenous identity as a mechanism against ableism is a theme present in the literature – as a mechanism to oppose and cope with the oppression that stems from ableism and disablement (Rivas Velarde, 2018).

Research with the Māori, the Indigenous Peoples of Aotearoa/New Zealand, undertaken through a *kaupapa* Māori methodology, producing Māori knowledge, identified caregiving as central to Māori culture, and Māori research participants centered the family home as where a family member with an intellectual disability should live (Bevan-Brown, 2013). The research elucidated the Māori values of caring for each member of the community, and the idea that learning is a life-long process. These values undergird the reasoning behind the Māori assertion that children with intellectual disability label learn in mainstream, as opposed to segregated, inclusive education. Bevan-Brown (2013) studied Māori perspectives on intellectual disability, blindness and vision impairment, and autism spectrum disorder (ASD). The study "examined for evidence of inclusive and exclusive attitudes and practices. Findings show that while Māori participants' opinions varied, people with intellectual disabilities, ASD, blindness and vision impairment were generally valued family members and many examples of inclusive attitudes and practices were shared" (p. 571). Bevan-Brown speaks about how "for Māori, disability relates to the loss of land, culture, identity, knowledge base, values and language rather than to a concept centered around individual pathology" (p. 573). In this sense, colonialism creates harm and is what "disables" people. The most frequent themes to emerge from participants in the study were "those of *whānau* [extended family] support, aroha [love in the broadest sense] and total acceptance" of the person with an intellectual disability by a person and the Māori community (p. 573).

Research with Māori families identified the lack of appropriately trained special education teachers to ensure that Māori language education was delivered to disabled children and the widespread pathologization and deficit theorizing of Māori children which created systemic barriers for inclusion in education (Bevan-Brown, 2013). Ineese-Nash (2020) calls for a re-imagining of the way that care is organized around disabled Indigenous children, centering their intersecting identity embedded in a culturally safe context that values all parts of Indigenous children and the ways they live with others in their communities.

By inserting a lens with an Indigenous worldview, a Cree or Nehiyaw worldview, for example, educators open greater possibilities of movement to spatial justice, gentleness, and respect in an ethic of inclusion. A Nehiyaw worldview contextualizes what pimatisiwin (Cree for the good life) (Ratt, 2014, in Kress, 2017) means for disabled children and their families, as it gives opportunity for an Indigenous ethical framework to be adapted prior to the offering up of special education, or what is seen as the preferable option, an inclusive education. Finally, this Nehiyaw worldview encourages educators to adopt Kanawayhitowin, an Indigenous foundation of care, and Gentle Teaching.

Knowing one's history and understanding it through the lens of power and oppression to allow for a process of resisting internalization of oppression and a movement toward collective healing are something that the Assembly of First Nations articulated in their collection of stories of the impacts of residential schools (1994, in Bombay et al., 2014). This same journey is something that Indigenous

Peoples can build in resistance to disablement, a process of healing and resistance to ways that the settler state has violently imposed a pathologized construction of disability. What could this complex process of Indigenization look like in and against settler states? What are ways that this process of decolonization can be supported by non-Indigenous disabled peoples and movements? Lavalle and Poole (2009) forward the teachings of the Algonquin and Ojibwe Nations of the Medicine Wheel and explain that other Nations have teachings that are analogous, that can explain this expansive understanding of health, and that sit outside Western constructions of health, especially the narrow focus on mental health when taking up impacts of colonization on Indigenous Peoples. The Medicine Wheel has four interconnected realms: the physical, mental, emotional, and spiritual, and all must be in balance in order for a healthy state to be realized. The deep wounds of colonization have violently disturbed this balance, and healing cannot happen without balance being restored. This healing work must include the ways identity has been fundamentally wounded through processes of colonization, which Lavalle and Poole assert are the root causes of ill health, as conceptualized in a holistic and expansive way and be firmly rooted in native pride, Indigenous understandings of health, and a resistance to internalization of the "undeservingness" that has been produced and reproduced through colonization (2009, p. 279).

Re-imagining relationships of care and reciprocity between disabled and non-disabled Indigenous Peoples in a colonized world is complex task. This complexity stems from the fact that relationships between disabled and non-disabled Indigenous people are rooted in traditional ways of being, teachings, and ontologies that predate colonization but of course do not sit outside of the violent and traumatic processes of ongoing colonization. Solidarities across difference are also the present and future of disability justice. Black, Black-Indigenous, and Indigenous solidarity and decolonial world making are some of the ways that the violence of settler state is being confronted. Indigenous and Black Peoples share interconnected histories in settler states and experience similar violence from the state in terms of "discriminatory hiring practices, racial profiling, inadequate healthcare, lack of access to clean water on reserves, school funding-by-postal-code, warehousing children and their parents in immigration cages, warehousing children in the child welfare system, and higher rates of probation and parole breaches" (Rai, 2020, n.p). The necessity of the work of unmaking of the settler state to a place where Indigenous, Black, and Black-Indigenous people can "breathe and live full lives" has been deepened under the violence and death that COVID-19 has brought to both communities (Habtom & Scribe, 2020).

We end our journey together centering the importance of land. Jaffee and John (2018) remind us that resistance to settler destruction and dispossession of land is essential in our collective resistance to disablement. Disablement cannot be resisted without a meaningful, not additive or extractive, centering of Indigenous ontologies around ways that land is central to life, to relationality and in building a decolonizing disability justice (Invalid, 2019). Disability theorizing, reflected in the disability studies canon, has not accounted for the centrality of land dispossession as a central organizing tenant in the production of disablement. Indigenous land struggles are examples of struggles for disability justice, as struggles against disablement by the settler state, with the Indigenous resistance at Standing Rock being forwarded as a recent and widely known example (Jaffee & John, 2018). We end this learning journey with a generous and humble call to all who are thinking, working, imagining, and struggling in the field of disability studies to center the lived experiences of Indigenous resistance to disablement and colonialism. A red intersectional approach to disability studies is the only path to realizing justice and freedom for all disabled people in settler states (Clark, 2016). We cannot have disability justice; we cannot transform disablement without centering land dispossession and Indigenous land rights and reclaiming of land in our analysis and praxis. Indigenous resistance to disablement will free all disabled people. This is the future, the collective future that we must each work for, from our own lived experience, social identity, and ability to give, in order to heal together and build a world that deserves the brilliance and gifts of all Indigenous Peoples.

Madness as Response-Ability Against State Terror: A Case Study from Iranian Revolution

33

Sona Kazemi and Hemachandran Karah

This chapter is dedicated to the memory of Darya.

Contents

Abstract

In this chapter, we engage with different forms of atrocities committed against imprisoned dissidents in post-revolutionary Iran. This is just a sample of state violence at large against its own people, from whom it seeks legitimacy and validation. This time, legitimacy is sort by a theocratic state. Through a case study, we demonstrate how madness can be both a product of and a response to state violence, namely, imprisonment and torture. Kazemi interviewed more than 30 former political prisoners who survived torture and imprisonment in the 1980s in Iran, and, now, live in exile, as part of the Iranian diaspora. Their testimonies demonstrate how human resilience can overcome the harshest of circumstances,

sustain psychological harm, witness the madness and death of friends, and yet manage to carry it all to a harbor. By a harbor, we mean their own memoirs, silence, suicide, drawings, and even witnessing via "madness." We investigate the processes and social relations involved in how some prisoners went "mad" and some remained "sane." Using the Transnational Disability Model (Kazemi, Critical Disability Discourse Journal, 31–63: 2017), we defetishize their disability by demonstrating how madness and sanity can be deliberately created (i.e., socially organized and imposed) from within extremely brutal institutions. Also, we ponder the ways in which madness could be the bodymind's "response" (Sakhi, Ethics and the resistant subject Levinas, Foucault, Marx. York University. Toronto: 2014) to power/violence or a "survival strategy" in the context of asymmetrical power relations (e.g., patriarchy, theocracy). As racialized activists-scholars from the global south, we strive in this chapter to re-articulate disabled-dissident subject's "response-abilities" in the form of "madness."

Keywords

Madness · theocracy · response-ability · political prisoner · Iran · Bodymind · witness · Iranian revolution · transnational disability model · Defetishizing disability

State violence is universal, and its ripple effects on individual lives and communities across societies vary significantly. After the eighteenth century and the arrival of modernity and the constitution of humans as subjects with rights, rights-based discourses legitimately condemn state violence. Equally, political philosophers such as Michel Foucault who are concerned about the state's power to influence its subjects by way of governmentality also gather evidence for indelible markers of torture and violence on broken "bodyminds" of the subaltern. Although these are useful methods to approach and quantify state violence, they do not capture the "madness" inherent to dissidents, especially of the kind that transpires within prisons as highly politicized institutions. Neither are these methods "intersectional," meaning they do not fully foreground inseparable dimensions of social justice struggles at the margins, where gender cannot be fully extricated from race, or race from class, or class from sexuality. In this chapter, we aim at transnationalizing and decolonizing disability (madness) as dissidence while theorizing the state as the embodiment of ableist social relations that injures its subjects. Documenting dissidence this way may come in handy for providing an intersectional locus for expanding the notion of experience within the fields of Transnational Disability Studies (DS) and Mad Studies.

Our interventions stem from Kazemi's decade-long ethnographic research with prison survivors. She interviewed several former political prisoners who survived torture and imprisonment in the 1980s in Iran and now live in exile as part of the Iranian diaspora. This is not to suggest that political torture has ceased after the 1980s in Iran. In fact, since its inception in 1979, the Islamic Republic regime has never stopped imprisoning, torturing, and executing its dissidents and infringing the rights of minorities and women. These claims are well substantiated by international human rights organizations, activists, and a plethora of evidence. For this chapter, however, we focus on the first decade after the revolution. The interviews were conducted in Farsi/Persian and were later translated into English by Kazemi.

Herein, we tell a story of a mad woman political dissident who fought the entire ideological and patriarchal apparatus of the Islamic Republic of Iran (IRI) with her bodymind. We theorize madness as a response-ability against retributive streaks of power and discuss how madness has always been a historical materialist construct, mediated by power relations. Focusing on the story of one "mad" prisoner, Darya, we examine how madness can be both a product of and a response to state violence, namely, imprisonment and torture. Kazemi gathered Darya's life story, reading other prisoners' memoirs and reports which mention Darya, listening to Darya's former comrades and cellmates' testimonies (in Farsi/Persian) firsthand, and reading some notes written (in Farsi/Persian) by Darya herself and collected by a family member. Unfortunately, Darya died not long after being released from prison in 1988, and therefore, Kazemi did not get a chance to interview her. Darya is a pseudonym. So are the rest of the names we use for the participants. The names of the former political prisoners who have written a memoir are cited as is. If they have written a memoir using an alias, we have mentioned the alias in citing their works. If they have used their own names, we too have cited them using their real names.

Following the Transnational Disability Model (TDM) (Kazemi, 2017), rooted in Dialectical Historical Materialism (DHM), we theorize disability (madness) in a transnational context at the intersections of gender, race, sexuality, and non−/citizenship within the theocratic nation-state. In contributing to intersectional and transnational approaches to madness and disability, we move away from mainstream DS content emerging from the United States, the United Kingdom, Canada, and Australia. We retheorize disability by trying to unveil the ways in which discursive and artistic representations of the global northern disabled subjects in disability rights and culture movements in the West have eclipsed our focus on disability caused by violence (e.g., war, theocracy, nationalism, gender-based violence, and torture). In other words, rights-based discourses from the global north can be overdeterministic and essentializing. Consequently, they obscure frameworks such as those deployed by Darya during her uneventful everyday life.

Fully aware of the risk of perpetuating the existing racist discourse of orientalism, which has been described by Edward Said (1978) as a plague that portrays regions outside the West as backward, nondemocratic, and not fully civilized, our intention here is to shed light on the forms of disabling-maddening state violence in Iran, where theocracy rules. Our work demonstrates the agency and politicized identity and subjectivity of Iranian women who participated in the 1979 revolution and resisted the Islamic State that was born out of that revolution. Following Saidiya Hartman's (1997) work – *Scenes of Subjection: Terror, Slavery, and Self-Making in Nineteenth-Century America* – where she refuses to render the slave body as "spectacular" suffering for the consumption of the reader, we also refuse to reproduce political prisoners' sufferings as commodity for the readers' appetite. Instead, we focus on them for the following reasons:

1. To contextualize an individual's experience and illuminate prisoners' living conditions. In order to "see" the prisoners' resistance, we need to know what they were resisting against.
2. To theorize violence not in and of itself, but how it constitutes the subject at the axes of multiple and intersecting social locations, that is, through an intersectionality lens. When we say "intersectionality," we are talking about the intersection not just of identities but of social struggles.
3. To propose the possibility of bearing witness to oppression as a research avenue. Following DHM, we define witnessing as an act that involves politically conscious human beings who can analyze their own roles in the story and also provide the critical context for understanding power relations in order to change them.
4. To rehabilitate the notion of readership shaped by "orientalist" leanings, fetishism, and commodification. Torture narratives tend to get such responses from readers. We offer an alternative account of readership shaped by acts of "witnessing."

Chapter Overview

First, we present our theoretical framework. Then we define state violence and discuss how it operated as a disabling power under the theocratic state in Iran. In order to contextualize the case study, we describe the prisoners' living conditions in the 1980s in Iran including the methods of tortures they endured and how they responded to the ways in which state violence was exercised on their bodyminds. Subsequently, by presenting and analyzing the case of Darya, we theorize madness as a response-ability against crude power.

Theoretical/Critical Constructs

Fetishization

According to Erevelles (2011), when historical and social relations that create disability are overlooked, disability gets fetishized. For instance, one way in which DS (as a field of knowledge and as a discourse) fetishizes disability is by mostly focusing on the contemporary attitudes and barriers that turn impairment into disability and often ignoring the historical, political, and economic conditions that produce disability in global contexts (2011). Erevelles argues that the romanticization of DS in general has prevented us from seeing the roots of the ableist tradition. It seems that understanding disability as a local issue only satisfies the dominant powers in the social relations prevalent in the world. Erevelles argues that "the very category of disability operates as a commodity fetish that occludes the violence of the socio-economic system" (2011, p. 67).

Here, we take this further by arguing that it also occludes the violence of other exploitative social relations and processes, such as theocracy, incarceration, fascism, patriarchy, and political torture. By defetishizing, we mean carrying out a thorough analysis of these categories, in order to unveil the social relations behind their creation and to name the processes that render people disabled through violence. This unveiling process is equivalent to a defetishizing process, which we argue has a revolutionary capacity to produce non-ideological knowledge and praxis. For instance, in the case of the torture survivors' disability/madness, the process of defetishization can take place by listening to what the survivors have to say about their dissidence and encounter with political suppression and by refusing to believe the official narrative that the nation-states impose on us and on those who die and become disabled through state violence. If we aim at producing a form of knowledge based on the material reality under which disabled/mad people live, we need to shift our analysis and pave the way for a revolutionary understanding of disability and its relationship with the nation-state, clerical fascism (Kalantari, 2016), theocracy, capitalism economy, and class society, contextualized within transnational political consciousness and activism.

Bodymind

Rooted in Buddhist philosophy, pioneered by traumatologist Babette Rothschild (2000), and further developed by Margaret Price (2014), Elie Clare (2017), and Sami Schalk (2018), "bodymind" is an approach to fathom the relationship between the human body and mind where they are perceived as a single integrated unit. Both terminology and the notion of bodymind attempt to tackle the duality of body (and) mind and resist the traditions of their separability. The term bodymind is typically encountered in Mad Studies and DS, referring to the intricate and often inseparable relationship between the body and the mind and how these two units cannot be dissected. By "bodymind," Margaret Price means "a sociopolitically constituted and material entity that emerges through both structural (power- and violence-laden) contexts and also individual (specific) experience" (2014, p. 4). Throughout this chapter, we follow Price's conceptualization of bodymind as it pertains to the physical and mental disabilities discussed in the case study. Our goal is to underline the fully integrated nature of the body and mind and the inseparability of the two in the harshest of circumstances such as torture.

Dialectical Historical Materialism

In *The German Ideology* (Marx & Engels, 1932/1998), the foundational conception of DHM was set and constituted as a new method of social inquiry and of recording history. Marx defined historical materialism as a way to understand the material conditions of humans through history. By understanding the material conditions of humans through history, Marx argued, human beings can come to understand their current social and political conditions. He developed DHM as a way to de-mystify human relations and understand history as a result of "sensuous activity of [hu]man[s]" (p. 25). Marx, as he argues in the *Theses on Feuerbach*, believed that knowledge is not separate/separable from the physical body and therefore not separate/separable from the material world. Marx according to his own words was out to change the world, not just interpret it. In formulating the approach of DHM, he developed a new knowledge adequate for creating change "with a centrally-situated agent or subject, without whom no transformative politics would be possible" (Bannerji, 1995, p. 19). From the standpoint of Marxist disability theory, the task is to use DHM to present a dialectical and reflexive understanding of disability, difference, subjectivity, and agency. The key to understanding DHM, and using it, is to understand everything as it relates to history, ideology, and social structures, such as class.

Ebert (1996) describes historical materialism as:

> a mode of knowing that inquires into what is not said, into the silences and the suppressed or missing, in order to uncover the concealed operations of power and the socio-economic relations connecting the myriad details and representation of our lives . . . [historical materialism] . . . disrupts "what is" to explain how social differences – specifically gender, race, sexuality, and class [and to which Erevelles (2011) adds disability] – have been systematically produced and continue to operate within regimes of exploitation, so that we can change them. It is the means for producing *transformative knowledge* (Ebert, 1996, p. 7)

In this project, we do not just look for causality or correlations. Instead, we go beyond what is apparent and examine the case study dialectically. Marx believed that phenomena are "processes" rather than discreet "things" and that every phenomenon is mediated by relations and forms of consciousness in extended circumstances from the past. We adopt this way of thinking, dialectically examining what constitutes reality at any given time and space, and throughout the chapter, we want you to shift from binary, oppositional, and linear thinking to dialectical thinking and historical materialist understandings of contemporary social relations. According to DHM, the dialectical relationship between labor and capital leads to a relation called class. The state, on the other hand, is an organized structure made up of people that serves the interest of the ruling class, meaning the capitalist, nationalist, and in this case theocratic power. Ideology refers to a set of beliefs rooted in a particular social order, held by a certain group of people, to serve the interest of the ruling class while concealing material reality.

Transnational Disability Model

The existing theories in DS are not typically modelled on injury, as a socially caused disability. Although the existing models have much to say about disabilities after they are created, they have said little about why and how disabilities are created or the material conditions and historical processes surrounding their creation. In other words, DS is mostly interested in celebrating disability, embracing difference (Kafer, 2013; Kuppers, 2009; McRuer, 2006), and imagining radical possibilities, including intersubjectivity and interdependence (Fritsch, 2010; Shildrick, 2009) as necessary pillars for a just world, particularly in the global north. This approach is capable of radical possibilities. However, if mere power imbalance causes people to *become* disabled at the hands of the other, how can we just celebrate that as difference and not mark it as a social wound? Besides, the celebratory politics of DS are very much Western-oriented, bourgeois, and not applicable to other parts of the world where people become disabled on a larger scale due to poverty, war, domestic violence, etc. Unfortunately, in the Western academy, one looks at these social practices as a form of violence in certain "cultures" but not necessarily as a *disabling* process.

We argue that an intersectional disability perspective should be deployed that not only engages with disability but also takes into account its close tie with race, gender, ethnicity, class, history, and geographical location within the material context of post/neo-colonial, imperialist, and theocratic states. Such a perspective is radical and anti-ableist because it is neither compliant to normative demands/standards (e.g., white, European, English-speaking, bourgeois, heterosexual, and non-disabled) nor is it complicit in bourgeois democratic agendas. This is what we mean by "transnational": engaging the local and global politics that render racialized bodies disabled by pure power imbalance and violence.

Besides being rooted in the material world, a transnational model means a) we can imagine a world with no borders and avoid trying to impose a universal disability identity upon all disabled people; b) we can resist what dominant DS has been teaching us, which centers "whiteness" and the "West" as its inseparable norms (Chen, 2012; Dossa, 2008; Erevelles, 2011; Meekosha, 2011; Bell, 2006; Gorman, 2016); and c) we can start imagining an organized and diverse group of people with intersectional and community-oriented response-abilities beyond nation-states' borders. d) Relying on Marx's dialectics, TDM can reveal the social relations of disability beyond the instantaneous narrative that the subject conjures, one which can attend to both the social organization of disablement and the situated consciousness/knowledges of, and resistance to, these social relations and power structures. The "what" we try to demonstrate here is how state violence *causes* disability and/or madness on a systemic level, and, equally, the capacity of dissidents in deploying madness as a way to respond to state power, a mode of resistance in all its myriad forms and shapes.

Enigmas and Aporias of Maddening Torture

The following section includes graphic references to topics such as physical, psychological, and sexual abuse and torture.

We are committed to enabling a trueful act of witnessing on the parts of the readers in whatever circumstance they are (e.g., in prisons, in psychiatric wards, in the global south, etc.). Not all forms of state violence are of the same style or degree. For example, in liberal democratic societies, state violence occurs in less direct ways, though still with the same purpose as that of the global southern states: preserving power and disciplining the masses (Blakeley, 2010). State violence targets sex workers, poor people, homeless people, queer, trans, black, Indigenous, people of color, and im−/migrants by hindering their access to humane treatment by law enforcement, health services, and educational institutions. Sometimes, denying access to those essentials could result in death, disablement, injury, deportation, or lifelong trauma. Additionally, transnational capitalism produces social inequalities in employment and access to financial resources, as its inherent logic is exploitation and not "equality" of access to the means and modes of production.

The IRI interrogated, tortured, and executed thousands of people in the immediate years following the 1979 revolution whose hallmark is the 1988 massacre in which approximately 5000 people were executed, most of whom had already served their prison sentences and should have technically been released (Iranian People's Tribunal, 2012; Abrahamian, 2008; Akhavan, 2017). According to numerous accounts, prison memoirs (see Agah et al., 2007; Talebi, 2011, Mesdaghi, 2006; Parvaz, 2002; Parsipour, 1995; Baradaran, 2000), witness testimonies (see Sakhi, 2009), interviews, and the finding of the Iranian People's Tribunal's Truth Commissions, prisoners were held under extremely inhuman conditions, and the torture methods comprised of beatings, sleep deprivation, standing still for up to 72 hours, bastinado, flagellation, and ghapani. Furthermore, "Other forms of torture included: the squeezing of testicles, the infliction of burns with lighters, cigarettes or hot irons, deliberate mutilation, the tying of prisoners to gallows for long durations in winter and summer, and the violent thrusting of a ballpoint pen up a prisoner's nose" (Iranian People's Tribunal, 2012, p. 21). Monireh Baradaran (2001), an Iranian dissident who spent 9 years behind bars as a political prisoner under the Islamic regime in Iran, argues that torture does not stay in prison, but leaks outside and affects every layer of society through what she calls "torture's ripple effect," which fosters fear and anxiety in the masses.

The Iranian People's Tribunal's Truth Commission found that during the 1980s, "political prisoners in Iran, besides getting beaten and abused on a regular basis, were also kept in grossly unhygienic conditions. They were denied soap and the right to showers. The prisons were overcrowded, leading to cases of skin diseases. Cells were teeming with rats; clothes, with lice. One survivor reported that a clergyman came to inspect her cell but would not enter because the smell was so ghastly" (2012, p. 24). Bastinado destroyed many prisoners' feet. One prisoner, Hassan (a pseudonym for one of the former prisoners who was interviewed by Kazemi) mentioned a prisoner whose feet were flogged with an electric cord/cable to the degree that it had turned black, which led to double amputation of his legs. Kidney failure as a result of bastinado was prevalent. There were people with disfigured feet or with a hole on the bottom of their feet caused by bastinado. Tiny toes were a target in some instances. Beatings with electric cables caused injuries including those that of brain. Hassan informed Kazemi about a prisoner who had had a concussion after being hit by an electric cable in the head repeatedly during an interrogation. After that incident, the prisoner showed sign of psychological "disorders," although only in the wintertime.

Mad/disabled people inside the IRI prisons were the living proof of the violence that was committed against the prisoners. The IRI regime, as a young state in the modern era, is an amalgamation of a hardliner religious fundamentalist ideology, carceral statehood, and commitment to corporal punishment. This regime arrested its political dissidents on a massive scale in the 1980s and incarcerated and tortured them for years (Abrahamian, 1999; Makaremi, 2015; Mesdaghi, 2006; Talebi, 2011). However, once people showed "non-normative" behavior or psychological distress, the regime did not commit them right away to psychiatric treatment or any kind of psychological therapy. Instead, it kept them for a long time either in solitary confinement or in a close proximity to other prisoners for two reasons, as we have learned from our conversations with the former prisoners of the regime: 1. to use those prisoners' bodymind as a "mirror" to frighten and threaten the others that this is what you could *become* and 2. to objectify the distressed prisoners' bodymind and turning them into scary objects in order to put extreme psychological pressure on others to recant, repent, submit, and write a letter to condemn their past political activity (read everything they ever stood for as political dissidents).

Prisoners' memoirs are the windows through which we witness what really happened in the IRI's prisons during the 1980s. A few names kept repeating themselves in our perusal of Iranian prison literature from the post-revolutionary era as much in conversations with prison survivors. Many were just names. This meant that we could not always match a name against living evidence such as memoir. Some were executed and some institutionalized in a psychiatric ward and/or ended their own lives after dealing with severe physical and/or mental health concerns. Besides, the Iranian People's Tribunal's Truth Commission (2012, p. 188) found that "Some people went mad in prison; everybody suffered either physical or psychological damage. In Evin and Ghezel Hesar prisons, it was possible to hear people being tortured and their bones broken at night; the witness's jaw was broken during torture." These people had entered the IRI prisons with a non-disabled bodymind and exited it (if at all) with shattered ones. What had happened to them? Who were they? We call them "mad" prisoners.

We use the word "mad" to refer to political prisoners who showed "non-normative" behavior. Non-normative behavior included not speaking with anyone for long periods of time, going nude in public, staying under really cold or hot showers with their clothes on for a long time, becoming incontinent, not caring about personal hygiene, going periodically catatonic and not moving for long periods of time, refusing to eat for days, hoarding food and other things, masturbating in public, cursing guards and regime officials, imitating animals [e.g., jumping like a kangaroo], going against the ward's regulations, being delusional, and being actively suicidal. These behaviors are ones often described by the fellow prisoners Kazemi has spoken with and, in rare cases, by family members. However, madness played out in many shapes and forms. For instance, prisoners perceived their cellmate as mad if she/he gazed into oblivion and remained silent for a long time. Or, one who was engaged in washing themselves too much or was obsessed with cleaning was perceived as someone with "obsessive-compulsive disorder." If someone refused to use the bathroom and, therefore, became smelly and unbearable, she/he was perceived as mad. Finally, one with unrealistic hopes would come across as "delusional."

One of Kazemi's interviewee survivors, Souri, mentioned that what the state terror needed to perform effectively in order to subdue people was to keep them in limbo, a place where contradictions intersected, overlapped, and were reinforced. For example, Souri reported that the regime demanded that they spied on their fellow prisoner, to somehow demonstrate their collaboration with the prison system, and "to participate in the slippery slope of the rational strategic action of survivalism" (Sakhi, 2017, p. 6), if they wanted their own torture to stop. Fledman (1991) argues that discipline divides the prisoner into a body and a self; the self becomes a part of the panoptic machine that applies discipline to its own body. As such, you are stuck between wanting to stop your own suffering and having the power to make your friend suffer. This contradiction, Souri says, is traumatic, per se, because it drives you to a point of confusion and suffering where you might not be able to make an ethical decision after all. The psychological pressure caused by these imposed contradictions, jig-sawing between resistance and submission, sanity and madness, and self and the "Other," was tremendous. Many could not put up with this pressure and gave in to the regime's demands, accepted the conditions, and sometimes even collaborated with their own oppressors in apprehending those who were once comrades. Some responded to this pressure by embracing "madness." Ceasing to exist in a certain form and metamorphosing into something else was a *response* to the non-normative conditions they had encountered.

After more than 30 years since their release, some survivors continued to have nightmares and sleep terrors. Some developed new phobias that they never had before. One prisoner, Nastaran (a pseudonym for one of the former prisoners who was interviewed by Kazemi), for instance, mentioned that she developed a fear of heights that she never had before going to prison. Some became claustrophobic. Some sit on the edge of their seat after 40 years since the days that they had to live in an extremely overcrowded cells packed like sardines. Many developed physical conditions and/or permanent damage, such as spider veins, varicocele, backache, extreme pain in legs and feet, and seizures after going through mandatory standing for up to 36 to 72 or more hours at the time. The psychological effects were also devastating. Some started hallucinating after remaining sleepless for few hours or days at the time. As is self-evident from these accounts, "becoming mad" is a historical materialist process and category – not a pathology. Madness is also a locally created human condition as much as an alternative state of existence, so as to handle extreme forms of dehumanizing torture and prolonged incarceration.

Madness as Response-Ability: The Case of Darya

No doubt, I have, perhaps, gone mad. ~ found in Darya's personal notes (To preserve Darya's anonymity, we refrain from referencing the source, which was given to Kazemi by a member of Darya's family.)

Where there is power, there is also resistance. However, when mass atrocities are narrated in criminal courts, the "victim" is supposed to testify about how power was exercised on his/her bodymind, rather than how she/he *responded* to that power. By "response," we mean resistance, submission, breaking, collaboration, silence, etc. The word "broken" in here as well as the Iranian prison literature refers to breaking inside, submission, and "converting" to what the totalizing system wants from you, Islam in the case of this chapter, and not "psychological breakdown" or a "psychotic break."

One form of torture that produced many mad people was the so-called Resurrection/boxes/graves/machines, the human-making factory" (*kārkhāneh-ye-ādam sāzi*), or the human-making machine (*dastgah-e-ādam sāzi*) that was experimented in Ghezel Hesar prison from the summer of 1983 to the fall of 1984. "Prisoners were forced to squat for hours in boxes in the form of coffins ('the Grave', also known as 'Resurrection'), with Quranic incantations sometimes blared loudly at them, during which they were intermittently beaten and whipped on their heads and faces" (Iranian People's Tribunal, 2012, p. 34).

Shokoufeh Sakhi, a former Leftist political prisoner, who spent 8 years in the IRI's prisons (9 months of which was in the "coffins") and later became the Tribunal's Executive Director, problematized a purely legal approach to justice-seeking. Sakhi argued that the survivors should not be reduced to helpless victims, bearers of the perpetrators' power, inscribed on their bodyminds. Instead, she argued, people, who have resisted the IRI's power in one way or another, should be allowed to say how *they* responded to power. The point, Sakhi (2014) argued, is to acknowledge the "response-ability" of the survivors, however tormented their sense of agency, subjectivity, and autonomy may be. This shift from perpetrator's power to the survivor's response to power is what distinguishes a legal approach to justice-seeking from an ethical approach, argues Sakhi (2017). Therefore, to adopt the ethical approach instead of a purely legal approach, we conceptualize mad behavior of the mad prisoners as a *response* to the forms of power (including ideological components) exercised in political prison. We refrain from pathologizing those behaviors from a biomedical perspective, which usually discount the historical and socio-cultural context in which the behavior occurs. Instead, we strive to unpack those non-normative actions and expressions as a way to understand them, not to diagnose, label, or judge them with a pitiful eye and ear.

We narrate Darya's story, although it is incredibly difficult to pick and choose only one story to tell when there are so many people who perished in the brutal suppression of dissidents in post-revolutionary Iran. We picked Darya's story because it is a representative of many young people's stories who gave up their comfortable lives in the Western countries to join the masses, to participate in the revolution against monarchy, and to make their own history, including Kazemi's father. Coming back to Darya, she was a member of a secular-leftist organization during and after the 1979 revolution in Iran. Darya was a double-major graduate student at a top university in the United States. During the revolution, while in her 20s, she gave up her graduate studies and went back to Iran to participate in the revolution like many other Iranian university students across the world did.

Shortly after the revolution, in June 1981, the newly established theocratic state, which was reluctant to share power with other political parties, cracked down on its opposition on a massive scale. The members, and even sympathizers, of the leftist political organizations, who got arrested, went through unimaginable physical and psychological torture. Darya was arrested in March 1982 and tortured for approximately 7 months, before being tried in a 15-minute-long "court" with no attorney, which sentenced her to 5 years of imprisonment. Darya spent the next 5 years in several prisons in and around Tehran, three of which was spent in solitary confinement. According to one of her cellmates, in the first prison she was at, after her 7-month-long initial interrogation period, which involved physical and psychological torture, she started showing "non-normative" behavior. She would walk for long hours in the tiny cell, speak with herself, refuse to eat or drink, stay awake at night, and go under a very cold shower with her clothes on.

Darya attempted to take her own life four times but failed. Once, she even swallowed a needle, hoping it would kill her, but it did not. M.G. (Kazemi interviewed M.G. to hear about Darya), who was Darya's cellmate during the first 7 months of her imprisonment, told us that their cell was so tiny that three people could not even lie down comfortably in it. She stated:

> Darya was interrogated constantly while bleeding due to her hemorrhoid problem. In her good days, she would teach us French language. On her bad days, she would not fall asleep sometimes for four or five days in a row; She would scream at night. As soon as she would get a little better, they would take her again for interrogation. They may have done terrible things to her. Darya was swearing at everyone. She looked at them from above. She would get kind suddenly. She was incontinent and bleeding constantly. She swore at the guards all the time. She would walk all day and tap her fingers on the wall, as if she was talking to someone. She was moody. She would stare at things for a long time. She was very anxious and stressed. Darya could not sleep. She would jump up and down. If her clothes got wet in blood, she would knock on the door violently and scream.

M.G. also mentioned that they did not have any access to clean clothes or even a spare underwear, never mind a sanitary napkin which is a necessity for women. Kazemi asked M.G. what she thought the first signs of madness were. M.G. who is a nurse responded that the first signs of "madness" were aggression, separation from others, the way the mad prisoners' eyes looked, vanity (*chap ravi* or being too radical), sleeplessness, praying all day and night, forgetfulness, and memory problems.

Darya and many other political activists at the time carried a cyanide capsule under their tongue. This was meant to protect their dignity, their information (e.g., names, organizational ranks, addresses), and therefore their comrades, in case they got arrested and landed in the regime's torture chambers. Because the regime was determined to crush people with torture and break them at any cost, many political activists were prepared to die but not break (i.e., respond to the state by submission). Swallowing a cyanide capsule was not aimed at just ending one's life, although that was the inevitable consequence. It was instead meant to deprive the state of subjugation, torture, extraction of information, and endangerment of other dissidents with that information. Keeping a cyanide capsule under their tongues was a deliberate act of "response-ability" because this was not an act of self-annihilation but a way to protect the dignity of comrades. This was meant to protect comradeship beyond their corporeal boundaries. They prioritized their collective will over individual survival.

The TDM lens that we use here to examine this case is a helpful lens as it does acknowledge the possibility and necessity of people's participation in making their own history. The TDM approach does not end at the exercise of power on the prisoners' bodymind but extends to politically conscious human beings who can analyze their own roles in the story and respond to that power. As such, using a TDM lens rooted in DHM, we argue that it is not just the state that uses the prisoners' bodymind to exercise its power but also the prisoner who utilizes her bodymind to resist the state apparatus. Thus, prisoners such as Darya use their corporeal will to protect the larger cartography of their commitment and mission. This is where responsibility becomes the Transnational Disability Praxis in a collective sense. Darya's response, which is beyond protection of the self who is in pain, is the will to die protecting the community will.

After unbearable torture during interrogation for 7 months, she tried four times to die by suicide which was unsuccessful. The necessity of resistance was encapsulated in her decision to live a life with agency and dignity, rather than living a life with submission which would have reduced her to what Sakhi calls "the survival ego," a self who lives for herself in herself. Sakhi (2014, p. 2), who resisted for 8 years in prison, defines "resistance" as an indication of the prisoner's ability to respond to power, or response-ability. She states:

> resistance is a process, an event, aroused as a response on the part of human beings to something and for something. In this sense, resistance as a response evoked by a human condition, a response to and for, is the manifestation of human's response-ability, a human capacity to respond.

Therefore, as long as the prisoner does not allow the totalizing system to replace him/her with a "system-compatible identity of the given system," that prisoner has resisted that totalizing system. It is at this crucial moment that "madness" should be interpreted as dissent and resistance, because it, in and itself, prevents the totalizing system to metamorphosize the prisoner from Other-of-the-state to Same-as-the-state.

In 1984, Darya was transferred to solitary in Gohardasht, which was known for its horrific solitary cells, absolute silence, and maddening isolation. Darya immediately demanded to get out of the solitary, but the guards just ignored her. Therefore, she went on hunger strike and refused to eat, but that did not change anything in her treatment by the regime. Refusing to eat is an act of resistance and defiance as we have seen in Irish, Turkish, and Indian prisoners who have gone on hunger strikes to resist state suppression or to protest their living conditions in prison. One survivor, M.Z. (We refrain from referencing the source to this blog to protect Darya's anonymity), wrote in her blog that the regime frequently force-fed Darya by putting a funnel inside her mouth while uttering the most malicious and dirty sexual slurs and insults at her. She was never silent. Instead, she was loud and clear and always shouted her demands.

In prison, Darya had a hemorrhoid problem, which got worse during her time in prison as the prison officials refused to provide her with the most basic treatments or even just her own medication. Many people remember her having bleeding problem without access to sanitary napkins, medication, and clean towels. Darya had bulging eyes, which could have been caused by hyperthyroidism or scurvy (caused by a lack of vitamin C). An inmate, who is a nurse, believes that Darya's psychological state must have been affected by her extreme lack of iron. Her blood pressure was often low; and her skin was at times yellowish, which could have been a sign of jaundice or a malfunctioning liver. Darya dealt with several physical and psychological concerns, which underscores the inseparability between the body and the mind. Also, the wounds caused by the state brutality seem as inseparable as the collective will and response-ability emanating from her wounds.

In Gohardasht prison's solitary cells, Darya would not communicate much with others. The prisoners mostly used Morse code. However, she would applaud inmates if they sang a song which infuriated the guards. All they wanted was the systemic breaking of the prisoners under maddening silence. They definitely did not appreciate prisoners building solidarity among themselves by a group song, punctuated with clapping. Darya talked with herself or her mother who was not there. She would also repeat her entire interrogation sessions. M.A. said that when Darya was brought back to Evin, she was completely mad, skinny, and with bulging eyes (cited in Sadr & Amin, 2012, [Page number is not provided to protect Darya's anonymity]). Many thought that Darya must have been raped, although there is no way to confirm or deny this assumption. She would perform the scenes that might have happened to her, such as unwanted sexual contact. We interpret these attempts as a way for Darya to communicate her pain and resistance to her comrades. Darya used dramaturgy as a rhetorical device aligned to madness. Dramaturgy aided Daria to go wholesomely non-normative in telling others what happened to her. This was much superior to a normative, and yet seemingly acceptable, statement. Darya appeared to have lost her hold on the here and now. Her face was just bones. M.A. pointed out that everyone realized that Darya "was not feeling well" (i.e., *hālesh khōb nabōd*), since her body language told her story loud and clear. M.A. said in her testimony that she was afraid of Darya. She avoided her. She believed that the reason they brought Darya back to the ward was to show what the ultimate resistance would do to someone. Going mad was a warning sign. She testified that looking at Darya one could understand what can actually be done to someone's bodymind (cited in Sadr & Amin, 2012).

F.A. was placed next to Darya in Gohardasht prison. F.A. said in a radio interview that Darya was taken out of her cell and tortured for a while (we refrain from giving reference to the interview to protect Darya's identity). When she was brought back, according to her cellmates, "she had lost her psychological balance" (i.e., *ta'ādol e ravāniash rā az dast dāde bood*). This expression is used in Persian/Farsi to indicate the onset of "madness." She sang the famous socialist anthem, the "*L'Internationale*" in French in her cell, which has been a standard of the socialist movement since the late nineteenth century. It appears, as though, she was using her voice to resist the maddening silence and to declare herself alive. As soon as the guards heard her, she was taken away for more torture and interrogation. They brought her back after a few days, while she was in a very bad psychological state. She screamed constantly and protested her living conditions. One day, Darya, persistently washing herself, had left the water tap on in her cell, and water had leaked outside, which enraged the guards, and they beat her up. They turned off the main water pipe to her cell, so she did not have access to water any longer. F.A. and her mates learned by experience that this type of obsession with cleaning and compulsion to self-wash characterized women prisoners who had been sexually abused by the guards. They had basically observed that usually inmates who were raped felt "unclean" and "dirty" and washed themselves compulsively. Darya was doing the same after coming back from an interrogation session. This is another indication that any behavior perceived as mad cannot be understood outside its social and historical context. We are never mad inside our bodies alone. Rather, we are perceived as mad by others who interpret our behavior as madness. In this case, if we contextualize Darya's "obsessive-compulsive" behavior, which resulted in over-cleaning, we would start to see it as a response to the embodied experience of violence and not a pathology.

Monireh Baradaran (2000) wrote in her memoir that Darya was incontinent and semi-conscious as a result of the [perhaps psychiatric] medication that she was given by the guards. Note that medicating Darya was perhaps causing Darya's mental health and physical issues rather than "fixing" them. One of the prisoners who happened to be a nurse frequently asked the guards to take Darya to the prison clinic, but they took her to the Gohardasht's notorious solitary, instead, and kept her there for 2.5 years. She never got back to her former self. Monireh reports that she saw Darya years later in Ghezel Hesar prison where she thought she had become "better" with the help of the pills. According to Monireh, Darya was an extraordinary learner and teacher. On the days that she felt well, she would study or teach French to others. Those who had seen her there remembered that the guards constantly beat Darya because they thought that you could treat "mental illness" by physical beatings. In the contexts of total isolation, psychiatric symptoms emerge, even in prisoners with no history of mental health issues. There is extensive literature documenting the horrific effects of solitary on prisoners (see Kupers, 1999, 2006; Rhodes, 2004).

Raindrop in a Swamp

Darya was released in 1988. She went to Europe, where she joined Amnesty International and also helped asylum seekers with their cases. According to a friend, who saw her in Europe after her release, Darya found the outside world very different from how she had left it. Her socialist dreams had turned into, what Esmaeil Khoei called, "a raindrop that fell into the swamp." It seemed that what Darya and her comrades had stood for was not the people's main concern any longer. People were living their lives as if the IRI was a legitimate state with popular support. The internal contradictions, inherent to every revolution and massive social change, were too much to handle for almost all political prisoners who were finally released. Few months after her release, unfortunately, she passed away or committed suicide. There are several contradictory stories about how she died or, perhaps, ended her life.

Darya's story brings into sharp relief the non-linear workings of TDM. For one thing, TDM is not a sequential and linear narrative; and for another, it can transpire without externally verifiable traces. For example, Darya's story may invoke hitherto dormant sentiments that someone may have for his/her community which went unnoticed so far.

Madness Is Intersectional, Political, and Historical

Resistance is intersectional and multi-modal emerging from multiple narrative universes. It is also collective, coming from different conceptions of madness (e.g., madness as response-ability, madness as an alternative way of being in the world). Intersectionality also involves mutual learning and pedagogy among and within different groups of marginalized people in and beyond carceral spaces. And an act of witnessing is always intersectional depending on where we draw our lenses from. Consider the following ways in which madness has been stigmatized and institutionally framed.

History shows that mad people have been imprisoned for their non-normative behavior (read also self-expression, sexuality, gender, race, ethnicity, and class). Political dissidents have been imprisoned for their resistance against the hegemony of state power. They are both about social and political control of the "undesirable," so power can remain in the hands of the elite and ruling class who decide who should be swept away to the corners of disciplining institutions and who is allowed to be included in the society.

Many nation-states incarcerate their political prisoners in psychiatric institutions by implicitly conflating political resistance with psychological "disorders." This is to say that the authoritarian states (e.g., former Soviet Union, China) or even liberal states (e.g., the United States) engage in incarcerating their political dissidents in psychiatric wards. People labeled mad also underwent incarceration, segregation, and torture by electroconvulsive therapy, lobotomy, and other inhumane techniques. Women who did not "obey" their husbands, slaves who ran away from the mandatory labor at the plantations, and gay people have historically been harmed and labeled by the psy apparatus as mad (Burstow, 2015). "'Psy' refers to the set of professionals who aim to intervene in and modify the behavior of others, including, but not limited to, psychiatrists, psychologists, psychotherapists, social workers, and guidance counselors, as well as paraprofessionals such as peer support workers" (Tam, 2012, p. 10).

Many communities remain historically harmed and subsequently receive a psychiatric label for their *responses* and reactions to the sources of their oppression. We have, for instance, "Long Term Historical Identity Based Trauma (community/group) [such as], the Native soul wound/colonization including residential school legacy, slavery, the historical subjugation of women, two thousand years of persecution of Jewry by Christianity, the burning of the witches, the use of gay men as 'faggots' or kindling in the burning of the witches)" (Burstow, 2015, p. 239). Another example is the Indigenous peoples forcibly held at the "Canton Asylum for Insane Indians," a federal psychiatric hospital in South Dakota, discussed in Susan Burch's book, *Committed*: *Remembering Native Kinship In and Beyond Institutions* (Burch, 2021).

As Eric Fabris (2011) has shown us, the first implication of receiving a psychiatric diagnosis is chemical or physical incarceration, if not both. We know from Foucault that incarceration in any sense, whether for racism, sexism, classism, sexuality, dissent, or madness, is political (Foucault, 1964). It has long been argued by anti-psychiatry and critical psychiatry theorists that madness or "mental illness" is a myth and a socio-political construct with no biological and/or biomedical evidence to prove its existence. Although psychiatry is an official branch of medicine and the only apparatus beside the criminal justice system that can imprison people against their will, many critics believe that there is no concrete evidence whatsoever to prove the existence of mental illness as a biological defect or malfunction (Szaz 1987; Burstow, 2015; Whitaker, 2002; Foucault, 1964).

*****

Using TDM, committed to intersectionality, materiality, and transnationality, we examined a historical case of a mad revolutionary woman from Iran at the intersections of torture, ideology, theocracy, patriarchy, state, gender, and disability. Drawing on the DHM, we defetishized Darya's disability (madness) by demonstrating how madness and "sanity" can be socially organized and imposed by the violence of exploitative power relations (e.g., theocracy and patriarchy). We theorized disability (madness) as a historical materialist category and provided a dialectical reading of how the bodymind of political prisoners is rendered disabled by the state even as the disabled bodymind serves as an act of resistance against the state power. As racialized activists-scholars from the global south, we struggled in this chapter to re-articulate disabled-dissident subject's response-abilities in the form of madness.

Bearing witness to the story of Darya, and others whose names we do not even know, the ways in which we understand disability/madness should be rethought. We should not pretend we already know what madness is/means after bearing witness to what happened to the Iranian dissidents who were forced to stare at Gorgon (Agamben, 2002), lost their capacity to speak, and ended their own lives. It is at this incomprehensible moment that we want to push the field to think anew and go beyond irresistible orientalist and neo-conservative traditions of reducing women from the global south to exotic objects, submissive wives, or cultural selves floating non-relationally in a socio-historical vacuum. The figure of a mad woman, a political dissident fighting an entire state apparatus with her bodymind, is what shatters the diverging boundaries of previously held ideas. Our project here was to go beyond the rights-bearing subject and to push the onto-epistemological boundaries of the humanities and social sciences to understand political violence as it injures the bodymind and as the bodymind responds to this power by dissent.

Abstract

The relationship between disability and trans studies and activism is fraught, not only because of transphobia and ableism in the respective movements but because of a diagnostic parceling up of bodies and identities into discrete categories that go back to the nineteenth century. This chapter uses the figure of the monster, one of the oldest representations of embodied difference, to challenge the "categorical exclusions" (Hong, 2002) between trans and disability. Delving into the history of monstrosity, the chapter not only advocates for an intersectional perspective that

M. H. Rioux et al. (eds.), *Handbook of Disability*,
https://doi.org/10.1007/978-981-19-6056-7_105

traces the converging lines of disablement, normative gendering, and racialization in constructions of the monstrous but also argues for the employment of the monster as itself an intersectional analytic. In the final section, the chapter turns to the case of Layleen Polanco, a Dominican trans woman who died in 2019 while incarcerated at the Rikers Island prison complex in New York in order to highlight the real material consequences of these discourses for racialized, disabled, and gender nonconforming bodies.

Introduction

"The monster's body is a cultural body" (Cohen, 1996, p. 4). This is the first of the seven titular theses that Jeffrey Cohen presents in the introductory chapter to his edited volume, *Monster Theory: Reading Culture*, a text that has become standard in the field of monster studies. It is a statement that is both true and misleading. The monster is a construct to be sure. As well as a projection of the fears, desires, and anxieties of a certain culture. And when Cohen goes on to say that "the monstrous body is *pure culture*," (ibid., my emphasis) I take it to mean that there is no materiality that can be thought of as monstrous outside of its designation as such through a specific cultural lens. Yet, Cohen's language mirrors the Western Enlightenment language of Frankensteinian creation: it is Culture (read *logos*) that is the implied subject of his passive sentence structures and which "creates" and "gives life" to the monster. For Cohen, not only the concept of the monster, but its very embodiment is a creation born out of the cultural unconscious of the dominant order as the uncanny Other which exists only in function of its creator.[1] While compelling, this suggests that the monstrous body is merely ideological, that it exists only in the realm of signification (as a metaphor or signifier), and that if the veil of ideology were to be lifted, we would find nothing underneath. Or else that what is underneath that veil is rendered harmless and fully knowable within an already existing (or newly emerging) epistemological framework. While the first of these options belies the embodied materiality, the fleshy substance of those beings that have come to be read as monstrous, the second suggests a progress narrative in which monstrosity is just an effect of an ignorant superstition on nonconforming, unruly bodies that would be remediated with increased knowledge about the bodies in question.

The monster is possibly the oldest representation of embodied difference. As such, it has served since ancient times as a warning not to stray off the beaten path, a sentiment that is plainly encapsulated in the well-known phrase "Here be dragons," referring to the drawings of dragons and other mythical monsters that inhabited the margins of medieval maps to mark unknown or dangerous

---

[1] Although Cohen describes the monster as being *given* "an uncanny independence," he also states that "the monster exists *only* to be read" (p. 4, my emphasis).

territories.[2] "Monster," however, does not only describe those fantastical beings that fill up our screens in the forms of zombies, aliens, or artificial intelligence gone haywire. Monstrosity has always and continues to be ascribed to human bodies, or rather bodies that are regarded as *in*human or less than human. Employing an intersectional perspective to monstrosity, specifically one that is mindful of the analytics generated by disability, trans, and critical race studies, it becomes possible to see how "monster" is what Sara Ahmed has called a "sticky" signifier, a signifier that sticks to other signs/signifiers as well as bodies and objects "as an effect of a history of articulation, which allows the sign to accumulate value" (2004, p. 92). Hence, my concern is not only to see how the concept of monstrosity "sticks" to some bodies more than others, e.g., trans bodies, disabled bodies, racialized bodies, but also how the stickiness of monstrosity collects, as it were, associations with disability, gender (nonconformity), and race, resulting in a sticky web of signification. "[W]ords stick," Ahmed explains (though in addition to words, I would also add here concepts, objects, and feelings), "because they become attached through particular affects" (ibid., p. 60). Once they stick, they may be invoked "through past forms of association" without being spoken (ibid., p. 92). Following this idea of stickiness, this chapter will not only provide an intersectional perspective on monstrosity but will also aim to use the monster as itself an intersectional analytic – a sticky concept that has accumulated value through past associations with various forms of nonnormative embodiment. In doing so, I hope to avoid either rendering the monstrous body into a mere sign without a referent or casting it as a dehumanized subject in need of rehabilitation. The chapter will first delve into the usage and history of monstrosity in relation to transness and disability before turning to the case of Layleen Polanco, a Dominican trans woman who died in 2019 while incarcerated at the Rikers Island prison complex in New York. While the first sections aim to ground the analysis within a wider and longer framework of disciplinary and historical discourses, the final section intends to highlight the real material consequences of these discourses for racialized, disabled, and gender nonconforming bodies.

Cripping Trans and Transing Disability

Both disability and trans discourses have had a long engagement with the concept of monstrosity, though very rarely are they brought in relation to each other. In 1993, at a conference titled "Rage Across the Disciplines" held at California State University, San Marcos, Susan Stryker gave a performance in which she invokes the figure of the monster from Mary Shelley's novel and claims it as a powerful site of identification. The piece, titled "My Words to Victor Frankenstein Above the Village of Chamounix: Performing Transgender Rage," would, in its published form, become one of the seminal

---

[2] While the phrase only very rarely appeared on medieval maps, it was later used to retroactively describe the practice. According to Chet Van Duzer, there are only two known appearances of the phrase "hic sunt dracones" on medieval maps and globes, though similar phrases were used referring to lions, griffins, and "men with huge ears," among other monstrosities Van Duzer, 2014, p. 311.

texts of trans(gender) studies, launching it as an academic discourse at the same time as it established the monster as one of its most persistently reoccurring tropes. In disability studies, monstrosity is discussed less as a site of identification.[3] Rather, it is more present in historical accounts of disability that trace the construction of specifically congenital disabilities to older discourses of monstrous births – from the portents of antiquity to the pathologized objects of teratology, the study of congenital anomalies in plants and animals. The monster in these accounts is a precursor to the so-called *freak of nature*. Yet, although the language of deformity abounds in both Shelley's novel as well as Stryker's invocation of it, Stryker does not incorporate disability into her analysis and nor do the majority of trans studies scholars writing about monstrosity. Conversely, trans theorizations of monstrosity are rarely cited in disability studies and neither is transness included in its accounts of monstrous embodiment, even in discussions of the freak show for which performances of gender nonconformity were a staple.[4]

This mutual exclusivity is indicative of the historically fraught relationship between the two discourses which a number of scholars have attributed to the presence of ableism and cisnormativity in trans and disability studies and activism respectively (cf. Clare, 2013; Kafer, 2013; Puar, 2014; Baril, 2015; Timmons, 2020). When trans and disability are brought together, it is usually, as Jasbir Puar points out, "only in terms of the intersectional 'trans-disabled subject' or the 'disabled trans subject'" (Puar, 2014, p. 78). This privileging of the intersectional subject, however, as Puar goes on to argue, can actually distract from establishing broader alliances, as "[s]uch approaches" often provide "a gestural intersectionality that can perform a citational practice of alliance without actually doing intersectional research or analyses" (ibid.). When not centered on the "intersectional subject," scholarship on the intersections between trans and disability tends to focus on the commonalities between the struggles of the two movements and the possible alliances between trans and disability politics and activism (cf. Mog & Swarr, 2008; Timmons, 2020). Alternatively, trans and disability analytics are combined to develop a queer-feminist critique of normative bodily paradigms (cf. Hall, 2009; Wilkerson, 2012). Some of the most critical perspectives on the "categorical exclusions" (Hong, 2002) of trans and disability can be found in US legal scholarship that questions the political, ideological, and moral underpinnings for the legal exclusion of "transvestism, transsexualism" and "gender identity disorders" from coverage under the Americans with Disabilities Act (ADA), among "other sexual disorders not resulting from physical impairments" such as pedophilia, exhibitionism, and voyeurism (42 U.S.C. §1221; cf. Hiegel, 1994; Hong, 2002; Strassburger, 2012; Barry, 2013). While these scholars provide important work in challenging the legal grounds for these exclusions, and thus also the legal definition of disability, their main objective is the subsumption of transsexualism under the legal category of disability, as well as civil

---

[3] This does not mean that the monster does not function as a site of identification for disabled people at all. In her oft-cited essay "On Being a Cripple," for example, Nancy Mairs invokes an identification with Shakespeare's Caliban, "a most scurvy monster" (see Mairs, 1986, p. 15). While Riva Lehrer, in her boldly titled memoir, *Golem Girl* (2020), cites a host of monsters as points of identification, from Frankenstein to werewolves and spider women.

[4] Two notable exceptions to this overwhelming trend are Clare (2015) (first published in 1999) and Sears (2015).

rights protection for transgender persons under the ADA. Rarely are the broader categories of trans and disability themselves questioned: they are simply assumed and assumed to be distinct.

Indeed, the separation between "trans" and "disabled" is so stark that even scholars whose aim is to bring the two together still end up emphasizing their distinctness. Alexandre Baril, for example, argues that transness should be recognized as debility, which, citing Julie Livingston, he defines as "the impairment, lack or loss of certain bodily abilities"[5] and aims to deconstruct "the borders between" transness and disability (Baril, 2015, pp. 61, 64; cf. Livingston, 2005). At the same time, he clarifies that he is "not saying that trans and disabled realities are identical or interchangeable," and that "despite significant similarities and intersections, trans and disabled people's experiences are different" (ibid., p. 63), reconsolidating them as discrete categories (cf. also Mog & Swarr, 2008; Clare, 2013, 2015). However, I would contend that given the variety of identities and forms of embodiment that are gathered under the umbrellas of "trans" and "disability," one could argue that there are more differences between various experiences of disability or transness than between transness and disability themselves. My aim here is not to do away with difference altogether, but to ask why certain forms of difference are considered to be distinct while others are grouped together as denoting common experiences. Thus, rather than regarding this discursive split as primarily a matter of interpersonal ethics – of unconscious ableist and cisnormative biases that when addressed can be overcome, enabling a more inclusive politics – I want to emphasize the historical and structural conditions that occasioned this separation to begin with. This I hope to do by looking at historical accounts of monstrosity, with specific focus on gender nonconformity.

"All Base, All Barbarous": Genealogies of the Monstrous

The word "monster" is generally traced to two etymological roots: the Latin verbs *monere*, meaning to warn, and *monstrare*, meaning to show. As such, the monster functions as a sign that always signals something outside of itself: a warning of impending disaster or a sign of God's will. As Rosemarie Garland-Thomson writes in her introduction to her edited volume *Freakery: Cultural Spectacles of the Extraordinary Body*, monstrous bodies are "always an interpretive occasion. [. . .] Never simply itself, the exceptional body betokens something else, becomes revelatory" (Garland-

---

[5] Baril draws not only on the work of Livingston, but also of Jasbir Puar to develop his concept of debility (see especially Puar 2009). Whereas debility and its relation to disability are points of contention within the wider framework of disability studies, this particular debate goes beyond the scope of this chapter. Baril doesn't offer a clear delineation between debility and disability. His argument is rather that the medicolegal management of transness as well as the social expectations of gender have mentally and physically debilitating effects (sometimes purposefully created) that lead to forms of impairment that are not readily recognized as disability. One striking example is compulsory sterilization as a prerequisite for gender reassignment, which has only recently been abandoned in Germany, Belgium, and Sweden, but is still common practice in many other national contexts (see also Verlinden, 2012).

Thomson, 1996, p. 1, 3). As the now familiar narrative goes, from antiquity until roughly the Enlightenment era, monsters were seen as portents and prodigies, marvels and wonders. They included mythical beings, often human–animal hybrids, as well as people we would now call disabled, racialized, and those who were considered sexually ambiguous. The common denominator was that the monster crossed and thus challenged boundaries: between human and animal, self and other, male and female, etc. In the seventeenth and eighteenth centuries, however, the monster comes increasingly under the purview of science, turning an ever more medicalized gaze unto monstrous bodies, i.e., bodies marked by difference. No longer prodigious, these bodies now become "freaks of nature" in need of correction (cf. Garland-Thomson, 1996).

In her recent book-length study on Renaissance representations of disability, however, Elizabeth Bearden takes to task both scholars writing about monstrosity in the Renaissance period as well as disability studies scholars for taking for granted the "grand narratives of disability's past" (largely influenced by Foucault), "from supernatural miracle, to natural marvel, to medical anomaly" (Bearden, 2019, p. 7). While she commends the work that has been done by scholars like Lennard J. Davis and Garland-Thomson on the "nineteenth-century advent of lexicalization, institutionalization, and social and statistical norming of disability," she argues that there is a romanticized misconception of medieval and early modern conceptions of disability as somehow free from "norming influence[s]" (ibid.). Similarly, in 1996 already, Stephen Pender also questioned this narrative of clear historical development, which he believed did not "take account of the complex, often conflictual status of the monstrous in the early modern period," as well as the distinctions "between the portentous and the merely anomalous" (Pender, 1996, p. 145). As he points out, it is difficult to gain a clear picture of the discourses around monstrosity in the early modern period as the evidence is spread out among a large variety of texts that do not necessarily conform to one particular discourse or genre (ibid., p. 146). What is clear, according to Pender, is that "the meaning of monsters was renegotiated throughout the early modern period" (ibid.).

Following these challenges made to the discourse, I want to question another distinction that structures disability studies' narrative of the history of the monstrous. In her 2009 book, *Staring: How We Look*, Garland-Thomson states: "Authentic monsters are born, never made" (Garland-Thomson, 2009, p. 178). In her elaboration, it becomes clear that authentic monsters are people born with a (highly visible) congenital disability, while inauthentic monsters are "high-tech, pop-culture monsters such as King Kong, Yeti, and Mummies" (ibid.). What is left out from this binary are those bodies that are considered monstrous but can neither be subsumed under the category of congenitally disabled, nor are they merely fantastical. Disability studies' emphasis on monstrous *births* effectively cuts out transness from its conception of monstrosity. After all, as Stryker writes in her "Words to Victor Frankenstein": "The transsexual body is an unnatural body. It is the product of medical science. It is a technological construction. It is flesh torn apart and sewn together again in a shape other than that in which it was born" (Stryker, 1994, p. 238). While there is a very clear line of interest in pre- and early modern writings on monstrous births, I would suggest that this represents only a subsection of a broader understanding of monstrosity.

Perhaps one of the reasons for this overemphasis is that monstrous births constitute events that are spectacularized through the discourses around them. As Kevin

Staggs writes: "Stories of bewildering and horrific births were a popular form of news in England and Wales over the course of the sixteenth and seventeenth centuries. They combined sensational detail of malformed bodies and horrified and distressed families with dire warnings of the need for all to repent" (Stagg, 2006, p. 21). On the other hand, other forms of deformity that are either acquired or discovered at a later stage are less spectacular and thus seem more quotidian. According to Katherine Schaap Williams, this distinction gained momentum in disability studies with Lennard J. Davis influential 2002 book, *Bending Over Backwards: Disability, Dismodernism and Other Difficult Positions*, in which he writes that "under the previous discursive grid, anomalous, strange births were distinguished from disabilities that were acquired" and "unless the deformity is wondrous, it is ignored or erased" (Davis, 2002, p. 53, see also Williams, 2015). One could argue, however, that this erasure is more an effect of the twentieth- and twenty-first-century reception of these discourses rather than an actual fact of medieval and early modern culture. One figure that to me challenges this clear distinction between the born and the made is the hermaphrodite.[6]

While the hermaphrodite, who is generally acknowledged as one of the prime historical examples of monstrous embodiment, is often at least citationally included in disability studies' discussions of monstrous births, it is assumed in those accounts that hermaphroditism is simply the precursor of what we now call intersex. But historical constructions of the hermaphrodite do not map neatly onto modern-day intersex bodies, nor can nature and culture – the born and the made – be so clearly separated in these historical depictions. Firstly, even if one understands the hermaphrodite as a monster that is born rather than made, they often did not fall into the spectacularized category of monstrous births since the condition was often only discovered later in life, as is attested by the numerous court cases surrounding the subject in early modern society. Secondly, what constituted the categories of the born and the made were not always clear-cut and distinct. One of the most famous monsters of Renaissance Europe, the so-called "Monster of Ravenna," was not only depicted as having wings instead of arms, a horn on its head, the foot of a griffon, and other elements that mark it as a human–animal hybrid, but it was also usually represented as having both a penis and breasts. Yet rather than read these depictions through a naturalistic lens that interprets the sexual features in light of a particular diagnosis of intersex or DSD, it is important to acknowledge the symbolic nature of the imagery. What we see is not a literal depiction of an intersex condition (indeed, most of the images of the Ravenna monster depict it as an infant or a child, too young for actual breast development), but a symbolic representation of sexual intermediacy that found expression not only through an admixture of genitals or even secondary sex characteristics, but also included attributes that we would now firmly place in the socially constructed realm of gender.

---

[6] When I use the term "hermaphrodite," I refer to a historical construction, not to individual people unless they identify as such. As will be shown below, I am here not interested in the reality of the hermaphroditic body in order to identify current diagnoses of intersex or DSD (Disorders of Sex Development), but rather in the ways in which these bodies were constructed and discussed in historical texts.

In their discussion of early modern French discourses on hermaphroditism, Lorraine Daston and Katherine Park note an increased interest in and emerging anxiety about hermaphroditism in late sixteenth- and early seventeenth-century France, which they attribute to its increased association with transvestism and sodomy, especially between women. While medieval authors from time to time also used hermaphroditism to refer to sodomy, such as Dante who described the sins of male sodomites as "hermaphroditic" (cited in Daston & Park, 1995, p. 424), according to Daston and Park, "medical literature that was produced after about 1550 not only devoted intense attention to hermaphroditism but also associated it to a far greater extent with the sexually, theologically, and morally charged issues of sodomy, transvestism, and sexual transformation" (ibid., p. 423). The French surgeon Ambroise Paré, for example, has a chapter on hermaphroditism in his *On Monsters and Prodigies* (1573), an often-cited text in disability studies accounts of the history of monstrosity, in which he includes "a long discussion of sex between women" (ibid., p. 423) and "lesbian anatomy" (ibid., p. 424), followed by a chapter in which he discusses "a series of what he terms 'memorable stories of certain women who degenerated into men'" (ibid., p. 423). Significantly, although Paré expanded these sections for the second edition, he was forced to remove them from subsequent editions because of protests from the medical establishment who, according to Paré, deemed it "unfit to be read, recited, and heard by Christians" (quoted in Daston & Park, 1995, p. 424, cf. also FN 14 p. 433).

In a different national context, an example of the relation between transvestism and hermaphroditism can be found in the anonymous *Hic Mulier; or, The Man-Woman* pamphlet that circulated in England in 1620 and in which the author suggests that, as Ruth Gilbert explains, "by affecting masculine gender attributes cross-dressed women, 'these new Hermaphrodites,' transformed themselves into *monstrous hybrids* who distorted their 'womanly' essence" (Gilbert, 2002, p. 84, my emphasis). In fact, multiple times throughout the text, the author describes these cross-dressing practices as monstrous deformities and links them to other forms of monstrosity – describing them as "giantlike," "Mearemaids, or rather Meare-Monsters," something that "Goblins themselves start at," and even meteors – as well as to other forms of sexual transgression such as prostitution, adultery, and bestiality (cf. *Hic Mulier* 1973). As the author also suggests, it is these acts of sexual transgression, likely already performed on the part of the mother, that engendered these "unnatural conceptions" in the first place (ibid.), further complicating the distinction between the born and the made: although the act of cross-dressing is acknowledged as a practice, the monstrous cross-dressers themselves were pushed back into a framework of heredity and blood ("from any purer blood would have issued a purer birth").[7] While it is not to be excluded that the invocation of the monstrous in this text is more metaphorical, it is clear that monstrosity is used to indicate hybridity, excess, and the threatening crossing of boundaries.

---

[7] The mother carried a lot of responsibility in early modern conceptions of monstrosity as the mother was often held responsible for the occurrence of a monstrous birth, not only due to her sexual practices, but also her anatomy (in the Aristotelian tradition), and even her imagination as is discussed by Huet 1993 (cf. also Canguilhem, 2008, pp. 138–139).

Daston and Park relate this newfound obsession with hermaphroditism to the revival of the Hippocratic tradition which viewed hermaphrodites as being of intermediate sex, placing them on a spectrum with masculine women and feminine men (cf. Daston & Park, 1995, p. 423). This view diverged from the Aristotelian tradition which had reigned for a longer time and which viewed hermaphrodism not primarily as a matter of sexuality, but of the doubling of body parts, thus relating it more to those forms of monstrosity that manifested through excess limbs or the conjoining of twins (ibid., p. 421). The Hippocratic idea of sexual intermediacy – combined with a male anxiety regarding "female pretensions to masculine status and prerogatives" (ibid., p. 431) – threatened the strictly sexually bifurcated legal and natural order of early modern European society and gave the hermaphrodite a distinct aura of illicit sexuality. As a consequence, hermaphrodites were no longer trusted to judge for themselves which sex predominated, as was mostly the case in earlier periods: as Daston and Park contend, they were not free to choose as Foucault claimed,[8] rather they were trusted to interpret the signs provided by nature, which as the hermaphrodite came of age presented itself mostly through (hetero)sexual attraction. The newfound ambiguity around sexual intermediacy, however, led to an increased reliance on medical authority to uncover nature's intentions. Moreover, since as Daston and Park further point out, "nature" included "not only procreative capability, but also the other related signs, such as activity and passivity, [. . .] character and conduct" (ibid., p. 428) such as "bold speech" and "impudent action" (*Hic Mulier* np), a careful reading of the body was necessary to uncover and distinguish natural inclination from simulation. Thus, the boundaries between what constituted monstrous sexual behavior which had to be eradicated, i.e., sodomy and transvestism (those who committed sodomy risked the death penalty), and monstrous embodiment which needed to be managed, i.e., hermaphroditism or sexual transformation, became more fraught and in need of stricter delineation. So, although there is a distinction between the born and the made in the sense of nature vs. artifice, in the case of hermaphroditism and other sexual transgressions, both are considered monstrous, while the made in this context, as the gender panic[9] that arose from the examples above shows, carries the added stigma of immorality.

A closer look at the *Hic Mulier* pamphlet reveals that there are multiple kinds of panic at play. Aside from the invocation of monstrosity and deformity, one particular paragraph of the text stands out for its description of the practice of transvestism as "all base, all barbarous." It is "barbarous, in that it is exorbitant from Nature and an Antithesis to kinde." The author continues:

> What can bee more barbarous, then with the glosse of mumming Art, to disguise the beauty of their creations? To mould their bodies to every deformed fashion: their tongues to vile and horrible profanations, and their hands to ruffianly and uncivill actions? [. . .] If this bee not

---

[8] Cf. Foucault 1980, p viii. For another critique of Foucault's discussion of hermaphroditism in relation to the transing of the Frankensteinian monster trope, see Koch-Rein (2019).

[9] Though she writes about a different time period and context, my use of "panic" is inspired by Gayle Salamon's *The Life and Death of Latisha King: A Critical Phenomenology of Transphobia* (2018).

> barbarous, make the rude Scithian, the untamed Moore, the naked Indian, or the wilde Irish, Lords and Rulers of well governed Cities.

While there is also no unified discourse on barbarism at this time – its meanings ranging from simply foreign or having different customs, to savage, wild, and cruel – it almost always connotes being other, uncivilized, and non-Christian, a discourse that played a large part in the justification of colonialism.[10] In this text, the author clearly links barbarism to racialized others who threaten to conquer the city. As Jean Howard writes in her discussion of this passage: "In a stunning revelation of a racial and national chauvinism, the aspiration of women beyond their place is associated with the monstrous notion of the black in rulership over the white, the Irish over the English" (Howard, 1988, p. 425). The description of the "deformed fashion" that the women mold their bodies to also echoes the descriptions found in early colonial travel literature of the time, of the indigenous peoples of the Americas or Africa who also "molded" their bodies to "deformed fashions." One example that circulated at the time is *Nova Francia, or The description of that part of New France which is one continent with Virginia* written by the French author Marc Lescarbot and published in English in 1609, in which he describes how "with these large nostrils, the Brasilians are accustomed to make themselues yet more deformed by Art, making great holes in their cheekes, and vnder the lower lippe, for to put therein greene stones and of other colours, of the bignesse of a tester: so that those stones being taken away, it is a hideous thing to see those people" (Lescarbot, 1609, p. 180).

A later but more well-known example of these dynamics is seventeenth-century physician John Bulwer, whose *Anthropometamorphosis* (1650), which Kevin Stagg describes as "a survey of ethnic monstrosity" (Stagg, 2006, p. 19), provides a kind of enthnographic account of the cosmetic practices of a number of foreign places, from European nations like France, Germany, and Portugal (among others) to more remote places in Asia, Africa, and the Americas, concluding his rather encyclopedic volume with a chapter on the fashion of the English. These cosmetic practices, which he gleaned from scientific writings and travel accounts, included those of the kind as found in Lescarbot's description of the people from Brazil above, but curiously also a lot of physiognomic traits, such as the shape of the head or nose, as well as some of the monstrous races which before were included in natural histories, such as the "Nation of Cynocephali, or Men with Dogs-Heads," which he says are "reported to be *Negroes* inhabiting a Mountaine neere the River *Indus*" (Bulwer, 1653, p. 19, emphasis in original) and the "Acephali, or a headlesse Nation" (ibid., p. 20), which he places in

---

[10] An example from roughly the same period is from *A reporte of the kingdome of Congo, a region of Africa, and of the Countries that border rounde the same* by Philippo Pigafetta who used the writings of Odoardo Lopes from Portugal. The text was translated from the Italian by Abraham Hartwell and printed in London in 1597. Hartwell writes in his introduction: "I thought good thus to make it knowen to my countreymen of England, to the end it might be a president for such valiant English, as do earnestly thirst and desire to atchieve the conquest of rude and barbarous Nations, that they doo not attempt those actions for commodity of Gold and Silver, and for other transitorie or worldly respectes, but that they woulde first seeke the Kingdome of God, & the saluation of many thousand soules, which the common enemie of mankinde still detayneth in ignorance" (Hartwell, 1597, np; cf. also Hall, 1995, pp. 40–44 for further discussion of Hartwell).

diverse areas in Asia and Africa. Other perhaps surprising inclusions in a book on customs are "a Nation of Hermaphrodites," which he places in Florida and Virginia (ibid., p. 386) and men with enlarged breasts which he locates in Egypt (ibid., p. 317). What is most surprising perhaps to current readers is that he describes all these as resulting from artificial practices.[11] As is already apparent from a glance at the title page, Bulwer's concern in this book is not only the distinction between nature and culture or, in his words, artifice, but mainly the transformation of "Man" through culture:

> Anthropometamorphosis: Man Transform'd: or, THE ARTIFICIALL CHANGLING Historically presented, In the mad and cruell Gallantry, foolish Bravery, ridiculous Beauty, filthy Finenesse, and loathsome Loveliness of most NATIONS, fashioning and altering their Bodies from the mould intended by NATURE; With Figures of those Transfigurations. To which artificiall and affected Deformations are added, all the Native and Nationall Monstrosities that have appeared to disfigure the Humane Fabrick. With a Vindication of the Regular Beauty and Honesty of NATURE. And an Appendix of the Pedigree of the ENGLISH GALLANT. (Bulwer 1653, title page)

Contrary to writers of the later Enlightenment period for whom nature was the province of the "natives" of colonized territories, Bulwer locates culture as foreign, while nature, which he equates with "regular beauty and honesty," he sees as the purview of white English men (as long as they did not engage in sodomy or other gender nonconforming practices, as shown below). Although there is a certain admiration and perhaps even desire in his description of these artificial practices ("ridiculous beauty," "filthy finesse," "loathsome loveliness"), they clearly have the power to "disfigure the Humane Fabrick." Like in the *Hic Mulier* pamphlet, cultural practices become inheritable traits. It is culture then which is monstrous above all.

Again, "unnatural" gender practices and race come together and conspire to produce monstrous deformities, from the "Sodomiticall Boyes" of Persia "who make an unrighteous use of the *Rectum Intestinum*, to the foule shame and dishonour of their Bodies. Which Contagion hath spread both into the East and West *Indies*"; to "young men in womens apparrell smooth and effeminately decked" (Bulwer, 1653, p. 413); women with facial hair: "Woman by Nature is smooth and delicate; and if she have many haires she is a Monster" (ibid., p. 215); Patagonians, "a Race of Giants, in the fortieth Degree of the South Pole," who "trusse their Genitall members so, as it is hidden within their body, which is a transgression against the morall Law of Nature, established in our members" (ibid., p. 353); to eunuchs and the "Semi-Eunuchs" of the "Cape of good-Hope" (ibid., p. 354) which is followed by an account of castration (ibid., p. 355) and then cannibalism (ibid., p. 356), the ultimate violation of the boundaries between self and other which here comes through as not only a racialized but also a sexualized practice. It is especially in the last chapter on "the English Gallant," however, that the anxiety around deformity comes out most of all. This chapter functions as a warning to the English that the adoption of foreign "artificiall and affected Deformations" would "disfigure" the English

---

[11] This tendency can already be seen in Lescarbot's account as well, as he states that "the Brasilians are borne as faire as the common sort of men, but coming out of the wombe, they are made deformed in squizing of their nose" (Lescarbot, 1609, p. 179). Bulwer, however, takes this idea much further.

"Nation" (ibid., p. 536; note that "nation" is here used more in the sense of an ethnic group than a political entity). Throughout the book, the images show Bulwer's fascination with an exotic racialized otherness. Although he includes images of Europeans as well, the vast majority are of individuals from Asia, Africa, and notably many of various indigenous peoples of the Americas. In the final chapter, he juxtaposes the images of foreign and racialized deformities with images of the English customs that he believes approximate them. This proximity creates an urgent address to the English to forego these abominable practices in order to – in a kind of past echo of nineteenth-century eugenics discourses – prevent the degeneration of the English race.

Linking back to the *Hic Mulier* pamphlet, transvestism, and other gender nonconforming practices thus becomes a nexus for multiple types of anxiety. Gender panic is fueled, in the first instance, by an insistent threat of deformation, the early modern conception of which does not fully overlap with our current categories of impairment or disability. As David M. Turner notes: "While the stigma of deformity derives from the appearance of bodies, modern definitions of disability focus more on the functions of bodies and their relationship to their social and physical environment" (Turner, 2006, p. 2). As such, deformity is primarily an aesthetic deviation from the norm.[12] But the pervasive anxiety surrounding deformity found in these early modern texts suggests a deeper anxiety around bodily integrity (that relates to a mental and spiritual integrity as well) that I would call a disability panic. Both of these then give rise to a third panic, a racial panic. These texts provide a kind of layering of social anxieties that consolidate and take shape in the figure of the monster. Thus, what the monster shows is that one kind of panic tends to invite another. Gender nonconformity, for example, is not only an affront to the laws of gender but also an affront to bodily integrity, as well as an affront to racial integrity.[13]

---

[12] Interestingly, John Bulwer was also known for his sympathetic treatises on deafness and the possibility of education for people with hearing disabilities. He is also considered to be the father of English sign language. This suggests that while deafness was seen as a disability in the sense of a restriction on full participation in society, Bulwer did not regard it as a deformity as it was not a violation of the aesthetic norm.

[13] The question of race in the early modern period is a complex and highly debated topic. It has been commonplace for many years for scholars to claim that race as we understand it today is a nineteenth-century invention and that to apply that lens to earlier periods can only be anachronistic. More recent scholarship, however, takes a more nuanced view on the subject. Ania Loomba and Jonathan Burton's introduction to their documentary reader, *Race in Early Modern England* (2007), is especially helpful here, so I quote it at some length: "The appropriateness of 'race' or 'racism,' 'xenophobia,' 'ethnicity,' or even 'nation' in describing community identities in early modern Europe has been much debated. Some of these words were coined later, and others, such as 'race,' did not necessarily convey the same meanings they do now. [...] [E]ven when modern-day meanings of words such as 'nation' or 'race' emerged in the early modern period, older or competing meanings retained a place alongside or in competition with them. But surely this complexity does not suggest that it is anachronistic to study race in the early modern period. After all, 'race' is, even today, a confusing word that does not carry a precise set of meanings, but becomes shorthand for various combinations of ethnic, geographic, cultural, class, and religious differences. [...] As is the case in the modern world, when we examine early modern notions of racial difference we must consider not only those divisions of humanity that were putatively based on distinctive combinations of physical traits and transmitted through a line of descent, but also the

What these anxieties further show is that there was a mutability to the body that had to be contained. Gender nonconforming and other subversive cultural practices were endowed with a kind of monstrous agency that threatened the social and natural order. In the eighteenth and nineteenth centuries, scientific discourses became more invested in differentiating and classifying monstrosity into discrete categories of abnormality (cf. Foucault, 2003). Disability, race, and gender/sexuality all become discrete categories that also gain ever more internal divisions. Hermaphroditism, for example, became first separated into the medicalized identity categories of "the homosexual" and "the (congenital) hermaphrodite," and later, in the twentieth century, into the three categories that we are now familiar with: homosexuality, trans, and intersex. This separation has conspired to diffuse the radical potential of the monster and render the individual and separate manifestations of it subject to either pity or annihilation. Medico-legal discourses have worked to distinguish forms of embodied difference and separate them into distinct areas of expertise that bring them under the purview of different institutional authorities. However, as many scholars working on the intersections of race, gender, and disability, especially in a historical perspective, have shown,[14] the specters of association never disappeared. On the one hand, this compartmentalization has worked to foreclose any meaningful alliance between marginalized communities. At the same time, it belies and thus obfuscates the discursive coconstitution of difference that undergirds these discourses themselves.

Toward a Feminism of the Monstrous

On June 17, 2021, following the death of EJ Boykin, a Black trans man who was killed in Virginia 3 days earlier, The Human Rights Campaign (HRC), a US-based organization dedicated to LGBTQ rights, reported that "[t]he level of fatal violence [they have] recorded this year is higher than [they have] ever seen" (Lhant, 2021). This pronouncement came less than 7 months after they had issued their 2020 report on "fatal violence against transgender and gender non-conforming people in the United States" (published annually in November to mark the Transgender Day of Remembrance), in which they reported a record number of deaths, prompting them to declare an "epidemic of violence" (2020). While the HRC listed 44 cases of fatal violence against trans and gender nonconforming people in the United States in 2020 (HRC, 2021), the Transgender Murder Monitoring Project (TMM) of the organization Transgender Europe (TGEU) reported "a total of 350 trans and gender-diverse

---

eclectic range of cultural differences that are used to explain, manage, or reorganize relations of power" (Loomba & Burton, 2007, p. 2). Other landmark studies on racial difference in early modern England include Hall (1995) and Wheeler (2000).

[14] To name just a few pertinent examples: for a transhistorical account of the intersections of race and disability, cf. Erevelles, 2011; for a transhistorical and intersectional perspective on trans and race, cf. Snorton, 2017; on race and (homo)sexuality in the nineteenth century, cf. Somerville, 2000; on trans, race, and disability in nineteenth century San Francisco, cf. Sears, 2015.

people registered murdered between 1 October 2019 and 30 September 2020" worldwide (TGEU, 2020). Both note a general increase in reported cases. In reality, the numbers are likely to be much higher, as the HRC explains, "data collection is often incomplete or unreliable [. . .], [s]ome victims' deaths may go unreported, while others may not be identified as transgender or gender non-conforming" (HRC, 2020). The lists also do not reflect the number of hate crimes that did not result in fatality or deaths that can be linked to mental or physical health issues that resulted from discriminatory practices (e.g. lack of access to healthcare, excessive policing, bullying, etc.). Similarly, in their 2019 report on hate crimes, the FBI noted a marked rise in disability hate crimes. And the Disability Day of Mourning project tracks and commemorates the people with disabilities who were specifically murdered by a family member or caretaker, while "The Ruderman White Paper on Media Coverage of Police Use of Force and Disability," published in 2016, states that "[d]isabled individuals make up a third to half of all people killed by law enforcement officers," a fact that is often left out of media coverage, emphasizing that "[d]isability intersects with other factors such as race, class, gender, and sexuality, to magnify degrees of marginalization and increase the risk of violence" (Perry & Carter-Long, 2016, p. 1). This ritualistic invocation of statistics has become an integral part of lives that are under constant threat of violence in a society that has marked them out for disposal, reminding us of Audre Lorde's recitation: "We were never meant to survive."[15]

What this brief look at the statistics also suggests, however, is how the separation of modes of oppression into different axes that only intersect in particular bodies – e.g., the "trans-disabled subject" (Puar, 2014, p. 78) or the "black.female.queer" (Holland, 2012, p. 12) – but otherwise remain essentially distinct, renders invisible the larger structural mechanisms that manage these categories of difference in relation to each other.[16] Ironically, this invisibilization of the structural frameworks also renders illegible the particular situationality of these often-invoked intersectional subjects themselves. In this final section, I want to close by drawing attention to a recent case that illustrates the need for a deeper and more thorough structural and historical engagement with the intersections of trans, disability and race. On June 7, 2019, Layleen Cubilette-Polanco, a 27-year-old Black Dominican trans woman from New York, and a member of the House of Xtravaganza, died at Rikers Island while she was being held in a "restrictive housing unit," a form of near-solitary confinement reserved for purposes of punitive segregation where she was placed after allegedly assaulting another prisoner. In their "Report of the Investigation into the Death in Custody of Layleen Polanco" (2020), the Bronx County District Attorney's Office (DAO) describes Polanco's death as follows:

---

[15] From Lorde's 1978 poem, "A Litany for Survival."

[16] For further critique of the use of intersectionality only in terms of the representation of intersectional identities and embodiment, see Haschemi Yekani (2022).

> On June 7, 2019, she was found unresponsive inside of her cell by Correction Officers and was later pronounced dead on scene. The Office of the Chief Medical Examiner found that the cause of Ms. Polanco's death was "sudden unexpected death in epilepsy due to mutation in her CACNA1H gene," ruling the manner of her death as natural. Ms. Polanco suffered from a seizure disorder and had other medical issues prior to June 7, 2019. (Clark, 2020, p. 2)

Although the New York City Department of Corrections (DOC) states in its directives that "persons with 'serious mental or physical disabilities or conditions' are barred from being placed [in punitive segregation]" (Clark, 2020, p. 16) and the staff at Rikers Island was not only aware of Polanco's medical status, but also noted "radical changes in [her] behavior" that they felt "should be brought to the attention of the Mental Health Staff" (ibid., p. 6), the DAO concluded that the threshold for criminal charges in this case was not met, meaning that no one would be prosecuted or held liable for Polanco's death.

The reasoning for this conclusion hinges on the fact that the DOC does not "define what serious physical and mental condition is for the purposes of Punitive Segregation" (Clark, 2020, p. 24) and that none of the staff could have known that Polanco would suffer life-threatening seizures during her time in restrictive housing (even though she had already had several seizures during her time at Rikers). They also reason that "it cannot be established that Ms. Polanco would have survived even if she was housed in general population" (ibid., p. 21). Furthermore, although, as the report states, the DOC requires corrections officers to monitor "signs of life" – for example, "the rise and fall of the chest [. . .], snoring, or some body movement" – in any incarcerated person confined to restrictive housing "at least once every half-hour on each tour of duty" (ibid., p. 15), Polanco had been unresponsive for at least 2 h before they called in medical help. The DAO finally concluded that:

> There is no evidence that they acted with the level of carelessness required by the statute. They periodically checked in on Ms. Polanco and reportedly saw her lying in bed – thinking nothing was wrong, none of them entered the cell. They complied with their requirement to make their rounds. (ibid., pp. 22–23)

It is noteworthy that in its conclusion, the report emphasizes that: "the purview of this Office is not to determine whether the decision to place Ms. Polanco into Punitive Segregation [. . .] while she was suffering from a documented seizure disorder, was wrong; rather, the purview of this Office is to determine whether that decision rose to the level of criminal behavior" (ibid., p. 24). In other words, while the staff at Rikers might have been wrong or made mistakes, they could not be held criminally liable for those mistakes. In the official DAO record, Layleen Polanco thus emerges as the tragic victim of a medical condition, "a sudden unexpected death in epilepsy," resulting from her own body's unruly production of a mutant gene, rendering her death natural and ultimately not reasonably preventable, as the reason for her being in punitive segregation is also attributed to her own unruly behavior, which was described by the DOC as "highly assaultive" (ibid., p. 5).

Another perspective on the case emerged with a later report issued by the Board of Corrections (BOC) which has independent oversight over the correctional facilitates under its jurisdiction. In this report, the Deputy General Counsel, Kate McMahon, finds several infractions on the part of correctional officers as well as a number of systemic failures. First of all, there is the failure on the part of correctional officers to "round every 15 min [not 30 as stated in the DAO report!] as required by DOC policy [. . .], leaving Ms. Polanco unobserved by DOC staff for stretches of 57 min, 47 min, and 41 min during the period between when she was last confirmed alive and when the medical emergency was declared" (McMahon, 2020, p. 11). What is even more significant, however, is that correctional officers were apparently "confused as to what DOC policy requires in terms of rounding frequency" (ibid.), they were "never informed that Ms. Polanco had a seizure disorder, and nothing in the DOC housing area records that BOC reviewed referenced Ms. Polanco's propensity for seizures" (ibid., p. 8), and they were not "adequately trained to conduct quality visual observations and confirm signs of life" (ibid., p. 12). Additionally, the report specifies that the "radical changes in behavior" reported by staff, which occurred the day after she was placed in confinement, included "expressing a desire to commit suicide and/or attempting suicide;" "having hallucinations/delusions (seeing objects or hearing voices that do not exist);" "showing poor personal hygiene or appearance, doesn't shave wash or change clothes, etc.;" "being alarmed (frightened) or in a state of panic;" and "inmate randomly crying, shouting" (ibid., p. 4). But although a psychiatrist from the Correctional Health Services (CHS) "verbally stated that due to [her] medical history as it pertains to seizure disorder that he would not be able to authorized [sic] a cell housing placement for inmate [Polanco]" (ibid., p. 6), the report finds there was "undue pressure" on the part of the DOC (ibid., p. 11) to place Polanco in Restrictive Housing, evidenced by an email from the Tour Commander stating that "We tried very hard to get Inmate [Polanco] cleared [for segregation] but [Mental Health] just won't clear her. We are in the process of generating [Protective Custody] paperwork for [her]" (ibid., p. 6). As the report states, this insistence to segregate Polanco was because of the "DOC's determination not to house a transgender woman in general population housing areas for cisgender women" (ibid., p. 11). In fact, it is common practice in many prisons to place trans inmates in solitary or near-solitary confinement, supposedly for their own protection, as indicated by the Tour Commander's instrumentalization of "Protective Custody" procedures. A further indictment to Rikers came in the form of a video released by Polanco's family which showed correctional officers laughing and talking for 2 min while apparently calling out to her instead of going inside her cell to check on her well-being, especially since she had already been unresponsive for a considerable amount of time. The family filed a wrongful death lawsuit against the city of New York and 25 anonymous members or Rikers' staff which was settled in the amount of $5.9 million.

In order to more fully understand the circumstances that led to her death, however, we have to look at the broader structural convergences. We have to ask ourselves what the conditions were that led to Polanco's incarceration in the first place and how her Black, trans, disabled, and criminalized body rendered her illegible as a person deserving of care. It is important to note that during the time of her death, Layleen Polanco was being held at Rikers on bail, meaning that she had not yet been convicted of any crime. In April 2019, Layleen Polanco was arrested for allegedly assaulting a cab driver, but as the prosecution was unable to secure any deposition to support their case, the court had reduced bail, initially set at $500 to one dollar. However, Polanco still had an outstanding bench warrant (an arrest warrant that is given out due to nonappearance in court) for earlier charges of misdemeanor prostitution and low-level drug possession. Rosa Goldensohn and Savannah Jacobson reporting for *The City* state that, according to the Manhattan District Attorney's Office, "[a]n undercover cop arrested Polanco in August 2017 for allegedly agreeing to engage in oral sex for money and having what police called a crack pipe in her pocket" (2019, np). Following this earlier arrest, Polanco was mandated to appear in Manhattan's Human trafficking Intervention Court, a court that refers those arrested on prostitution charges and whom it deems victims of human trafficking to mandatory counseling. Or in the words of New York State Chief Judge Jonathan Lippman: "the New York State Court System will [. . .] identify trafficking victims, refer them to services, and restore them to law-abiding lives" (Center for Court Innovation, 2013). Polanco's failure to appear in this Intervention Court is what led to the outstanding bench warrant and an additional bail amount of $500, resulting in a total amount of $501 which she was unable to pay. However, since Polanco engaged in sex work of her own volition, it is not clear how a court that intervenes into sex trafficking would help her. On the contrary, "restoring" her to a "law-abiding life" would have effectively deprived her of her livelihood.

It is also important to view Layleen Polanco's arrest and death in relation to larger structures that conspire to police bodies that are marked by race, gender nonconformity, and disability. These include laws that prohibit "loitering with the intent of prostitution," which have come to be known as the "walking while trans ban" as they have been used to disproportionately target trans women, especially trans women of color. "Crimes against nature' laws, also known as antisodomy laws, which, in spite of the Supreme Court decision in the case of *Lawrence v Texas* in 2003 which deemed these laws unconstitutional, have still not been repealed in a number of states, especially in the South. While antisodomy laws, which criminalize not only consensual anal intercourse, but also oral sex, have historically been enforced almost exclusively to police consensual same-sex relations, they have been increasingly used to target trans women, again especially trans women of color. Another context that played into Polanco's arrest is the ongoing War on Drugs, which, as Michelle Alexander and other critical race scholars have shown, is used to disproportionately target Black and Latinx people (the NYPD's reference to Polanco's alleged "crack pipe" is instructive here; cf. Alexander, 2010). Furthermore, we need to take into account the relations between disability and incarceration. As Liat Ben-Moshe argues in her recent book, *Decarcerating Disability: Deinstitutionalization and Prison Abolition* (2020):

> [D]isability is central to mass incarceration and decarceration in the United States. This is true in terms of both the disabling nature of incarceration in prisons and the pervasiveness of incarceration (whether in so-called therapeutic facilities like psych hospitals or punitive ones

> like jails) characterizing the lives of many disabled people whether in so-called therapeutic facilities like psych hospitals or punitive ones like jails [. . .]. (Ben-Moshe, 2020, p. 1)

Not only had Layleen Polanco been shuttled between psychiatric facilities and the prison several times (she was sent to Bellevue Hospital before being placed at Rikers and during her time at Rikers, she was sent to Elmhurst Hospital where she spent 8 days in the Psychiatric Prison Ward), it should not be overlooked that her repeated encounters with police and the insistent threat of violence and incarceration leveled at her racialized trans body severely affected her mental health. Additionally, people who are stigmatized for what is seen as a "disturbed" mental state ("erratic," "randomly crying, shouting," "assaultive") or for involuntary bodily movements (e.g., seizures) are often considered to be inherently dangerous and in need of segregation. Finally, the explicit exclusion of trans from the ADA has led to trans people being rejected from health coverage, not only for trans-related medical needs, but also for completely unrelated health concerns. And while trans people continue to be marked as "mentally ill," very real trans-specific mental and physical health concerns are not recognized at all, and they are also not protected under the ADA with regard to employment or housing discrimination.

The monster is a figure that instills fear. Fear of contamination, of a loss of self, a loss of bodily integrity. Monstrous figures, after all, manifest a kind of conspicuous visibility that resists rehabilitation within the normative category of the human. It is a body that needs to be contained and rendered harmless – dis-abled – either through management (biopolitics) or annihilation (necropolitics). While the history of monstrosity might seem a far-removed issue for most, it still plays a huge and often devastating role in the lives and deaths of those whose complex embodiment and positionality resist neat categorization and render them suspect in a multiplicity of contexts. Layleen Polanco, as well as many other boundary-crossing beings that emerge from the historical archive, still represents a threat because of the monstrous agency that they embody. While agency usually describes an ability to act, to be an agent, in the social or symbolic order, this presupposes that your actions are legible to the dominant order. Monstrous agency, I would suggest, is a kind of agency that is dangerous or threatening to the social order because it subverts its categories, crosses its boundaries, and disrupts the "law of genre" that prohibits hybridization (cf. Derrida, 1980). As such, it is a form of power or capacity that is not necessarily intelligible in the social order. Rather, it is a form of power that comes from a place of abjection.[17] It is the appropriation and thus subversion of identities and practices that were meant to contain rather than enable. It is to derive power from a source not intended for you. As such, it is a power that marks one off as dangerous and in need of containment or elimination.

What I hope to have shown with both the historical examples as well as with the case of Layleen Polanco is that the strict separation of identity categories and the

---

policing of their borders only works to mask their ontological interdependencies, by which I mean that they never exist in and of themselves but always only in relation. My aim in this piece is then not only to offer an intersectional perspective of the monster, but to advocate for an understanding of intersectionality that is itself monstrous: an intersectionality that radically questions the boundaries of the categories it operates with, that questions the category of the human itself and resists the need to rehabilitate monstrous subjects within that category.

Black-Abundance, Fat-Revolt, and Crip-Desire: Intersectionality as Interference in the Life and Death of Rohan Garfield Salmon

Fady Shanouda and Terri-Lynn Langdon

Contents

Abstract

This chapter is an examination of the life and death of Mr. Rohan Garfield Salmon, an evicted resident of a long-term care home in Ontario, Canada. It will be shown that Rohan's experiences both demonstrate the healthcare system's abject failures as well as the agentic capacity of difference. Rohan's case, more than highlighting the deplorable state of care in the nursing home-industrial-complex, suggests that critical analyses of intersecting social categories must consider the emergence of those categories in intra-actions – in emergence with other humans and nonhumans. The authors argue that Rohan simultaneously experienced constricting forces from dominant cultural understandings of fatness, blackness, and disability and also produced equally disrupting and interfering forces – reimagining the capacities and desires of his bodymind. In particular, the

Introduction

In the Summer of 2017, Rohan Garfield Salmon was served an eviction notice from Sunrise Senior Living for failing to pay rental arrears in the amount of $18,000 (Zarzour, 2019). In the subsequent 3-year legal battle between Sunrise Senior Living, the Newmarket Enforcement Office, and Rohan, the rapacious corporations, and impermissible violations of the nursing home-industrial-complex (Tremain, 2021) would come into full view. Rohan died in 2019, only a few days after learning that a provincial Court had sided with Sunrise, and that he would be evicted. The appalling gaps in long-term care in Canada are longstanding (Estabrooks et al., 2020) and were made more glaring during the COVID-19 global pandemic, where disabled communities witnessed the devastating loss of life in care homes across the country. Rohan's life ended before COVID-19 was rampant in assisted living spaces. Still, the same negligence and ill-care that caused the over 15,000 deaths during the pandemic in Canada are apparent in Rohan's case as contributing factors to his eviction and untimely death (Inter Pares, 2021). Undeniably, Rohan's life and death add to the justifiable outpouring of criticism against this system. The chapter's focus is to capture the deeply flawed state of disability care in Canada pre-pandemic and to add to the chorus of calls to abolish different forms of institutionalization and incarceration (Linton, 2021; Fritsch and Shanouda, 2022).

In this chapter, the authors examine the intricate relationship between oppressive forces, and consider the different ways disability, race, and size were entangled in the life and death of Rohan Salmon. It will be shown that Rohan's experiences both demonstrate the healthcare system's abject failures as well as the agentic capacity of difference. Rohan's case, more than highlighting the deplorable state of care in the nursing home-industrial-complex, suggests that critical analyses of intersecting social categories must consider the emergence of those categories in intra-actions – in emergence with other humans and nonhumans. It is a reminder that relations of power are not determinant but can re-form and are in constant becomings (Grosz, 2011).

In reflecting on Rohan's life, the authors argue that he simultaneously experienced constricting forces from dominant cultural understandings of fatness, blackness, and disability and, in relation to other humans and materials things, produced equally disrupting and interfering forces – reimagining the capacities and desires of his bodymind. In particular, the chapter will highlight how *fat/black/disability-becomings* created certain conditions that successfully prevented the state from exercising its force for nearly 2 years. The authors invite scholars to consider how such analyses, that take into consideration the material things, can open up ways of understanding the different capacities of individuals too often already marked as disposable. Examining relations of power with material things in mind can extend analyses beyond predeterminant stories of subjugation, and begin to include experiences of and capacities for resistance, agency, and change – becomings too often ignored.

The authors started researching and writing about Rohan after he died, and therefore never had a chance to meet and interview him, as they would have wished. Therefore, the analysis relies on those who wrote about Rohan in court documents, Sheriff's statements, and news media. The authors also interviewed Kim Zarzour, a reporter who wrote several articles on Rohan's case, and his lawyer, Melissa Miller, who represented him until his death. Both Kim and Melissa expressed deep admiration for Rohan and remarked on how psychologically taxing and affecting reporting and representing him had been on their personal and professional lives.

The chapter has four sections. First, a discussion of Rohan's legal case and the changes in management at his residence that precipitated the rental increases and subsequent eviction. Next, an introduction to an intersectionality-as-interference (Barad, 2007; Geerts and van der Turin, 2013) approach and the significance of analyzing Rohan's experiences through a onto-epistemological lens. To demonstrate Rohan's agentic capacity, the analysis focuses on his social classifications in relation to three material objects and describes how these emergences (between Rohan, the material object, and staff at Sunrise) made and unmade differences. This will show that contrary to the dominant cultural understanding of fat/black/crip-ness as dying/death/dead, Rohan expressed life. In the final section, alternatives to long-term care are described. Together, these sections demonstrate that in the legal and healthcare systems, Rohan was experiencing the collective force of dominant intersectional cultural perceptions of fatness, blackness, and disability as disposable, although he expressed a desire for life and living. Focusing on what residents *do,* rather than what it means, might illuminate their capacities for life, and change social and cultural understandings of what it means to live in assisted and long-term care spaces.

Mr. Rohan Garfield Salmon: September 27, 1968–January 30, 2020

Rohan immigrated to Canada from Jamaica in 1977 (Fanfair, 2018). He attended Carleton University and received his Master's from the University of Ottawa. In 2002, he was an ESL teacher on a day trip with his students when their vehicle overturned and crashed (Fanfair, 2018). One of the students died, and Rohan acquired a spinal cord injury from the chest down. Following the crash, he was in recovery at a hospital for almost a year and spent several months on a rehabilitation ward. In 2004, Sunrise Senior Living, a retirement home in Richmond Hill, Ontario, Canada, that provides assisted living and memory care services, offered Rohan a basic package of 1 hour of care a day, supplemented by 3 or more hours of care from his insurance. Sunrise Senior Living is part of a much larger care system in Canada comprised of long-term care, nursing homes, groups homes, and other supportive-living centers. There are approximately 200,000 disabled people living in these contemporary institutions, 23,650 under the age of 65, and 230 under the age of 18 (Statistics Canada, 2021).

Sunrise's initial care package would have included a lift for transfers, personal support workers for his personal care and hygiene needs, and assistance with all household tasks. In 2015, under new management, Sunrise reassessed Rohan's level of care and ultimately determined that his needs had increased. In Ontario, care homes are allowed to increase rental fees once a year only at a specific rate. Still, they can increase the costs of care services and meals as much as they need (Zarzour, 2018) – a rule that can put residents in a place of financial precarity and uncertainty. They can also change the rental costs with a new tenant – making quick turnovers an essential part of their business plan.

However, Rohan insisted that his care needs had not changed since his accident. His doctors came to the same conclusion (Fanfair, 2018). Sunrise disagreed and insisted he take on the additional costs for the care plan they were implementing. At the same time, Sunrise also alleged that Rohan was in arrears for a rental increase that took effect in late 2014 (Zarzour, 2019). In total, Sunrise Senior Living demanded Rohan pay $28,358.46 in rental arrears and the additional costs of care or find a new place to live (Zarzour, 2018). Rohan's living options were always limited because of the scarcity of bariatric equipment to support his size and living needs in the Ontario healthcare system (see Shanouda, forthcoming-1). Rohan later learned that Sunrise had notified him of the rental increases in writing but had placed the letter in a mailbox that he never used because it was not accessible to him. In the past, the Sunrise director had delivered similar news to him in person.

Rohan called a friend who helped him hire a lawyer. They decided to settle, and Rohan sent Sunrise a cheque for the initial cost of arrears of $14,700. Sunrise informed him that they would not be accepting his payment and that they would be evicting him. Rohan would enter several legal challenges over the next couple of years and ultimately die weeks before the final written decision concerning his eviction was published. Speaking with his lawyer, Melissa, the authors learned that Rohan was informed of the oral decision to press on with eviction days before he died. Melissa said, "He cried, and it was very difficult. He went into shock."

Rohan's legal case is compelling, and its many different decisions are worthy of further study. However, the chapter's focus is on the tensions that arose between Sunrise, the Court, and the Sheriff's Office. These three entities shifted blame and responsibility for Rohan's care and housing back and forth and kept him persistently in limbo for the duration of the legal proceedings. This is not a unique part of his case, but given his care – and not just living accommodations – were provided by Sunrise, Rohan was facing a diminishing level of support. Sunrise's retaliatory actions included changes to his laundry schedule (that would ultimately result in him lying in dirty sheets), reduced hours for daily bathing (that would increase the chances of a urinary tract infection), and theft of his personal belongings. These experiences were never part of the court proceedings. Still, they demonstrate the harm and consequences he experienced upon entering into legal battle with the corporation that housed him and provided his care.

After Sunrise refused to accept Rohan's cheque for the lapsed rent, it became the Sheriff's office's responsibility to evict Rohan. According to the Residential Tenancies Act, one of the statutory duties of the provincial Sheriff's office is to physically evict tenants when there is a legal order due to non-payment of rent. However, in Rohan's case, the Sheriff's Office refused to comply with the eviction order "due to the unique circumstances" of health and safety in this case (*Sunrise North Senior Living Ltd. v. The Sheriff (Regional Municipality of York)*, 2020). The Sheriff also noted that although it is customary to involve the police in eviction orders where a tenant is legally required to leave, their primary role, in this case, would be to keep the peace.

In response to the Sheriff's decision, Sunrise applied to the Newmarket Court Enforcement Office – which oversees enforcement of three main areas: (1) subpoena documents and enforcement, (2) orders to appear in court, and (3) eviction orders (Sheriff's Office, 2020). This office determined that Rohan could not be evicted from his residence since "there was no safe place for Rohan to be moved in light of his underlying physical challenges and associated daily care needs." Sunrise responded by applying to the Divisional Court for a *mandamus order* against the Sheriff. As the Latin term implies, this results in a mandatory order from the court to a government agency to meet its obligations and legal duties. The Divisional Court granted the mandamus order without specifying how the Sheriff should carry it out. Ultimately, the Sheriff's failure to comply would constitute contempt of court.

Sunrise sought clarity from the Superior Court in Newmarket which upheld the eviction order and determined that Rohan did have a place to go. However, no evidence of such a place outside of long-term care ever seemed to materialize. In the legal decision, the Superior Court states,

> With absolutely no disrespect to Mr. Salmon, and while I have sympathy for the position in which he finds himself, having no right to remain at Sunrise and nowhere to go (he says), he is, in effect, a homeless paraplegic. I am confident that in Ontario in 2018 (and now 2019), there is some place, or places, to which the sheriff may safely take such a person, upon carrying out an eviction order. It is, in my view, the public duty of the sheriff to determine what that place or places are, and to carry out the eviction (*Sunrise North Senior Living Ltd. v. The Sheriff (Regional Municipality of York)*, 2020).

The judge's expectation of an accommodating place for Rohan relied on inappropriate options, including other retirement homes that did not have enough space to accommodate Rohan (such as proper bariatric lifts, wider doors, staff that could lift and bath him) or accommodate his belongings, long-term care homes, which he refused to consent to, and even short or long-term stays in a hospital. The judge determined that these were reasonable alternatives. The judge also determined that the Sherriff's office was the expert in this situation and could reasonably find accommodations for Rohan – when all evidence points to the contrary. The Court granted the mandamus order and directed the Sheriff to enforce the eviction order and pay Sunrise costs of $20,000. Rohan died in the hospital from septic shock, precipitated by a UTI infection, before the Sheriff had a chance to evict him.

The changes to Rohan's rent and the suggestion that his care needs were increasing came after new management took over at Sunrise Senior Living in 2015. These changes were likely consequences of restructuring that followed the purchase of Sunrise Senior Living by Revera Inc. and Health Care REIT (Revera Inc, 2014). Revera is a Canadian/multinational corporation that owns, invests in, or manages over 500 properties in Canada, the USA, and the UK and claims to support over 55,000 seniors/residents. In 2006, the Public Sector Pension Investment Board (PSP), a federal Crown corporation charged with investing funds for the pension plans of the federal public service, the Canadian Forces, the Royal Canadian Mounted Police, and the Reserve Force, bought Revera (Ontario Health Coalition, 2020; Tasker, 2020). In 2019, before the COVID-19 pandemic, Revera faced 85 lawsuits from individuals across Canada who were seeking damages between $150 and 175 million (Hoye, 2019). Since COVID-19, the company is facing an additional $120 million class-action lawsuit for the loss of life, neglect, lack of testing, and improper sanitation experienced by residents during the pandemic. The estimated size of the class is over 10,000 plaintiffs (Guly, 2020). This is just one of many lawsuits against long-term care providers across Canada. There are continued calls by the public sector union Public Service Alliance of Canada to divest from Revera (Kennedy, 2020), and a recent report on the crisis in long-term care settings outlines both the legal and operational risks of continued investment in for-profit long-term care spaces (Uni Global Union, 2020). The PSP has yet to divest.

Therefore, Rohan was living in a senior residence owned by the pension fund for Canadian police and military. Sunrise was managed and operated independently of the PSP; however, the timing of his reassessment and rental increases with Revera's takeover is too convenient. These two actions have allowed Sunrise Senior Living to place Rohan's room and care at current market value – likely doubling their income in the process, according to Rohan's lawyer (Melissa Miller, 2021, "personal communications"; Fanfair, 2018).

Rohan made his case public. He was a self-advocate and sought to bring public scrutiny to the conditions in the senior and long-term care settings in Ontario and Canada. He consulted with journalists; hired a lawyer; ensured that his story and the actions of Sunrise, Revera, and PSP would not go unnoticed. He also challenged the Court, the Sheriff, and Sunrise, often ignoring requests, partially complying with agreements between the parties – refusing to apply for long-term care and withdrawing his consent. It is the authors' assertion that Rohan was no longer willing to participate in a culture of compliance and was much more interested in a politics of resistance. He obfuscated the legal parameters to ensure he would stay at Sunrise. Kim and Melissa describe him as someone with their "heels dug in." His resistance mirrors the work and strength of disability activists in Canada and the USA fighting against assisted dying legislations as part of the Disability Filibuster (https://disabilityfilibuster.ca/) and other organizations, like Not Dead Yet (https://notdeadyet.org/). The authors argue that Rohan, like so many other self-advocates, simply refused to experience any further injustices. The following section will describe Rohan's relation to material things that made and unmade disability, race, and size and, contrary to the belief he was already dead, expressed his desire to live.

Intersectionality-as-Interference

The conditions of Rohan's eviction require an analysis that interrogates the systemic inequity he experienced. An intersectional analysis allows the authors to examine how racism, ableism, and fatphobia converge and entangle at these moments. It offers a way to understand how Rohan's experiences are a consequence of these various interlocking systems. Intersectionality is essential to the analysis because of its roots in black women's efforts to name oppressions and work toward transformational and structural change (Crenshaw, 1989). The authors are invested in the principal purpose of intersectionality – to interrogate the complex interconnections of forces of power and oppression that constitute a body disposable spatially, discursively, and materially. However, the chapter's aim is to learn what role Rohan played in relation to other human and nonhuman elements in the making and unmaking of difference in this situation. His bodymind differences mediated through the material objects around him prevented his eviction for a long time. Although he experienced significant pain and harm during this process, he was also resourceful and unyielding in his desire to stay put. This is a show of agency that must be a part of the analysis. The analysis suggests that the traditional ordering processes – the social script or status quo – were upended and thwarted in these moments of interference or disruption. As such, the authors explore Rohan's experience through patterns of interference to consider both power and structural inequity onto-epistemologically.

Interference (Barad, 2007) or intersectionality-as-interference (as described by Geerts and Van der Tuin (2013) is an examination of power structures that conceptualizes these as "the convergence of waves (light/sound/water), which results in patterns of intensification or higher intensity, while there are also places where the waves cancel each other or are weakened" (Verloo, 2009, p. 10 as cited in Geerts and Van der Tuin, 2013). Interference allows scholars to examine power structures without assuming that certain identities or relations of power are determinable. The chapter's focus is on examining power relations as patterns of interference or as crashes of waves without assuming a priori what can come of the interactions and emergencies.

This approach does not seek to abandon an intersectional lens. This would only reassert white European intellectuals over and above black women's scholarship and activism – a dynamic the authors are not interested in supporting (Pickens, 2019). Interference was developed by Haraway (1997), Barad (2007), Barad and DeKoven (2001), and Verloo (2006), but owes its intellectual rigor to black feminist scholars, authors, and activists including Crenshaw (1989), Collins (2000), Hooks (1984), and Butler (1993), who coined, developed, and evolved the concept of intersectionality to address systemic structures and see them change. By adding a lens of interference, the authors could examine "(power) relations differently, working with '[s]tructures [that] are constraining and enabling, not [just] determining'" (Barad & DeKoven, 2001: 99 as cited in Geerts & Van der Tuin, 2013, p. 176).

In thinking through Rohan's experience as intersectionality-as-interference, the authors also approached the research with Moser's (2006) work and writing in mind. Moser's (2006) analysis of the making and unmaking of differences in interactions with people and things, helped conceptualize Rohan's experiences in similar ways to consider disability, fatness, and blackness enacted materially and discursively. Moser (2006) refers to this approach as a material semiotics, which she states, "attends to. . .how particular practices carry and enact differences and also how that is enacted in and by the situation and all its elements without necessarily being intended, experiences, immediately obvious, or controlled by the human verbal participant" (p. 561). The intention is to think about how matter matters in these interactions and works to make and unmake differences outside of language.

Moser's approach to interference is also brought into discussion with Mollow's (2017) fat black disability studies – a transdisciplinary methodology developed to conceptualize the relationships between racism, ableism, and fatphobia. Mollow brings together critical race theory, fat studies, disability studies, and the Black Lives Matter movement to argue how systems of oppression are "weaponized" to further state-sanctioned violence. Although Mollow's focus is on anti-black state violence – specifically police murders of black people – she invites others to extend her analysis to other forms of anti-black state violence. The authors contend that senior living and long-term care spaces constitute forms of state-sanctioned violence against disabled, mad, and aging people – among others – as they are sites of incarceration and transinstitutionalization (see Haley & Jones, 2020). These are institutional sites that have transitioned through space, time, and elaborate social policy to continue to medically pathologize and express violence on marginalized communities, some of the most vulnerable in society. In Mollow (2017) she describes the healthcare system as part of state-sanctioned violence, especially against black women, like Barbara Dawson of Florida, who was denied care in a hospital and subsequently died in the hospital parking lot surrounded by police after she refused to leave.

The systemic murders of black adults and children by police are not comparable to the neglect of long-term care residents, but they are both products of state-sanctioned violence against bodymind differences (Ben-Moshe, 2020). The connection here is that the treatment of fat, black, disabled bodies are similar not because of their locations or sites of oppression or oppressors, but because they are conceptualized as already close to death.[1] Mollow (2017) argues that being so close to death makes "state-sanctioned violence...appear to have negligible effects" (pg.108). The authors contend that Rohan's bodymind differences put him close to death or already dead. Rohan felt this and said as much when he argued, "As time went by and I

---

[1] See Razack, 2013, for a similar conceptualization of Indigenous people as already dead.

didn't die in the three to five years as most elderly residents, they [Sunrise] realized it was a bad deal [their initial rental and care offer] and they wanted to stick it to me. I have outlived anything they could have imagined, and they figured they have got to find a way to get me out" (Fanfair, 2018).

Sunrise was covert in its efforts to make its space unlivable for Rohan. They changed his care schedule; they ignored his personal choices, and they misplaced his belongings. Rather than focus on these as part of a larger scheme to push Rohan out, the authors argue that his capacity for life was contrary to everything expected of a fat, black, disabled man, all of which invited more scrutiny and objection.

The next sections focus on three material things that were not central in the legal proceedings or reporting on Rohan's legal case or life and death. The stories around these objects were relayed to the authors by Kim and Melissa – the reporter and Rohan's lawyer, respectively. In highlighting these objects and the stories around them in the analysis, it will be shown that Rohan was simultaneously becoming-fat/black/disabled and obstinate and difficult and already dead. As patterns of interference, these moments are acts of disruption and a desire for *difference*. They evoke a sense of who Rohan was and what he loved and how he sustained an agentic capacity in a space that had resolved to see him erased.

Food

In asking Melissa to recall moments of fatphobia and racism that she thinks Rohan might have experienced at Sunrise, she immediately brought up his preference for Jamaican food. As a Jamaican immigrant, it is reasonable that Rohan wants to eat food that he is familiar with, desires, enjoys, and views as healthy, nourishing, or indulgent. Additionally, according to this lawyer, Rohan wanted to eat Jamaican food to ensure he could maintain his cultural independence. However, Sunrise did not take this requirement seriously. According to Melissa, Sunrise staff described his food preferences as unreasonable and Rohan as intransigent.

Kelley (2016) argues, "The food we eat and its preparation define who we are culturally, socially, economically and politically" (p. 21). One could add that it also contributes to conceptions of health and wellness – and marks outliers in size as either eating too much and too little and of the wrong things. As a long-time fat person, Rohan would have been aware of the constant surveillance of the type and quantity of food he ate. Fat people experience a certain level of scrutiny when they shop for food or eat in public. Miller (2017) describes this as a part of the social contract between everyone else and the "Good Fatties" – to not rub fat people's perceived overindulgence in thin people's faces. The pressure to eat a salad (with dressing on the side, as Miller (2017) remarks) or only buy greens in the grocery store, is at times, overwhelming for fat folks. Performing as "Good Fatties" is how one can avoid stares or unwanted comments. In the end, it is a way to prevent forms of violence. Rohan would have been aware of this surveillance, and his requests for food – any type of food would have been remarked on and scrutinized. Rohan's requests for Jamaican food would have been perceived as less healthy or nutritious, and followed the over 100 years pseudo-scientific knowledge that marked the health disparities between White and Black people on racialized peoples' diets, according to Strings (2020). Requesting non-European food would have invited more attention to Rohan's size, bad eating habits, and inevitably become evidence of his lack of self-control, like so many others before him.

In requesting Jamaican food, Rohan was enacted not just as obese and unhealthy but also as intransigent, essentially meaning, difficult. Versions of this story are part of most black people's lives – the angry black women or men are familiar tropes (see Quaye, 2017). These ignore the histories of black people on Turtle Island[2] and turn justifiable rage against the constant threat of systemic violence into personal characteristics. Rohan thus becomes difficult through his requests to perform his blackness through food. He is difficult in his refusal not to eat more easily accessible, so-called "Canadian food." His stance against his ethnicity's erasure, and instead, its celebration, makes this a challenge to the status quo. More than just a microaggression, this defining of Rohan by Sunrise transforms him into an unreasonable individual. Rohan becomes the impossible client, the impractical, illogical, irrational individual. He becomes the *mad*, black man. Through this discursive and material entanglement, Rohan is made into a madman (Shanouda, forthcoming-2). This, according to Meerai et al. (2016) is an example of anti-black sanism, which "at its heart is the pathologization of simply being black" (p.19). The work on anti-black sanism exposes the ongoing systemic racism and dehumanization of black folks, as major factors in the development of distress in the black community as well as how black bodies are made not to matter in health, education, and legal systems (Meerai et al., 2016; Keating, 2016). Rohan understood this was taking place. He shared with a local news outlet that within the housing and care systems he was struggling with infantilization, and a continuing diminishing of his self-value.

Jamaican food made this situation unfold because it rejects the white culture that organizes the event-space[3] (Massumi, 2002) at Sunrise. Food within Sunrise is read "as a material object [that] has the capacity to act as an agential object. . ." (Kjær, 2017, p. 78). Food, in this sense, has a productive power to create an individual's social identity and embodied subjectivity. Rohan, through his desire and relationship to Jamaican food, was able to make present his fatness and blackness. Food made central and active his size and Jamaican ethnicity, forcing Sunrise and the staff to acknowledge those differences as significant. In the process of requesting Jamaican

---

[2] Turtle Island refers to the continent more commonly known as North America. Turtle Island is the name given to this landmass by some of the Indigenous communities who have lived here since time immemorial.

[3] The "event-space" is a term used by Massumi (2002) to describe the "folding of dimensions of time into each other" (15). Puar (2012), borrows this term from Massumi to explain the possibilities of moving from analyses that take up intersectionality to those that think with Deleuze's concept of assemblage. The authors are thinking alongside these scholars in their work on shifting identity, subjugation, and/or privilege from any sense of interiority to one that explores how these experiences are relational and take place in the event-space between human, nonhumans, and more than human things.

food, Rohan accentuated the other food offerings at Sunrise – European or Americanized foods – white people's food that he was not interested in consuming. He unmade the white discursive and material logics that governed definitions of good food and healthy choices. Undoubtedly, food produced an "event-space" in-between Sunrise and Rohan that made and unmade the ways of thinking about food, race, and eating processes. His requests interfered with Sunrise's management style, and undoubtedly its conceptions of good, healthy food, and as a result, forced the corporation to adjust and shift, even for a short time. These were changes it was not interested in making and that certainly did not lower costs.

Cologne

Similarly, Melissa relayed to the authors that Rohan was an avid collector of expensive cologne. She described this as a sort of passion or hobby of Rohan's that he spent "serious money on." She remarked that he displayed these bottles all over his room at Sunrise and that she did not recognize many of the brands; his collection was sizable and unique. These bottles indeed held a certain level of significance for Rohan, not just because he spent time collecting them but that he also displayed them in his room. Unfortunately, when Rohan would leave Sunrise (often for health reasons), bottles from his collection were stolen. Additionally, according to Melissa, the Sunrise staff were mystified by Rohan's collection and perplexed as to why he would need cologne. They seemed to want to ask, "Who is Rohan trying to impress?"

The authors cannot say conclusively what collecting or applying cologne meant to Rohan. However, such actions surely enacted Rohan as a sexual and gendered person – interested in performing his sexuality. Perfumery, after all, is "rooted in the sexual drive," as Bain (1997) argues. Although interpreted through Melissa, the staff's remarks are like those disabled people and scholars have described in other places. Contemporary society has desexualized disabled people – rendered undesirable or worse, unworthy of love and relationships (Kattari, 2015; Liddiard, 2017; Shakespeare, 2000; Shildrick, 2007). Further, Sabrina Strings (2020) writes about how nineteenth-century racial categorization also "largely served to regulate who could enjoy romantic and sexual congress with whom." She also contends that this area of exclusion included fat bodies. Too often, disabled people are denied access to their sexual lives and made into sexless bodies, not only incapable of sexual expression, but themselves lacking sexual desire.[4]

Similarly, to his desire for Jamaican food, Rohan's choice to spend money and time on cologne was an expression of pleasure and joy. Expressing his sexuality, his pleasure in the little things not only made Rohan into a sexual person but also

---

[4] Unlike previous discussions in disability studies scholarship, the authors*f* are not suggesting that Rohan was made asexual, as form of oppression, as that would deny the positive experiences of asexual disabled people (see Santinele Martino, 2017).

reaffirmed his interest in life and living. Through these material things, he becomes more than expected, thus rejecting the social script around the marker quadriplegic. This is contrary to the expectations. As Shackelford (2021) writes about fat, black bodies, they are expected to "Become no-thing." The expectations on Rohan's bodymind are that they, "Do not take space because it is not yours. . . Your existence does not afford you the right to be too much, too loud, too full, too human, too living, too free, too abundant. . ." (p. 253). Cologne enacted a sexualized intra-action that expressed an aliveness that was not just human or sexual but also destabilizing of traditional conceptions of disability. In the next section, Rohan's expression of life as disruptive, dangerous, and an act of resistance is further entangled with the other material things around him.

Mobility Devices

In this final example, the focus is on Rohan's deluxe rehab arm bike, custom-fitted wheelchair, and power chair. Together, they cost an estimated $65,000 and were incredibly important to Rohan (Fanfair, 2018). They not only allowed him to access the spaces and activities at Sunrise but made it possible for him to exercise and venture outside of Sunrise (Zarzour, 2018). Unfortunately, Rohan's equipment disappeared from his room 1 day. Rohan said,

> I was led to believe that it [the equipment] was in storage at Sunrise's Aurora location all this time. They told me they [the equipment] were safe and would be returned whenever I wanted them (Fanfair, 2018).

A week before his scheduled eviction, Sunrise informed him that the equipment was "gone" (Zarzour, 2018). Sunrise did not provide any additional information. As a show of good faith, they did offer Rohan $3500 in compensation. Rohan believes it was an inducement to keep quiet and leave without hassle. He said, "...this money [was offered] on condition that I never talk about the equipment again. I was also informed it was a one-time offer and if I accepted it, I would also have to move out..." (Fanfair, 2018). Sunrise claimed no responsibility for these missing/stolen items, much like the cologne, and denied any knowledge of how these large pieces of machinery were now "gone." Melissa intimated that Sunrise was unconcerned by Rohan's missing equipment, as it only made his living conditions more intolerable.

The significance of mobility devices for disabled people cannot be understated (Linton, 1998; Disability Rag, 1984). They produce access. They allow for the enactment of different capacities. They unmake definitions of disability as only ever limiting or confining. A wheelchair, therefore, is as much a tool to move around in as it is an instrument that expresses freedom, possibility, and a transgressive mode of embodiment and subjectivity. Fritsch (2010), Quinlan and Bates (2014), and Shildrick (2015) describe this as a human-machine assemblage and argue how this entanglement between the material and immaterial produces configurations and capacities for change. The articulations society assigns to disability shift when others can also speak to Rohan's movement as swift, agile, and powerful. Here, interferences of power and non-disabled/disabled converge to produce a sort of friction between what Sunrise needs and what Rohan wants. In unmaking disability or in making it differently through the production of access in relation to a machine, Rohan reconfigures the relationship between Sunrise and himself. As a human/machine, he is no longer just disabled, but is rather, something entirely new – more disruptive and with new capacities and possibilities. He might now be able to check his mail; to speak to a lawyer or a reporter outside of Sunrise; to build momentum in the community. Rohan, of course, did all these things from within Sunrise and without his equipment. However, with access to his devices, Rohan's capacity to resist could have been that much more.

Kim and Melissa only spoke in fleeting remarks about Rohan's life outside of the legal case, but if Rohan decided to convey the theft of his equipment to them it must have been an important element in his life. Its disappearance, would equally, have had a significant affecting quality. Rohan would have lost not just access to movement, but access to parts of this life. Rohan again made bodymind differences pertinent. He activated disability not as a *thing*, but as in relation to the other human and non-human elements. Fritsch (2013) argues that when disability is a thing, it "can be known, contained, marketed, consumed, profited from, and solutions can be found" (p. 142). However, disability in relation is "fluid, contextual, social relation" (p. 142). It is much more difficult to ignore or suppress when it is made relevant and expressed as a force intra-acting with other elements.

The examination of these moments of interference demonstrates Rohan's agential capacity to make and unmake differences and to resist dominant cultural understandings of fat/black/disability embodiment. The refusal to comply with his food preferences and the theft of his cologne and equipment only further attests to the hostile and violent experiences Rohan had to endure during his legal challenge. Melissa repeated Rohan's argument stated earlier – that the underlying reason for Sunrise's determination to evict him was because he lived longer than they ever expected. Rohan's expression of life – in all the things discussed above – was a constant reminder of his aliveness. This is contrary to the conception of fat bodies, black bodies, and disabled bodies as dying and already dead. In making his body not only alive, but one that enjoyed food, was sexual, and had a desire to explore, Rohan remade the meanings of fat/black/disabled bodies that undermined Sunrise's and Revera's business model. The next section will demonstrate how Rohan's desire for life permitted him to resist the state and achieve his goal of staying at Sunrise.

Fat

The Sheriff's refusal to remove Rohan from Sunrise was a serious matter. The Court stated as such when they said,

> A Sheriff is an officer of the court, sworn to uphold the law. Refusal by a law enforcement officer to enforce an order of the court can only serve to undermine respect for the judicial

> system and bring the administration of justice into disrepute. A Sheriff, therefore, has no discretion to refuse to execute a writ of possession (*Sunrise North Senior Living Ltd. v. The Sheriff (Regional Municipality of York)*, 2020).

After reading about the Sheriff's refusal in the court proceedings, summaries from legal analysts, and in Kim Zazour's reporting, the authors were left confounded by the Sheriff's inaction. Was this, in fact, an act of solidarity or resistance? Did the police refuse to engage on moral or ethical grounds, or because of feelings of pity or charity? Kim, thankfully, explained their reasoning. She stated, "There was discomfort around moving, Rohan." Melissa concurred with Kim's assessment of the Sheriff's inaction and clarified that it was, without a doubt, not an act of resistance. Making sense of the Sheriff's refusal to move Rohan based on discomfort was now even more challenging. What about Rohan, or the situation was so affecting? Why does *this* black man, who was found guilty in a court of law, warrant different treatment from the police and the state compared to the thousands of innocent black men murdered on the streets? The analysis suggests that it was Rohan's fat, black, disabled body that unsettled the police and allowed him to stay in place

To understand how this unfolded, one must first unpack the meaning-making around fat, black, disabled bodies in contemporary society. Intra-acting within the event-space comprised of Rohan, Sunrise, the police (and so many other elements) was also the common notions of the fat body as dying, the black body as death, and the disabled body as dead (Shackelford, 2021). Rohan was thrice-dead – his body far out of bounds – occupying spaces beyond "being, life, death, other, imagination, extravagance. . ." (Shackelford, 2021, p. 254). However, in this beyond-space, he made fatness, blackness, and cripness relevant, significant, and qualities of life and living. Shackelford (2021) speaks of this as a black fat politic of abundance intrinsically rebellious against the anti-blackness of the world. The authors would add that disability is equally abundant and tied up in the making and unmaking of blackness. Thus, Rohan lived in the abundance of his fat/black/crip-ness. He enacted this being and becoming and conveyed his desire for those expressions in the Jamaican food he selected to nourish and feed him; in the colognes he collected and applied and, in the machines, and equipment he so badly wanted back so he could move and explore. He lived his life and expressed this desire to live. This abundance for life – in fat/black/crip-ness – the authors assert, was the Sheriff's source of discomfort.

Discomfort is a culturally acceptable way of expressing disgust and revulsion against fat people. These are also all too common adjectives used to express hostility toward disabled and racialized people. However, LeBesco upends these ideas by arguing that in reading fat bodies as revolting, there is an opportunity to make this misreading political. Fat bodies, LeBesco (2001) contends, are revolting *and* thus capable of "...overthrowing authority, rebelling, protesting, and rejecting..." (p. 75). LeBesco's argument is, if fat is to be conceptualized as revolting, then it can also be considered an act of revolt. Fat is not just being acted upon or discursively imagined and reimagined through dominant or counter-dominant cultural notions but is also acting upon the human and nonhuman elements in any given space. It has, as Colls

(2007) argues, "...its own capacities to act and be active" (p. 358). Fat acted as a force preventing the police, the Sheriff, the Courts, and a multinational corporation from doing their bidding. It is in this full resistance, embodied and embedded with black-abundance, fat-revolt, and crip-desire that Rohan was able to stay 2 years past his eviction at Sunrise – what he wanted from the beginning. Rohan's bodymind already imagined as dying/death/dead caught up to his time-space, all too soon. Although he was never physically evicted from Sunrise, he also did not escape. He did, however revolt, and from that, there are lessons for fat, black, and disability scholars and activists to remember, learn from, and share.

Reimagining Long-Term Care

Rohan's choices were very limited. His family could not provide him a place to stay, even temporarily. Other retirement homes could accommodate him, but not all his belongings. His choices, therefore, were between a long-term care facility or a hospital. What he really wanted was to stay put, but Sunrise was no longer an option. Together, the healthcare and justice systems in Ontario failed to support Rohan in this effort. As disability studies scholars, and Ontario residents, it is devastating to know that the legal system would fine the province for failing to evict a man rather than charge the state for failing to house him. It's equally devastating that Rohan's options were so limited. Rohan wanted people to recognize his capacity for life (Zarzour, 2021). In this regard, Rohan's attempts to distance and separate himself from long-term care homes were an act of resistance, a recognition that he had a lot more to contribute. He imagined his life outside of long-term care. He saw too many friends die at Sunrise or be transferred away to hospitals and long-term care facilities, only to die shortly thereafter (Zarzour, 2021). He perceived that admission into long-term care would have been a death sentence (Miller, 2021, "personal communications"). Melissa expressed concern over Rohan's possible placement in long-term care. She shared Rohan's fears and expressed similar concerns about his life in long-term care. Rohan was in a state of unrest and upset, waiting to hear where he might go, surrounded by half-packed boxes prepared for the move, worried it would cause him to lose caregivers who had been with him for over a decade and whom he considered family. He had trouble sleeping during this time, experienced recurring nightmares, and left depressed and helpless (Zarzour, 2019).

According to a Canadian scoping review (Alberga, et al., 2019) on weight-bias and healthcare utilization, having an increased body mass index (BMI) impedes access to health care and studies have documented a decrease in the use of healthcare services associated with an increase in body mass index (BMI) (Olson et al., 1994; Fontaine et al., 1998; Amy et al., 2006; Aldrich and Hackley, 2010). Disability scholars have also discussed fear of using healthcare services due to weight bias and racism in healthcare (Gardiner, 2020). The authors contend that this weight-bias extended to the type of care and support that Rohan needed, it limited his personal support worker and healthcare options including his ability to select Direct Funding as a care model.

The Direct Funding (DF) Program is an Ontario-wide program that provides funding to directly eligible disabled people (referred to in the program as "self-managers) to hire and manage attendant services from their homes. Criteria for the program are set by the Ontario Ministry of Health and Long-Term Care and the funding is administered by the Centre for Independent Living in Toronto (CILT), Inc. Only after diligent assessments to meet the criteria can individuals access the funding. The program allows for recipients to have more choice and control over their own attendant care needs. The program was created following considerable disability activism, and it eventually would follow the principles of the Independent Living Movement – choice, control, freedom, equality – which emerged from the disability rights movement started in the UK and Berkeley, California (Evans, 2003; Hasler, 2003; Martinez, 2003). When the idea of self-directed care emerged, many in the disability community were speaking out against institutionalized "care" and the abuses within those systems.

DF has some very real limitations. It is important to note that it is the most cost-effective option for the support and care of disabled people, and it relies on the free labor of disabled self-managers as well as close to no benefits or opportunities for attendant, with no path to advance in their career. Kelly (2014) points to DF as a program that is monetized based on ability and care needs as defined by the Ministry rather than the self-determination of disabled people. As Hande et al. (2020) write, "DF should be one component of a broad spectrum of social care policies" (p. 27).

Due to the poor conditions in retirement congregate living, nursing homes, and long-term care homes there have been calls to increase homecare services in Ontario. Not long into the pandemic stories of abandonment, neglect, and mass loss of life spread rapidly and the significant gaps in long-term care planning and management were finally center stage (Howlett, 2021; Morocco et al., 2021). As a response, disabled activists (Jama, 2020; Schulson, 2020) are calling for the abolition of long-term care in recognition of the need for more *care at home* and not more *housed* disabled people (Home Care Ontario, 2021). Care at home would promote self-agency, ensure care, and allow a person to select their chosen community. The Canadian Red Cross (2021) states, "If given the choice, most Canadians would *choose* to age or recover at home." The Red Cross does not define homecare but provides a list of three common characteristics: (1) personal care, (2) home management, and (3) respite and companion care (Canadian Red Cross, 2021). Many models of homecare do not recognize younger, permanently disabled people as likely users of the model. This erasure is evident in the popular definitions for the model that focus on the care of seniors, individuals with temporary disabilities, and those at the end-of-life.[5] This is an interesting erasure and a gap in the system, one

---

[5] Please consider this definition from Bayshore (2018): "Home care services are extensive and varied, depending on the need. Services can include meal preparation, medication reminders, companionship or assisting with errands. Home care services can also include respite care, wound care, serious injury care, or palliative care. Home care is about meeting the most basic, but essential, needs such as a friendly face dropping by for a chat or something as intimate and poignant as end-of-life care" (n.p).

that Rohan described to various news media outlets. Rohan should have had the opportunity to live in his own home and receive care throughout his life. However, the required adaptations for fat bodies are far from the minds-eye of designers of care systems in Canada. These assumptions surely created enormous barriers for Rohan. And yet, while homecare might still have been within the realm of possibility for Rohan, none of it materialized. Currently, long-term care and meager homecare provisions represent a system that operates below the threshold that would allow for the survival of disabled people. By moving to a system that addresses quality of life and care, rather than state-recognized and monetized basic body needs, disabled people, including Rohan, could live fuller, dignified lives.

The time spent reading about Rohan's life allowed the authors to reflect on less popular, more radical care models. Specifically, care collectives (see Piepzna-Samarasinha*,* 2018). Care collectives are a model of care where friends, rather than attendants or personal support workers (PSWs), provide the necessary daily assistance with living. Loree Erickson, a disability studies scholar and activist, has operated her care collective in both the USA and Canada for the past 17 years. It has become a political space for training in activism and teaching disability politics. Piepzna-Samarashinha (2018), calls Loree's care collective, "a deep possibility model, not a one-size-fits-all solution for everyone who needs care" (p. 60). What if similar model of care, adapted for Rohan, might have worked if the right support or infrastructure was present? From what others have told the authors about Rohan, he was a master at building community. When Rohan could not continue to live at Sunrise Senior Living, he quickly made significant attempts to identify community allies through pro bono legal groups, reporters, former colleagues, and influential community members and leaders. Rohan's care collective then was not only a collection of PSW's, nurses, doctors, and friends but folks concerned about disability justice in the broader community. What would it be like to imagine Rohan organizing his care at *his* home? This care would be organized to include his food preferences, his hobbies, and his equipment – and so much more. It would have meant that Rohan could have actualized more of his life and his desires. It certainly would have stifled the suffering that he experienced repeatedly at the hands of deepening and entangled systemic oppressions. It is in the realm of possibility that Rohan would have been able to create a little utopia.

Conclusion

Fady learned of Rohan's situation in 2018 from Kim's reporting. At the time, he was on the board of the Centre for Independent Living in Toronto (CILT) Inc and thought he could help in that capacity. He emailed the Executive Director, at the time, Sandra Carpenter. Fady figured that Sandra, a life-long disability activist, would know what to do. Sandra's response was quick but defeating. She said, "I'll definitely look into it. The trouble is he is bariatric and so not many attendant service providers can accommodate that." She explained, "For example they would need extra wide wheel-chairs [and] doorways, maybe two person transfers. A definite hole in the system." Comments about "holes in the system" are abundant but after following Rohan's care, the flaws in the systems and institutions he encountered seem more akin to cavernous pits than just a few holes. Many mourn for those who have fallen in, who are pushed in every day – those whose stories are heard, analyzed, and remembered, and the many, many more that disappear without any discussion.

The authors mourn with Rohan's family and friends for their loss and with Kim and Melissa who tried for nearly 2 years to bring attention and justice to Rohan's situation. The analysis has hopefully brought further scrutiny to Rohan's case and to the fatphobia, anti-black racism, and ableism he experienced and that make up many disabled people's experiences in the nursing home-industrial complex. However, this chapter is also a celebration of Rohan's life and his commitment to living. Rohan's resistance against the state was purposeful, meaningful, but also time limited. There is a temporality to this resistance. The state and its actions killed him. But Rohan made his mark – claiming his subjectivity at the intersections. He actualized intersectionality-as-interference – occupying conceptual and material space before state violence could erase him. Despite the state conceiving of him as disposable, his agential interference – enacting a crip-desire, within a black body that embraced excess as a mode of refusal was a spirit that the state could not destroy. Other marginalized people, both inside and outside long-term care, enact similar resistances to Rohan's. As disability studies scholars, analysis of power relations and agency considers patterns of interference in emergencies with material things to ensure they are not territorializing expressions of resistance. In truth, witnessing and acknowledging these acts of resistance and expressions of life render unintelligible any justification for the violence, harm, and hate too many disabled people experience in care institutions.

This chapter has argued that Rohan expressed a desire for life, through his relation to material things that made and unmade fatness, blackness, and disability in such a way that it brought attention and scrutiny on to his body, which was already deemed dead and dying. In focusing on the relational ontology of fatness, blackness, and disability, the authors have shown the fluidity of these categories, and their interconnections, to demonstrate how Rohan enacted a desire for difference through fat/black/crip-ness that upended the social script – and allowed him to thwart police and the courts. *Fat/black/crip becoming* had an affective political intensification on those in positions of power, which allowed Rohan to get what he wanted – to stay put, for as long as possible.

Monitoring and Indicators of Disability Rights

Monitoring and Indicators of Disability Rights: Introduction

36

Radoš Keravica

Abstract

This introduction offers a brief overview of the key challenges that the stakeholders involved in the monitoring of the implementation of the UN Convention on the Rights of Persons with Disabilities are facing, opportunities for engagement with national and international human rights mechanisms and the best practices of participatory monitoring led by disabled people and their representative organizations. It introduces readers to the content of seven chapters written by contributors which come from different spheres of work and include activists from civil society, human rights professionals from intergovernmental organizations, academic researchers, and disabled people themselves. The readers will be able to get a glimpse of the contributions which tackle some of the contemporary issues in the field of monitoring and indicators of disability rights mapping out the challenges and potential solutions to advance human rights monitoring holding governments accountable to the population of disabled people worldwide.

Disability rights · Monitoring · UN Convention on the Rights of Persons with Disabilities · Indicators · Sustainable Development Goals

The UN Convention on the Rights of Persons with Disabilities (CRPD) brought into force in 2006 has marked an important milestone in the global struggle of disabled people for equal enjoyment of human rights. The drafting process of the CRPD had seen unprecedented participation of disabled people and their organizations, unparalleled in any other human rights treaty before it. The CRPD has been ratified so far by 184 States Parties and after the UN Convention on the Rights of the Child, it is the

most ratified treaty in the corpus of international human rights law (UN DESA, 2022).

The Convention is a hybrid human rights treaty in so far as it includes both civil and political and economic, social, and cultural rights. It also comes close to creating new rights or at least innovates the existing human rights standards as it introduces some of the concepts which had never before been mentioned in international human rights law, such as independent living or supported decision-making (Megret, 2007). That being said, not only does it require profound and carefully planned legal reforms, it requires changes in how society views and treats disabled people and changes in attitudes and professional practices which result in segregation and isolation of disabled people.

After the ratification, most of the States Parties have engaged to some extent in legal reforms in order to align domestic legislation with the CRPD provisions. The CRPD Committee has consistently been pointing out in the first cycle of state reporting the need to bring the domestic legislation in compliance with the CRPD norms. Now, more than 15 years after the CRPD has been brought into force, it seems that the onus is shifting toward the need to ensure full implementation of reformed legal frameworks at the national levels and the CRPD as a whole. Since the CRPD is to a significant extent innovative human rights treaty demanding profound changes in society, it might seem easier to identify the practices which are not compliant with the standards enshrined in the CRPD, rather than knowing what exactly should be done to make the full enjoyment of human rights a reality for disabled people. OHCHR defines monitoring as “a broad term describing the active collection, verification and immediate use of information to address human rights problems” (Office of the High Commissioner for Human Rights, 2001). This definition begs the question of who is supposed to collect the information and how, which information is needed, or how that information can be used to address human rights problems. With those questions about monitoring in mind, we can say with certainty that it becomes increasingly important to establish independent national monitoring mechanisms with strong involvement of disabled people and DPOs which would have resources and skills to monitor the implementation of the Convention on an ongoing basis. Participation of disabled people in the monitoring process should ensure that their lived experiences are used to provide evidence of human rights violations but should also inform the advocacy agendas of civil society actors and ultimately the implementation of the CRPD.

The CRPD monitoring and reporting is not the only international mechanism on disposal for disabled people to track societal progress. The Sustainable Development Goals (SDGs) or Agenda 2030 is an internationally agreed set of goals adopted by the UN General Assembly (UNGA) which succeeded the former development agenda known as the Millenium Development Goals (MDGs). The SDGs do not have a legally binding nature as the human rights treaties but rather represent the world’s vision of the future and aspirations to reach a more equitable and sustainable society. Although based on voluntary compliance, the SDGs provide for substantial institutional mechanisms to monitor the progress made by the states and for the engagement of disabled people and their organizations in the process of monitoring.

However, disabled people should be aware that the SDG's potential to bring about desired changes is not uncontested. The SDGs are criticized for failing to challenge the existing institutional order of the world's economy which generates inequalities and poverty in the first place (Pogge & Sengupta, 2015). The lack of structural changes in how the global economy operates ensures the continuity with the prioritization of commercial interests of transnational cooperation weakening the power of states to provide for their citizens and guarantee their human rights (Josephsen, 2017; Eisenmenger et al., 2020). Despite the claims of universality and ideological neutrality, the SDGs seem to perpetuate the neoliberal politics of development and in this regard are far from being ideologically neutral. Neoliberal politics promotes economic growth rather than redistribution policies as the main vehicle for the reduction of inequalities (Weber, 2017). Its ideological premises underpin the liberalization of markets, commercialization, and commodification of goods and services including public ones such as health care or social services which have vital importance for disabled people. Disabled people have experienced detrimental effects of the neoliberal commitment to reduce the state's role in funding and provision of health and social care as part of the austerity measures (Sakellariou & Rotarou, 2017). A stark example of this is the reform of disability benefits in the UK which tightened eligibility criteria and led to significant cuts to financial support for disabled people undermining their right to independent living (Cross, 2013). These reforms even triggered an inquiry procedure under the UNCRPD and an investigation of the UNCRPD Committee which established that grave or systematic violations of the rights of disabled people have been committed by the UK Government (CRPD Committee, 2016).

These developments tell that the disability movement needs to be aware of the weaknesses of the current international human rights and development mechanisms and to remain vigilant and understand the impact of underlying social structures that cause disablement. Monitoring should help to develop such understanding and inform disability activism because disability justice will only be achieved when disabling social structures that lead to our marginalization are identified and dismantled.

This section seeks to explore the latest developments in the field of disability rights monitoring. The chapters prepared by the contributors to this section cover different aspects of disability rights monitoring which will contribute to answering the questions posed in the previous paragraph. Here, we offer a brief overview of the content of the chapters included in this section.

Colin Caughey and Hanxu Liu in ► Chap. 37, "Role of National Human Rights Institutions and Organizations of Persons with Disabilities in the National Monitoring of the CRPD," explore the normative framework of the CRPD as it concerns monitoring at the national level. The CRPD Article 33 has envisaged a robust system of monitoring of the CRPD implementation. Its text includes a standalone article on monitoring (Article 33) drawing from the decades-long experiences and lessons learnt from monitoring of other human rights law instruments. Among the key requirements of Article 33 is the involvement of persons with disabilities and their representative organizations in the process of monitoring, both through national and international monitoring mechanisms. Colin and Han in their research examine the requirement for the State Parties to set up independent monitoring frameworks. They draw from their research of organizational models of independent monitoring frameworks and analyze the examples of designation of the National Human Rights Institutions (NHRI) as the independent monitoring frameworks while paying special attention to the issue of involvement of DPOs in the work of such frameworks and monitoring processes.

Victoria Lee and Juan Ignacio Perez Bello in ▶ Chap. 38, "Bridging the Gap: Harnessing the Synergies Between the CRPD and the SDG Monitoring Frameworks," analyze the ways of strengthening complementarity and synergies between the monitoring frameworks of the CRPD and SDGs in order to harness their potential to ensure full inclusion of disabled people in contemporary societies. Both instruments and their monitoring frameworks create important opportunities to advance the rights of persons with disabilities through data collection and disaggregation, the use of indicators to track progress, as well as the participation of persons with disabilities and their representative organizations. Victoria and Juan Ignacio examine the possibilities for DPOs to engage in the monitoring processes under both instruments and they also present the SDG-CRPD resource package developed by the Office of the UN High Commissioner for Human Rights (OHCHR), particularly its human rights indicators and data sources guidance with an aim to contribute to converging and consolidating efforts toward a disability-inclusive 2030 and beyond.

Elizabeth Lockwood in ▶ Chap. 39, "Disability Rights Monitoring: Focus on the Sustainable Development Goals," explores the evolution of advocacy of the inclusion of persons with disabilities into the 2030 Agenda, participation in follow-up and review mechanisms, and how this, in turn, influences national policies. She argues that despite incredible efforts, persons with disabilities remain left behind after five years into the implementation of the SDGs, particularly due to the lack of disability data to monitor the SDGs. Further on, she underlines the importance of the engagement of DPOs in advocacy efforts to make sure that the States collect and disaggregate data on disability to enable evidence-based policymaking in line with the CRPD standards and toward the fulfillment of the ambitious Agenda 2030.

Steven Allen and Sandor from Validity Foundation reflect on the challenges that disabled people faced globally during the pandemic of COVID-19. In ▶ Chap. 40, "COVID-19 Disability Rights Monitor: State Measures' Impact on Persons with Disabilities during the Coronavirus Pandemic," they draw from the major global initiative the COVID-19 Disability Rights Monitor which was set up to monitor the impact of COVID-19 impact on disabled people worldwide. They reflect on the methodology used to monitor the impact of the pandemic on disabled people and highlight the significance of participatory monitoring which relies on people's testimonies and the significance of working in a transnational coalition of disability organizations to collect monitoring data and reveal human rights violations. They show the findings of the survey and share representative testimonies from persons with disabilities and other respondents.

Teodor Mladenov as a member of the Independent Living Research Network offers an account of the engagement of the international DPO – European Network on Independent Living (ENIL) in the process of monitoring the implementation of CRPD Article 19 at the European level. In ▶ Chap. 41, "Independence and Its Meaning: ENIL's Monitoring of Article 19 as a Struggle for Hermeneutical Justice," Teodor explores the efforts of disabled people's independent living movement to negotiate the meaning of independence and conceptualizes ENIL's monitoring of the implementation of Article 19 of the CRPD as a struggle for hermeneutical justice. ENIL's understanding of independence as having a choice and control in one's everyday life, including choice and control over one's support, has guided ENIL's monitoring of deinstitutionalization reform and personal assistance schemes in Europe that are discussed in the chapter as instances of disabled people's organized collective struggle for hermeneutical justice. This highlights the importance of monitoring as an emancipatory tool through which the disability movement can promote its philosophy and disability rights as a whole.

Sonja Vasić and Emma Matreniuc in ▶ Chap. 42, "Disability Rights Monitoring in Practice: Applying Holistic Participatory Methodology," offer an account of the personal impact experienced during the participation in the Disability Rights Promotion International (DRPI) Project (Rioux, 2017) in Europe by two women disability rights activists with the living experience of disability. Sonja and Emma were involved in DRPI Project in Eastern Europe in different roles within the project, supporting the collaborative participatory country monitoring projects in the region. They explain the key features of DRPI's holistic participatory methodology of disability rights monitoring and share their experiences of participation in the project. They examine the personal impact they experienced in the monitoring process and critically reflect on the impact of participation in the monitoring process for the disability movement as a whole. Their chapter reminds us of the emancipatory potential of participatory monitoring for disabled people and their movement. It underscores the strong message that the process of monitoring is equally important as its results. In the participatory monitoring process, DPOs can come together to work in cross-disability coalitions, learn about their rights, share their testimonies of human rights violations, and use evidence to shape their common advocacy agendas.

Sophie Pecourt and Silvia Quan share their experience of working with the Making it Work (MiW) methodology. In ▶ Chap. 43, "Protecting Women and Girls with Disabilities from Violence and Upholding Their Rights: Making It Work Methodology," they reflect on the utility of MiW methodology to collect information on best practices of CRPD implementation shifting the focus from collection of data on human rights violations to collection of data on what works best in the process of CRPD implementation. They explore MiW methodology as applied to the initiative to prevent, eliminate, and respond to violence, abuse, and exploitation against women and girls with disabilities and demonstrate that placing persons with disabilities, particularly women with disabilities, as key and central actors in the implementation and monitoring of the CRPD, is a successful road for their empowerment.

It is our hope that this collection of chapters on disability rights monitoring will shed light on key challenges and lessons learnt from the engagement of DPOs in the processes of monitoring pertaining to the CRPD, but also to SDGs at the national and international levels. These insights from fellow advocates for disability rights cover a range of topics including but not limited to the normative framework of the CRPD as it concerns the monitoring, its methodologies, and participation of disabled people and their organizations in data collection and reporting. Further, the contributors to this section focus on the synergies and differences between the CRPD and the SDGs and their systems of monitoring, the use of human rights indicators for monitoring purposes, the use of monitoring to uncover specific forms of human rights violations, or the emancipatory potential of monitoring for disabled individuals and disability movement as a whole.

The contributors to this section of the handbook come from different backgrounds and we are proud that among them there are prominent disability activists working in national and international civil society organizations, United Nations, academia or development agencies, and disabled people themselves. We are convinced that their insights will represent a significant resource for all those wishing to engage in disability rights monitoring or merely to learn more about it and at the same time will provide us all with an impetus for joint reflection.

It seems that it is now important, perhaps more than ever, to use the CRPD and its system of disability rights monitoring to systematically collect data and report on the human rights violations disabled people are facing during the pandemic of COVID-19 but also in the period of societal recovery. The times of crisis as we have seen after 2008 and the financial crisis that ensued followed by austerity programs worldwide represent a threat to previously attained levels of enjoyment of human rights and disabled people are among the first groups to experience the setbacks (Macdonald & Morgan, 2021). The present conflict in Ukraine coupled with pandemic effects is already causing economic instability. The effects of the high inflation rates, increased cost of living, energy crisis, and refugee crisis will certainly influence national economic and social policies worldwide. As some countries are announcing significant increases in their military spending, it can be assumed that the spending on disability may come under attack.

Thus, it is important that disability movement monitors the impact of emerging crisis and policies which form the response to this crisis. The social model of disability as the “big idea” of the disability movement should be at the heart of monitoring efforts as the social model points toward the sources of disablement which have nothing to do with people’s impairments but lie in the social structures that generate the barriers and social exclusion that disabled people face (Oliver & Barnes, 2012; Beckett & Campbell, 2015).

The most important way to do this data collection and monitoring in the future will be by developing sustainable, independent, and robust systems of human rights monitoring at the national level. Such systems should be properly funded and should apply periodically, on a regular basis, a consistent methodology to compile the sets of quantitative and qualitative data including the testimonies of disabled people. Equally important, disabled people and their organizations should be directly involved in the monitoring processes. Monitoring should not be the exercise reserved only for "experts" (disabled or nondisabled) with specialized knowledge of the CRPD who get hired to draft reports on the realities of disabled people without consulting them. Instead, the monitoring process is equally important as the result and disabled people across all impairment, age, and gender groups should be engaged in it. The monitoring process should be participatory and emancipatory, in so far as it should create the space for disabled people to voice their views and tell about human rights violations they experience. It should also help them to learn about their human rights, sources of disablement and commonalities with disabled people with other impairments than theirs, and provide them with the possibilities to engage in disability activism. The methodology of holistic and participatory disability rights monitoring developed under the global and collaborative Disability Rights Promotion International (DRPI) project has come furthest toward achieving this purpose (Disability Rights Promotion International, 2011). Tested in more than 40 countries worldwide and based on an emancipatory paradigm it sought to build the capacities of disabled people at the grassroots level to monitor their rights equipping them with the knowledge and tools to conduct participatory disability rights monitoring drawing on their expertise by experience.

It is our hope that this section will offer important lessons learned through the recent monitoring processes in which disabled people were engaged. Our contributors attempted to answer the questions of what do we monitor, what kind of data we need to collect, and how and where do we report the findings if we are to see long-awaited changes. Let their contributions be the starting point for further development of monitoring practice and joint deliberations on the issues raised in this section.

Abstract

This chapter explores the relationship between national human rights institutions (NHRIs) and organizations of persons with disabilities (OPDs) in the context of the UN Convention on the Rights of Persons with Disabilities (UNCRPD). The chapter focuses on Article 33(2) of the UNCRPD; it analyses the obligation placed on states to establish an independent monitoring framework and how states are meeting this obligation in practice. It looks at the different models which states have adopted when developing their monitoring frameworks, noting that the designation of an NHRI within the framework as the independent monitoring mechanism has in practice been shown as the strongest guarantee of both independence and effectiveness. The chapter considers the opportunities which the designation of an NHRI within the independent monitoring framework presents to OPDs. The unique characteristics of NHRIs are considered. Noting these, a number of potential opportunities for collaboration between NHRIs and OPDs are considered with reference to relevant examples. Overall the chapter highlights the need for a more detailed appreciation of the relationship between NHRIs and OPDs along with the need to consider what achievements can be made through effective collaboration.

Introduction

When the UN Convention on the Rights of Persons with Disabilities (hereinafter CRPD or Convention) was opened for signature, it was anticipated that it would lead to procedural innovation at the domestic level. Including it was hoped that the establishment of institutional architecture for the implementation of the CRPD would act as an engine for law reform (Quinn, 2009a, b, pp. 47–48; UNCRPD, 2007). This architecture is constructed around three pillars consisting of a government focal point, a reinvigorated civil society, and an independent monitoring framework.

Some 15 years since the Convention was opened for signature, it seems to be an appropriate time to take stock of how this architecture has been developed in practice and whether the promise of innovation has been delivered. This chapter will focus on the latter two pillars considering how states have complied with the obligation to establish an independent monitoring framework and the opportunities which this presents to civil society. The chapter highlights that central to the success of both pillars is the relationship between national human rights institutions (hereinafter NHRIs), designated within a monitoring framework and civil society organizations, particularly organizations of persons with disabilities (hereinafter OPDs).

During the negotiation of the CRPD, civil society organizations and NHRIs collaborated effectively to influence the development of both the substantive and procedural articles within the Convention. Echoing the international disability movement's mantra of "nothing about us without us," the CRPD places general and specific obligations on the state to involve civil society in the implementation of the Convention (UNCRPD, 2007, Article 4.3, 33.3 and 32.1).

NHRIs are "State-mandated bodies, independent of government, with a broad constitutional or legal mandate to protect and promote human rights at the national level" (Paris Principles, 1994). NHRIs are accredited by the Global Alliance of NHRIs (hereinafter, GANHRI) on the basis of their compliance with the Paris Principles relating to the status and functioning of national institutions for protection and promotion of human rights (hereinafter the Paris Principles). The Paris Principles are referred to within Article 33(2) which puts in place a requirement on State Parties to establish a framework, including an independent mechanism to monitor the implementation of the Convention (Degener, 2016, p. 31; Quinn, 2009b, pp. 47–48). As we will set out below in practice, NHRIs are the presumptive nominee as the independent mechanism. In practice many independent monitoring frameworks are single entity frameworks. NHRIs designated as the independent monitoring mechanism therefore also effectively make up the entirety of the monitoring framework.

This chapter aims to consider the legal aspects of the independent monitoring mechanisms as required by the CRPD and investigate states' obligations, civil society's role under such mechanisms, and some current issues in practice. With a focus on the independent monitoring mechanism, this chapter considers how civil society organizations, especially OPDs, can collaborate with NHRIs designated as the independent mechanism to bring about change. We introduce an overall discussion, rather than a comprehensive reflection on the current practice of CRPD monitoring, drawing on existing studies and documents from online database[1] of the Committee on the Rights of Persons with Disabilities (hereinafter CRPD Committee or Committee).

The following discussion is developed in four sections. First, section "International Normative Framework: National Monitoring and Civil Society's Participation" provides an insight into the normative frameworks under the CRPD regarding independent monitoring mechanisms and the participation of civil society, especially OPDs. Section "Current Situation of National CRPD Monitoring" looks into the implementation of such mechanisms among states and then discusses the effective collaboration between the NHRIs and civil society organizations in section "Effective Collaboration Between Independent Monitoring Frameworks and Civil Society Organizations." The last section provides some concluding remarks.

International Normative Framework: National Monitoring and Civil Society's Participation

The OHCHR (2009) published a thematic study on the structure and role of national mechanisms for the implementation and monitoring of the CRPD, followed by a guidance document in 2014 (Conference of States Parties to the Convention on the

---

[1] See https://tbinternet.ohchr.org/_layouts/15/treatybodyexternal/TBSearch.aspx?Lang=en

Rights of Persons with Disabilities). Guidance issued by the CRPD Committee by way of its concluding observations and general comments have further prescribed the form and function of independent monitoring frameworks (CRPD Committee, 2018d). The CRPD Committee have also issued specific guidelines on the independent monitoring frameworks and their participation in the work of the Committee (CRPD Committee, 2016a, b). Despite these additional sources of guidance, a number of ambiguities remain relating to independent mechanisms, which we will seek to address in this section.

The CRPD was negotiated at a time at which the effectiveness of the treaty body system was under scrutiny and consideration was being given to adapting practices and procedures regulating treaty body examinations to make them more effective (Pillay, 2012, as cited in Guernsey 2018). During the negotiation of the CRPD, a number of proposals for innovating the international examination process were put forward. However, as the negotiations progressed, it became clear that states were unwilling to subscribe to new methods of international monitoring (Stein & Lord, 2010, p. 689, as cited in Combrinck, 2018, p. 1066). The negotiations focused on developing innovative arrangements at the domestic rather than at the international level (Raley, 2016, p. 138). As a result the CRPD represents "a clear improvement for human rights implementation" at the domestic level (Marianne Schulze, 2013, p. 209). The CRPD puts in place a dual approach to oversight, with responsibility for international oversight resting with the Committee and responsibility for domestic oversight with the independent monitoring framework (Ferrajolo, 2017, p. 610). We would add to this assessment that the CRPD improves human rights at the domestic level through requiring states to ensure the participation of persons with disabilities in the implementation process and to support their participation in the monitoring framework.

The CRPD Article 4(3) places a specific obligation on governments to "closely consult and actively involve" persons with disabilities including children and their representative organizations in "decision-making processes concerning issues related to persons with disabilities." This obligation is closely related to the right to political and public life protected by Article 29 of the CRPD. Article 29 (b) emphasizes the value of participating through NGOs and associations, especially OPDs that represent people with disabilities at international, national, regional, and local levels.

OPDs should be systematically and openly consulted and involved in decision-making processes related to monitoring the CRPD, in a "meaningful and timely manner," which requires states to ensure accessibility and provide reasonable accommodations in relation to information, communications, the physical environment, and national funds (CRPD Committee, 2018d, para. 22). By way of general comment, the CRPD Committee have elaborated on the requirements of Article 4(3). The CRPD Committee have made clear that OPDs should be systematically and openly consulted and involved in the development of CRPD implementation measures, in a "meaningful and timely manner," which requires states to ensure accessibility and provide reasonable accommodations in relation to information, communications, the physical environment, and national funds (CRPD Committee, 2018d, para. 22).

The CRPD at article 33(2) makes provision for the establishment of an independent monitoring framework, it provides:

> *States Parties shall, in accordance with their legal and administrative systems, maintain, strengthen, designate or establish within the State Party, a framework, including one or more independent mechanisms, as appropriate, to promote, protect and monitor implementation of the present Convention. When designating or establishing such a mechanism, States Parties shall take into account the principles relating to the status and functioning of national institutions for protection and promotion of human rights.*

From initial observation, this provision requires a state to have regard to the Paris Principles when designating the independent monitoring mechanism. The OHCHR stated that NHRIs are the "natural core entities of the monitoring framework at the national level" (OHCHR, 2009, para. 78).

The text of Article 33(2) is not prescriptive as to the role, powers, and composition of the framework (Conference of States Parties to the Convention on the Rights of Persons with Disabilities, 2014, para. 8). States have broad discretion to establish an independent monitoring framework in line with their domestic arrangements (Lorion, 2019, pp. 234–258). Article 33(3) also places a specific obligation on states to ensure "civil society, in particular persons with disabilities and their representative organizations, shall be involved and participate fully in the monitoring process." The precise form this participation should take is somewhat unclear (Conference of States Parties to the Convention on the Rights of Persons with Disabilities, 2014, para. 8). Some commentators have suggested that the Article 33(3) obligation mirrors the general obligation contained in Article 4(3) (Quinn, 2009a, p. 252). However the CRPD Committee by way of its general comment have made clear that Article 33(3) is more extensive than Article 4(3) amounting to an obligation to "ensure their effective participation in the processes of the independent monitoring frameworks" (CRPD Committee, 2018d, para. 39). This is clearly greater than the Article 4(3) obligation which is focused around the government's consultation exercises (CRPD Committee, 2018d, para. 21).

Composition of the Framework

The OHCHR has made clear that Article 33(2) does not "prescribe a unique organisational form for the monitoring framework" (Conference of States Parties to the Convention on the Rights of Persons with Disabilities, 2014, para. 19). In practice many independent frameworks are single entity frameworks. In such contexts, the terms framework and mechanisms are often used interchangeably (Murray & Johnson, 2013, p. 110).[2]

---

[2] Also see the General Comment No.7, where the CRPD Committee refers to the national structure under Article 33(2) as "independent monitoring frameworks."

The CRPD Committee have not set out its preferred composition of an independent monitoring framework. However, it is notable that in its concluding observation on Spain and New Zealand, the Committee commended the state for its monitoring framework. In both states, the independent framework is composed of an A status NHRI and an OPD. The Committee noted that Spain was "*in full compliance with Article 33(2)*" (CRPD Committee, 2019d, para. 6). However within the General Comment No. 7, the Committee did not suggest that states were required to designate an OPD as part of the independent framework. The general comment acknowledges that NHRIs "play a key role in the monitoring process of the Convention" (CRPD Committee, 2018b, para. 36). Indeed the CRPD Committee in their concluding observations have consistently emphasized that within a monitoring framework, a State Party "must have an institution that is in compliance with" the Paris Principles (CRPD Committee, 2014a). As set out above, the OHCHR considers that NHRIs are best placed to perform this role. Academic scholars similarly have put forward the view that the inclusion of an NHRI is best practice (The Center for Disability Law and Policy, 2016, p. 13). The Committee in general appear content for the framework to be composed solely of an NHRI, for instance, in its concluding observations on the Czech Republic the Committee recommended that "the office of Ombudsman should be entrusted with the mandate as the independent national monitoring mechanism" (CRPD Committee, 2015a). Similarly the Committee recommended that the Canadian Government "formally appoint the Canadian Human Rights Commission as the independent monitoring mechanism," a recommendation supported by OPDs in Canada (CRPD Committee, 2017b, para. 55(b)). While they are content for an NHRI to be solely designated, the Committee have consistently recommended that independent frameworks should be required to ensure the "full involvement of organizations of persons with disabilities in its monitoring tasks under the Convention" (CRPD Committee, 2017b, para. 55(b)). Therefore while a state may choose not to designate an OPD within the independent monitoring framework, it must still facilitate their involvement in other ways.

Independence of the Framework

The wording of Article 33(2) is ambiguous as to whether the requirements of independence relate to the entirety of the framework or to the independent mechanism alone. It has been suggested that all bodies within the framework "need to be compliant with the Paris principles" (Mental Disability Advocacy Center, 2011). However Quinn and Crowther (as cited in Mental Disability Advocacy Center (2011, p. 63) in a guidance document produced for the Asia Pacific Forum have, in our view, correctly set out that, "the best interpretation is that while the designated independent mechanism must comply with the Paris Principles, the other entities in the framework have to exhibit some functional independence from the executive in order to be effective." This view reflects the established approach of the CRPD Committee which has recommended the removal of state bodies from the independent framework when they are considered to lack independence (CRPD Committee, 2015c).

In their concluding observations, the CRPD Committee have consistently highlighted that compliance with the Paris Principles is the key test of an independent mechanism's independence (CRPD Committee, 2019e). In the case of Belgium, the Committee specifically recommended that the state ensure the accreditation of the Interfederal Center for Equal Opportunities as an A status NHRI (CRPD Committee, 2014a).

The CRPD Committee have emphasized the need to ensure separation between independent monitoring and implementation activities stating that "representatives of departments and units involved in the implementation of the Convention" should not be involved in the monitoring framework (Committee on the Rights of Persons with Disabilities, 2018b, para. 20).

While there is a need for a clear separation between implementation and monitoring, effective monitoring will inevitably involve extensive engagement with the state, and monitoring frameworks will draw on the state's own data collection systems (Aichele, 2018, p. 1000). Conversely an effective plan for implementing the CRPD will incorporate extensive monitoring by the state. For instance, a state must monitor uptake of programs to support persons with disabilities. The independent monitoring framework may advise the state on its monitoring arrangements, and it may input to its analysis. However, in doing so it should maintain a "cordon sanitaire" between independent monitoring and implementation (Quinn, 2008, as cited in Aichele, 2018, p. 984). Contributing to state efforts to monitor implementation should not hinder or undermine the capacity of the independent monitoring framework to engage in its own independent monitoring activities.

Designation of an Independent Mechanism

Article 33 requires states to formally designate an independent mechanism. However this designation is not a pre-requisite for ratification. Some states have ratified the CRPD without establishing an independent mechanism (Birtha, 2013; UN Human Rights Council, 2016). An analysis of concluding observations issued by the CRPD Committee suggests that around a third of all states examined were yet to have designated an independent mechanism.[3]

Upon ratifying the CRPD, the Zambian Government implied that the Zambian Human Rights Commission had been designated as its independent mechanism. However no formal designation had taken place. In her mission report on Zambia, the UN Special Rapporteur on the rights of persons with disabilities (hereinafter Special Rapporteur) made clear that the official designation of the Zambian Human

---

[3] 34 of 91 concluding observations issued include a recommendation that the State designate an independent mechanism or framework in line with Article 33(2).

Rights Commission was required (UN Human Rights Council, 2016, para. 26). This example underscores need for a formal process of designation.

The Committee have made clear that the monitoring framework must have "a stable institutional basis that allows it to operate properly over time and that it is appropriately funded and resourced" (CRPD Committee, 2019d, para. 54). The Committee have not set out in detail the steps which a state should take in designating an independent mechanism.

NHRIs must be vested with competence to promote and protect human rights and should be given as "broad a mandate as possible" (UNGA, 1994, paras 1–2). The Paris Principles require that an NHRI mandate is "clearly set forth in a constitutional or legislative text." This suggests that all accredited NHRIs should have a sufficient mandate to protect and promote the CRPD. However in practice, an NHRI's mandate may be constrained by the domestic legal framework (Murray & Johnson, 2013, p. 93). In a number of cases, the Committee have recommended that an NHRI designated as the independent mechanism be provided with a clear mandate and with sufficient authority to perform its role (Committee on the Rights of Persons with Disabilities, 2018a, para. 60). While the Committee have on occasion recommended that the founding legislation of an NHRI be amended to reflect its role as an independent mechanism, this has not been a consistent recommendation (CRPD Committee, 2017a, para. 63). In practice many NHRIs have been designated as an independent mechanism without amendments being made to their legal basis (Gauthier de Beco, 2011, p. 42).

Resourcing of Independent Mechanisms

Aichele points out that, "the CRPD Committee has indefatigably claimed that the framework must include adequate resources" (Aichele, 2018). The CRPD Committee have consistently recommended that State Parties "provide adequate funding for the functioning of an independent mechanism" (CRPD Committee, 2017b, para. 58). Within their guidelines, the Committee provide that the State Party must, "*further equip them with additional and adequate budgetary and skilled human* resources to *appropriately discharge their mandate under Article 33(2) of the Convention*" (CRPD Committee, 2016b, para. 15). The Committee increasingly consider whether an NHRI designated as the independent mechanism have sufficient resources to carry out the role. For instance, the Committee recommended that the Rwandan Government "allocate human, technical and financial resources that are sufficient in both quality and quantity to the National Commission for Human Rights to enable it to effectively perform its mandate" (CRPD Committee, 2019b).

In practice research by the OHCHR, Europe Office indicates that, "The independent mechanisms generally received no additional funding to promote, protect and monitor the implementation of CRPD. No budget has been provided following their designation" (Gauthier de Beco, 2011, p. 42). The Danish Institute of Human Rights was provided with additional funding on its designation as the independent mechanism and continues to receive specific funding for monitoring the CRPD which has facilitated the development of a specific CRPD unit within the Institute (Gauthier de Beco, 2011, p. 42).

Within General Comment No.7, the CRPD Committee have specifically emphasized the need for OPDs to receive funding to facilitate their participation in the independent monitoring framework (CRPD Committee, 2018d, para. 39). This funding should presumably be administered by the state.

Role of Independent Mechanisms

Reflecting the language of the Paris Principles, Article 33(2) sets out that the role of an independent mechanism is "to promote, protect and monitor implementation of the Convention." Within the Committee's Guidelines on independent monitoring frameworks, it is set out that promotional activities include awareness raising, provision of advice on legislation, research, and reporting including to the UN system. The Guidelines emphasize that independent monitoring frameworks should be able to issue reports "at their own initiative" (CRPD Committee, 2016b). The protection activities include complaints handling, investigations, and participating in court proceedings. The monitoring role of the independent mechanism includes the "development of a system to assess the impact of the implementation of legislation and policies," including the development of indicators and databases. The Paris Principles do not specifically address the monitoring activities of an NHRI. The focus of NHRI monitoring activities has tended to be on the identification of violations. The monitoring activities envisaged for independent monitoring frameworks appears to be more broad based and more closely linked to the policy process (Quinn, 2009a, p. 227). The performance of this more expansive monitoring role is likely to require additional financial and human resources.

Relationship with Organisations of Persons with Disabilities

The CRPD Committee have made clear that the independent monitoring framework must "ensure the full involvement and participation of persons with disabilities through their representative organizations in all areas of its work" (CRPD Committee, 2016b, para. 18).

Within General Comment No. 7, the CRPD Committee have elaborated that independent frameworks should ensure the participation of persons with disabilities and their representative groups, "through formal mechanisms, ensuring that their voices are heard and recognized in its reports and the analysis undertaken." Since the publication of General Comment No. 7, the Committee have become more prescriptive in their recommendations relating to Article 33. The Committee have consistently recommended that NHRIs designated as independent mechanisms adopt formal procedures to facilitate the participation of persons with disabilities in their monitoring activities (CRPD Committee, 2019d). The Committee have also more consistently emphasized the obligation on the state to provide OPDs with the necessary funding to ensure their participation (CRPD Committee, 2018c, para. 56).

Current Situation of National CRPD Monitoring

At the time of writing, the CRPD Committee have issued concluding observations relating to 91 states. In all but one set of concluding observations, the Committee have considered the independent mechanisms. Through reviewing the CRPD Committee's concluding observations, the reports of the Special Rapporteur's country visit procedures, and previous independent studies, a number of trends can be identified in the composition of independent monitoring frameworks.

There is a notable trend of designating an NHRI either solely or jointly as the independent monitoring framework. The designation of an NHRI as the independent mechanism is clearly seen by the Committee as way of guaranteeing its effectiveness. Before considering the essential features of an independent monitoring framework, we will briefly consider the features of an NHRI which makes them suitable to this role.

The key feature of an NHRI is its independence from the state. A body is only recognized as an NHRI when it has been accredited by an independent UN system which assess the body against the Paris Principles and provide it with a grading depending on its level of compliance (GANHRI, 2017). Once initially examined, an NHRI is subject to a quinquennial review and may have its status downgraded. While the accreditation system has been subject to criticism, it provides an open internationally recognized procedural check on the independence of an NHRI which reviews its legal framework, its budget, and its activities.

GANHRI, in particular through its Sub-Committee on Accreditation (hereinafter, SCA), provides NHRI support and assistance in safeguarding its independence. The OHCHR emphasizes that independence is guaranteed through legal safeguards and also through organizational culture (OHCHR, 2009). NHRIs foster a culture of independent thinking and analysis which safeguards them against being co-opted from the state.

As a state institution with a defined legal mandate, an NHRI brings permanence to human rights monitoring. Disability Rights Promotion International highlights that durable human rights monitoring "is not a snapshot but an on-going video."[4] NHRIs have the capacity to establish monitoring tools which track human rights developments in the long term. For instance, a number of NHRIs have established innovative human rights tracker tools which track implementation of the treaty body recommendations.[5]

---

[4] Disability Rights Promotion International available at http://drpidisability.apps01.yorku.ca/resources/DRPIProgRep/Chapter1

[5] See, for instance, the New Zealand Human Rights Tracker available at https://rightstracker.org/en/country/NZL

An NHRI has a range of statutory powers which facilitate its monitoring activities. Firstly an NHRI will often have powers to request information from government departments and to interview government officials.[6] These powers can guarantee access to information necessary to determine if human rights violations have taken place.

A key challenge for human rights monitors is ensuring that their reports receive attention once they are published. The Paris Principles (1993) require that an NHRI be empowered to raise matters of concern with government. As such the designation of an NHRI as the dedicated mechanism ensures that monitoring reports relating to the CRPD receive appropriate government attention.

The designation of an NHRI also brings significant expertise to the monitoring of the CRPD. The expertise which an NHRI has can be placed into three categories; technical; policy; and process.

An NHRI and its staff have technical expertise in human rights law generally. As set out above, NHRIs are required to have as broad a mandate as possible. As a consequence, NHRIs have developed expertise in advising on and monitoring compliance with the full range of international and domestic human rights protections. The CRPD sits alongside other international treaties and domestic protections; monitoring compliance with the CRPD requires broad technical expertise in human rights law. NHRIs with broad expertise in domestic and international human rights standards are well positioned to monitor the implementation of the CRPD.

The development of policy and law reform measures which bring about the implementation of the CRPD is a complex task. Monitoring the development of reforms and their implementation will require extensive policy expertise (Waldschmidt, 2009, p. 9). Policy expertise refers to "knowledge of the range of policies and instruments, proposed and enacted, governing a particular policy area as well as knowledge of how they work" (Page, 2010, p. 271). The range of policies which impact on persons with disabilities is vast. There is a risk that "disability policy" will be defined restrictively to include only those social welfare and health policies designed specifically for persons with disabilities. NHRIs through their broad policy expertise can play a key role in ensuring the rights of persons with disabilities are mainstreamed throughout all relevant policies.

The third category of expertise which an NHRI brings can be classed as process expertise. Process expertise refers to "knowledge of the complex processes that have to be followed to ensure a proposal can be put into effect" (Page, 2010, p. 271). Through its role as an advisor of government and other state bodies on human rights compliance, an NHRI accumulates expertise on the processes of policy-making. The importance of human rights monitors being attentive to political priorities and bureaucratic cultures was recently acknowledged in a review of the impact of the office of the Special Rapporteur (Crowther & Priestley, 2020). NHRIs have extensive experience of presenting human rights in a credible way that resonates with domestic priorities and cultures. This expertise is valuable when developing

---

[6] See, for example, the NI Human Rights Commission Northern Ireland Act 1998.

observations on the human rights situation and when developing plans for the implementation of recommendations emerging from the CRPD Committee.

Having now considered the specific features of an NHRI which make them suitable for inclusion in the monitoring framework, we will now consider how monitoring frameworks have been developed in practice.

Monitoring Frameworks Not Including NHRIs

Where frameworks have been developed without the inclusion of an NHRI, these have been shown to lack resources, capacity, and most significantly the independence required to perform their duties effectively (CRPD Committee, 2012, 2016a, 2018a; Ferrajolo, 2017; Tabaj & Uršič, 2013). In the case of Kenya, the Committee expressed concern that the framework did not comply with the Paris Principles and specifically recommended that the Kenya National Commission on Human Rights be included to address this (CRPD Committee, 2015b). Similarly the Committee found that the designation of a Chief Commissioner for Persons with Disabilities along with state commissioners as the Indian independent mechanism was insufficient to guarantee independence and recommended the inclusion of the NHRI within the framework (CRPD Committee, 2019f, para. 69).

Austria initially established an independent framework composed of a monitoring committee under the Federal Disability Council, which was responsible for advising the Minister for Social Affairs. While the monitoring committee included a strong representative from civil society, when the CRPD Committee examined Austria, it raised concerns about the lack of independence of the monitoring committee and the absence of a designated budget. The Committee recommended that it should be brought into compliance with the Paris Principles (CRPD Committee, 2019a). Noting these concerns, the Austrian Government has developed new regulations to guarantee the independence and a budget for the Independent Monitoring Committee in 2018 (Austrian Monitoring Body, 2018, p. 30). As Austria is undergoing the second cycle of country review, whether the Committee is satisfied with this adjustment and the framework's compliance to Article 33(2) is yet to be known.[7]

In Spain the Spanish Committee of Representatives of Persons with Disabilities was initially solely designated as the independent monitoring framework. However in light of concerns relating to the lack of statutory powers, the Spanish Government included the Spanish A status NHRI within the monitoring framework (The Center for Disability Law and Policy, 2016, p. 22).

Overall it appears that independent monitoring frameworks which do not include an NHRI have been found to be inadequate by the CRPD Committee. Frameworks designed around OPDs, state bodies with thematic responsibility for disability, and even bespoke bodies have not proven to be effective or compliant with Article 33(2).

---

[7] There is no question on Article 33 in the list of issues prior to submission of the combined second and third periodic reports of Austria. See UN Doc CRPD/C/AUT/QPR/2–3.

Monitoring Frameworks Composed of NHRIs and OPDs

While it was initially presumed that states would include OPDs within the independent monitoring framework, in reality there are limited examples of this in practice (De Beco & Hoefmans, 2013, p. 30). There are two examples known to the authors of frameworks in which an NHRI has been designated alongside an OPD, which we will now consider.

The New Zealand Human Rights Commission is designated as the independent mechanism alongside the Ombudsman, who handles complaints, and the Disabled People's Organizations' Coalition, a body composed of representatives from seven OPDs. Reflecting its new role, the composition of the New Zealand Human Rights Commission was reformed to include a designated disability commissioner. Commissioners are appointed by the New Zealand Government but can be nominated by interest groups such as OPDs (Ministry of Justice New Zealand Government, 2020).

The New Zealand Independent Mechanism operates as one entity in how it goes about engagement and in the production of reports.[8] The Mechanism meets twice yearly with relevant Ministers to share its views and press for change. However, it noted, "engagement does not necessarily translate to commitments to integrate accommodation and inclusion meaningfully, or to make the large-scale shifts in systems-level policy required in education, justice, housing or employment" (Independent Monitoring Mechanism NZ, 2020).

New Zealand was examined by the CRPD Committee in 2014, and the Committee commended New Zealand for establishing a framework in compliance with Article 33(2). However, the framework itself notes that there is room for improvement. In a recent report, the Mechanism noted that it does "not always have as diverse representation as that envisaged by General Comment 7" (Independent Monitoring Mechanism NZ, 2020).

In Spain, the independent framework is composed of an OPD, the Spanish Committee of Representatives of Persons with Disabilities, and the Spanish NHRI. The Spanish Committee is an umbrella organization representing over 600 organizations (The Center for Disability Law and Policy, 2016, p. 22). In its initial examination of Spain, the CRPD Committee recorded that Spain was "in full compliance with Article 33(2)" (CRPD Committee, 2019c, para. 6). Reflecting the importance of state resourcing, a subsequent review of Spain in 2019 recommended that the State Party "strengthen the capacity of the Spanish Committee of Representatives of Persons with Disabilities" (CRPD Committee, 2019c).

In a research report to inform the development of the independent mechanism in Ireland, the NUIG Center for Disability Law and Policy noted that the Spanish framework was an attractive model. However, they acknowledged that few states hosted an umbrella OPD analogous to the Spanish Committee of Representatives (The Center for Disability Law and Policy, 2016). In light of the emphasis which the CRPD Committee have placed on the establishment of an umbrella organization, this

---

[8] See https://www.hrc.co.nz/our-work/people-disabilities/making-disability-rights-real/.

may lead to a growth in their number, potentially facilitating the adoption of similar models.

Monitoring Frameworks Including NHRIs Alongside Other Statutory Bodies

A number of states have designated an NHRI alongside other relevant public authorities.

The Danish Government designated the Danish Institute for Human Rights, the Danish Disability Council, and the Danish Parliamentary Ombudsman as the independent framework.[9] The Danish Institute, in line with the Paris Principles, is responsible for protecting, promoting, and monitoring the Convention. The Parliamentary Ombudsman is the national equality body, principally handling complaints. The Danish Disability Council is a 17-person council composed of representatives of government bodies and civil society organizations including 5 OPDs (CRPD Committee, 2014b, para. 383). The Danish Disability Council has specific responsibility for "discussing and assessing developments in society for persons with disabilities" (CRPD Committee, 2014b, para. 383). The Council, therefore, provides a link with OPDs to allow the lived experience of persons with disabilities. In addition to these arrangements, the founding statute of the Danish Institute was amended to provide for its board to include a member nominated by OPDs.

Monitoring Frameworks Solely Designated NHRIs

As set out above, the CRPD Committee have been broadly content for NHRIs to be solely designated as the independent mechanism. In recent examinations, the Committee have considered in more detail how an NHRI is including persons with disabilities in its monitoring activities. In its concluding observations on the Philippines, the Committee specifically raised concerns at the, "lack of specific mechanisms within the Commission on Human Rights of the Philippines to engage and ensure the participation of persons with disabilities, through their representative organizations, in monitoring the Convention at the national and local levels" (CRPD Committee, 2018b).

NHRIs who have been designated more recently as independent mechanisms have tended to give detailed consideration to the inclusion of persons with disabilities within their structures (The Center for Disability Law and Policy, 2016). Upon ratification of the CRPD, the Irish Government indicated that it would designate its NHRI the Irish Human Rights and Equality Commission as its independent mechanism. In anticipation of this, the Commission have established a Disability Advisory Committee or DAC to advise the Commission on its role as the independent

---

[9] Parliamentary Decision B 15 of 17 December 2010

monitoring framework. The members of the DAC were appointed following an open recruitment process and are appointed on an individual basis (Irish Human Rights and Equality Commission, 2019). While many members of the DAC are involved in or employed by OPDs, they are appointed in their individual capacity rather than to represent the views of particular organizations. Ireland has not yet been examined by the CRPD Committee.

In Australia, the Australian Human Rights Commission or AHRC, which is also the national equality body, is solely designated as the independent monitoring framework. The AHRC reflects the Commission model of a NHRI (Australian Human Rights Commission, 2020). The AHRC is led by a Chief Commissioner along with seven Commissioners. Each Commissioner has a specific remit, including a Disability Discrimination Commissioner.

The Disability Discrimination Commissioner is appointed by the government. The Disability Commissioner engages in national consultations with persons with disabilities and draws on their expertise by way of a number of expert reference groups on specific projects (CRPD Committee, 2019a, para. 111). Despite these efforts in a shadow report to the CRPD Committee in advance of the second examination of Australia, the OPD Disability Rights Now expressed concern at the lack of formal engagement mechanisms within the AHRC to engage with OPDs (Disabled People's Organizations Australia, 2017). In its concluding observations, the CRPD Committee recalled these concerns and recommended the State Party "establish a formal mechanism and ensure sustainable and adequate funding for the meaningful engagement of persons with disabilities and their representative organizations in the implementation and monitoring of the Convention" (CRPD Committee, 2019a, para. 62).

This recommendation reflects the emphasis which the CRPD Committee place on the involvement of persons with disabilities through their representative groups, who will reflect the diversity of views of persons with disabilities. It appears that the inclusion of persons with disabilities on advisory boards or even within decision-making bodies will be insufficient to meet the requirements of Article 33(2).

Since the publication of General Comment No. 7, a number of NHRIs solely designated as an independent mechanism have revised their internal arrangements for engaging with persons with disabilities and their representative groups, for instance, the Northern Ireland Human Rights Commission or NIHRC, which is jointly designated with the national equality body as the independent mechanism for Northern Ireland. Following the publication of the General Comment No. 7, the NIHRC has proposed the development of a disability forum. The forum will be composed of OPDs, civil society organizations, and persons with disabilities. The forum will advise the independent mechanism on its work providing insight into the lived experience of persons with disabilities.[10] In determining the composition of OPDs and civil society organizations to be represented on the forum, the NIHRC

---

[10] Independent Mechanism for NI, IMNI Disability Forum

must ensure the selected members are reflective of all persons with disabilities in Northern Ireland.

The South African NHRI has both a Commissioner specifically responsible for disability and an advisory committee on disability issues.[11] The advisory committee includes both civil society organizations and individual experts who advise the Commission. The composition of an advisory committee is determined at the discretion of the South African NHRI. OPDs have raised concerns that their views have not been taken into consideration by the South African NHRI (CRPD Committee, 2011; Mahomed et al., 2019, p. 356). The designation of the South African NHRI as the Independent Mechanism has not yet taken place (South African Human Rights Commission, 2020).

As set out above, many NHRIs have been designated as the independent mechanism without amendments being made to their legal mandate. Of the examples discussed only in Denmark, do we see the state adjusting the composition of the NHRI to provide for the inclusion of an additional member of their governing body, to be nominated by OPDs. In the absence of states amending or reviewing the NHRIs mandate to ensure its suitability for the role of an independent mechanism, the onus is placed on the NHRI itself to consider how it includes persons with disabilities and their representative groups in its activities.

Quinn and Crowther (2017) highlight that, "Some NHRIs have expressed concern about the impact of involving persons with disabilities on their 'de facto' independence as required by the Paris Principles." While it is accepted that the independence of an NHRI can be encroached by civil society organizations just as it can by state bodies, through careful management, such risks can be addressed (Aichele, 2018).[12] Indeed in addition to requiring that NHRIs are independent, the Paris Principles require that they be pluralistic. To be effective NHRIs must be pluralistic and reflect prevailing social forces in society, including CSOs. The Paris Principles (1994, para.3) acknowledge "the fundamental role played by the non-governmental organizations." The SCA suggest that pluralism can be guaranteed in a number of ways including through procedural mechanisms such as advisory committees, networks, or public forums. The SCA recommends that NHRIs develop constructive and systematic working relationships with NGOs and other bodies. It further suggests that these relationships be formalized through "public memoranda of understanding" (GANHRI, 2017, p. 11). The involvement of OPDs within an advisory committee or a formal mechanism established by an NHRI is therefore in fact recommended by the SCA and rather than impinging upon the independence of the NHRI should instead strengthen its capacity.

The inclusion of civil society and OPDs can significantly strengthen the capacity of an NHRI to perform its role as the independent monitoring mechanism.

[12] Aichele has highlighted that for NHRIs, *the principle of independence requires equidistance from the state and any civil forces.*

Effective Collaboration Between Independent Monitoring Frameworks and Civil Society Organizations

Collaboration between NHRIs and OPDs in monitoring the implementation of the CRPD can be mutually reinforcing. Now, we will consider what opportunities the designation of an NHRI as an independent mechanism opens up to OPDs. We will set out four opportunities which the designation of an NHRI as an independent mechanism presents to OPDs.

Collection of Data

The OHCHR identifies one of the five purposes of monitoring to be the creation of new partnerships (OHCHR, 2012b, p. 19). In addition to developing its own independent monitoring activities, a key role for an independent monitoring mechanism is to develop new partnerships between the state and civil society in developing monitoring data systems to inform and track implementation.

For the first time in a human rights treaty, the CRPD in Article 31 requires that "states parties undertake to collect appropriate information, including statistical and research data, to enable them to formulate and implement policies to give effect to the present Convention."

When formulating Article 31, negotiators suggested that a reference to data collection be included within Article 33 (UN Enable, 2004). While this proposal was not adopted, it continues to be acknowledged that robust data collection is essential both for effective policy-making and effective monitoring by the independent mechanism. As Pederson has highlighted, "the work of the monitoring bodies in assessing implementation through the use of statistics and research data depends in large on the quality of the data collected by states parties" (Pedersen & Ferretti, 2018).

The development of Article 31 was influenced by the need to reform data collection systems which tended to focus on the measurement of impairment rather than the identification and measurement of disabling barriers (Lawson & Priestly, 2015). States need to develop data collection processes which identify previously hidden impediments to the full participation of persons with disabilities in society.

The CRPD Committee and disability advocates emphasize the importance of including OPDs and their accounts of the lived experience of persons with disabilities within processes of knowledge production (Boucher & Fiset, 2015, p. 128). In contrast to this approach, states have increasingly moved toward evidence-based policy-making processes. Such processes tend to privilege objective evidence which is scientifically rigorous over lived experience or experiential knowledge (Smith-Merry, 2020, pp. 305–316).

Disability advocates emphasize the need to develop emancipatory processes of evidence production through the establishment of workable dialogue between persons with disabilities and those responsible for research (Barnes, 1992, p. 122). NHRIs can play a key role in working with state entities to develop facilities for persons with disabilities and their representative groups to provide inputs to data collection processes (Priestley & Lawson, 2014, p. 752).

The use of indicators has taken on significant prominence in monitoring the implementation of human rights instruments. Eilionoir Flynn has highlighted that, “. . .the CRPD implicitly requires the development of future indicators and sets the contours for measuring success in improving the lives of persons with disabilities” (Flynn, 2011, p. 34). While the use of indicators is seen as a positive development in human rights monitoring, there are certain risks (OHCHR, 2012a).

Indicators frame problems and if the process for their development is not robust and inclusive, they may be manipulated by states to present narratives of success (Davis et al., 2012, p. 71). NHRIs and OPDs must work together to ensure indicators satisfy standards of validity while reflecting the principles of the CRPD (OHCHR, 2012a). The OHCHR has developed a holistic set of indicators linked to the CRPD articles, which provide a basis on which to develop indicators specific to their jurisdiction which can be integrated into domestic instruments.[13]

The development of a monitoring strategy based on indicators can often privilege those with technical expertise over those with lived experience (Brunsson & Jacobsson, 2002, p. 46). NHRIs can play a role in advising the state on the need to develop facilities to allow persons with disabilities to provide insight from their lived experience (Berghs et al., 2016, p. 35). NHRIs can also play a role in assisting OPDs to frame the evidence gathered from their lived experience to ensure it is credible and relevant to the process of applying indicators.

Monitoring CRPD Recommendations

The CRPD Committee’s Guidelines on independent mechanisms emphasize a key role for an independent mechanism in monitoring the implementation of the recommendations of the CRPD Committee (CRPD Committee, 2016b, para. 21). Discussion on UN treaty reform has highlighted how NHRIs can play a key role in the “domestication of treaty body outputs” (Egan, 2013, p. 664). NHRIs have developed innovative tools for tracking the implementation of treaty body recommendations (FRA, 2020).

As the CRPD Committee recommendations are rarely put forward in an implementable form, it is necessary for an NHRI to play a key role in “thickening” the standards and recommendations to ensure they have resonance in the domestic context (Soohoo & Stolz, 2008, p. 495). Human rights commentators highlight the need for processes of vernacularization, “by which transnational human rights are adapted to local contexts” (Merry, 2009, p. 211). The first task of monitoring treaty body recommendations is therefore the development of a domestic plan for implementation. The participation of OPDs in the decision-making processes of such domestic plans should be ensured. The CRPD Committee encourage states to first adopt “legal and regulatory frameworks and procedures to ensure the full and equal involvement” of OPDs (CRPD

---

Committee, 2018d, para. 53) (CRPD Committee, 2018d, para. 53) (CRPD Committee, 2018d, para. 53) (CRPD Committee, 2018d, para. 53).

During the negotiation of the CRPD, the Australian NHRI proposed the incorporation of an obligation on Member States to develop a National Disability Action Plan or NDAP on implementation of the CRPD (Stein & Lord, 2010, pp. 702–703). While this proposal was not adopted, interest in the utility of NDAPs remains (Stein & Lord, 2010, pp. 702–703). Jerome Bickenbach (2011) highlights that to be effective rights must be *operationalizable* into policy goals, which should then be broken down into *challenging yet feasible* targets. An NHRI which has accumulated knowledge of how government works and political perceptiveness is uniquely placed to propose or scrutinize implementation plans which are challenging yet feasible (Mintrom, 2007, p. 146). The New Zealand NHRI has played a key role in developing New Zealand's National Action Plan, a plan consisting of 100 actions, supported by 232 indicators to effect the implementation of recommendations from the international human rights system including the CRPD Committee.[14] Thanks to the participation and collaboration of Disabled People's Organisation Coalition in New Zealand with government, the newest Disability Action Plan 2019–2023 responds to issues raised by the disability community.[15]

Developing New Analytical Approaches

Ensuring that a state's data collection systems provides an accurate reflection of the lives of persons with disabilities is central to ensuring the effective implementation of the CRPD. Through their advisory role, NHRIs can challenge government approaches to statistical analysis to ensure they are presenting an accurate reflection of the lived experience of persons with disabilities.

In the UK, austerity measures were considered to have disproportionately impacted on persons with disabilities. However due to the state's silo approach to data collection, the full impact of austerity measures on the lived experience of persons with disabilities was not being captured (Roberts et al., 2017, pp. 167–184). Noting this the UK's Equality and Human Rights Commission developed a methodology for conducting Cumulative Impact Assessment or CIAs to assess the impact of social security and tax reforms on the household incomes of individuals.[16] Such assessments would provide a more accurate record of the impact of the totality of austerity measures on the lives of persons with disabilities.

The Commission has advocated that the UK Government integrate CIAs into their own monitoring activities. On examining the UK, the CRPD Committee recommended that the UK Government conduct CIAs in relation to the impact of

[16] See https://www.equalityhumanrights.com/en/publication-download/cumulative-impact-tax-and-welfare-reforms

social security reforms in the UK and integrate the methodology into policy development processes (CRPD Committee, 2017c). The adoption of this methodology would significantly strengthen the capacity of OPDs to analyze the impact of proposed policy measures.

Independent Investigation

While often associated with the protection remit of an NHRI, the systemic investigation of human rights issues can form part of NHRI's monitoring plans. Such investigations can be used to mitigate the failure of state monitoring activities to fully capture the lived experience of persons with disabilities. For instance, the National Human Rights Commission of Mexico conducted an investigation into the accessibility status of certain government facilities which demonstrated the failure of government monitoring activities to identify and address obstacles to accessing buildings and services.[17]

For those states where NHRIs are assigned the investigation role, OPDs could participate through several means, including submission of complaints, provision of support to applicants, and submitting evidence to NHRIs when conducting an investigation.

Conclusion

The innovation of establishing the independent monitoring framework at the domestic level is still in a process of discovery. The publication by the CRPD Committee of General Comment No. 7 has led to an increased focus on how persons with disabilities and their representative groups are being included within independent frameworks. The reluctance by State Parties to develop frameworks which include OPDs has placed the onus on NHRIs to review their internal structures. While NHRIs face resourcing issues and have concerns relating to independence, these are not insurmountable. The CRPD Committee have clearly demonstrated a need for independent mechanisms to develop formal procedures of engagement with persons with disabilities and OPDs. While a number of NHRIs have developed advisory committees, these have tended to include persons with disabilities as individuals rather than as representatives of organizations of persons with disabilities. The CRPD Committee clearly see the value of OPDs participating in the activities of the monitoring framework (CRPD Committee, 2018d). There is clearly a need for NHRIs designated as an independent mechanism to establish formal procedures of engagement with OPDs. Through such procedures, NHRIs can share their expertise

---

and insights with OPDs and strengthen the development of domestic disability movements.

Further research is required to identify how effective collaboration between NHRIs and OPDs can achieve advancements in the rights of persons with disabilities which would not have been achievable otherwise. We believe that experience to date has shown that the key to this lies in the triangular relationship of civil society, NHRIs, and the state. NHRIs can play a key role in collaborating with OPDs in ensuring the lived experience of persons with disabilities is presented to governments in a way that is impactful. The credible evidence which it generates can facilitate the initiation of a program of law reform to implement the CRPD. Delivering this reform requires collaboration, long-term commitment, and patience from all actors.

Bridging the Gap: Harnessing the Synergies Between the CRPD and the SDG Monitoring Frameworks

38

Victoria Lee and Juan Ignacio Pérez Bello

Contents

Abstract

Since the adoption of the Convention on the Rights of Persons with Disabilities (CRPD), the recognition and advancement of the rights of persons with disabilities at the international level has grown exponentially, thanks to the work of the Committee on the Rights of Persons with Disabilities (CRPD Committee) and other stakeholders. The rise of the disability agenda is also reflected in the 2030

The views expressed herein are those of the authors and do not necessarily reflect the views of the United Nations nor the International Disability Alliance.

Agenda for Sustainable Development that includes explicit references to persons with disabilities, including in its indicators framework, meaning that action taken for persons with disabilities should be tracked, measured, and reported on to the High-level Political Forum (HLPF) on Sustainable Development. The SDG-CRPD resource package, recently launched by the Office of the United Nations High Commissioner for Human Rights (OHCHR), came to offer additional guidance to promote SDGs implementation under the CRPD. Against this background, the purpose of this chapter is to explore the complementarity of the monitoring frameworks of the CRPD and SDGs, and how to harness those synergies to advance the rights of persons with disabilities. To do so, the chapter compares CRPD- and SDG-based frameworks and processes for monitoring and explores the SDG-CRPD resource package developed within the EU-funded project, Bridging the Gap I, offering tools to ensure that all actions for the SDGs are inclusive of persons with disabilities and informed by the CRPD, including human rights indicators on the CRPD and data sources guidance to guide data collection and monitoring efforts.

Introduction

Over 15 years have passed since the adoption of the Convention on the Rights of Persons with Disabilities (CRPD), one of the latest human rights treaties adopted at the United Nations. The Convention enshrines a paradigm shift from outdated perspectives to the human rights model of disability which considers persons with disabilities first and foremost as rights holders. Its convening power is evident; with 185 States Parties, the Convention has achieved near-universal ratification. Considered as both a human rights instrument and a development tool, the Convention spells out the importance of international cooperation and partnerships with international and regional organizations and civil society, particularly organisations of persons with disabilities (OPDs), to support national efforts to realize its principles and provisions. The CRPD Committee, through its reviews, individual communications, and general comments, has elaborated on key standards of inclusive equality as it applies to equal recognition before the law, education, participation, and living independently and being included in the community, among other rights.

Since the adoption of the CRPD, the recognition, awareness, and advancement of the rights of persons with disabilities at the international level have grown exponentially. This is in large part thanks to the work of the Committee on the Rights of Persons with Disabilities (CRPD Committee) which has been central to the unfolding and understanding of the standards of the Convention. Additionally, multiple stakeholders, among others, States, the UN Special Rapporteur on the Rights of Persons with Disabilities, UN entities, development actors, and a very active disability movement have contributed to mobilizing and dynamizing the discourse and practice on the rights of persons with disabilities. The adoption of the United Nations Disability Inclusion Strategy (United Nations, 2019) exemplifies and embodies this mobilization and momentum: as coined by the former Special Rapporteur on the Rights of Persons with Disabilities, the UNDIS represents “the operationalization of the CRPD for the UN,” calling for disability inclusion across the UN system from HQ to the field, throughout its policies, procedures, and programming.

The rise of the disability agenda is also reflected in the 2030 Agenda for Sustainable Development which was adopted in 2015 and puts forward 17 Goals and 169 targets (United Nations, 2015). Its adoption marks a turning point for persons with disabilities. Having been overlooked by its predecessor, the Millennium Development Goals (MDGs), and thereby excluded from the gains achieved, the disability community was mobilized not to once again be left behind. Equipped with the CRPD and the lessons acquired through its negotiations, organizations of persons with disabilities (OPDs) achieved the inclusion of persons with disabilities in the 2030 Agenda, not only through explicit references across several Goals but also more broadly due to the fact that the SDGs are grounded in human rights and adopt a people-focused approach. Moreover, the SDGs refer to persons with disabilities in their indicators framework, meaning that action taken for persons with disabilities should be tracked, measured, and reported on to the High-Level Political Forum (HLPF) on Sustainable Development.

Strengthening the complementarity of the monitoring frameworks of the CRPD and SDGs is central to their mutual success and the overall inclusion and participation of persons with disabilities. Despite significant strides to enhance disability inclusion in the global agenda, further guidance and action are needed to effectively reach persons with disabilities, who remain among the furthest left behind. The SDG-CRPD resource package, launched by the Office of the United Nations High Commissioner for Human Rights (OHCHR), offers such guidance, in particular through the application of human rights indicators on the CRPD that contribute to converge monitoring of the CRPD and SDGs.

Against this background, the purpose of this chapter is to explore the complementarity of the monitoring frameworks of the CRPD and SDGs and how to harness those synergies to advance the rights of persons with disabilities. Section “The CRPD and SDG Monitoring Frameworks” of this chapter addresses and compares CRPD- and SDG-based frameworks and processes for monitoring, while section “Bridging the Gap: OHCHR’s SDG-CRPD Resource Package” explores the SDG-CRPD resource package developed within the EU-funded project, Bridging the Gap I, offering tools to ensure that all actions for the SDGs are inclusive of persons with disabilities and informed by the CRPD, including human rights indicators on the CRPD and data sources guidance to guide data collection and monitoring efforts.

The CRPD and SDG Monitoring Frameworks

The Importance of Monitoring and Data

Monitoring of human rights instruments and political commitments is an indispensable step toward their realization. In essence, monitoring seeks to verify whether States are fulfilling their obligations and whether individuals are enjoying their rights in practice; in doing so, it unveils a host of information on how, where, when, and whom, information which serves to improve actions and identify gaps to be addressed for continued and strengthened implementation. Actions entail all possible efforts that contribute to realizing rights and commitments, be it legal reform, policies, programs, resource allocation and investments, awareness-raising, training, information dissemination, consultations, or data collection. As such, monitoring serves as a mechanism to identify rights violations, as well as to detect shortcomings and delays in implementation with the overall aim of fostering accountability and enforcement of human rights obligations.

Monitoring can take many forms and can be conducted by any individual or body interested in tracking progress and upholding accountability. This includes everyone from the government itself to NHRIs, civil society, development actors, donors, and regional and international bodies overseeing development and human rights. Monitoring includes gathering testimonies and case studies of individuals' lived experiences that attest to the exercise of rights in practice; this is pertinent not only in relation to human rights instruments but also to gauge the progress of people-centered commitments such as the SDGs. Hence, the participation of civil society organizations (CSOs), including organizations of persons with disabilities, is a key component to monitoring processes and has been so recognized by the CRPD and the SDGs.

Data is also a vital element to monitoring – both qualitative and quantitative data. Data collection and disaggregation are enshrined in the CRPD and SDGs in recognition of their capacity to measure progress over time and enable assessment of progress as it concerns the diversity of individuals and populations. Indicators are increasingly playing a part in monitoring by putting forward measures capable of determining the fulfilment of the normative content of rights or commitments.

The CRPD and SDG frameworks provide for their monitoring through their call to institutionalize data collection and disaggregation, thus assuring the generation of information necessary to engage in monitoring. Further, monitoring obligations call for putting structures and processes in place at the national level to facilitate measuring and tracking advances, thereby driving implementation forward. And periodic reviews at the global level create further impetus for implementation.

Monitoring of the CRPD

The drafting of the CRPD benefitted from the experience of decades of monitoring of previous human rights treaties and the lessons learned through those processes. Furthermore, CRPD drafting itself involved an unprecedented level of participation by civil society, determined to secure measures to facilitate and strengthen the Convention's fulfilment in practice. Consequently, the CRPD encompasses innovative provisions including on monitoring the rights of persons with disabilities. The framework includes a combination of national and international monitoring mechanisms that highlight the participation of organizations of persons with disabilities.

Obligation to Collect and Disaggregate Data

Article 31 of the CRPD requires States to "collect appropriate information, including statistical and research data, to enable them to formulate and implement policies to give effect to the present Convention," in accordance with data protection standards and ethical principles from statistics (paragraph 1). The information should be "disaggregated, as appropriate, and *used to help assess the implementation* of States Parties' obligations" (emphasis added) and duly disseminated ensuring accessibility to persons with disabilities (paragraphs 2 and 3). In this sense, States need to ensure that their data collection efforts – carried out by the national statistics offices (NSOs) and public authorities – consider explicitly the variable of disability (e.g., through national censuses, administrative data gathered by sectoral authorities, survey data, etc.).

Data disaggregation by disability, in particular statistical data, remains a complex and technical challenge which requires continuous development and improvement to ensure the quality and employability of data, as well as increased representation of the diverse constituencies among the population of persons with disabilities. Throughout the last years, the CRPD Committee has recommended the use of the tools developed by the Washington Group on Disability Statistics, notably the Short Set of Questions on Disability for national censuses and surveys (UNCRPD Committee, 2019a, 2019b, 2019c, 2019d; UNCRPD Committee & GANHRI, 2018). Disaggregation is one component of a human rights-based approach to data collection, along with participation, self-identification, transparency, privacy, and accountability (UNOHCHR, 2018). These principles are central to improving the quality, relevance, and use of data and statistics in accordance with international human rights.

Monitoring Mechanisms Under the CRPD

The CRPD foresaw the need for strong and institutionalized national monitoring practices encompassing not only data collection and disaggregation by disability but also national and international monitoring mechanisms. At the national level, the CRPD calls for designating one or more independent mechanisms in charge of monitoring implementation and the involvement of civil society, including the right holders, persons with disabilities.

Article 33(2) of the Convention mandates States to put in place national independent monitoring mechanisms. It provides:

> States Parties shall, in accordance with their legal and administrative systems, maintain, strengthen, designate or establish within the State Party, a framework, including one or more independent mechanisms, as appropriate, to promote, protect and monitor implementation of the present Convention.

In practice, this function usually falls on existing national human rights institutions (NHRIs), which should comply with the Principles relating to the status and functioning of national institutions for protection and promotion of human rights (or "Paris Principles"). In this way, the CRPD envisions the existence of one or more permanent independent mechanism(s) with budgetary and technical resources to closely monitor the implementation of the CRPD. Through country reviews, the CRPD Committee has consistently called for the appointment of the independent monitoring mechanism and the allocation of sufficient budgetary resources for their effective functioning (UNCRPD Committee, 2015, 2017a, 2017b, 2018a).

Furthermore, Article 33(3) of the CRPD requires that "[c]ivil society, in particular persons with disabilities and their representative organizations, shall be involved and participate fully in the monitoring process." The CRPD Committee has stressed on the obligations of States to support, including with budgetary resources, the development of technical capacities to enable the meaningful participation of organizations of persons with disabilities (UNCRPD Committee, 2018b).

The work of the independent monitoring framework at the national level contributes to the role of international monitoring under the mandate of the CRPD Committee. The principal monitoring activity of the CRPD Committee is undertaken through review of State Parties' compliance with the CRPD carried out through its periodic reporting framework. States Parties to the CRPD submit their initial report, which provides information on the situation of persons with disabilities as it relates to Articles 1 to 33 of the CRPD and what measures have been undertaken to enhance the enjoyment of their rights as enshrined therein. Once the country figures on the Committee's agenda of work, it will adopt a List of Issues directed to the State that comprises questions for clarification and requests for additional information to complement the initial State report. States should present their Reply to the List of Issues ahead of the scheduled exchange. The Committee and the State prepare for the "constructive dialogue" comprising 6 hours of discussion covering Articles 1 to 33 of the CRPD, following which the Committee will adopt its Concluding Observations, i.e., recommendations directed to the State to better implement and meet the obligations of the CRPD.

The CRPD Committee puts significant weight on the participation of OPDs and civil society in this process and welcomes alternative information and testimonies by persons with disabilities which serve to cast light on lived experiences and the reality on the ground. At each stage of the review process, OPDs and other CSOs have the opportunity to provide information in writing, through comprehensive alternative reports or briefs which include responses to and alternate versions of information provided by the State (UNCRPD Committee, 2014). There are both official and informal spaces for private briefings with the Committee. Formal briefings usually last between 1 hour and 1.5 hours and take place prior to the adoption of List of Issues, as well as just before the commencement of the constructive dialogue between the Committee and the State. Informal meetings with Committee members, in particular the member appointed as country rapporteur who is tasked to lead the dialogue with that State, can also take place on the sidelines of the Committee's session and allow for more in-depth discussion, including updates and clarifications on any of the information officially submitted. These informal meetings are held at the discretion of members and are dependent on their availability and interest. It is commendable that, since it began engaging in constructive dialogues in 2011, Committee members have consistently made efforts to be available to OPDs and

CSOs to learn from their concerns and experiences. National OPDs have welcomed the CRPD Committee's Concluding Observations as valuable tools for their national advocacy.

Monitoring of the SDGs

The experience of the Millennium Development Goals (MDGs) underscored the need for a sound indicator framework and corresponding monitoring systems to effectively measure progress toward achieving the SDGs. Therefore, the 17 Sustainable Development Goals and its 169 related targets have been designed to be monitored through a set of global indicators. Progress on indicators informs the High-Level Political Forum (HLPF), the principal platform on sustainable development that oversees the follow-up and review of the implementation of the agenda at the international level, including through the state-driven Voluntary National Reviews.

Sustainable Development Goals: Data-Specific Targets and SDG Indicators Framework

Within the SDG framework, there are two main elements which drive monitoring. First, the 2030 Agenda includes specific targets calling for data collection and disaggregation. Second, the Inter-Agency and Expert Group on SDG Indicators (IAEG-SDGs) developed a global indicator framework, adopted in 2017.

Given the need to improve national data systems to produce quality data to assess progress of its implementation, Sustainable Development Goal 17 "Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development" includes a sub-section on "Data, monitoring and accountability." Within that, Target 17.18 stresses the need to enhance capacity-building support to developing countries "to increase significantly the availability of high-quality, timely and reliable data disaggregated by income, gender, age, race, ethnicity, migratory status, *disability*, geographic location and other characteristics relevant in national contexts." Target 17.19 calls for building on initiatives to "develop measurements of progress on sustainable development that complement gross domestic product." Both targets clearly lay out the need for States to strengthen their systems for data collection and disaggregation in order to better track and better know the situation of people and how different groups are faring, aligning fully with the overarching objective of the 2030 Agenda to leave no one behind. At the 2016 HLPF, several countries acknowledged the need for improved quality of data collection and disaggregation to measure progress and pointed out to the human resource and financial constraints and the challenges to produce data at the local levels (UNDESA, 2016).

The UN Statistical Commission created the Inter-Agency and Expert Group on SDG Indicators to develop a proposal for a "Global indicator framework for the Sustainable Development Goals." In March 2017, the UN Statistical Commission adopted a global indicator framework, which was subsequently endorsed by the

General Assembly on 6 July 2017 (United Nations, 2017). The global indicator framework includes 231 unique indicators, linked to the 169 targets. Posterior refinements, deletions, and additions to the framework have taken place, and the framework will continue to be adapted. The metadata for the SDG indicators have been developed, which put forward the technical information and methods underlying measurement of the indicators (e.g., concepts and definitions, rationale, computation method, etc.). In addition, alternative or complementary indicators for national and subnational levels of monitoring can be developed on the basis of national priorities, realities, capacities, and circumstances (UN Statistical Commission, 2020). The global indicator framework entails four levels of monitoring for the SDGs: national, regional, global, and thematic (Sustainable Development Solutions Network, 2015). Data drawn from these processes, including through the work of "custodian agencies" (UN entities or international organizations responsible for collecting data from countries under existing mandates and reporting mechanisms), is transmitted and compiled, extending to the annual SDG progress report that, in turn, serves to inform the HLPF and highlight matters requiring attention (United Nations, 2016; UN Secretary General, 2016).

SDG International Monitoring Processes: Voluntary National Reviews

Besides monitoring based on the global indicator framework, the core element for follow-up and review on the implementation of the SDGs is through the Voluntary National Review (VNR). The VNR is a process through which countries assess their progress in realizing the SDGs and share their challenges and experiences. Member states are encouraged to "conduct regular and inclusive reviews of progress at the national and subnational levels, which are country-led and country-driven" (United Nations, 2015). Consultations at the national and regional levels feed into the global VNR and are thus important opportunities for civil society organizations, including OPDs, to voice their concerns (Lockwood, n.d.).

Every year, a group of VNRs is presented at the HLPF during the 3-day ministerial segment during the 3-day ministerial segment. In 2022, 45 counriest will be subject to the VNR. States undergoing a first-time review are allocated 30 minutes, and those undergoing a subsequent review are allocated 20 minutes and often are grouped with other countries. Even though the review is voluntary, there is considerable political peer pressure for countries to undertake their review as a display of their commitment to the SDGs. Each year, an overarching theme is selected for the HLPF, linked to specific Goals, and which may figure in the VNR, alongside review of all 17 SDGs. For example, the designated theme for 2022 is "Building back better from the coronavirus disease (COVID-19) while advancing the full implementation of the 2030 Agenda for Sustainable Development." This theme is to be accompanied by in-depth review of Goals as wide and varying as Goals 4 on quality education, 5 on gender equality, 14 on life below water, 15 on life on land, and 17 on partnerships for the Goals (United Nations 2021). The limited time and plurality of topics for review leave it very much to the State to shape the focus of the VNR discussions.

Civil society organizations can participate at the local and national level in the lead up to the HLPF in national consultations, as well as in regional consultations. One of the most important opportunities for CSOs to engage in the VNR process is through national consultations organized by governments. At the HLPF, CSOs can participate exclusively through the "Major Groups and other Stakeholders," which includes the Stakeholder Group of Persons with Disabilities. The Stakeholder Group of Persons with Disabilities aims to "enhance the opportunity for persons with disabilities, their representative organizations, and non-governmental and other organizations working on the rights of persons with disabilities to advocate with a unified voice for their inclusion in all sustainable development related UN processes" (Stakeholder Group of Persons with Disabilities, 2017) including putting forward issues related to persons with disabilities in the VNR. Stakeholders have the opportunity to deliver one statement per country raising issues and posing questions, which implies the need for all CSOs and stakeholders to coordinate, prioritize, and agree on the topics to be addressed. Other States are also able to put forward questions. Finally, there is no formal mechanism or structure for follow-up of the VNR. However, subsequent VNR reports can provide a summary of initiatives and actions rolled out since the previous review, including challenges overcome and lessons learned.

Differences and Synergies of CRPD and SDG Reporting Processes: Opportunities and Threats (Table 1)

The reviews by the CRPD Committee and the VNR at the HLPF represent distinct processes with distinct purposes, and their comparison would liken that between apples and oranges. The table below exposes the complementarity between the CRPD review and the VNRs. What is common to both is that their respective success depends on each other and organizations of persons with disabilities have a central role in achieving synergies toward their mutual reinforcement. The CRPD review yields in-depth recommendations and provides a platform for cooperation between OPDs and the government, primarily the disability focal point. The HLPF provides another type of exposure for civil society before high-level political actors. While time and space are more restricted at the HLPF, meaning that OPDs need to vie for attention, the return in political capital can be significant. Over the years, OPDs have visibly gained ground at the HLPF. Thanks to the support and guidance of the Stakeholder Group of Persons with Disabilities, OPDs are participating at national, regional, and global SDG fora, and, as a result of this increased engagement, there are growing references to persons with disabilities in VNR processes as well as explicit mention of implementation of the CRPD by States in their VNR presentations (Lockwood, n.d.). On its side, since 2016, the Committee, encouraged by OPDs, has been making explicit references to the SDG goals and targets in its recommendations, thereby connecting the legal obligations under the Convention with the political commitments under the 2030 Agenda.

On the face of it, the adoption of the SDGs and its attention to persons with disabilities bring about a propitious climate to advance their rights and create more

Table 1 Comparison of CRPD and SDG monitoring and reporting processes

	CRPD	2030 Agenda and the SDGs
Adoption	Unanimous adoption at the General Assembly, 2006 185 states parties including the European Union	Unanimous adoption at the General Assembly, 2015
Nature of instrument	International treaty with legally binding provisions	Global political commitment
Call for data collection at the national level and beyond	Article 31 puts forward the obligation for states to engage in data collection and disaggregation to help assess the implementation of the convention and to identify and address the barriers faced by persons with disabilities in exercising their rights	Goal 17, target 18, on capacity-building to support developing countries to produce more high-quality, timely, and reliable data disaggregated by income, gender, age, race, ethnicity, migratory status, disability, geographic location, and other characteristics relevant in national contexts The goals and targets are followed up and reviewed through the global indicator framework, with data compiled and transmitted from the national, regional, and global levels
Call for monitoring at the national level	Articles 33(2) and 33(3) require the designation of an independent national monitoring mechanism with civil society participation	The 2030 Agenda encourages Member States to conduct regular and inclusive reviews of progress at the national and subnational levels which are country-led and country-driven
Participation by OPDs at the national level	Article 33(3) calls for the involvement and full participation of organizations of persons with disabilities and their representative organizations in the monitoring process and, more broadly, in decision-making processes under article 4(3)	Reviews should draw on contributions from indigenous peoples, civil society, the private sector, and other stakeholders, in line with national circumstances, policies and priorities (Para 79, A/RES/70/1)
International monitoring process		
International monitoring mechanism	Periodic review by the Committee on the rights of persons with disabilities	Voluntary National Review at the high-level political forum
Year of first review	2011	2016
Number of review as of 30 June 2022	105 country reviews held - 99 countries with 6 countries having undergone a second review	247 VNRs held - 176 countries with 58 countries having undergone more than one VNR
Nature of review	Review by independent experts	Peer review by states
Length of formal exchange	6 hour dialogue	30 minute for first time review (divided into 15 minute of presentation by the state and 15 minute of questions and responses)

(continued)

Table 1 (continued)

	CRPD	2030 Agenda and the SDGs
		20 minute for states being reviewed again (divided into 10 minute of presentation by the state and 10 minute of questions and responses)
Scope of review	Comprehensive on the rights of persons with disabilities under articles 1 to 33 of the CRPD	Countries are encouraged to review all 17 SDGs (UNDESA, 2021); however, a specific theme and specific goals are designated for each HLPF (without prejudice to the integrated, indivisible, and interlinked nature of the Sustainable Development Goals). The themes and goals are designated through a General Assembly resolution (United Nations, 2016, 2021)
Participation by OPDs in the review process	Several opportunities for OPDs and civil society to share their views, both ahead of the adoption of the list of issues and before the Committee's dialogue with the state party, including: – Submission of written information – Participation in formal private briefings – Informal meetings with individual Committee members	Opportunity for OPDs to submit information and pose questions, exclusively through the stakeholder Group of Persons with disabilities
Outcome document of the review	Results in the adoption of concluding observations, a document of recommendations (approximately 12 pages long)	Results in brief reports on each state and a general summary covering the whole HLPF
Follow-up mechanism(s)	Follow-up through: – The Committee's short-term follow-up mechanism targeting specific identified recommendations – Next review in the periodic review cycle by the CRPD Committee – Other treaty body reviews	No formal follow-up mechanism or structure Eventually, a topic can be revisited in a future VNR, for example, subsequent reports could address "how challenges in implementation, including persistent challenges, were overcome" (UNDESA, 2021)

inclusive environments and societies. However, such opportunities are conditional on the understanding that there is a shared vision among stakeholders of what it means to include persons with disabilities. In practice, this common vision is often lacking: the CRPD is still a relatively young human rights treaty, and the human rights-based approach to disability continues to be misunderstood and misinterpreted by States and other actors. Further, for a long while, there was an absence of guidance on how to measure progress in upholding the rights of persons with disabilities, as well as a persistent lack of data on persons with disabilities to inform monitoring.

Hence, the risks could be foreseen even before the 2030 Agenda was formally adopted. The greatest threat was that the standards embodied by the CRPD and the Committee's jurisprudence – this *acquis* – could be diluted, forgotten, or replaced by actions on persons with disabilities taken in the name of the SDGs, but that fall short of the CRPD. In effect, any of the above would result in a loss and reversal of the long fought for *acquis*. For example, SDG Target 8.5 calls for achieving full and productive employment and decent work for all, including persons with disabilities. The CRPD Committee has been resolute that persons with disabilities should have opportunities to access work and employment in the open labor market on an equal basis with others with equal protection of their labor rights. Despite this standard, many States continue to "employ" persons with disabilities, particularly persons with intellectual disabilities, in segregated work settings where they are often denied labor rights including a minimum wage. Target 8.5 may drive States to enhance and expand these practices in their efforts to lower the unemployment rate of persons with disabilities (see indicator 8.5.2), thereby undermining the rights-based approach to the employment of persons with disabilities and ultimately threatening their effective inclusion and participation in society.

Bridging the Gap: OHCHR's SDG-CRPD Resource Package

In recognition of these opportunities and threats, OHCHR conceived a project to develop tools to help States and all stakeholders to implement the SDGs guided by the CRPD. With the support of the European Union, the Bridging the Gap I project began in 2016 and concluded in 2020 with the launch of the SDG-CRPD resource package. The resource package aims to promote the rights, participation, and inclusion of persons with disabilities in the implementation of the 2030 Agenda, in line with the CRPD. It includes:

- Human rights indicators for the CRPD.
- Data sources guidance.
- Policy guidelines on realizing the SDGs informed by the CRPD.
- Training materials and videos.

The resource package primarily targets States which are responsible for both SDG and CRPD implementation, but it can serve all stakeholders playing a role in the implementation and monitoring of the SDGs and CRPD including development actors, UN agencies, donors, national human rights institutions, national statistics offices, and civil society including organizations of persons with disabilities. All the resources are designed to be complementary and reinforce disability-inclusive implementation of the SDGs. While an overview of the policy guidelines and other resources are provided, the focus will more specifically be directed at the human rights indicators on the CRPD as a means to converge the implementation and monitoring of the CRPD and the SDGs.

Human Rights Indicators on the CRPD

The human rights indicators on the CRPD function similar to the SDG indicator framework, in that they propose measures that enable tracking progress with respect to specific provisions. In particular, human rights indicators track progress in the realization of rights and can contribute to identifying gaps in the implementation of human rights standards.

The human rights indicators on the CRPD were developed in line with OHCHR's methodology on human rights indicators (UNOHCHR, 2012); they are based on international human rights standards as enshrined in the CRPD and CRPD jurisprudence, as well as other human rights treaties, and are divided into three types of indicators to measure the commitments (structural indicators) and efforts (process indicators) by States to meet their human rights obligations, as well as the results (outcome indicators) in ensuring the enjoyment of human rights. The CRPD indicators comprise universally applicable indicators, both qualitative and quantitative, which can be adapted to specific national and local contexts.

For example, the indicators on Article 24 of the CRPD on inclusive education put forth a structural indicator looking at the State's commitment: specifically whether legislation has been enacted that ensures inclusive education for all students (indicator 24.1). Process indicators seek to evaluate the efforts made to achieve inclusive education, for example, the proportion of schools with accessible infrastructure and materials for students with disabilities (indicator 24.11(d)) or the budget allocated to ensure inclusive education in mainstream settings compared to budget allocated to segregated settings (indicator 24.24). And outcome indicators seek to assess the level of enjoyment of the right to education: i.e., rates of persons with disabilities relating to enrolment, attendance, promotion, completion, dropping out, and out of school across all levels of education, disaggregated by several categories including sex, age, and disability (indicator 24.27) (Table 2).

The human rights indicators on the CRPD are key to facilitating understanding and implementation of the Convention's provisions. They serve to give both substantive and practical guidance of each CRPD provision in terms of reflecting the human rights standard and providing steps to translate the standard into policy and practice. As such, the indicators converge understanding on what the provision entails and how to measure progress in its implementation.

In addition, the CRPD indicators incorporate SDG indicators, showing the link between the two instruments and demonstrating how efforts and actions to uphold the rights of persons with disabilities mutually reinforce both. Many SDG indicators have been included as CRPD outcome indicators to capture the enjoyment of the right by persons with disabilities (see above in table SDG indicator 4.a.1 which doubles as CRPD indicator 24.11). For example, SDG indicator 11.7.2: Proportion of persons victim of physical or sexual harassment, by sex, age, disability status and

Table 2 Example of different types of indicators relating to Article 24 of the CRPD on the right to education

Type of indicator	Purpose	Indicator example
Structural	Assesses commitment of the state in policy and legislation	24.1 Legislation enacted that ensures inclusive education for all students, including students with disabilities in public and private settings across all levels of education
Process	Evaluates the efforts toward translating the commitment into action	24.11 Proportion of schools with access to: (a) electricity; (b) the internet for pedagogical purposes; (c) computers for pedagogical purposes; (d) adapted infrastructure and materials for students with disabilities; (e) basic drinking water; (f) single-sex basic sanitation facilities; and (g) basic handwashing facilities (as per the WASH indicator definitions) (SDG indicator 4.a.1) 24.24 Budget allocated and spent to ensure the right of persons with disabilities to inclusive education in mainstream settings, as compared to as compared to budget allocated and spent on segregated/separated education settings, whether in mainstream or special schools
Outcome	Assesses the level of enjoyment of the right resulting from the commitments and efforts taken	24.27 Rates of persons with disabilities out of school, enrolled, attending, promoted by grade, completing, and dropping out in mainstream primary, secondary, tertiary educational institutions, vocational training, lifelong learning courses, as compared to others, disaggregated by sex, age, disability, minority or indigenous background, grade and level of education

place of occurrence, in the previous 12 months, doubles as CRPD indicator 16.31, one of the outcome indicators under Article 16 of the CRPD which seeks to ascertain the extent to which persons with disabilities are protected from exploitation, violence, and abuse, compared to others.

Where the SDG indicator does not have a particular focus on persons with disabilities, the CRPD indicators have incorporated the SDG indicators and expanded them by adding in the call for disaggregation by disability: e.g., proportion of population in a given age group achieving at least a fixed level of proficiency in functional literacy and numeracy skills, by sex (SDG indicator 4.6.1), *disability and minority or indigenous background* (CRPD indicator 24.29). Enhanced data collection and disaggregation by disability reflect the obligations under Article 31 of the CRPD and the commitment under SDG Target 17.18 (see above, section "The CRPD and SDG Monitoring Frameworks"). Not only does data collection and disaggregation by disability, alongside other characteristics, facilitate assessment and monitoring of the impact of measures on persons with disabilities; it helps to identify patterns of discrimination and exclusion specific to persons with disabilities and among different groups of persons with disabilities. Furthermore, it serves as an evidence base to reshape policy approaches.

While the use of indicators is growing in parallel to the call for a data revolution, it is necessary to be mindful of their limits. Indicators provide a snapshot of how a situation looks at a given moment. On their own, many indicators may not be capable of assessing advancement of implementation and will require ongoing monitoring and collection of data over time to determine and track progress. In any and every case, indicators should not be used in isolation: given the interdependent and indivisible nature of human rights, indicators should be looked at in unison and holistically, not only to gauge advancement but also to better pinpoint the gaps which impede the fulfilment of human rights obligations. In addition, indicators have a specific purpose and are thus limited. They are one kind of tool; given their necessary brevity and focus on measurement, their use and effectiveness are enhanced when complemented by other monitoring tools and methodologies such as case studies, testimonies through interviews and focus groups, and academic and participatory research, among others.

Data Sources Guidance

The absence of data related to persons with disabilities has been a longstanding barrier to shaping laws and policies that improve the development, access, and exercise of their rights on an equal basis with the rest of society. Identifying data sources and their gaps is key to ensuring that government action is informed to better reach out to those who are left behind, including persons with disabilities. The Data Sources Guidance provides a compilation of existing sources of data that can be used to respond to and provide a measure for the outcome indicators of the human rights indicators on the CRPD. For each article, the outcome indicators are listed, accompanied by examples of data sources which can be used to populate the indicator. The guidance categorizes outcome indicators into three categories: 1) indicators for which countries are already producing relevant data; 2) indicators for which the data is being produced but not yet disaggregated by disability or where the data exists but is not yet being reported on; and 3) indicators for which no example of a data source was found. The guidance seeks to provide examples of data collection efforts that can be useful for countries in thinking through the best way to populate these indicators in their own contexts. In doing so, the guidance also sheds light on those areas where further efforts are needed. Given the global call to mobilize data collection and disaggregation, it is expected that new methodologies and data gathering tools will be developed to meet this obligation and progressively address the data deficit concerning persons with disabilities.

Policy Guidelines

The policy guidelines provide guidance goal by goal (or by clusters of goals) on steps that need to be taken by policymakers to ensure that the SDGs are realized for persons with disabilities. The guidelines have been designed to be used both as a cohesive set and as standalone components. The policy guidelines are composed of components specific to SDG 1 (no poverty), SDG 3 (good health and well-being), SDG 4 (quality education), SDG 5 (gender equality), SDG 8 (decent work and economic growth), SDG 11 (sustainable cities and communities), and a "Foundations guideline" considered a precursor to all guidelines. The Foundations guideline covers key concepts of the CRPD and structural requirements to create an enabling legal, policy and programming environnment for disability inclusion, based on SDG 10 (reducing inequalities), SDG 16 (peace, justice, and strong institutions), and SDG 17 (partnerships for the goals). In addition, six thematic briefs provide information and recommended actions in relation to food and nutrition, clean water and sanitation, climate change and disaster risk reduction, rural areas, tourism, and research and innovation, each covering a range of SDG goals and targets. References to related CRPD indicators, data sources, training materials, and videos are provided throughout policy guidelines to reinforce the importance of connecting implementation with data and monitoring as well as implementation, capacity-building, and awareness-raising.

Training Materials and Videos

The training materials and videos are structured to mirror and build on the components of the policy guidelines; each policy guideline is accompanied by a training module and a short video. They serve to build capacity and raise awareness on how to apply the human rights-based approach to disability across these policy sectors including ensuring the participation of persons with disabilities in the design and monitoring of related laws and policies. The training modules can be used independently and together and be tailored to the interests of different participants.

The Added Value of the SDG-CRPD Resource Package

The SDG-CRPD resource package can help drive SDG and CRPD implementation. The human rights indicators on the CRPD, in particular, serve to track progress of SDG implementation as it relates to persons with disabilities. The CRPD indicators provide an avenue for States to assess and report on their progress in implementing the rights of persons with disabilities, not only within the context of the CRPD review but also for reporting within the framework of the VNR at the HLPF and monitoring the progress of SDG implementation in the regional and national contexts. VNR guidelines give instruction on submission of data using the SDG indicators and also encourage countries to refer to complementary and priority indicators identified at regional and national levels, opening up space for making use of the human rights indicators on the CRPD (UNDESA, 2021). For example, realizing Goal 5 on gender equality for women and girls with disabilities as well as other goals and targets inclusive of women and girls with disabilities could be guided by the indicators on Article 6 of the CRPD and other related articles. The CRPD indicators bring complementary information to SDG indicators essential to uncover discriminatory practices which otherwise may go unnoticed and remain unaddressed. For instance, SDG Target 16.7 calls on States to "ensure responsive, inclusive, participatory and representative decision-making at all levels," and accompanying SDG indicators intended to verify this commitment are:

> 16.7.1: Proportions of positions (by sex, age, persons with disabilities, and population groups) in public institutions (national and local legislatures, public service, and judiciary) compared to national distributions
> 16.7.2: Proportion of population who believe decision-making is inclusive and responsive, by sex, age, disability, and population group

While the first indicator captures the diversity of people in decision-making positions including elected posts, and the second indicator captures the perception of inclusiveness and responsiveness in decision-making by different population groups, neither serve to identify a common barrier which excludes persons with disabilities from participating in voting and standing for election. Many country's constitutions and electoral laws continue to deny persons with disabilities from participating in decision-making on the basis of actual or perceived impairment UNDESA (2018), including having been formally restricted of one's legal capacity; being characterized as "of unsound mind," "insane," "incompetent," and "incapable"; on account of physical or "mental" "unfitness"; related to one's ability to write, read, and speak the official language; or due to lack of accessibility of voting procedures or denial of access to voting polls. Neither SDG indicator touches on this widespread violation which must be tackled in order to leave no one behind in accomplishing SDG 16. CRPD indicators on Article 29 of the CRPD (participation in political and public life), in particular indicator 29.2, do clearly draw attention to this and call for checking that there are "no provisions in the constitution, legislation or regulations which restrict the rights of persons with disabilities to vote, be elected and hold office and perform all public functions."

The SDG-CRPD resource package, in particular the CRPD human rights indicators in connection with the policy guidelines, can also help to guide and tailor SDG implementation to be responsive to and inclusive of persons with disabilities. It can benefit law, policy, and other decision-makers across all levels of government to know what kind of steps are needed to transform the legal, policy, and budgetary frameworks to include persons with disabilities. In addition, the package serves as a tool for civil society, including organizations of persons with disabilities, and national human rights institutions to hold the government accountable, as well as for international cooperation agencies, UN agencies, donors, and others to assess a State's progress and setbacks in proposing projects, investment, and other forms of support.

Closing Considerations

The CRPD and the Sustainable Development Goals share a common vision for a world and society which values each and every individual and enables their participation and inclusion. The instruments create important opportunities to advance the rights of persons with disabilities by building momentum and calling for the involvement and collaboration of diverse actors. Monitoring offers a platform for engagement, at the heart of which lies the lived experiences of rights holders captured through documenting and measuring, including through the use of indicators. Indicators enhance implementation through their dual mission of description and prescription.

The use of the human rights indicators on the CRPD, together with the totality of the OHCHR's SDG-CRPD resource package, has immense potential to converge and consolidate efforts of a wide array of stakeholders, as attested by recent application of the indicators. Following a workshop held in Asunción in September 2019 centering on the CRPD indicators, an accountability and indicators framework for Paraguay's National Action Plan for the Rights of Persons with Disabilities 2015–2030 was adopted. The workshop, coordinated by Bridging the Gap II, invited OHCHR to discuss the human rights indicators on the CRPD with the National Secretariat for the Human Rights of Persons with Disabilities and Paraguayan officials from various ministries. The adopted National Action Plan is structured in 17 axes accompanied by 109 guidelines. For each guideline, at least one indicator is identified and categorized as *structural, process, or outcome* and accompanied by a data source. A few references to SDG indicators are also integrated, though this could have been applied more consistently. The approach and substance of the National Action Plan's indicators reflect the influence of the human rights indicators on the CRPD and augur well for mutual reinforcement of the CRPD and SDGs.

Furthermore, the indicators are contributing to research initiatives to enhance rights-based studies which prioritize the perspective and lived experiences of persons with disabilities. For example, a research group at McGill University have developed data mining methodology based on the CRPD indicators. This methodology is being used in a global COVID-19 monitoring project to analyze pandemic responses for persons with disabilities across 16 countries. These results will be key to understanding the effectiveness of actions as well as to identify the gaps to improve policy responses. They will also serve as important data and evidence for reporting by States and civil society to the treaty bodies as well as in the context of the VNRs, for example, this year's HLPF will be dedicated to building back better from the COVID-19 pandemic while advancing the 2030 Agenda for Sustainable Development.

These are just a few pioneer efforts that have put the CRPD at the center of national and global policy implementation and monitoring. The success and legacy of the SDGs are necessarily bound to the CRPD, and the SDG-CRPD resources, particularly the CRPD indicators, help to pave the way to a disability-inclusive 2030 and beyond.

Disability Rights Monitoring: Focus on the Sustainable Development Goals

39

Elizabeth M. Lockwood

Contents

Abstract

The ambitious 2030 Agenda for Sustainable Development and its Sustainable Development Goals (SDGs) created the space for persons with disabilities and their representative organizations to be at the center of global sustainable development processes. In turn, organizations of persons with disabilities (OPDs) have meaningfully engaged in advocacy to ensure the rights of persons with disabilities are realized in national policies. Yet, despite incredible efforts, persons with disabilities remain left behind after 5 years into the implementation of the SDGs, particularly due to the lack of disability data to monitor the SDGs. This entry explores the evolution of advocacy of the inclusion of persons with disabilities into the 2030 Agenda, participation in follow up and review mechanisms, and how this in turn influences national policies.

Organizations of persons with disabilities · Sustainable development goals · Disability rights monitoring · Disability data · United Nations · 2030 Agenda for Sustainable Development

Introduction

The adoption of the 2030 Agenda for Sustainable Development (2030 Agenda) and its Sustainable Development Goals (SDGs) in 2015 marked a new phase of ambition for global sustainable development. The Agenda is the culmination of more than 2 years of intensive public consultation and engagement with civil society and other stakeholders, including organizations of persons with disabilities from around the world to build upon the achievements of the Millennium Development Goals (MDGs) and to address their unfinished business, particularly in reaching the most marginalized groups.

Since the adoption of the 2030 Agenda, persons with disabilities and their representative organizations have been increasingly advocating to eradicate poverty, reduce inequalities, and gather disability data through the realization of the Sustainable Development Goals (SDGs). With the SDGs, there are new opportunities for engagement for civil society and other stakeholders, including organizations of persons with disabilities and allies. It is imperative that the legally-binding UN Convention on the Rights of Persons with Disabilities (CRPD) and political commitment of the SDGs are interlinked to achieve the inclusion of persons with disabilities in society. Organizations of persons with disabilities have been engaged in the monitoring and review of the CRPD, as well as in the follow-up and review of SDG implementation. This provides organizations of persons with disabilities with increased representation and momentum at the global and regional levels of sustainable development, which in turn strengthens national advocacy for disability rights.

An Inclusive Global Agenda for Sustainable Development

The Millennium Development Goals (MDGs), eight goals agreed in 2000, to end extreme poverty by 2015 had a tremendous effect on the collaboration and prioritization of international development during their 15-year span. Yet, persons with disabilities were not referenced in the MDGs and as a result were excluded from many important development initiatives and funding streams around the world despite making up an estimated 15% of the world's population and being overrepresented among the most impoverished in the world (World Health Organization & The World Bank, 2011; Banks & Polack, 2015). In fact, the 2030 Agenda highlights that more than 80% of persons with disabilities lives in poverty. Such exclusion invigorated the global disability rights movement to work tirelessly to combat such discrimination.

One subsequent transformative achievement for persons with disabilities was the adoption of the CRPD in 2006 that (as of May 2022) 185 nations and regional integration organizations have ratified. The adoption of the CRPD represented a fundamental shift in how persons with disabilities were regarded, moving away from a medical view of disability towards a human rights approach. Uniquely providing both a human rights and development framework, the CRPD redefined what it means to build truly inclusive and sustainable societies, providing the groundwork for future advocacy.

Building on this momentum through tireless and coordinated advocacy from organizations of persons with disabilities and partners, the 2030 Agenda for Sustainable Development resulted in meaningful inclusion of persons with disabilities. On September 25, 2015, the United Nations General Assembly officially and unanimously adopted Resolution A/RES/70/1 "Transforming our world: the 2030 Agenda for Sustainable Development" (2015). The 2030 Agenda represents the first global agenda of its kind in scale and ambition and encompasses social development, climate change, and economic development. The Agenda is a substantive 35-page document containing five sections one of which comprises the SDGs. All sections of the Agenda are important, yet the main focus, particularly regarding implementation, centers on the 17 SDGs and its related 169 targets. The SDGs and targets focus on a broad range of sustainable development issues.

Persons with disabilities are explicitly referenced 11 times throughout the Agenda. These are found in paragraphs on human rights (paragraph 19), vulnerable groups (paragraph 23), education (paragraph 25), and data disaggregation (paragraph 74, g). Additionally, there are seven references in the SDGs on education (Goal 4), employment (Goal 8), reducing inequalities (Goal 10), sustainable and inclusive cities (Goal 11), and data (Goal 17). There are also numerous inexplicit references to persons with disabilities, such as being included in "vulnerable groups" (defined in paragraph 23) and is referenced 18 times throughout the Agenda. Additionally, the commitment to leave no one behind is a foundational element of the Agenda and the SDGs are inherently interlinked, inclusive, and for all people.

In terms of monitoring the SDGs, the 2030 Agenda calls for a global indicator framework indicating that the Goals and targets will be followed up and reviewed using a set of global indicators, complemented by regional and national-level indicators developed by member states (UN General Assembly, 2015: para 75). The Inter-agency and Expert Group on SDG Indicators (IAEG-SDGs) was established by the UN Statistical Commission at its 46th session in March 2015 to develop the indicator framework for the monitoring of the Goals and targets of the 2030 Agenda at the global level and to support its implementation. The global indicator framework was agreed upon, including refinements of several indicators, at the 48th session of the UN Statistical Commission in March 2017, and was subsequently adopted by the United Nations General Assembly on July 6, 2017 (UN General Assembly, Resolution A/RES71/313, 2017). The global indicator framework also contains 11 indicators explicitly referencing persons with disabilities in the areas of poverty eradication, education, employment, reducing inequalities, sustainable and inclusive cities, and peaceful and inclusive societies. Also included in the framework is the chapeau on disaggregation that states "Sustainable Development Goal indicators should be disaggregated, where relevant, by income, sex, age, race, ethnicity, migratory status, disability and geographic location, or other characteristics, in accordance with the Fundamental Principles of Official Statistics" (A/Res/71/313).

The inclusive 2030 Agenda provides significant space for the participation, leadership, and recognition of persons with disabilities and their representative organizations as active contributing members of society. Moreover, with the commitment to leave no one behind as a foundational element of the 2030 Agenda, the rights of persons with disabilities for the first time are included as a central issue in sustainable development. With explicit references, the 2030 Agenda, like the CRPD, has provided equal opportunities for the participation of persons with disabilities and their representative organizations to meaningfully address the institutional, physical, communication, legal, and attitudinal barriers that have inhibited their full participation within human rights and development dialogues.

It is essential that the implementation of the SDGs is in line with and build upon existing international and national commitments and mechanisms, including the CRPD as this will ensure that exclusion and inequality are not created or perpetuated for persons with disabilities. The SDGs apply to all countries and draw particular attention and commitment to include persons with disabilities in all aspects of sustainable development under a number of goals and targets that are also found in the CRPD. In addition, several CRPD Articles are cross-cutting and should be included in the implementation of the SDGs. Some examples include equality and non-discrimination (Article 5), women with disabilities (Article 6), children with disabilities (Article 7), accessibility (Article 9), access to justice (Article 13), statistics and data collection (Article 31), international cooperation (Article 32), and national implementation and monitoring (Article 33).

Persons with disabilities must continue to be included in sustainable development processes as pervasive discrimination against persons with disabilities has an economic cost to all of society. And thus, if persons with disabilities are not agents of change and included in the implementation of the SDGs, then the Agenda will not be achieved for all.

Monitoring the SDGs to Ensure the Inclusion of Persons with Disabilities

The monitoring mechanism for the SDGs, called follow-up and review under the 2030 Agenda, is voluntary and country-led. Although the 2030 Agenda is not legally binding, there is political pressure to implement the SDGs. This pressure is especially evident at the High-level Political Forum (HLPF), which is the main global platform for the follow-up and review of the SDGs where countries volunteer to report on their national implementation of the SDGs with voluntary national reviews (VNRs). In addition, regional reviews, led by UN regional commissions, focus on regional learning and feed into the HLPF.
