Eastern Allergy Conference

Mario Castro, MD, MPH Asthma & Airway Translational Research Unit University of Kansas School of Medicine Kansas City, Kansas, USA

l <mark>Catment</mark>

Objectives

- 1. Assess new phenotypes in severe asthma
- 2. Discuss available therapies for severe T2 asthma
- 3. Characterize the use of six biologics currently approved for treatment of severe asthma
- 4. Review criteria for selection of patients that will benefit from asthma biologics

Asthma Phenotypes According to Type 2-High and Type 2-Low

- Type 2-High Asthma¹⁻³:
 - Eosinophilia
 - Early age of onset
 - Atopic/allergic component
 - More likely to respond to corticosteroid therap
- Type 2-Low Asthma¹⁻³:
 - Lower levels of eosinophilia
 - Generally adult onset
 - May be linked to obesity, neutrophilia, smoking
 - Less likely to respond to corticosteroid therapy

- 1. Wenzel SE. Nat Med. 2012;18(5):716-725.
- 2. Fahy JV. Nat Rev Immunol. 2015;15(2):57-65.

. Woodruff PG et al. Am J Respir Crit Care Med. 2009;180(5):388-395.

Inflammation in Asthma Is Complex and Heterogeneous

Type 2 Spec	trum of Inflammation Non-Type 2
 FeNO=fractional exhaled nitric oxide; IgE=immunoglobulin E; IL=inte 	erleukin.
Type 2 (Type 2 High)	Non-Type 2 (Type 2 Low)
More severe	Less severe
Blood eosinophilia	Airway neutrophilia
Elevated tissue eosinophilia	Pauci-granulocytes
Elevated serum IgE	Poor response to corticosteroids
Elevated FeNO	Obesity associated
Variable response to corticosteroids	Lack response to targets of type 2 inflammation
Targets type 2 inflammation	
Type 2 comorbidities	
Most common cytokines: IL-4, IL-13, and IL-5	

GINA Guidelines recognize the need to assess the inflammatory phenotype, type 2 or non-type 2, in patients with severe asthma⁵

IL-6 and Blood Eos predict Future Exacerbations

T2 Low Subjects Are Less Responsive to Therapy & Demonstrate Metabolic Dysfunction

Each 1-pg/ml increase in baseline plasma IL-6 IM Steroid-Response levels increased the incident rate ratio (IRR) of B) A) **BD-Response** C) HOMA-IR 10 asthma exacerbations by 10% over 3 years! p < 0.001 p < 0.001 p = 0.0079 16 в С Number of Asthma Exacerbations Number of Asthma Exacerbations over 14 over 3 Years of Follow up 3 Years of Follow up FEV1 % Change FEV1 % Change ANDA 3 8 8 12p=0.008 p=0.011 Predicted Number f Asthma Exacerbations Predicted Number of Asthma Exacerbations 10-8 6 of Internitent Persistentialow Internitent istentiyLow SistentyHigh Internitent Persistentlyhigh stentillow tistently High 10 100 200 300 400 500 600 700 800 900 1.000 0 2 3 5 6 9 0 Plasma IL-6 (pg/uL) Blood Eosinophil Cell Counts (cells/uL) Longitudinal T2-Status Longitudinal T2-Status

Marginal effect of primary predictor variables of (B) plasma IL-6 and (C) blood eosinophil cell counts are controlled for BMI, age, and history of depression. Marginal effect of plasma IL-6 and blood eosinophils are also controlled for each other.

PrecISE Network: the partnerships

GINA: Identifying Patients and Selecting Biologic

SPECIALIST CARE; SEVERE ASTHMA CLINIC IF AVAILABLE

No evidence of Type 2 airway inflammation

No evidence of Type 2 airway inflammation. Go to section 10

Macrolide therapy - Potential for NonT2 Asthma

- 420 patients were randomly assigned (213 in the azithromycin group and 207 in the placebo group
- Azithromycin reduced asthma exacerbations (1.07 per patient-year [95% CI 0.85-1.29]) compared with placebo (1.86 per patient-year [1.54-2.18]; incidence rate ratio [IRR] 0.59 [95% CI 0.47-0.74]; p<0.0001).
- Azithromycin significantly improved asthma-related quality of life (adjusted mean difference, 0.36 [95% CI 0.21-0.52]; p=0.001).
- Diarrhoea was more common in azithromycin-treated patients (72 [34%] vs 39 [19%]; p=0.001).

Bronchial Thermoplasty

The catheter is a flexible tube with an expandable wire array at the tip

The Radiofrequency Controller supplies energy that is converted to heat in the airway wall

- Monopolar radiofrequency (RF) energy
- Temperature controlled: 65 °C
- 10 seconds
- Multiple safety algorithms to ensure controlled energy delivery

BT Clinical Studies

Effectiveness and Safety

2011- 2019 **PAS2 TRIAL**

5 clinical studies in patients with asthma, all with 5 years of follow-up

3 randomized, controlled, clinical studies, with 1 sham-controlled

Evidence: Bronchial Thermoplasty (BT)

- One-time treatment lasting for 5 years¹
 - Patients (N=288, AIR2) ICS 1,000 µg/d beclomethasone or equivalent and LABA >100 µg/d salmeterol or equivalent, other meds including leukotriene modifiers, OmAb (if used for ≥1 year prior), and ≤10 mg/d OCS
- 32% decrease in severe exacerbations (requiring systemic CS) vs no treatment²
 - Reduction in exacerbations at 1 year maintained for ≥ 5 years¹
- 84% reduction in ED visits for respiratory symptoms at 1 year vs no treatment²
 - Reduction in ED visits at 1 year maintained for ≥ 5 years¹

CS, costicosteroid; ED, Emergency department; OmAb, Omalizumab; OCS, oral corticosteroid

1. Wechsler M, et al. *J Allergy Clin Immunol*. 2013;132(6):1295-1302.

2. Castro M, et al. Am J Respir Crit Care Med. 2010;181(2):116-124.

Bronchial Thermoplasty - Severe Exacerbations over 5 yrs

• The reduction in severe exacerbations requiring systemic corticosteroids at 1 year (vs. sham-treated patients) was maintained out to at least 5 years.

Compared with 1 year prior to BT treatment (baseline):

- 44% average decrease in percentage of patients having severe exacerbations
- 48% average decrease in severe exacerbation event rates

PAS2, 5 Year Data

TASMA trial

- 40 patients with severe asthma randomized to immediate BT or delayed
- Median ASM mass decreased by >50% in immediate BT (n = 17) versus no change in the delayed controls (n = 19) (P = 0.0004).
- In immediate BT, Asthma Control Questionnaire scores improved with -0.79 ([IQR], -1.61 to 0.02) compared with 0.09 (IQR, -0.25to 1.17) in delayed (P = 0.006).
- Treatment response in the total group (*n* = 35) was **positively** associated with serum IgE and eosinophils but not with baseline ASM mass.

Table 3. Clinical Characteristics before and after BT in the Total Group (n = 35)

Characteristics	Before BT	After BT	Median Difference (95% Cl)	P Value
ACQ-6 score	2.67 ± 0.64	2.00 ± 1.05	–0.67 (–0.17 to –1.17)	0.0005 <u>*</u>
AQLQ score	3.99 ± 1.00	4.73±1.24	0.85 (0.19 to 1.41)	0.0023 <u>*</u>

n = 17

Delayed group

n = 19

Guided XeMRI BT

Guided versus Conventional BT -Primary Endpoint

Single BT treatment guided by ¹²⁹Xe MRI provided similar quality of life improvement as standard three-session BT

Hall CS, et al. Am J Respir Crit Care Med. 2020;202:524-534.

Guided versus Conventional BT - Adverse Events within 3 Weeks of BT

	Asthma Exacerbations	Guided BT	Unguided BT
BT 1	AE	4/15 (26.7%)	7/15 (46.7%)
	SAE	1/15 (6.7%)	2/15 (13.3%)
BT 2	AE	1/15 (6.7%)	5/15 (33.3%)
	SAE	1/15 (6.7%)	1/15 (6.7%)
BT 3	AE	4/15 (26.7%)	5/14 (35.7%)
	SAE	2/15 (13.3%)	3/14 (21.4%)
	Total Events	13 Events	23 Events
	1 Guided vs 3 Unguided	4 AE / 1 SAE (33%)	17 AE / 6 SAE (73%)

Single BT guided by ¹²⁹Xe MRI is associated with fewer peri-procedure adverse events than standard 3-session BT

Hall CS, et al. Am J Respir Crit Care Med. 2020;202:524-534.

TSLP Is Also Released by Multiple Downstream Cells, Perpetuating Inflammation

Year 1

Year 3

Mucus plug relation to airflow over time

Tang M & SARP. AJRCCM 2022

Mucus scores were reduced in patients receiving tezepelumab compared with placebo

EUROPEAN RESPIRATORY SOCIETY INTERNATIONAL CONGRESS 2022 BARCELONA Spain, 4-6 September

- 116 pts randomized to Tezepelumab (anti-TSLP) mAb or placebo for 28 wks in the CASCADE Phase 2 study; 82 patients scored for MP with paired CT scans over treatment period
- Change in FEV1 correlated with change in mucus score r=-0.505, p=0.0001

Brightling, C et al CASCADE Phase 2. ERS Sept 2022

Non-T2 therapies for asthma

- Severe asthma is quite heterogenous with different phenotypes: exacerbation-prone, airway inflammation, mucus plugs, and airway and parenchymal remodeling
- New biomarkers are needed for Non-T2 asthma
 - Exacerbation prone asthma is characterized by lower FEV1, obesity, HTN, DM and higher IL-6 levels
- Macrolide therapy (azithromycin) may add benefit though this has not been replicated (low evidence)
- Bronchial thermoplasty offers benefit to those with uncontrolled asthma with an acceptable safety profile in selected patients
 - It has not been specifically tested in non-T2 asthma (low evidence)
- Tezepelumab blocks TSLP, an epithelial alarmin
 - Reduces exacerbations even in the low eosinophil severe uncontrolled asthma patient
 - Sustained effects on exacerbations (~0.4-0.6/yr) and lung function (FEV1 ~200 ml) over two years
 - Significant reduction in submousal eosinophils (though no other cells) with significant reduction in T2 inflammatory markers and airway hyperresponsiveness to mannitol

Options for Non-T2 asthma are expanding ... can we get to therapies for nearly all endotypes??
