

Hi All

As Janet and I prepare for our California event with Steven Greer I find that my original expectations about the reality of UFO's and aliens has changed dramatically.

My original interest in this topic going back to the 1990's revolved around seeing solid UFO's, seeing aliens either alive or dead, seeing how reengineering attempts to use alien technology have progressed, and other nuts and bolts issues. Now, although I still want to see the "stuff" I have no doubt at all that the stuff is real so seeing will be great but I am more intrigued about bigger issues that will affect humanity such as:

- Moving our current understanding of physics from the dark ages of the 2000's to what advanced civilizations know who are thousands, millions and billions of years ahead of us. See a more detailed discussion below.
- Understanding how primitive and fragile our tribal human existence is. We will kill humanity by atomic warfare and severe climate change long before we can even come close to becoming an advanced civilization. We probably don't deserve to become more advanced as we are just tribal primates with more intelligent frontal brain lobes (which may very well have been DNA reengineered).
- Until we move away from our tribal nature and become more spiritual (not religious) we will not be accepted as a peaceful member of advanced civilizations.
- Advanced civilizations do not kill themselves or other advanced groups. If they wanted to destroy us it would have happened already. They are watching, observing and likely helping us at times to evolve peaceably. Their interest in humanity increased dramatically when we developed the atomic bomb because that was a sure sign that we will destroy

ourselves and the scalar waves (our science does not yet understand this) from atomic explosions also affects multi dimension space that aliens live and travel in. They have already demonstrated to us in several well documented events that they can turn our atomic weapons off at will. Maybe it is the aliens who will save humanity from ourselves - but only if we deserve it.

- Aliens and UFO's exist primarily in non-3D space when they travel and come to Earth. However, when they materialize in 3D space that is when we see solid objects. We can cause their craft to crash in 3D space by our own use of scalar radio waves which disrupts the electromagnetic anti gravity bubble used for propulsion - so they literally drop out of the sky. So most of the time they exist in higher dimensional space and appear as fuzzy images or not at all when they are emitting only infra red light.
- I have recently been reading a lot about "consciousness" and, in particular, how many successful experiments have been conducted over several decades proving many psychic phenomenon including experiences that suggest the presence of deep, invisible connections between people, and between people and objects. These experiences seem to transcend the usual boundaries of time and space. Experiments have been conducted that prove instances of telepathy, perception at a distance (remote viewing), perception through time, mind-matter interaction, mental interactions with living organisms, psi in casinos and more. It doesn't mean that this is easy or that everybody can do it or that it happens all the time. But it happens far more than random events and some people have greater natural skills than others just like somebody who has musical, artistic, mathematical skills that are way ahead of the general population.
- I think that the extent and depth of consciousness will be the single biggest discovery of our time even more so than the existence of alien civilizations and their interactions with our planet. It used to be thought that consciousness was a by product of the human mind (or other "minds" in life forms). No

minds are consciousness. Now consciousness appears to be a

minds no consciousness. Now consciousness appears to be a non-local (meaning everywhere where time is meaningless) plane in multi dimensional space. This could become apparent as string theory evolves or even when we have no space or time. We live in "time and space" but ultimately existence may be part of "no space or time" where everything that happens in lesser dimensions of time all is happening simultaneously. Our current understanding of quantum mechanics (which currently is the most successful scientific theory around) includes the concept of quantum entanglement which means, for example, that two particles with certain characteristics such as spin will instantly change their spin to agree if one particle changes. Even if they are separated by billions of light years. In other words the communication of characteristics such as spin happens way faster than the speed of light. In fact, at infinite speeds. Aliens can communicate through a plane of cosmic consciousness using telepathy with each other and other sentient life (including us). They can also board their 3D craft and as they use anti-gravitic propulsion their crafts become weightless (almost) and can start to travel faster and move into trans-dimensional space and can almost travel instantly the same way as entangled particles communicate. However, because they can't get the mass of their craft to zero (although very close to zero) they can't travel infinitely fast but do go many multiple times faster than the speed of light by using extra dimensions of time and space.

- Conventional scientists say "impossible" because they have been taught a theory that says "if you travel at the speed of light your mass goes to infinity" so obviously that can't happen. This is true if we only believe in 3D space plus time. Many conventional scientists will say that extra or inter dimensions are not proven so they are emphatic that travelling at or close to the speed of light is still impossible. These are the same scientists who still only understand a fraction of how the energies in the known universe work even now. So, unless you are a scientist who does understand 100% of how the existing universe works, then your opinions about it being impossible that nothing can travel faster than the speed of

impossible that nothing can travel faster than the speed of light puts you in the same category of a scientist in the 1850's who said "it is impossible to fly an airplane", "x rays don't exist because I can't see them", "computers, cell phones, atomic bombs can never happen" and, obviously, many other stupid and dumb (in hindsight) statements. These scientists are smart at what they know but dumb at what they don't know. However, there are a lot of scientists who will at least admit to the possibility of future new laws of science and can even make some educated guesses about what they could be. My favourite example of one of the "dumb" (not dumb with what they know but about their open mindedness) well known scientists is Neil deGrasse Tyson and my favourite example of an enlightened scientist is Michio Kaku. If Einstein had the same mental blocks as some of our scientists then we would never have discovered that time is not constant but relative, and relative to the extreme point where time can disappear, and the bending of time and space (gravity). Einstein discovered these through "thought" experiments, not a real physical experiment. But both were proven several years later by having to correct satellites for time dilation and observing the bending of star light during a solar eclipse.

The CE5 event that Janet and I are attending (with 500 other people) will teach us how to communicate with advanced civilizations using meditation techniques to send our thoughts into the quantum plane of cosmic consciousness and, in peace, ask them to come to us in some way, shape or form. Believe me, given how much this trip costs I will be the first to complain about service/product quality!

However, if we do have an amazing experience then get ready for me to really dig into the more crazy theories of Steven Greer that I have not bought into yet.

Now, for any of you who want to more fully understand all of the Steven Greer theories (with a lot of evidence) I have attached a link to a 4 hour session that gives all the evidence context history

link to a 1 hour session that gives all the evidence, context, history, and connecting dots that support his theories. He has a huge ego but is one of the most impressive speakers (some may say con artist) that I have seen.

All the best,

Alan
