

CJC1295/IPAMORELIN

CJC1295/Ipamorelin is a combination of two peptides, a GHRH (growth hormone-releasing hormone) and GHRP (growth hormone releasing peptide), all in one. Both of these peptides work together synergistically to amplify the pulse to promote the release of growth hormone.

The primary purpose of CJC-1295 is to boost protein synthesis levels and help fuel the growth of muscle tissues in the body.

CJC 1295 was developed to treat diseases and medical conditions for patients who had muscle disorders, diseases, and burn victims.

BENEFITS:

- Improve sleep quality.
- Increase cognitive function.
- Decrease body fat.
- Quicker recovery times post-injury.
- Increased muscle mass.
- Increase in strength.

It is used alongside Ipamorelin because of the synergistic effects and increased GH release levels. These are naturally released by the pituitary gland, and as your body stops producing the hormone as you age, a supplement, such as Ipamorelin, can naturally help increase those dissipated levels.
