

How far do we need to evolve  
as pathologists focusing on  
melanocytic tumors?

Aeree Kim

Korea University

# Melanoma

- 76,000 new cases in 2014 in the US & 9,700 deaths
- UV light
- Lightly pigmented individual: higher risk
- >10mm
- Other site: oral & anogenital mucosa, pharynx, GI & GU tract, esophagus, meninges, uvea of the eye

# Contents

- 2018 WHO Classification, which lets us assume a molecular pathway through which melanoma develops.
- Melanoma simulants
- Histopathology of melanoma
- What will be our role in the future? How can we prepare for it?

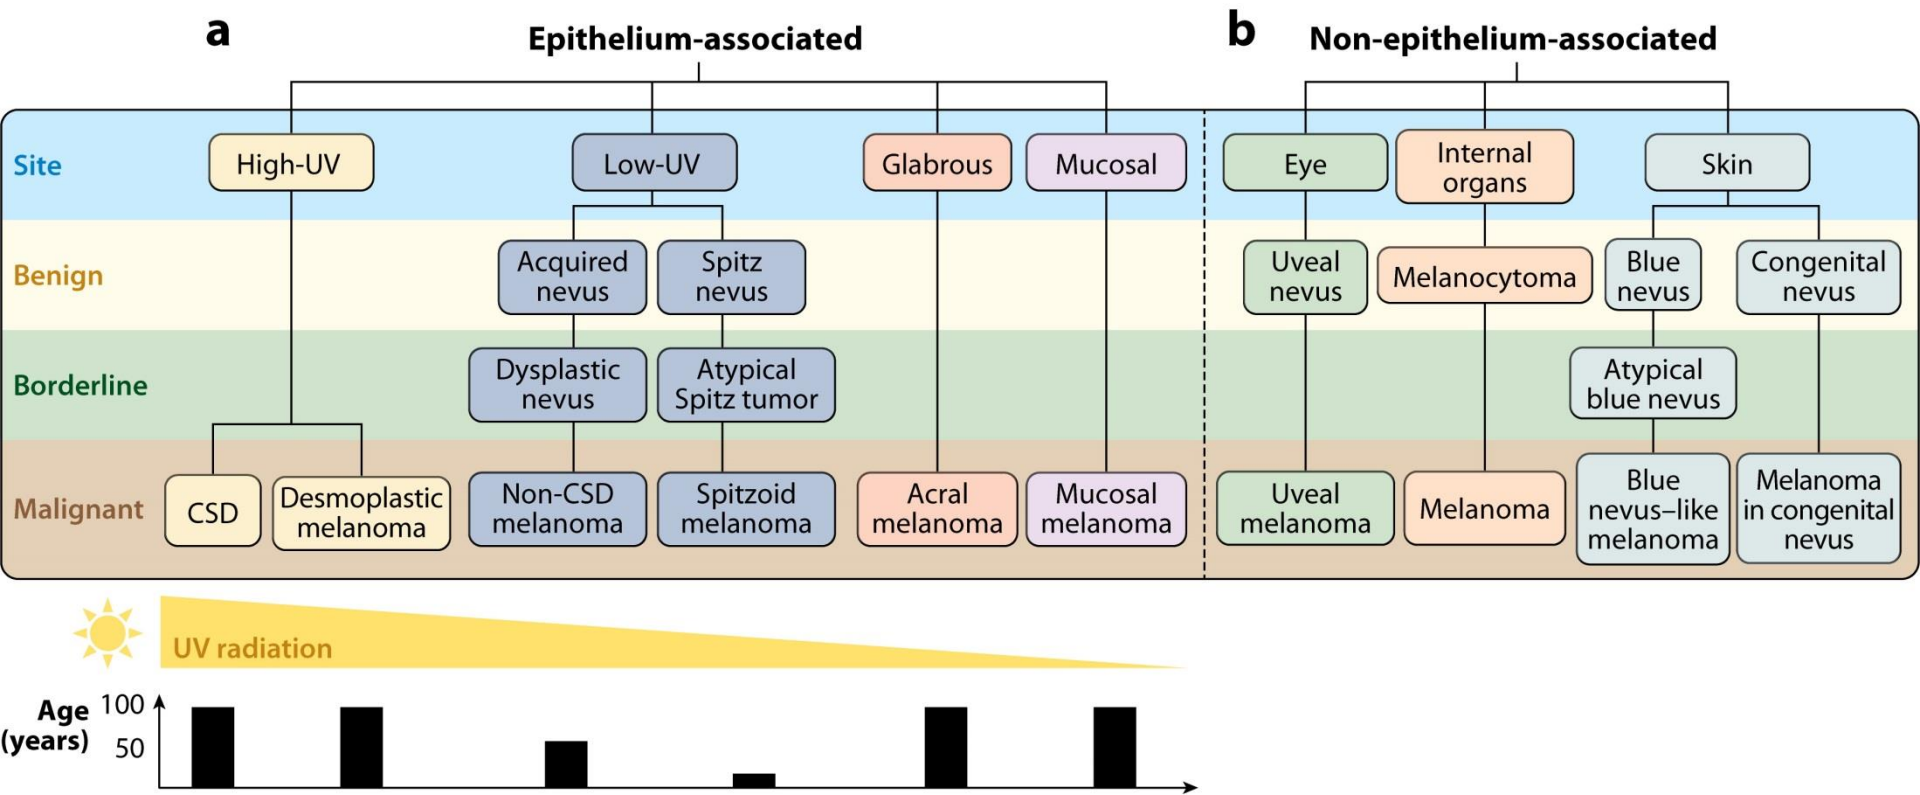

# **2018 WHO CLASSIFICATION**

# WHO, 2006

## WHO histological classification of melanocytic tumours

<b>Malignant melanoma</b>	8720/3	Dermal melanocytic lesions	
Superficial spreading melanoma	8743/3	Mongolian spot	
Nodular melanoma	8721/3	Naevus of Ito and Ota	
Lentigo maligna	8742/2	Blue naevus	8780/0
Acral-lentiginous melanoma	8744/3	Cellular blue naevus	8790/0
Desmoplastic melanoma	8745/3	Combined naevus	
Melanoma arising from blue naevus	8780/3	Melanotic macules, simple lentigo and lentiginous naevus	
Melanoma arising in a giant congenital naevus	8761/3	Dysplastic naevus	8727/0
Melanoma of childhood		Site-specific naevi	
Naevoid melanoma	8720/3	Acral	
Persistent melanoma	8720/3	Genital	
		Meyerson naevus	
<b>Benign melanocytic tumours</b>		Persistent (recurrent) melanocytic naevus	
Congenital melanocytic naevi		Spitz naevus	8770/0
Superficial type	8761/0	Pigmented spindle cell naevus (Reed)	8770/0
Proliferative nodules in congenital melanocytic naevi	8762/1	Halo naevus	8723/0

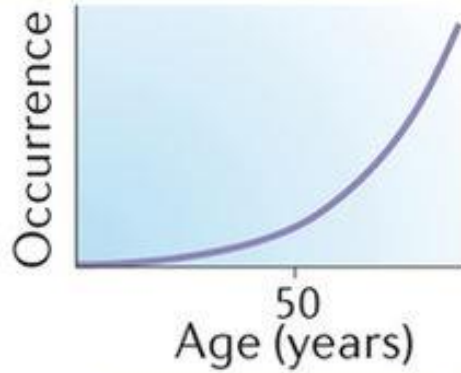

<sup>1</sup> Morphology code of the International Classification of Diseases for Oncology (ICD-O) {786} and the Systematized Nomenclature of Medicine (<http://snomed.org>). Behaviour is coded /0 for benign tumours, /3 for malignant tumours, /2 for non-invasive tumours, and /1 for borderline or uncertain behaviour.

## Histopathologic criteria for conventional Spitz nevi, atypical Spitz tumors, and melanoma

	Conventional Spitz tumors	Atypical Spitz tumors	Melanoma
<b>Architecture</b>			
Diameter	<5 to 6 mm	≥5 to 6 mm	≥10 mm
Outline	Symmetric (wedge-shaped)	Asymmetric	Asymmetric
Circumscription	Sharp lateral circumscription	Often poor circumscription	Poor circumscription
Epidermal hyperplasia	Present	Effacement of the epidermis may be present	Absent, or effacement of the epidermis may be present
Maturation with dermal depth	Present	Possibly diminished or lack of zonation and maturation	Lack of zonation and maturation often present
Eosinophilic hyaline globules (Kamino bodies)	Present	Absent or few	Typically absent
Cellular density	Orderly nondisruptive infiltration of collagen by melanocytes	High cellular density	High cellular density
<b>Cytology</b>			
Cellular population	Uniform spindle and/or epithelioid	Spindle and/or epithelioid cells showing increasing cytologic atypia	Spindle and/or epithelioid cells showing increasing cytologic atypia and pleomorphism
Cytoplasm	Opaque or ground glass cytoplasm	Granular versus ground glass cytoplasm	Granular or mixed cytoplasm
Nuclear to cytoplasmic ratio	Low nuclear to cytoplasmic ratio	Increasingly high nuclear to cytoplasmic ratio	High nuclear to cytoplasmic ratio
Chromatin pattern	Nuclei with open, delicate chromatin pattern	Loss of delicate or dispersed chromatin pattern	Loss of delicate or dispersed chromatin pattern
Nucleoli	Uniform nucleoli	Increasingly prominent nucleoli	Large nucleoli
Pleomorphism	Rare	May be present	Usually present
Hyperchromatism	Absent	May be present	Present
<b>Proliferation</b>			
Mitotic rate	<2/mm <sup>2</sup> Absent or rare mitoses in deep dermis Lack of atypical mitoses	2 to 6/mm <sup>2</sup> (particularly >6/mm <sup>2</sup> ) Deep or marginal dermal mitoses may be present	2 to 6/mm <sup>2</sup> (particularly >6/mm <sup>2</sup> ) Deep or marginal dermal mitoses frequently present
Proliferative index (Ki-67 expression)	<2%	2 to >10%	Often >15 to 30%

(D)

# Nodular, Nevoid, metastatic Melanomas

Nodular melanoma	8721/3
Nevoid melanoma	8720/3
Metastatic melanoma	8720/6

**HOW CAN WE DIFFERENTIATE  
MELANOMA FROM ITS SIMULANT?**

# Melanoma Simulants

- Deep penetrating nevus
- Spitz nevus vs **spitzoid melanoma**
- Cellular blue nevus vs **melanoma arising in blue nevus**
- Acral nevus vs **acral melanoma**
- Dysplastic nevus vs **melanoma**
- Combined melanocytic nevus vs **melanoma arising in a nevus**
- **Densely inflamed melanoma** vs lichenoid keratosis/ dermatitis (LPLK)
- **Nevoid melanoma**
- **Desmoplastic melanoma vs MPNST**
- Proliferative Nodules within congenital nevi

# **HISTOPATHOLOGY OF MELANOMA**

- Lack of symmetry
- Lack of maturation
- Poor circumscription
- Nest vs Single cell predominance
  - Pagetoid scatter of melanocytes, especially at edges
  - lentiginous pattern
- Confluence of nests
- Consumption of the epidermis
- Variable cellular density, cellular pleomorphism, mitosis, necrosis, lymphatic invasion...
- Fibrosis displacing Solar elastosis

# Symmetry

- Silhouette
- Lateral margins
- Horizontal levels of the lesion
- Distribution of the pigment
- Distribution, size, shape of nests
- Epidermal pattern

		Benign	w-grade dysplasia	high-grade dysplasia	Malignant
I	Low-CSD melanoma	Nevus	Low-grade Dysplasia	High-grade Dysplasia	Low-CSD melanoma
			BIN	BAP1-inactivated melanocytoma	Melanoma in BIN
			DPN	Deep penetrating melanocytoma	Melanoma in DPN
				Pigmented epithelioid melanocytoma	Melanoma in PEM
III	Desmoplastic M	IMP	IMAP	MIS	Desmoplastic melanoma
IV	Malignant Spitz T/M	Spitz nevus	Atypical Spitz Nevus	STUMP/MELTUMP	Malignant Spitz T/ melanoma
V	Acral melanoma	Acral nevus	IAMP/dysplasia	Acral MIS	Acral melanoma
VI	Mucosal melanoma	Melanosis	Atypical melanosis /dysplasia	Mucosal MIS	Mucosal lentiginous M
VII	Melanoma in CN	CN	Nodule in CN	MIS in CN	Melanoma in CN
VIII	Melanoma	Blue	Cellular BN	Atypical CBN	Melanoma in BN

# IPX 활용

- Lineage : Melan-A
- Junctional: SOX-10
- Architecture: Melan A
- Differentiation: HMB45, Ki67
- Margin: S-100 , SOX-10
- Invasion: Melan A
- Gene fuse or gene loss: ROS1, BAP-1, ALK
- Proliferation: Ki-67, PHH3

# Characteristic attributes

	<b>Mutation Burden</b>	<b>UV Radiation Signature</b>	<b>DNA Copy Number Changes</b>	<b>Types of Aberration</b>
<b>High-CSD</b>	Very high	Strong	Multiple	Typically chromosomal arms or entire chromosomes
<b>Low-CSD</b>	High	Strong	Multiple	Typically chromosomal arms or entire chromosomes
<b>Acral/Mucosal</b>	Low	Absent	Numerous	Multiple focused amplification and deletions
<b>Uveal</b>	Very low	Absent	Few	Typically chromosomal arms or entire chromosomes
<b>Spitz</b>	Probably low	Variable	Multiple	Typically chromosomal arms or entire chromosomes

# Copy # Variation

- Multiple gain and loss in melanoma
- Lack in gain and loss in conventional and blue nevus
- 9p loss in melanoma
- Amplifications at 11q13(cyclin D1, FGF3, and FGF4) in acral melanoma
- 11p gain in Spitz N(HRAS)
- Proliferative nodule: multiple gain and loss
- Gene fusion → no gain: FISH

# FISH

## Overview

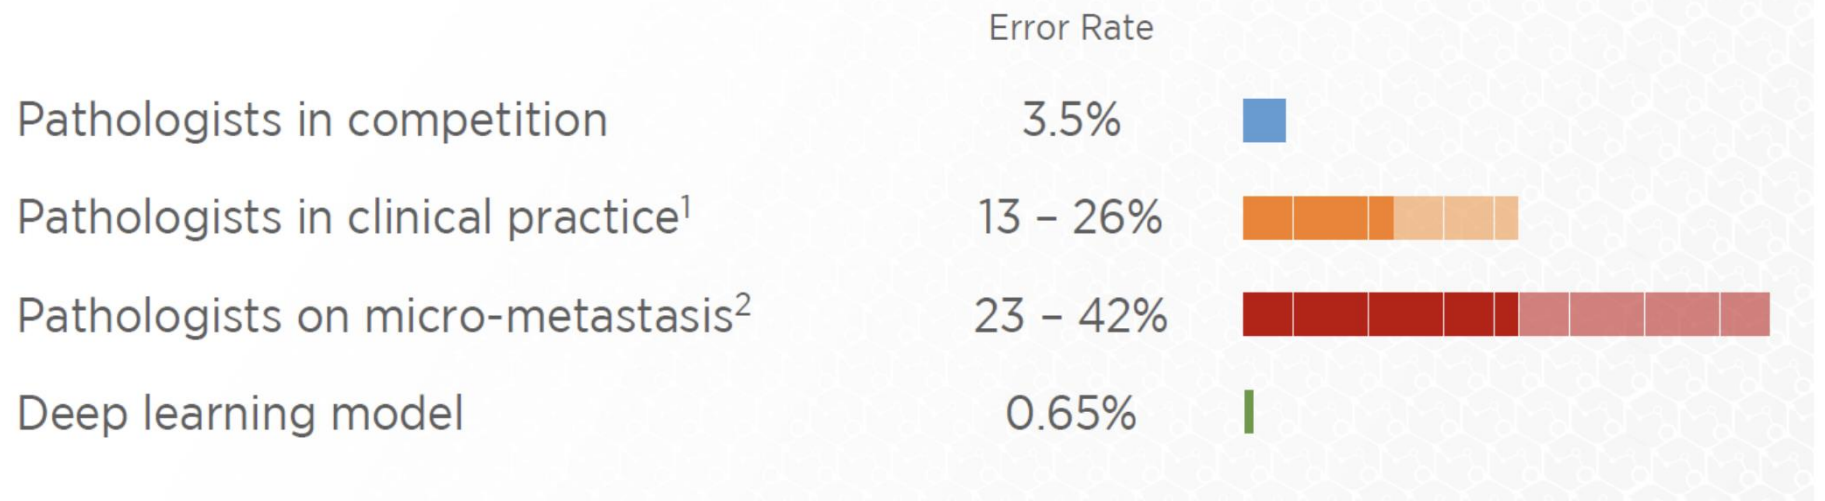

Built on the success of its predecessor, CAMELYON17 is the second grand challenge in pathology organised by the Diagnostic Image Analysis Group ([DIAG](#)) and Department of Pathology of the Radboud University Medical Center ([Radboudumc](#)) in Nijmegen, The Netherlands.

The goal of this challenge is to evaluate new and existing algorithms for automated detection and classification of breast cancer metastases in whole-slide images of histological lymph node sections. This task has high clinical relevance and would normally require extensive microscopic assessment by pathologists. The presence of metastases in lymph nodes has therapeutic implications for breast cancer patients. Therefore, an automated solution would hold great promise to reduce the workload of pathologists while at the same time reduce the subjectivity in diagnosis.

Last year at ISBI, we organised the highly successful [CAMELYON16](#) grand challenge, in which 32 submissions from as many as 23 research groups were received. This was the first challenge ever using whole-slide images, having participants download over 600GB of data. This year, CAMELYON17 will invigorate the challenge by moving from slide level analysis to patient level analysis (i.e. combining the assessment of multiple lymph node slides into one outcome). This will bring the efforts closer to direct usefulness in a clinical setting. Compared to last year, the dataset will be significantly extended and will contain images from five medical centers.
