Tools of Geometry

: • Then	:·Now	:∙Why? ⊾
• You graphed points on the coordinate plane and evaluated mathematical expressions.	 In this chapter, you will: Find distances between points and midpoints of line segments. Identify angle relationships. Find perimeters, areas, surface areas, and volumes. 	<text></text>

Get Ready for the Chapter

Diagnose Readiness | You have two options for checking Prerequisite Skills.

Textbook Option Take the Quick Check below. Refer to the Quick Review for help.

Quick Check	Quick Review
Graph and label each point in the coordinate plane.	Example 1
1. <i>W</i> (5, 2) 2. <i>X</i> (0, 6)	Graph and label the point $Q(-3, 4)$ in the coordinate plane.
3. Y(-3, -1) 4. Z(4, -2)	Start at the origin. Since the $Q(-3, 4)$
5. GAMES Carolina is using the diagram to record her chess moves. She moves her knight 2 spaces up and 1 space to the left from f3. What is the location of the knight after Carolina completes her turn?	3 units to the left. Then move 4 units up since the <i>y</i> -coordinate is positive. Draw a dot and label it <i>Q</i> .
Find each sum or difference.	Example 2
6. $\frac{2}{3} + \frac{5}{6}$ 7. $2\frac{1}{18} + 4\frac{3}{4}$	Find $3\frac{1}{6} + 2\frac{3}{4}$.
8. $\frac{13}{18} - \frac{5}{9}$ 9. $14\frac{3}{5} - 9\frac{7}{15}$	$3\frac{1}{6} + 2\frac{3}{4} = \frac{19}{6} + \frac{11}{4}$ Write as improper fractions.
10. FOOD Alvin ate $\frac{1}{3}$ of a pizza for dinner and took $\frac{1}{6}$ of it	$= \frac{19}{6} \left(\frac{2}{2}\right) + \frac{11}{4} \left(\frac{3}{3}\right)$ The LCD is 12.
for lunch the next day. How much of the pizza does he	$=\frac{38}{12}+\frac{33}{12}$ Multiply.
	$=\frac{71}{12} \text{ or } 5\frac{11}{12}$ Simplify.
Evaluate each expression.	Example 3
11. $(-4-5)^2$ 12. $(6-10)^2$	Evaluate the expression $[-2 - (-7)]^2 + (1 - 8)^2$.
13. $(8-5)^2 + [9-(-3)]^2$	Follow the order of operations.
Solve each equation.	$[-2 - (-7)]^2 + (1 - 8)^2$
14. $6x + 5 + 2x - 11 = 90$	$=5^{2} + (-7)^{2}$ Subtract.
15. $8x - 7 = 53 - 2x$	$= 23 + 49 \qquad 5^{-} = 23, (-7)^{-} = 49$ = 74 Add.

Get Started on the Chapter

You will learn several new concepts, skills, and vocabulary terms as you study Chapter 1. To get ready, identify important terms and organize your resources. You may refer to Chapter 0 to review prerequisite skills.

Points, Lines, and Planes

:•Then	: Now	:·Why?
• You used basic geometric concepts and properties to solve problems.	 Identify and model points, lines, and planes. Identify intersecting lines and planes. 	• On a subway map, the locations of stops are represented by <i>points</i> . The route the train can take is modeled by a series of connected paths that look like <i>lines</i> . The flat surface of the map on which these points and lines lie is representative of a <i>plane</i> .

B NewVocabulary

undefined term point line plane collinear coplanar intersection definition defined term space

Common Core State Standards

Content Standards G.CO.1 Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.

Mathematical Practices

- 4 Model with mathematics.
- 6 Attend to precision.

Points, Lines, and Planes Unlike the real-world objects that they model, shapes, points, lines, and planes do not have any actual size. In geometry, point, line, and *plane* are considered **undefined terms** because they are only explained using examples and descriptions.

You are already familiar with the terms point, line, and plane from algebra. You graphed on a coordinate plane and found ordered pairs that represented *points* on *lines*. In geometry, these terms have a similar meaning.

The phrase *exactly one* in a statement such as, "There is exactly one line through any two points," means that there is one and only one.

connectED.mcgraw-hill.com

Key Conce	pt Undefined Terms	
A <mark>point</mark> is a lo	ocation. It has neither shape nor size.	4
Named by	a capital letter	A •
Example	point A	
A <mark>line</mark> is mad There is exac	e up of points and has no thickness or width. tly one line through any two points.	P Q
Named by	the letters representing two points on the line or a lowercase script letter	m
Example	line <i>m</i> , line <i>PQ</i> or \overrightarrow{PQ} , line <i>QP</i> or \overrightarrow{QP}	
A <mark>plane</mark> is a f infinitely in al through any t	lat surface made up of points that extends I directions. There is exactly one plane three points not on the same line.	
Named by	a capital script letter or by the letters naming three points that are not all on the same line	C. K
Example	plane \mathcal{K} , plane <i>BCD</i> , plane <i>CDB</i> , plane <i>DCB</i> , plane <i>DCB</i> , plane <i>DBC</i> , plane <i>CBD</i> , plane <i>BDC</i>	

Collinear points are points that lie on the same line. *Noncollinear* points do not lie on the same line. Coplanger points are points that lie in the same plane. Noncoplanar points do not lie in the same plane.

Example 1 Name Lines and Planes

Use the figure to name each of the following.

a. a line containing point W

b. a plane containing point *X*

The line can be named as line *n*, or any two of the four points on the line can be used to name the line

P VWX P VPPV T VPPV T

One plane that can be named is plane \mathcal{P} . You can also use the letters of any three *noncollinear* points to name this plane

noncontinent points to	nume uns plune.	
plane XZY	plane VZW	plane VZX
plane VZY	plane WZX	plane WZY

The letters of each of these names can be reordered to create other acceptable names for this plane. For example, *XZY* can also be written as *XYZ*, *ZXY*, *ZYX*, *YXZ*, and *YZX*. In all, there are 36 different three-letter names for this plane.

GuidedPractice

1A. a plane containing points *T* and *Z*

1B. a line containing point *T*

Real-World Example 2 Model Points, Lines, and Planes

MESSAGE BOARD Name the geometric terms modeled by the objects in the picture.

The push pin models point G.

The maroon border on the card models line *GH*.

The edge of the card models line HJ.

The card itself models plane FGJ.

GuidedPractice

Name the geometric term modeled by each object.

2A. stripes on a sweater

G H J F

2B. the corner of a box

2 Intersections of Lines and Planes The **intersection** of two or more geometric figures is the set of points they have in common. Two lines intersect in a point. Lines can intersect planes, and planes can intersect each other.

Line *r* represents the intersection of planes \mathcal{A} and \mathcal{B} .

StudyTip

Additional Planes Although

not drawn in Example 1b.

there is another plane that contains point *X*. Since points

W, *T*, and *X* are noncollinear, point *X* is also in plane *WTX*.

Real-WorldCareer

Drafter Drafters use perspective to create drawings to build everything from toys to school buildings. Drafters need skills in math and computers. They get their education at trade schools, community colleges, and some 4-year colleges. Refer to Exercises 50 and 51.

Example 3 Draw Geometric Figures

Draw and label a figure for each relationship.

a. ALGEBRA Lines AB and CD intersect at E for A(-2, 4), B(0, -2), C(-3, 0), and D(3, 3) on a coordinate plane. Point F is coplanar with these points, but not collinear with \overrightarrow{AB} or \overrightarrow{CD} .

Graph each point and draw \overrightarrow{AB} and \overrightarrow{CD} .

Label the intersection point as *E*.

An infinite number of points are coplanar with A, B, C, D and E but not collinear with \overrightarrow{AB} and \overrightarrow{CD} . In the graph, one such point is F(2, -3).

b. *QR* intersects plane *T* at point *S*.

Draw a surface to represent plane $\ensuremath{\mathcal{T}}$ and label it.

Draw a dot for point *S* anywhere on the plane and a dot that is not on plane T for point *Q*.

Draw a line through points *Q* and *S*. Dash the line to indicate the portion hidden by the plane. Then draw another dot on the line and label it *R*.

GuidedPractice

- **3A.** Points *J*(-4, 2), *K*(3, 2), and *L* are collinear.
- **3B.** Line *p* lies in plane \mathcal{N} and contains point *L*.

Definitions or **defined terms** are explained using undefined terms and/or other defined terms. **Space** is defined as a boundless, three-dimensional set of all points. Space can contain lines and planes.

Example 4 Interpret Drawings

a. How many planes appear in this figure? Six: plane *X*, plane *JDH*, plane *JDE*,

plane *EDF*, plane *FDG*, and plane *HDG*.

- **b.** Name three points that are collinear. Points *J*, *K*, and *D* are collinear.
- **c.** Name the intersection of plane *HDG* with plane *X*. Plane *HDG* intersects plane *X* in \overrightarrow{HG} .
- **d.** At what point do \overrightarrow{LM} and \overleftarrow{EF} intersect? Explain. It does not appear that these lines intersect. \overleftarrow{EF} lies in plane *X*,

It does not appear that these lines intersect. *EF* lies in plane *X*, but only point *L* of \overrightarrow{LM} lies in *X*.

GuidedPractice

Explain your reasoning.

- **4A.** Are points *E*, *D*, *F*, and *G* coplanar?
- **4B.** At what point or in what line do planes *JDH*, *JDE*, and *EDF* intersect?

StudyTip

StudyTip

Three-Dimensional Drawings

Because it is impossible to

show an entire plane in a figure, edged shapes with

used to represent planes.

different shades of color are

CCSS Precision A point has

no dimension. A line exists in one dimension. However, a circle is two-dimensional, and a pyramid is three-dimensional.

7. Plane Z contains lines x, y, and w. Lines χ and y intersect at point V and lines χ and w intersect at point *P*.

Example 4 Refer to the figure.

- **8.** How many planes are shown in the figure?
- **9.** Name three points that are collinear.
- **10.** Are points *A*, *H*, *J*, and *D* coplanar? Explain.
- **11.** Are points *B*, *D*, and *F* coplanar? Explain.
- **12. ASTRONOMY** Ursa Minor, or the Little Dipper, is a constellation made up of seven stars in the northern sky including the star Polaris.
 - **a.** What geometric figures are modeled by the stars?
 - **b.** Are Star 1, Star 2, and Star 3 collinear on the constellation map? Explain.
 - c. Are Polaris, Star 2, and Star 6 coplanar on the map?

 \mathcal{B}

Extra Practice is on page R1.

Practice and Problem Solving

xample '	Refer to the figure.

- **13.** Name the lines that are only in plane *Q*.
- 14. How many planes are labeled in the figure?
- **15.** Name the plane containing the lines *m* and *t*.
- **16.** Name the intersection of lines *m* and *t*.
- (17) Name a point that is not coplanar with points *A*, *B*, and *C*.
- **18.** Are points *F*, *M*, *G*, and *P* coplanar? Explain.
- **19.** Name the points not contained in a line shown.
- **20.** What is another name for line *t*?
- **21.** Does line *n* intersect line *q*? Explain.

Name the geometric term(s) modeled by each object.

26. a blanket
27. a knot in a rope
28. a telephone pole
29. the edge of a desk
30. two connected walls
31. a partially opened folder

Example 3 Draw and label a figure for each relationship.

- **32.** Line *m* intersects plane \mathcal{R} at a single point.
- **33.** Two planes do not intersect.
- **34.** Points *X* and *Y* lie on \overrightarrow{CD} .
- **35.** Three lines intersect at point *J* but do not all lie in the same plane.
- **36.** Points *A*(2, 3), *B*(2, -3), *C* and *D* are collinear, but *A*, *B*, *C*, *D*, and *F* are not.
- **37.** Lines \overrightarrow{LM} and \overrightarrow{NP} are coplanar but do not intersect.
- **38.** \overrightarrow{FG} and \overrightarrow{JK} intersect at P(4, 3), where point *F* is at (-2, 5) and point *J* is at (7, 9).
- **39.** Lines *s* and *t* intersect, and line *v* does not intersect either one.

Example 4 (CSS) MODELING When packing breakable objects such as glasses, movers frequently use boxes with inserted dividers like the one shown.

- **40.** How many planes are modeled in the picture?
- **41.** What parts of the box model lines?
- **42.** What parts of the box model points?

Refer to the figure at the right.

43. Name two collinear points.

- 44. How many planes appear in the figure?
- **45** Do plane \mathcal{A} and plane *MNP* intersect? Explain.
- **46.** In what line do planes \mathcal{A} and QRV intersect?
- **47.** Are points *T*, *S*, *R*, *Q*, and *V* coplanar? Explain.
- **48.** Are points *T*, *S*, *R*, *Q*, and *W* coplanar? Explain.

connectED.mcgraw-hill.com

FINITE PLANES A *finite plane* is a plane that has boundaries, or does not extend indefinitely. The street signs shown are finite planes.

- **a.** If the pole models a line, name the geometric term that describes the intersection between the signs and the pole.
- **b.** What geometric term(s) describes the intersection between the two finite planes? Explain your answer with a diagram if necessary.

50. ONE-POINT PERSPECTIVE One-point perspective drawings use lines to convey depth. Lines representing horizontal lines in the real object can be extended to meet at a single point called the *vanishing point*. Suppose you want to draw a tiled ceiling in the room below with nine tiles across.

- a. What point represents the vanishing point in the drawing?
- **b.** Trace the figure. Then draw lines from the vanishing point through each of the eight points between *A* and *B*. Extend these lines to the top edge of the drawing.
- **c.** How could you change the drawing to make the back wall of the room appear farther away?
- **51. TWO-POINT PERSPECTIVE** Two-point perspective drawings use two vanishing points to convey depth.
 - **a.** Trace the drawing of the castle shown. Draw five of the vertical lines used to create the drawing.
 - **b.** Draw and extend the horizontal lines to locate the vanishing points and label them.
 - **c.** What do you notice about the vertical lines as they get closer to the vanishing point?
 - d. Draw a two-point perspective of a home or a room in a home.
- **52. CSS ARGUMENTS** Name two points on the same line in the figure. How can you support your assertion?

53. TRANSPORTATION When two cars enter an intersection at the same time on opposing paths, one of the cars must adjust its speed or direction to avoid a collision. Two airplanes, however, can cross paths while traveling in different directions without colliding. Explain how this is possible.

- **54. Solution Solu**
 - **a.** Tabular Represent the locus of points satisfying the equation 2 + x = y using a table of at least five values.
 - **b. Graphical** Represent this same locus of points using a graph.
 - c. Verbal Describe the geometric figure that the points suggest.

- **a.** What is the probability that the points chosen are collinear?
- **b.** What is the probability that the points chosen are coplanar?

- **56.** Solution 56. Solution 56.
 - **a.** Tabular Represent the locus of points satisfying the inequality y < -3x 1 using a table of at least ten values.
 - **b.** Graphical Represent this same locus of points using a graph.
 - c. Verbal Describe the geometric figure that the points suggest.

H.O.T. Problems Use Higher-Order Thinking Skills

- 57. OPEN ENDED Sketch three planes that intersect in a line.
- **58.** ERROR ANALYSIS Camille and Hiroshi are trying to determine the most number of lines that can be drawn using any two of four random points. Is either correct? Explain.

Camille

Since there are four points, 4 · 3 or 12 lines can be drawn between the points. Hiroshi

You can draw 3 · 2 · 1 or

6 lines between the points.

- **59. (CS) ARGUMENTS** What is the greatest number of planes determined using any three of the points *A*, *B*, *C*, and *D* if no three points are collinear?
- **60. REASONING** Is it possible for two points on the surface of a prism to be neither collinear nor coplanar? Justify your answer.
- **61.** WRITING IN MATH Refer to Exercise 49. Give a real-life example of a finite plane. Is it possible to have a real-life object that is an infinite plane? Explain your reasoning.

⁵ PROBABILITY Three of the labeled points are chosen at random.

Standardized Test Practice

62. Which statement about the figure below is *not* true?

- **A** Point *H* lies in planes *AGE* and *GED*.
- **B** Planes *GAB*, *GFD* and *BED* intersect at point *E*.
- **C** Points *F*, *E*, and *B* are coplanar.
- **D** Points *A*, *H*, and *D* are collinear.

63. ALGEBRA What is the value of *x* if 3x + 2 = 8?

- **64. GRIDDED RESPONSE** An ice chest contains 3 types of drinks: 10 apple juices, 15 grape juices, and 15 bottles of water. What is the probability that a drink selected randomly from the ice chest does *not* contain fruit juice?
- **65. SAT/ACT** A certain school's enrollment increased 6% this year over last year's enrollment. If the school now has 1378 students enrolled, how many students were enrolled last year?

When you are learning geometric concepts, it is critical to have accurate drawings to represent the information. It is helpful to know what words and phrases can be used to describe figures. Likewise, it is important to know how to read a geometric description and be able to draw the figure it describes.

CCSS Common Core State Standards **Content Standards**

G.MG.1 Use geometric shapes, their measures, and their properties to describe objects (e.g., modeling a tree trunk or a human torso as a cylinder). ★ **Mathematical Practices 6**

The figures and descriptions below help you visualize and write about points, lines, and planes.

Point *Q* is on ℓ . Line ℓ contains Q. Line ℓ passes through Q.

Line ℓ and point *R* are in \mathcal{N} . Point *R* lies in \mathcal{N} . Plane \mathcal{N} contains *R* and ℓ . Line *m* intersects \mathcal{N} at *R*. Point *R* is the intersection of *m* with $\mathcal{N}_{:}$ Lines ℓ and m do not intersect.

Exercises

Lines *r* and *t* intersect at *W*. Point *W* is the intersection of *r* and *t*. Point *W* is on *r*. Point *W* is on *t*.

 \overrightarrow{AB} is in \mathcal{P} and Q. Points *A* and *B* lie in both \mathcal{P} and Q_i Planes \mathcal{P} and Q both contain \overleftrightarrow{AB} . Planes \mathcal{P} and Q intersect in \overleftrightarrow{AB} . \overleftrightarrow{AB} is the intersection of \mathcal{P} and Q.

Write a description for each figure. 2. 3. 1. q m С

4. Draw and label a figure for the statement Planes \mathcal{N} and \mathcal{P} contain line *a*.

Linear Measure

• Then

modeled points,

lines, and planes.

: Now

: Why?

- You identified and Measure segments. Calculate with measures.
- When the ancient Egyptians found a need for a measurement system, they used the human body as a guide. The cubit was the length of an arm from the elbow to the fingertips. Eventually the Egyptians standardized the length of a cubit, with ten royal cubits equivalent to one rod.

NewVocabulary

line segment betweenness of points between congruent segments construction

Common Core State Standards

Content Standards G.CO.1 Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.

G.CO.12 Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.).

Mathematical Practices 6 Attend to precision.

Measure Line Segments Unlike a line, a line segment, or segment, can be measured because it has two endpoints. A segment with endpoints A and B can be named as \overline{AB} or \overline{BA} . The *measure* of \overline{AB} is written as AB. The length or measure of a segment always includes a unit of measure, such as meter or inch.

All measurements are approximations dependent upon the smallest unit of measure available on the measuring instrument.

Example 1 Length in Metric Units

Find the length of \overline{AB} using each ruler.

The ruler is marked in centimeters. Point *B* is closer to the 4-centimeter mark than to 3 centimeters.

Thus, \overline{AB} is about 4 centimeters long.

- **1A.** Measure the length of a dollar bill in centimeters.
- **1B.** Measure the length of a pencil in millimeters.
- **1C.** Find the length of \overline{CD} .

The long marks are centimeters, and the shorter marks are millimeters. There are 10 millimeters for each centimeter.

Thus, \overline{AB} is about 3.7 centimeters long.

StudyTip

Using a Ruler The zero point on a ruler may not be clearly marked. For some rulers, zero is the left edge of the ruler. On others, it may be a fine line farther in on the scale. If it is not clear where the zero is, align one endpoint on 1 and subtract 1 from the measurement at the other endpoint.

Example 2 Length in Standard Units

Each inch is divided into fourths.

Point *D* is closer to the $1\frac{1}{4}$ -inch mark. \overline{CD} is about $1\frac{1}{4}$ inches long.

Each inch is divided into sixteenths. Point *D* is closer to the $1\frac{4}{16}$ -inch mark. \overline{CD} is about $1\frac{4}{16}$ or $1\frac{1}{4}$ inches long.

GuidedPractice

- **2A.** Measure the length of a dollar bill in inches.
- **2B.** Measure the length of a pencil in inches.

Calculate Measures Recall that for any two real numbers a and b, there is a real number n that is *between* a and b such that a < n < b. This relationship also applies to points on a line and is called **betweenness of points**. In the figure, point N is between points A and B, but points R and P are not.

between points *A* and *B*, but points *R* and *P* are not. Measures are real numbers, so all arithmetic operations can be used with them. You know that the whole usually equals the sum of its parts. That is also true of line segments in geometry.

connectED.mcgraw-hill.com

Example 4 Find Measurements by Subtracting

Point *B* is between *A* and *C*.

AB + BC = AC*AB* + **5.8** = **13.2** AB + 5.8 - 5.8 = 13.2 - 5.8AB = 7.4 mSimplify.

Betweenness of points Substitution Subtract 5.8 from each side.

GuidedPractice

4. Find *QR*. Assume that the figure is not drawn to scale.

Example 5 Write and Solve Equations to Find Measurements

ALGEBRA Find the value of *a* and *XY* if *Y* is between *X* and *Z*, *XY* = 3a, *XZ* = 5a - 4, and YZ = 14.

Draw a figure to represent this information.

XZ = XY + YZBetweenness of points 5a - 4 = 3a + 14Substitution 5a - 4 - 3a = 3a + 14 - 3aSubtract 3a from each side. 2a - 4 = 14Simplify. 2a - 4 + 4 = 14 + 4Add 4 to each side. 2a = 18Simplify. $\frac{2a}{2} = \frac{18}{2}$ Divide each side by 2. a = 9Simplify. Now find *XY*.

B 5.8 m

13.2 m

С

PT

XY = 3aGiven = 3(9) or 27a = 9

GuidedPractice

5. Find x and BC if B is between A and C, AC = 4x - 12, AB = x, and BC = 2x + 3.

Segments that have the same measure are called **congruent segments**.

Real-WorldLink

The first commercial skateboard was introduced in 1959. Now there are more than 500 skate parks in the United States. **Source:** *Encyclopaedia Britannica*

Real-World Example 6 Congruent Segments

SKATE PARKS In the graph, suppose a segment was drawn along the top of each bar. Which states would have segments that are congruent? Explain.

Source: SITE Design Group, Inc.

The segments on the bars for Nebraska and South Carolina would be congruent because they both represent the same number of skate parks.

GuidedPractice

- **6A.** Suppose Oklahoma added another skate park. The segment drawn along the bar representing Oklahoma would be congruent to which other segment?
- **6B.** Name the congruent segments in the sign shown.

Drawings of geometric figures are created using measuring tools such as a ruler and protractor. **Constructions** are methods of creating these figures without the benefit of measuring tools. Generally, only a pencil, straightedge, and compass are used in constructions. *Sketches* are created without the use of any of these tools.

You can construct a segment that is congruent to a given segment.

Check Your Understanding

Examples 3–4 Find the measurement of each segment. Assume that each figure is not drawn to scale.

Example 5ALGEBRA Find the value of x and BC if B is between C and D.7 CB = 2x, BD = 4x, and BD = 128. CB = 4x - 9, BD = 3x + 5, and CD = 17**Example 6**9. 655 STRUCTURE The Indiana State Flag was adopted in 1917. The measures of the segments between the stars and the flame are shown on the diagram in inches. List all of the congruent segments in the figure.

Practice and Problem Solving

20. CSS SENSE-MAKING The stacked bar graph shows the number of canned food items donated by the girls and the boys in a homeroom class over three years. Use the concept of betweenness of points to find the number of cans donated by the boys for each year. Explain your method.

Example 5 ALGEBRA Find the value of the variable and YZ if Y is between X and Z. **21.** XY = 11, YZ = 4c, XZ = 83**22.** XY = 6b, YZ = 8b, XZ = 175**23.** XY = 7a, YZ = 5a, XZ = 6a + 24**24.** XY = 11d, YZ = 9d - 2, XZ = 5d + 28**25.** XY = 4n + 3, YZ = 2n - 7, XZ = 22**26.** XY = 3a - 4, YZ = 6a + 2, XZ = 5a + 22

Example 6

Determine whether each pair of segments is congruent. **28.** \overline{AC} , \overline{BD} $\overline{KJ}, \overline{HL}$ **29.** *EH*, *FG*

TRUSSES A truss is a structure used to support a load over a span, such as a bridge or the roof of a house. List all of the congruent segments in the figure.

- 34. CONSTRUCTION For each expression:
 - construct a segment with the given measure,
 - explain the process you used to construct the segment, and
 - verify that the segment you constructed has the given measure.

Extension Lesson Precision and Accuracy

	_	_			
•				н	
			1 -	4 1	

1 Determine precision of measurements.

2 Determine accuracy of measurements.

As stated in Lesson 1-2, all measurements are approximations. Two main factors are considered when determining the quality of such an approximation.

- How *precise* is the measure?
- How *accurate* is the measure?

Precision Precision refers to the clustering of a group of measurements. It depends only on the smallest unit of measure available on a measuring tool. Suppose you are told that a segment measures 8 centimeters. The length, to the nearest centimeter, of each segment shown below is 8 centimeters.

Notice that the exact length of each segment above is between 7.5 and 8.5 centimeters, or within 0.5 centimeter of 8 centimeters. The **absolute error** of a measurement is equal to one half the unit of measure. The smaller the unit of measure, the more precise the measurement.

StudyTip

Precision The absolute error of a measurement in customary units is determined before reducing the fraction. For example, if you measure the length of an object to be $1\frac{4}{16}$ inches, then the absolute error measurement is precise to within $\frac{1}{32}$ inch.

Example 1 Find Absolute Error

Find the absolute error of each measurement. Then explain its meaning.

a. 6.4 centimeters

The measure is given to the nearest 0.1 centimeter, so the absolute error of this measurement is $\frac{1}{2}(0.1)$ or 0.05 centimeter. Therefore, the exact measurement could be between 6.35 and 6.45 centimeters. The two segments below measure 6.4 \pm 0.05 centimeters.

b. $2\frac{1}{4}$ inches

The measure is given to the nearest $\frac{1}{4}$ inch, so the absolute error of this measurement is $\frac{1}{2}\left(\frac{1}{4}\right)$ or $\frac{1}{8}$ inch. Therefore, the exact measurement could be between $2\frac{1}{8}$ and $2\frac{3}{8}$ inches. The two segments below measure $2\frac{1}{4} \pm \frac{1}{8}$ inches.

- **Guided**Practice
- **1A.** $1\frac{1}{2}$ inches

Real-WorldLink

Precision in measurement in the real world usually comes at a price.

- Precision in a process to 3 significant digits, commercial quality, can cost \$100.
- Precision in a process to 4 significant digits, industrial quality, can cost \$500.
- Precision in a process to 5 significant digits, scientific quality, can cost \$2500.

Source:Southwest Texas Junior College

Precision in a measurement is usually expressed by the number of **significant digits** reported. Reporting that the measure of \overline{AB} is 4 centimeters is *less precise* than reporting that the measure of \overline{AB} is 4.1 centimeters.

To determine whether digits are considered significant, use the following rules.

- Nonzero digits are always significant.
- In whole numbers, zeros are significant if they fall between nonzero digits.
- In decimal numbers greater than or equal to 1, every digit is significant.
- In decimal numbers less than 1, the first nonzero digit and every digit to the right are significant.

Example 2 Significant Digits

Determine the number of significant digits in each measurement.

a. 430.008 meters

Since this is a decimal number greater than 1, every digit is significant. So, this measurement has 6 significant digits.

b. 0.00750 centimeter

This is a decimal number less than 1. The first nonzero digit is 7, and there are two digits to the right of 7, 5 and 0. So, this measurement has 3 significant digits.

GuidedPractice

2A. 779,000 mi

2B. 50,008 ft

2C. 230.004500 m

Accuracy Accuracy refers to how close a measured value comes to the actual or desired value. Consider the target practice results shown below.

The relative error of a measure is the ratio of the absolute error to the expected measure. A measurement with a smaller relative error is said to be more accurate.

StudyTip

Accuracy The accuracy or relative error of a measurement depends on both the absolute error and the size of the object being measured.

Example 3 Find Relative Error

MANUFACTURING A manufacturer measures each part for a piece of equipment to be 23 centimeters in length. Find the relative error of this measurement.

relative error = $\frac{\text{absolute error}}{\text{expected measure}} = \frac{0.5 \text{ cm}}{23 \text{ cm}} \approx 0.022 \text{ or } 2.2\%$

GuidedPractice

Find the relative error of each measurement.

Practice and Problem Solving

Find the absolute error of each measurement. Then explain its meaning.

1. 12 yd **2.** $50\frac{4}{16}$ in. **3.** 3.28 ft

5. ERROR ANALYSIS In biology class, Manuel and Jocelyn measure a beetle as shown. Manuel says that the beetle measures between $1\frac{5}{8}$ and $1\frac{3}{4}$ inches. Jocelyn says that it measures between $1\frac{9}{16}$ and $1\frac{5}{8}$ inches. Is either of their statements about the beetle's measure correct? Explain your reasoning.

4. 2.759 cm

6. PYRAMIDS Research suggests that the design dimensions of the Great Pyramid of Giza in Egypt were 440 by 440 royal cubits. The sides of the pyramid are precise within 0.05%. What are the greatest and least possible lengths of the sides?

Determine the number of significant digits in each measurement.

 7. 4.05 in.
 8. 53,000 mi
 9. 0.0005 mm
 10. 750,001 ft

 11. VOLUME When multiplying or dividing measures,
 11. VOLUME When multiplying or dividing measures,
 11. VOLUME When multiplying or dividing measures,

the product or quotient should have only as many significant digits as the multiplied or divided measurement showing the least number of significant digits. To how many significant digits should the volume of the rectangle prism shown be reported? Report the volume to this number of significant digits.

Find the relative error of each measurement.

12. 48 in. **13.** 2.0 mi **14.** 11.14 cm **15.** 0.6 m

Determine which measurement is more precise and which is more accurate. Explain your reasoning.

16. 22.4 ft; 5.82 ft **17.** 25 mi; 8 mi **18.** 9.2 cm; 42 mm **19.** $18\frac{1}{4}$ in.; 125 yd

For each situation, determine the level of accuracy needed. Explain.

- **20.** You are estimating the height of a person. Which unit of measure should you use: 1 foot, 1 inch, or $\frac{1}{16}$ inch?
- **21.** You are estimating the height of a mountain. Which unit of measure should you use: 1 foot, 1 inch, or $\frac{1}{16}$ inch?
- **22. PERIMETER** The *perimeter* of a geometric figure is the sum of the lengths of its sides. Jermaine uses a ruler divided into inches and measures the sides of a rectangle to be $2\frac{1}{4}$ inches and $4\frac{3}{4}$ inches. What are the least and greatest possible perimeters of the rectangle? Explain.
- **23. E** WRITING IN MATH How precise is precise enough?

Distance and Midpoints

Bar NewVocabulary

distance irrational number midpoint segment bisector

Common Core State Standards

Content Standards G.CO.1 Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.

G.CO.12 Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.).

Mathematical Practices

- 2 Reason abstractly and quantitatively.
- 7 Look for and make use of structure.

Distance Between Two Points The **distance** between two points is the length of the segment with those points as its endpoints. The coordinates of the points can be used to find this length. Because \overline{PQ} is the same as \overline{QP} , the order in which you name the endpoints is not important when calculating distance.

Section 2017 Secti				
Words	The distance between two points is the absolute value of the difference between their coordinates.	P	Q	
Symbols	If <i>P</i> has coordinate x_1 and <i>Q</i> has coordinate x_2 , $PQ = x_2 - x_1 $ or $ x_1 - x_2 $.	^x 1	×2	

StudyTip

Pythagorean Theorem Recall that the Pythagorean Theorem is often expressed as $a^2 + b^2 = c^2$, where a and *b* are the measures of the shorter sides (legs) of a right triangle, and *c* is the measure of the longest side (hypotenuse). You will prove and learn about other applications of the Pythagorean Theorem in Lesson 8-2.

To find the distance between two points A and B in the coordinate plane, you can form a right triangle with \overline{AB} as its hypotenuse and point *C* as its vertex as shown. Then use the Pythagorean Theorem to find AB.

 $(CB)^2 + (AC)^2 = (AB)^2$ $(|x_2 - x_1|)^2 + (|y_2 - y_1|)^2 = (AB)^2$ $CB = |x_2 - x_1|, AC = |y_2 - y_1|$ $(x_2 - x_1)^2 + (y_2 - y_1)^2 = (AB)^2$ $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2} = AB$

The square of a number is always positive.

Take the positive square root of each side.

This gives us a Distance Formula for points in the coordinate plane. Because this formula involves taking the square root of a real number, distances can be irrational. Recall that an **irrational number** is a number that cannot be expressed as a terminating or repeating decimal.

Pythagorean Theorem

The order of the x- and y-coordinates in each set of parentheses is not important.

Example 2 Find Distance on a Coordination	ate Plane	P
Find the distance between $C(-4, -6)$	and <i>D</i> (5, –1).	
$CD = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$	Distance Formula	
$=\sqrt{[5-(-4)]^2+[-1-(-6)]^2}$	$(x_1, y_1) = (-4, -6)$ and $(x_2, y_2) = (5, -1)$	
$=\sqrt{9^2+5^2} \text{ or } \sqrt{106}$	Subtract.	

The distance between C and D is $\sqrt{106}$ units. Use a calculator to find that $\sqrt{106}$ units is approximately 10.3 units.

CHECK Graph the ordered pairs and check by using the Pythagorean Theorem.

> $(CD)^2 \stackrel{?}{=} (EC)^2 + (ED)^2$ $(CD)^2 \stackrel{?}{=} 5^2 + 9^2$ $(CD)^2 \stackrel{?}{=} 106$ $CD = \sqrt{106}$

GuidedPractice

Find the distance between each pair of points.

2A. E(-5, 6) and F(8, -4)

2B. J(4, 3) and K(-3, -7)

2 Midpoint of a Segment The midpoint of a segment is the point halfway between the endpoints of the segment. If *X* is the midpoint of \overline{AB} , then AX = XB and $\overline{AX} \cong \overline{XB}$. You can find the midpoint of a segment on a number line by finding the *mean*, or the average, of the coordinates of its endpoints.

StudyTip

Alternative Method In Example 3, the coordinate of the midpoint could also have been located by first finding the length of AB, which is 37.5 - 15 or 22.5inches. Half of this measure is the distance from one endpoint to the point midway between A and B, $\frac{22.5}{2}$ or 11.25. Add this distance to point A's distance from the left wall. So the midpoint between A and B is 15 + 11.25 or 26.25 inches from the left wall.

Real-World Example 3 Find Midpoint on a Number Line

DECORATING Jacinta hangs a picture 15 inches from the left side of a wall. How far from the edge of the wall should she mark the location for the nail the picture will hang on if the right edge is 37.5 inches from the wall's left side?

The coordinates of the endpoints of the top of the picture frame are 15 inches and 37.5 inches. Let M be the midpoint of \overline{AB} .

$$M = \frac{x_1 + x_2}{2}$$

Midpoint Formula
$$= \frac{15 + 37.5}{2}$$

$$x_1 = 15, x_2 = 37.5$$

$$= \frac{52.5}{2} \text{ or } 26.25$$

Simplify.

PT

The midpoint is located at 26.25 or $26\frac{1}{4}$ inches from the left edge of the wall.

GuidedPractice

3. TEMPERATURE The temperature on a thermometer dropped from a reading of 25° to -8° . Find the midpoint of these temperatures.

You can find the midpoint of a segment on the coordinate plane by finding the average of the *x*-coordinates and of the *y*-coordinates of the endpoints.

When finding the midpoint of a segment, the order of the coordinates of the endpoints is not important.

Example 4 Find Midpoint in Coordinate Plane

Find the coordinates of *M*, the midpoint of \overline{ST} , for S(-6, 3) and T(1, 0).

$$M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$$

Midpoint Formula
$$= \left(\frac{-6 + 1}{2}, \frac{3 + 0}{2}\right)$$

$$= \left(\frac{-5}{2}, \frac{3}{2}\right) \text{ or } M\left(-2\frac{1}{2}, 1\frac{1}{2}\right)$$

Simplify.

CHECK Graph *S*, *T*, and *M*. The distance from *S* to *M* does appear to be the same as the distance from *M* to *T*, so our answer is reasonable.

GuidedPractice

Find the coordinates of the midpoint of a segment with the given coordinates.

4A. *A*(5, 12), *B*(-4, 8) **4B.** C(-8, -2), D(5, 1)

You can also find the coordinates of the endpoint of a segment if you know the coordinates of its other endpoint and its midpoint.

PT Example 5 Find the Coordinates of an Endpoint Find the coordinates of J if K(-1, 2) is the midpoint of \overline{JL} and L has coordinates (3, -5).**Step 1** Let *J* be (x_1, y_1) and *L* be (x_2, y_2) in the Midpoint Formula. $K\left(\frac{x_1+3}{2}, \frac{y_1+(-5)}{2}\right) = K(-1, 2)$ $(x_2, y_2) = (3, -5)$ **Step 2** Write two equations to find the coordinates of *J*. $\frac{x_1+3}{2} = -1$ $\frac{y_1 + (-5)}{2} = 2$ Midpoint Formula **Midpoint Formula** $x_1 + 3 = -2$ Multiply each side by 2. $y_1 - 5 = 4$ Multiply each side by 2. $x_1 = -5$ $y_1 = 9$ Subtract 3 from each side. Add 5 to each side. The coordinates of *J* are (-5, 9). **CHECK** Graph *J*, *K*, and *L*. The distance from *J* to *K* J(-5, 9)does appear to be the same as the distance from *K* to *L*, so our answer is reasonable. K(-1, 2)**Guided**Practice 0 4 8 X Find the coordinates of the missing endpoint if *P* is the midpoint of *EG*.

5A. E(-8, 6), P(-5, 10)

5B. *P*(-1, 3), *G*(5, 6)

StudyTip

Check for Reasonableness Always graph the given information and the calculated coordinates of the third point to check the reasonableness of your answer.

You can use algebra to find a missing measure or value in a figure that involves the midpoint of a segment.

	Example 6	Use Algebra to Find I	Measures				
StudyTip	ALGEBRA Find the measure of \overline{PQ} if Q is the midpoint of \overline{PR} .						
Perseverance The four-step problem solving plan is a tool	Understand	You know that <i>Q</i> is the midpoint of \overline{PR} . You are asked to find the measure of \overline{PQ} .					
for making sense of any problem. When making and executing your plan, continually ask yourself, "Does	Plan	Because <i>Q</i> is the midpoint, you know that $PQ = QR$. Use this equation to find a value for <i>y</i> .					
this make sense?" Monitor and evaluate your progress	Solve	PQ = QR	Definition of midpoint	R			
and change course if necessary.		9y-2=14+5y	PQ = 9y - 2, QR = 14 + 5y				
		4y - 2 = 14	Subtract 5 <i>y</i> from each side.				
		4y = 16	Add 2 to each side.				
		y = 4	Divide each side by 4.				
		Now substitute 4 fc	or y in the expression for PQ .				
		PQ = 9y - 2	Original measure				
		= 9 (4) - 2	<i>y</i> = 4				
		= 36 - 2 or 34	Simplify.				
		The measure of \overline{PQ}	is 34.				
	Check	Since $PQ = QR$, wh also be 34.	en the expression for <i>QR</i> is evaluate	ed for 4, it should			
		$QR = 14 + 5\mathbf{y}$	Original measure

Angle Measure

NewVocabulary

ray opposite rays angle side vertex interior exterior degree right angle acute angle obtuse angle angle bisector

Common Core State Standards

Content Standards G.CO.1 Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.

G.CO.12 Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.).

Mathematical Practices 5 Use appropriate tools strategically.

6 Attend to precision.

Measure and Classify Angles A ray is a part of a line. It has one endpoint and extends indefinitely in one direction. Rays are named by stating the endpoint first and then any other point on the ray. The ray shown cannot be named as OM because O is not the endpoint of the ray.

0 ray MP, MP, ray MO, or MO

If you choose a point on a line, that point determines exactly two rays called **opposite** rays. Since both rays share a common endpoint, opposite rays are collinear

An **angle** is formed by two *noncollinear* rays that have a common endpoint. The rays are called **sides** of the angle. The common endpoint is the **vertex**.

When naming angles using three letters, the vertex must be the second of the three letters. You can name an angle using a single letter only when there is exactly one angle located at that vertex. The angle shown can be named as $\angle X$, $\angle YXZ$, $\angle ZXY$, or $\angle 3$.

An angle divides a plane into three distinct parts.

- Points *Q*, *M*, and *N* lie on the angle.
- Points *S* and *R* lie in the **interior** of the angle.
- Points *P* and *O* lie in the **exterior** of the angle.

Seal-World Example 1 Angles and Their Parts

MAPS Use the map of a high school shown.

a. Name all angles that have *B* as a vertex.

 $\angle 1$ or $\angle ABD$, and $\angle 2$ or $\angle DBC$

- **b.** Name the sides of $\angle 3$. \overrightarrow{CA} and \overrightarrow{CE} or \overrightarrow{CB} and \overrightarrow{CE}
- **c.** What is another name for $\angle GHL$? $\angle 7$, $\angle H$, or $\angle LHG$
- **d.** Name a point in the interior of $\angle DBK$. Point *E*

GuidedPractice

The protractor has two

scales running from 0 to

180 degrees in opposite

Place the center point

directions.

the vertex.

- **1A.** What is the vertex of $\angle 5$?
- **1C.** Write another name for $\angle ECL$.
- **1B.** Name the sides of $\angle 5$.
- **1D.** Name a point in the exterior of $\angle CLH$.

Angles are measured in units called degrees. The **degree** results from dividing the distance around a circle into 360 parts.

-6

-8-

Ε

To measure an angle, you can use a *protractor*. Angle *DEF* below is a 50 degree (50°) angle. We say that the *degree measure* of $\angle DEF$ is 50, or $m \angle DEF = 50$.

Study Tip

Segments as Sides Because a ray can contain a line segment, the side of an angle can be a segment.

D

one side of the angle.
Angles can be classified by their measures as shown below.

ReadingMath

Straight Angle Opposite rays with the same vertex form a *straight angle*. Its measure is 180. Unless otherwise specified in this book, however, the term *angle* means a nonstraight angle.

Example 2 Measure and Classify Angles

Copy the diagram below, and extend each ray. Classify each angle as *right*, *acute*, or *obtuse*. Then use a protractor to measure the angle to the nearest degree.

WatchOut!

Classify Before Measuring Classifying an angle before measuring it can prevent you from choosing the wrong scale on your protractor. In Example 2b, you must decide whether $\angle LJP$ measures 75 or 105. Since $\angle LJP$ is an obtuse angle, you can reason that the correct measure must be 105.

a. ∠MJP

 $\angle MJP$ is marked as a right angle, so $m \angle MJP = 90$.

b. ∠LJP

Point *L* on angle $\angle LJP$ lies on the exterior of right angle $\angle MJP$, so $\angle LJP$ is an obtuse angle. Use a protractor to find that $m\angle LJP = 105$

CHECK Since 105 > 90, $\angle LJP$ is an obtuse angle.

c. $\angle NJP$

Point *N* on angle $\angle NJP$ lies on the interior of right angle $\angle MJP$, so $\angle NJP$ is an acute angle. Use a protractor to find that $m \angle NJP = 20$.

CHECK Since 20 < 90, $\angle NJP$ is an acute angle. \checkmark

GuidedPractice

- **2A.** ∠*AFB*
- **2B.** ∠*CFA*
- **2C.** ∠AFD
- **2D.** *LCFD*

2 Congruent Angles Just as segments that have the same measure are congruent segments, angles that have the same measure are *congruent angles*.

In the figure, since $m \angle ABC = m \angle FED$, then $\angle ABC \cong \angle FED$. Matching numbers of arcs on a figure also indicate congruent angles, so $\angle CBE \cong \angle DEB$.

You can produce an angle congruent to a given angle using a construction.

StudyTip

Segments A line segment can also bisect an angle.

A <u>ray</u> that divides an angle into two congruent angles is called an **angle bisector**. If YW is the angle bisector of $\angle XYZ$, then point W lies in the interior of $\angle XYZ$ and $\angle XYW \cong \angle WYZ$.

Just as with segments, when a line, segment, or ray divides an angle into smaller angles, the sum of the measures of the smaller angles equals the measure of the largest angle. So in the figure, $m \angle XYW + m \angle WYZ = m \angle XYZ$.

StudyTip Checking Solutions Check

that you have computed the value of *x* correctly by substituting the value into the expression for $\angle NKL$. If you don't get the same measure as $\angle JKN$, you have made an error.

You can produce the angle bisector of any angle without knowing the measure of the angle.

A Construction Bisect a	n Angle		
Step 1 Draw an angle on your paper. Label the vertex as <i>P</i> . Put your compass at point <i>P</i> and draw a large arc that intersects both sides of $\angle P$. Label the points of intersection <i>Q</i> and <i>R</i> .	Step 2 With the compass at point <i>Q</i> , draw an arc in the interior of the angle.	Step 3 Keeping the same compass setting, place the compass at point <i>R</i> and draw an arc that intersects the arc drawn in Step 2. Label the point of intersection <i>T</i> .	Step 4 Draw \overrightarrow{PT} . \overrightarrow{PT} is the bisector of $\angle P$.

adjacent angles linear pair vertical angles complementary angles supplementary angles perpendicular

Common Core State Standards

Content Standards Preparation for G.SRT.7 Explain and use the relationship between the sine and cosine of complementary angles.

Mathematical Practices

- 2 Reason abstractly and quantitatively.
- 3 Construct viable arguments and critique the reasoning of others.

Pairs of Angles Some pairs of angles are special because of how they are positioned in relationship to each other. Three of these angle pairs are described below.

KeyConcept Special Angle Pairs

Adjacent angles are two angles that lie in the same plane and have a common vertex and a common side, but no common interior points.

Examples $\angle 1$ and $\angle 2$ are adjacent angles. **Nonexamples** $\angle 3$ and $\angle ABC$ are nonadjacent angles

A linear pair is a pair of adjacent angles with noncommon sides that are opposite rays.

Example $\angle 1$ and $\angle 2$

Nonexample $\angle ADB$ and $\angle ADC$

A B D

Vertical angles are two nonadjacent angles formed by two intersecting lines.

Examples $\angle 1$ and $\angle 2$; $\angle 3$ and $\angle 4$

Zia Soleil/Iconica/Getty Images

CHEERLEADING Name an angle pair that satisfies each condition.

a. two acute adjacent angles

 \angle *HJK*, \angle *LJM*, \angle *MJN*, and \angle *NJO* are acute angles.

 $\angle LJM$ and $\angle MJN$ are acute adjacent angles, and $\angle MJN$ and $\angle NJO$ are acute adjacent angles.

b. two obtuse vertical angles

 \angle *HJN* and \angle *KJM* are obtuse vertical angles.

GuidedPractice

1A. a linear pair

1B. two acute vertical angles

Some pairs of angles are special because of the relationship between their angle measures.

Remember that angle measures are real numbers. So the operations for real numbers and algebra can be used with angle measures.

connectED.mcgraw-hill.com

StudyTip

Linear Pair vs. Supplementary Angles While the angles in a linear pair are always supplementary, some supplementary angles do not form a linear pair.

Example 2 Angle Measure

ALGEBRA Find the measures of two supplementary angles if the difference in the measures of the two angles is 18.

Understand The problem relates the measures of two supplementary angles. You know that the sum of the measures of supplementary angles is 180. You need to find the measure of each angle.

Plan Draw two figures to represent the angles. Let the measure of one angle be *x*. If $m \angle A = x$, then because $\angle A$ and $\angle B$ are supplementary, $m \angle B + x = 180$ or $m \angle B = 180 - x$.

The problem states that the difference of the two angle measures is 18, or $m \angle B - m \angle A = 18$.

 Solve $m \angle B - m \angle A = 18$ Given

 (180 - x) - x = 18 $m \angle A = x, m \angle B = 180 - x$

 180 - 2x = 18 Simplify.

 -2x = -162 Subtract 180 from each side.

 x = 81 Divide each side by -2.

Use the value of *x* to find each angle measure.

 $m \angle A = x$ $m \angle B = 180 - x$ = 81 = 180 - 81 or 99

Check Add the angle measures to verify that the angles are supplementary.

```
m \angle A + m \angle B \stackrel{?}{=} 18081 + 99 = 180 \checkmark
```

GuidedPractice

2. Find the measures of two complementary angles if the measure of the larger angle is 12 more than twice the measure of the smaller angle.

Perpendicular Lines Lines, segments, or rays that form right angles are perpendicular.

 Perpendicular lines intersect to form congruent adjacent angles. Segments and rays can be perpendicular to lines or other line segments and rays. The right angle symbol in the figure indicates that the lines are 	 Perpen 	dicular lines intersect to form fo	ur right angles.	X A B
 Segments and rays can be perpendicular to lines or other line segments and rays. The right angle symbol in the figure indicates that the lines are 	 Perpen 	dicular lines intersect to form co	ongruent adjacent angles.

perpendicular.	 The rig perpent 	ht angle symbol in the figure ind dicular.	licates that the lines are	

Problem-SolvingTip

Write an Equation While you could use the guess-andcheck strategy to find two measures with a sum of 180 and a difference of 18, writing an equation is a more efficient approach to this problem.

Example 3 Perpendicular Lines **ALGEBRA** Find x and y so that \overrightarrow{PR} and \overrightarrow{SQ} are perpendicular. If $\overrightarrow{PR} \perp \overrightarrow{SQ}$, then $m \angle STR = 90$ and $m \angle PTQ = 90$. $(4v - 2)^{\circ}$ To find *x*, use $\angle STW$ and $\angle WTR$. $m \angle STR = m \angle STW + m \angle WTR$ Sum of parts = whole (5x + 6)90 = 2x + (5x + 6)Substitution 90 = 7x + 6Combine like terms. 84 = 7xSubtract 6 from each side. 12 = xDivide each side by 7. To find *y*, use $m \angle PTQ$. $m \angle PTQ = 4y - 2$ Given 90 = 4y - 2Substitution 92 = 4yAdd 2 to each side. 23 = yDivide each side by 4. **Guided**Practice **3.** Suppose $m \angle D = 3x - 12$. Find *x* so that $\angle D$ is a right angle.

In the figure at the right, it *appears* that $\overrightarrow{FG} \perp \overrightarrow{JK}$. However, you cannot assume this is true unless other information, such as $m\angle FHJ = 90$, is given.

In geometry, figures are sketches used to depict a situation. They are not drawn to reflect total accuracy. There are certain relationships that you can assume to be true, but others you cannot. Study the figure and the lists below.

The list of statements that can be assumed is not a complete list. There are more special pairs of angles than those listed.

Н

StudyTip

Additional Information Additional information for a figure may be given using congruent angle markings, congruent segment markings, or right angle symbols.

Example 4 Interpret Figures

Determine whether each statement can be assumed from the figure. Explain.

a. $\angle KHJ$ and $\angle GHM$ are complementary.

No; they are congruent, but we do not know anything about their exact measures.

b. $\angle GHK$ and $\angle JHK$ are a linear pair.

Yes; they are adjacent angles whose noncommon sides are opposite rays.

c. \overrightarrow{HL} is perpendicular to \overrightarrow{HM} .

Yes; the right angle symbol in the figure indicates that $\overrightarrow{HL} \perp \overrightarrow{HM}$.

GuidedPractice

4A. \angle *GHL* and \angle *LHJ* are supplementary.

4B. \angle *GHM* and \angle *MHK* are adjacent angles.

Check Your Understanding

Skills Review

You can use a compass and a straightedge to construct a line perpendicular to a given line through a point on the line, or through a point *not* on the line.

Common Core State Standards Content Standards

G.C0.12 Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.).

Mathematical Practices 5

Activity Construct a Perpendicular

a. Construct a line perpendicular to line ℓ and passing through point *P* on ℓ .

Step 1

Place the compass at *P*. Draw arcs to the right and left of *P* that intersect line ℓ using the same compass setting. Label the points of intersection *A* and *B*.

With the compass at A, draw an arc above line ℓ using a setting greater than AP. Using the same compass setting, draw an arc from B that intersects the previous arc. Label the intersection Q.

Use a straightedge to draw \overleftarrow{QP} .

b. Construct a line perpendicular to line *k* and passing through point *P* not on *k*.

Step 1

Place the compass at *P*. Draw an arc that intersects line k in two different places. Label the points of intersection *C* and *D*.

Step 2

With the compass at *C*, draw an arc below line k using a setting greater than $\frac{1}{2}CD$. Using the same compass setting, draw an arc from *D* that intersects the previous arc. Label the intersection *Q*.

Use a straightedge to draw \overrightarrow{PQ} .

Model and Analyze the Results

- **1.** Draw a line and construct a line perpendicular to it through a point on the line.
- **2.** Draw a line and construct a line perpendicular to it through a point not on the line.
- 3. How is the second construction similar to the first one?

Two-Dimensional Figures

: Why?

Then

You measured one-dimensional figures.

Identify and name polygons.

: Now

- Find perimeter, circumference, and area of twodimensional figures.
- Mosaics are patterns or pictures created using small bits of colored glass or stone. They are usually set into a wall or floor and often make use of polygons.

abr **NewVocabulary**

polygon vertex of a polygon concave convex *n*-aon equilateral polygon equiangular polygon regular polygon perimeter circumference area

Common Core State Standards

Content Standards G.GPE.7 Use coordinates to compute perimeters of polygons and areas of triangles and rectangles, e.g., using the distance formula.

Mathematical Practices

- 2 Reason abstractly and quantitatively.
- 6 Attend to precision.

KeyConcept Polygons

A polygon is a closed figure formed by a finite number of coplanar segments called sides such that

- the sides that have a common endpoint are noncollinear, and
- · each side intersects exactly two other sides, but only at their endpoints.

The vertex of each angle is a vertex of the polygon. A polygon is named by the letters of its vertices, written in order of consecutive vertices.

The table below shows some additional examples of polygons and some examples of figures that are not polygons.

Polygons can be **concave** or **convex**. Suppose the line containing each side is drawn. If any of the lines contain any point in the interior of the polygon, then it is concave. Otherwise it is convex.

convex polygon

StudyTip

Naming Polygons The Greek prefixes used to name polygons are also used to denote number. For example a *bi*cycle has two wheels, and a *tri*pod has three legs. In general, a polygon is classified by its number of sides. The table lists some common names for various categories of polygon. A polygon with *n* sides is an *n*-gon. For example, a polygon with 15 sides is a 15-gon.

An **equilateral polygon** is a polygon in which all sides are congruent. An **equiangular polygon** is a polygon in which all angles are congruent.

A convex polygon that is both equilateral and equiangular is called a **regular polygon**. An *irregular polygon* is a polygon that is *not* regular.

regular pentagon ABCDE

Number of Sides	Polygon
3	triangle
4	quadrilateral
5	pentagon
6	hexagon
7	heptagon
8	octagon
9	nonagon
10	decagon
11	hendecagon
12	dodecagon
п	<i>n</i> -gon

PT

Name each polygon by its number of sides. Then classify it as *convex* or *concave* and *regular* or *irregular*.

b.

octagon.

is convex.

equiangular.

octagon.

ReadingMath

Simple Closed Curves

Polygons and circles are examples of *simple closed curves*. Such a curve begins and ends at the same point without crossing itself. The figures below are *not* simple closed curves.

The polygon has 6 sides, so it is a hexagon.

Two of the lines containing the sides of the polygon will pass through the interior of the hexagon, so it is concave.

Only convex polygons can be regular, so this is an irregular hexagon.

There are 8 sides, so this is an

No line containing any of the

sides will pass through the

interior of the octagon, so it

Since the polygon is convex, equilateral, and equiangular, it

is regular. So this is a regular

are congruent, so it is

All of the sides are congruent, so it is equilateral. All of the angles **Perimeter, Circumference, and Area** The **perimeter** of a polygon is the sum of the lengths of the sides of the polygon. Some shapes have special formulas for perimeter, but all are derived from the basic definition of perimeter. You will derive these formulas in Chapter 11. The **circumference** of a circle is the distance around the circle.

The **area** of a figure is the number of square units needed to cover a surface. Review the formulas for the perimeter and area of three common polygons and circle given below.

ReadingMath

Pi The symbol π is read *pi*. This is not a variable but an irrational number. The most accurate way to perform a calculation with π is to use a calculator. If no calculator is available, 3.14 is a good estimate for π .

Example 2 Find Perimeter and Area Find the perimeter or circumference and area of each figure. a. b. 3 in. 2.1 cm 3.2 cm $P = 2\ell + 2\omega$ $C = 2\pi r$ Perimeter of rectangle Circumference = 2(3.2) + 2(2.1) $\ell = 3.2, w = 2.1$ $=2\pi(3)$ r = 3= 10.6Simplify. ≈ 18.85 Use a calculator. The circumference is about 18.9 inches. The perimeter is 10.6 centimeters. $A = \pi r^2$ Area of circle $A = \ell v$ Area of rectangle = (3.2)(2.1) $\ell = 3.2, w = 2.1$ $=\pi(3)^{2}$ r = 3= 6.72Simplify. ≈ 28.3 Use a calculator. The area is about 6.7 square centimeters. The area is about 28.3 square inches. **Guided**Practice 2A. 2B. 2C. 6 ft 6.2 cm 9.5 in. 9.5 in. 5.5 ft 8 in. 10.2 in.

StudyTip

Perimeter vs. Area Since calculating the area of a figure involves multiplying two dimensions (unit \times unit), square units are used. There is only one dimension used when finding the perimeter (the distance around), thus, it is given simply in *units*.

Standardized Test Example 3 Largest Area

Yolanda has 26 centimeters of cording to frame a photograph in her scrapbook. Which of these shapes would use *most* or all of the cording and enclose the *largest* area?

- A right triangle with each leg about 7 centimeters long
- B circle with a radius of about 4 centimeters
- C rectangle with a length of 8 centimeters and a width of 4.5 centimeters
- D square with a side length of 6 centimeters

Read the Test Item

You are asked to compare the area and perimeter of four different shapes.

Solve the Test Item

Find the perimeter and area of each shape.

Right Triangle

Use the Pythagorean Theorem to find the length of the hypotenuse.

L	ese mer jungereun meere	in to mice the foright of the f	-) F
	$c^{2} = a^{2} + b^{2}$ $c^{2} = 7^{2} + 7^{2} \text{ or } 98$ $c = \sqrt{98} \text{ or about } 9.9$	Pythagorean Theorem $a = 7, b = 7$ Simplify.	7 cmC
>	$P = \mathbf{a} + \mathbf{b} + \mathbf{c}$ $\approx 7 + 7 + 9.9 \text{ or about } 23.9$	Perimeter of a triangle C cm Substitution	7 cm
	$A = \frac{1}{2}bh$ = $\frac{1}{2}$ (7)(7) or 24.5 cm ²	Area of a triangle Substitution	
	Circle	Rectangle	Square
	$C = 2\pi r$	$P = 2\ell + 2w$	P = 4s
l	$=2\pi(4)$	= 2(8) + 2(4.5)	= 4 <mark>(6)</mark>
	≈ 25.1 cm	= 25 cm	= 24 cm
	$A = \pi r^2$	$A = \ell w$	$A = s^2$
	$=\pi(4)^2$	= (8)(4.5)	$= 6^2$
н	Fo o 2	\mathbf{r}	26
l	$\approx 50.3 \text{ cm}^2$	$= 36 \text{ cm}^2$	$= 36 \text{ cm}^{-1}$

The shape that uses the most cording and encloses the largest area is the circle. The answer is B.

GuidedPractice

- **3.** Dasan has 32 feet of fencing to fence in a play area for his dog. Which shape of play area uses *most* or all of the fencing and encloses the *largest* area?
 - F circle with radius of about 5 feet
 - G rectangle with length 5 feet and width 10 feet
 - H right triangle with legs of length 10 feet each
 - J square with side length 8 feet

Test-TakingTip

Mental Math When you are asked to compare measures for varying figures, it can be helpful to use mental math. Estimate the perimeter or area of each figure, and then check your calculations.

StudyTip

Irrational Measures Notice that the triangle perimeter given in Example 3 is only an approximation. Because the length of the hypotenuse is an irrational number, the actual perimeter of the triangle is the irrational measure $(14 + \sqrt{98})$ centimeters.

You can use the Distance Formula to find the perimeter of a polygon graphed on a coordinate plane.

Example 4 Perimeter and Area on the Coordinate Plane

PT 🗞

COORDINATE GEOMETRY Find the perimeter and area of $\triangle PQR$ with vertices P(-1, 3), Q(-3, -1), and R(4, -1).

Step 1 Find the perimeter of $\triangle PQR$.

Graph $\triangle PQR$.

To find the perimeter of $\triangle PQR$, first find the lengths of each side. Counting the squares on the grid, we find that QR = 7 units. Use the Distance Formula to find the lengths of \overline{PQ} and \overline{PR} .

 \overline{PQ} has endpoints at P(-1, 3) and Q(-3, -1).

$PQ = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$	Distance Formula
$=\sqrt{[-1-(-3)]^2+[3-(-1)]^2}$	Substitute.
$=\sqrt{2^2+4^2}$	Subtract.
$=\sqrt{20}$ or about 4.5	Simplify.

 \overline{PR} has endpoints at P(-1, 3) and R(4, -1).

$$PR = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$
Distance Formula

$$= \sqrt{(-1 - 4)^2 + [3 - (-1)]^2}$$
Substitute.

$$= \sqrt{(-5)^2 + 4^2}$$
Subtract.

$$= \sqrt{41} \text{ or about 6.4}$$
Simplify.

The perimeter of $\triangle PQR$ is 7 + $\sqrt{20}$ + $\sqrt{41}$ or about 17.9 units.

Step 2 Find the area of $\triangle PQR$.

To find the area of the triangle, find the lengths of the height and base. The height is the perpendicular distance from P to \overline{QR} . Counting squares on the graph, the height is 4 units. The length of \overline{QR} is 7 units.

$A = \frac{1}{2}bh$	Area of a triangle
$=\frac{1}{2}(7)(4)$ or 14	Substitute and simplify

The area of $\triangle PQR$ is 14 square units.

GuidedPractice

4. Find the perimeter and area of $\triangle ABC$ with vertices A(-1, 4), B(-1, -1), and C(6, -1).

StudyTip

Linear and Square Units Remember to use linear units with perimeter and square units with area.

- **Step 1** Use the pointer tool to select points *X*, *Y*, and *Z*.
- **Step 2** Under the **Construct** menu, select **Triangle Interior**. The triangle will now be shaded.
- **Step 3** Select the triangle interior using the pointer.
- **Step 4** Choose the **Perimeter** command under the **Measure** menu to find the perimeter of $\triangle XYZ$.
- The perimeter of $\triangle XYZ$ is 8.38 centimeters.

Activity 4 Measure Angles

Find $m \angle X$, $m \angle Y$, and $m \angle Z$.

- Step 1Recall that $\angle X$ can also be named $\angle YXZ$ or $\angle ZXY$.
Use the pointer to select points Y, X, and Z in order.Step 2Select the Angle command from the Measure menu
to find $m \angle X$.
- **Step 3** Select points *X*, *Y*, and *Z*. Find $m \angle Y$.
- **Step 4** Select points *X*, *Z*, and *Y*. Find $m \angle Z$.
- $m \angle X = 63.16, m \angle Y = 86.05, \text{ and } m \angle Z = 30.8.$

Analyze the Results

- 1. Add the side measures from Activity 2. How does this compare to the result in Activity 3?
- **2.** What is the sum of the angle measures of $\triangle XYZ$?
- **3.** Repeat the activities for each figure.
 - **a.** irregular quadrilateral **b.** square **c.** pentagon **d.** hexagon
- **4.** Draw another quadrilateral and find its perimeter. Then enlarge your figure using the **Dilate** command. How does changing the sides affect the perimeter?
- 5. Compare your results with those of your classmates.
- 6. Make a conjecture about the sum of the measures of the angles in any triangle.
- 7. What is the sum of the measures of the angles of a quadrilateral? pentagon? hexagon?
- 8. How are the sums of the angles of polygons related to the number of sides?
- **9.** Test your conjecture on other polygons. Does your conjecture hold? Explain.
- **10.** When the sides of a polygon are changed by a common factor, does the perimeter of the polygon change by the same factor as the sides? Explain.

Example 1 Identify Solids

a.

b.

C.

1A.

Determine whether each solid is a polyhedron. Then identify the solid. If it is a polyhedron, name the bases, faces, edges, and vertices.

ReadingMath

Symbols Symbols can be used in naming the focus of polyhedra. The symbol \Box means rectangle. The symbol \triangle means triangle. The symbol \odot means circle.

Math HistoryLink

Plato (427–347 в.с.) Plato, a philosopher, mathematician, and scientist, lived in Athens, Greece. He is best known for founding a school known as "The Academy." In mathematics, he was concerned with the idea of proofs, and he insisted that definitions must be accurate and hypotheses must be clear.

D

С

GuidedPractice

R

The solid is formed by polygonal faces, so it is a polyhedron. There are two parallel congruent rectangular bases, so it is a rectangular prism.

Bases:	$\Box MNOP, \Box RSTQ$
Faces:	$\Box RQPM$, $\Box RSNM$, $\Box STON$,
	$\Box QTOP, \Box RSTQ, \Box MNOP$
Edges:	$\overline{MN}, \overline{NO}, \overline{OP}, \overline{PM}, \overline{RS}, \overline{ST}, \overline{TQ}, \overline{QR}, \overline{RM},$
	$\overline{SN}, \overline{TO}, \overline{QP}$
Vertices:	M, N, O, P, Q, R, S, T

The solid has a curved surface, so it is not a polyhedron. It has two congruent circular bases, so it is a cylinder.

The solid is formed by polygonal faces, so it is a polyhedron. The base is a triangle, and the three faces meet in a vertex, so it is a triangular pyramid.

Bases:	$\triangle ABC$
Faces:	$\triangle ABC, \triangle ADC, \triangle CDB, \triangle BDA$
Edges:	$\overline{AB}, \overline{BC}, \overline{CA}, \overline{DA}, \overline{DB}, \overline{DC}$
Vertices:	A, B, C, D

A polyhedron is a **regular polyhedron** if all of its faces are regular congruent polygons and all of the edges are congruent. There are exactly five types of regular polyhedrons, called **Platonic Solids** because Plato used them extensively.

RICHARD NOWITZ/National Geographic Image Collection

StudyTip

Euclidean Solids The Euclidean solids include the cube, the pyramid, the cylinder, the cone, and the sphere.

Surface Area and Volume Surface area is a two-dimensional measurement of the surface of a solid figure. The surface area of a polyhedron is the sum of the areas of each face. **Volume** is the measure of the amount of space enclosed by a solid figure.

Review the formulas for the surface area and volume of five common solids given below. You will derive these formulas in Chapter 12.

 $=\frac{1}{3}$ (36)(4) or 48

 $B = 36 \text{ cm}^2$, h = 4 cm

The volume is 48 cubic centimeters.

GuidedPractice

Find the surface area and volume of each solid to the nearest tenth.

WatchOut!

Height vs. Slant Height The *height* of a pyramid or cone is not the same as its *slant* height.

StudyTip

CCSS Precision Be sure that

you have converted all units of measure to be consistent before you begin volume or surface area calculations.

Real-World Example 3 Surface Area and Volume

POOLS The diameter of the pool Mr. Sato purchased is 8 feet. The height of the pool is 20 inches. Find each measure to the nearest tenth.

a. surface area of the pool

The pool is a cylinder.

$$A = 2\pi rh + \pi r^{2}$$
$$= 2\pi (4) \left(1\frac{2}{3}\right) + \pi (4)^{2}$$
$$\approx 92.2$$

Surface area of cylinder with one base

```
r = 4 ft, h = 20 in. or 1\frac{2}{3} ft
```

Use a calculator.

The surface area of the pool is about 92.2 square feet.

b. the volume of water needed to fill the pool to a depth of 16 inches

$V = \pi r^2 h$	Volume of cylinder
$=\pi(4)^2\left(1\frac{1}{3}\right)$	$r = 4$ ft, $h = 16$ in. or $1\frac{1}{3}$ ft
≈ 67.0	Use a calculator.

The volume of water needed is approximately 67.0 cubic feet.

GuidedPractice

- **3. CRAFTS** Jessica is making spherical candles using a mold that is 10 centimeters in diameter. Find each measure to the nearest tenth.
 - A. the volume of wax needed to fill the mold
 - **B.** the surface area of the finished candle

connectED.mcgraw-hill.com

Identify the solid modeled by each object. State whether the solid modeled is a polyhedron.

USS STRUCTURE Determine whether the solid is a polyhedron. Then identify the solid. If it is a polyhedron, name the bases, faces, edges, and vertices.

Find the surface area and volume of each solid to the nearest tenth.

Example 3 24. SANDBOX A rectangular sandbox is 3 feet by 4 feet. The depth of the box is 8 inches, but the depth of the sand is $\frac{3}{4}$ of the depth of the box. Find each measure to the nearest tenth.

- a. the surface area of the sandbox assuming there is no lid
- **b.** the volume of sand in the sandbox

your reasoning.

- **ART** Fernando and Humberto Campana designed the Inflating Table shown. The diameter of the table is $15\frac{1}{2}$ inches. Suppose the height of the cylinder is $11\frac{3}{4}$ inches. Find each measure to the nearest tenth. Assume that the sides of the table are perpendicular to the bases of the table.
 - **a.** the volume of air that will fully inflate the table
 - **b.** the surface area of the table when fully inflated
- 26. **CSS SENSE-MAKING** In 1999, Marks & Spencer, a British department store, created the biggest sandwich ever made. The tuna and cucumber sandwich was in the form of a triangular prism. Suppose each slice of bread was 8 inches thick. Find each measure to the nearest tenth.
 - **a.** the surface area in square feet of the sandwich when filled
 - **b.** the volume of filling in cubic feet to the nearest tenth
- **27.** ALGEBRA The surface area of a cube is 54 square inches. Find the length of each edge.
- **28.** ALGEBRA The volume of a cube is 729 cubic centimeters. Find the length of each edge.
- **29. PAINTING** Tara is painting her family's fence. Each post is composed of a square prism and a square pyramid. The height of the pyramid is 4 inches. Determine the surface area and volume of each post.
- **30. COLLECT DATA** Use a ruler or tape measure and what you have learned in this lesson to find the surface area and volume of a soup can.

4 in

3 in.

- **b.** Calculate the area of the cylindrical cake that will be frosted, if each layer is 4 inches in height.
- **c.** If one can of frosting will cover 50 square inches of cake, how many cans of frosting will be needed for each cake?
- **d.** If the height of each layer of cake is 5 inches, what does the radius of the cylindrical cake need to be, so the same amount of frosting is used for both cakes? Explain

32. CHANGING UNITS A gift box has a surface area of 6.25 square feet. What is the surface area of the box in square inches?

33 CHANGING UNITS A square pyramid has a volume of 4320 cubic inches. What is the volume of this pyramid in cubic feet?

- **34. EULER'S FORMULA** The number of faces *F*, vertices *V*, and edges *E* of a polyhedron are related by Euler's (OY luhrz) Formula: F + V = E + 2. Determine whether Euler's Formula is true for each of the figures in Exercises 18–23.
- **35. CHANGING DIMENSIONS** A rectangular prism has a length of 12 centimeters, width of 18 centimeters, and height of 22 centimeters. Describe the effect on the volume of a rectangular prism when each dimension is doubled.
- **36.** Solution **5** MULTIPLE REPRESENTATIONS In this problem, you will investigate how changing the length of the radius of a cone affects the cone's volume.
 - **a. Tabular** Create a table showing the volume of a cone when doubling the radius. Use radius values between 1 and 8.
 - **b. Graphical** Use the values from your table to create a graph of radius versus volume.

- **c. Verbal** Make a conjecture about the effect of doubling the radius of a cone on the volume. Explain your reasoning.
- **d. Algebraic** If *r* is the radius of a cone, write an expression showing the effect doubling the radius has on the cone's volume.

H.O.T. Problems Use Higher-Order Thinking Skills

37. CRITIQUE Alex and Emily are calculating the surface area of the rectangular prism shown. Is either of them correct? Explain your reasoning.

- **38. REASONING** Is a cube a regular polyhedron? Explain.
- **39. CHALLENGE** Describe the solid that results if the number of sides of each base increases infinitely. The bases of each solid are regular polygons inscribed in a circle.

a. pyramid **b.** prism

- **40. OPEN ENDED** Draw an irregular 14-sided polyhedron which has two congruent bases.
- **41. CHALLENGE** Find the volume of a cube that has a total surface area of 54 square millimeters.
- **42.** WRITING IN MATH A reference sheet listed the formula for the surface area of a prism as SA = Bh + 2B. Use units of measure to explain why there must be a typographical error in this formula.
Standardized Test Practice

43. GRIDDED RESPONSE What is the surface area of the triangular prism in square centimeters?

44. ALGEBRA What is the value of $(-0.8)^2 + (-0.3)^3$?

C 0.370D 0.327

A	0.627
B	0.613

- **45.** The length of each side of a cube is multiplied by 5. What is the change in the volume of the cube?
 - **F** The volume is 125 times the original volume.
 - **G** The volume is 25 times the original volume.
 - **H** The volume is 10 times the original volume.
 - J The volume is 5 times the original volume.
- **46. SAT/ACT** What is the difference in surface area between a cube with an edge length of 7 inches and a cube with edge length of 4 inches?

A	18 in ²	D	99 in ²
B	33 in ²	Ε	198 in ²
С	66 in ²		

Spiral Review

Name each polygon by its number of sides. Then classify it as *convex* or *concave* and *regular* or *irregular*. (Lesson 1-6)

Geometry Lab Two-Dimensional Representations of Three-Dimensional Objects

view

If you see a three-dimensional object from only one viewpoint, you may not know its true shape. Here are four views of a square pyramid.

The two-dimensional views of the top, left, front, and right sides of an object are called an orthographic drawing.

top left front r

view

front right view view

COMMON Core State Standards Content Standards

G.MG.1 Use geometric shapes, their measures, and their properties to describe objects (e.g., modeling a tree trunk or a human torso as a cylinder). ★ **Mathematical Practices** 5

Step 5 Use the left and right views and the breaks in those views to confirm that you have made the correct figure.

Model and Analyze

1. Make a model of a figure for the orthographic drawing shown.

2. Make an orthographic drawing of the figure shown.

Geometry Lab Two-Dimensional Representations of Three-Dimensional Objects Continued

If you cut a cardboard box at the edges and lay it flat, you will have a two-dimensional diagram called a **net** that you can fold to form a three-dimensional solid.

Activity 2

Model and Analyze

Make a model of a figure for each net. Then identify the solid formed and find its surface area. If the solid has more than one name, list both.

76 | Extend 1-7 | Geometry Lab: Two-Dimensional Representations of Three-Dimensional Objects

To draw the net of a three-dimensional solid, visualize cutting the solid along one or more of its edges, opening up the solid, and flattening it completely.

Model and Analyze

Draw a net for each solid. Then label its dimensions.

12. PACKAGING A can of pineapple is shown.

- **a.** What shape are the top and bottom of the can?
- **b.** If you remove the top and bottom and then make a vertical cut down the side of the can, what shape will you get when you uncurl the remaining body of the can and flatten it?
- **c.** If the diameter of the can is 3 inches and its height is 2 inches, draw a net of the can and label its dimensions. Explain your reasoning.

Study Guide

KeyConcepts

Points, Lines, and Planes (Lesson 1-1)

- There is exactly one line through any two points.
- There is exactly one plane through any three noncollinear points.

Distance and Midpoints (Lesson 1-3)

- On a number line, the measure of a segment with endpoint coordinates *a* and *b* is |a - b|.
- In the coordinate plane, the distance between two points
- (x_1, y_1) and (x_2, y_2) is given by $d = \sqrt{(x_2 x_1)^2 + (y_2 y_1)^2}$.
- · On a number line, the coordinate of the midpoint of a segment with endpoints *a* and *b* is $\frac{a+b}{2}$.
- In the coordinate plane, the coordinates of the midpoint of a segment with endpoints that are (x_1, y_1) and (x_2, y_2) are

```
\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right).
```

Angles (Lessons 1-4 and 1-5)

- An angle is formed by two noncollinear rays that have a common endpoint, called its vertex. Angles can be classified by their measures.
- Adjacent angles are two coplanar angles that lie in the same plane and have a common vertex and a common side but no common interior points.
- Vertical angles are two nonadjacent angles formed by two intersecting lines.
- A linear pair is a pair of adjacent angles with noncommon sides that are opposite rays.
- Complementary angles are two angles with measures that have a sum of 90.
- Supplementary angles are two angles with measures that have a sum of 180.

FOLDABLES StudyOrganizer

Be sure the Key Concepts are noted in your Foldable.

VocabularyCheck

Fill in the blank in each sentence with the vocabulary term that best completes the sentence.

- **1.** A is a flat surface made up of points that extends infinitely in all directions.
- 2. A set of points that all lie on the same line are said to be
- 3. If two lines intersect to form four right angles, the lines are
- 4. If the sum of the measures of two angles is 180, then the angles are called angles.

Lesson-by-Lesson Review

Draw and label a figure for the relationship below.

Plane X contains line a, line b intersects line a at point Q, but line *b* is not in plane X.

Draw a surface to represent plane X and label it.

Draw a line in plane X and label it line a.

Draw a line *b* intersecting both the plane and line *a* and label the point of intersection *Q*.

Linear Measure

Find the value of the variable and XP, if X is between P and Q.

- **11.** XQ = 13, XP = 5x 3, PQ = 40
- **12.** XQ = 3k, XP = 7k 2, PQ = 6k + 16

Determine whether each pair of segments is congruent.

15. DISTANCE The distance from Salvador's job to his house is 3 times greater than the distance from his house to school. If his house is between his job and school and the distance from his job to school is 6 miles, how far is it from Salvador's house to school?

Example 2

Use the figure to find the value of the variable and the length of \overline{YZ} .

10	3 <i>x</i> + 7
X Y ∢ 29 -	Z
XZ = XY + YZ	Betweenness of points
29 = 10 + 3x + 7	Substitution
29 = 3x + 17	Simplify.
12 = 3x	Subtract 17 from each side.
4 = <i>x</i>	Divide each side by 3.
YZ = 3x + 7	Given
= 3(4) + 7 or 19	Substitution
So, $x = 4$ and $YZ = 19$.	

2 Distance and Midpoints

Find the distance between each pair of points.

16. *A*(-3, 1), *B*(7, 13)

17. *P*(2, -1), *Q*(10, -7)

Find the coordinates of the midpoint of a segment with the given endpoints.

18. *L*(-3, 16), *M*(17, 4)

19. C(32, -1), D(0, -12)

Find the coordinates of the missing endpoint if *M* is the midpoint of \overline{XY} .

- **20.** *X*(-11, -6), *M*(15, 4)
- **21.** *M*(-4, 8), *Y*(19, 0)
- **22. HIKING** Carol and Marita are hiking in a state park and decide to take separate trails. The map of the park is set up on a coordinate grid. Carol's location is at the point (7, 13) and Marita is at (3, 5).
 - a. Find the distance between them.
 - **b.** Find the coordinates of the point midway between their locations.

Example 3

Find the distance between X(5, 7) and Y(-7, 2).

Let
$$(x_1, y_1) = (5, 7)$$
 and $(x_2, y_2) = (-7, 2)$.
 $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$
 $= \sqrt{(-7 - 5)^2 + (2 - 7)^2}$
 $= \sqrt{(-12)^2 + (-5)^2}$
 $= \sqrt{169}$ or 13

The distance from *X* to *Y* is 13 units.

Example 4

Find the coordinates of the midpoint between P(-4, 13) and Q(6, 5).

Let
$$(x_1, y_1) = (-4, 13)$$
 and $(x_2, y_2) = (6, 5)$.

$$M\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) = M\left(\frac{-4 + 6}{2}, \frac{13 + 5}{2}\right)$$
$$= M(1, 9)$$

The coordinates of the midpoint are (1, 9).

Angle Measure

For Exercises 23–26, refer to the figure below.

- **23.** Name the vertex of $\angle 7$.
- **24.** Write another name for $\angle 4$.
- **25.** Name the sides of $\angle 2$.
- **26.** Name a pair of opposite rays.
- 27. SIGNS A sign at West High School has the shape shown. Measure each of the angles and classify them as *right*, *acute*, or *obtuse*.

Refer to the figure below. Name all angles that have *Q* as a vertex.

 $\angle OQN$, $\angle NQP$, $\angle PQR$, $\angle RQS$, $\angle SQO$, $\angle OQP$, $\angle NQR$, $\angle PQS$, $\angle OQR$

Example 6

B

С

Ε

In the figure above, list all other names for $\angle 1$. $\angle NOQ, \angle QON, \angle MOQ, \angle QOM, \angle MOR, \angle ROM, \angle NOR, \angle RON$

Angle Relationships

For Exercises 28–30, refer to the figure below.

- **28.** Name an angle supplementary to $\angle TVY$.
- **29.** Name a pair of vertical angles with vertex *W*.
- **30.** If $m \angle SXW = 5x 16$, find the value of x so that $\overline{SX} \perp \overline{WY}$.
- **31. PARKING** The parking arm shown below rests in a horizontal position and opens to a vertical position. After the arm has moved 24°, how many more degrees does it have to move so that it is vertical?

Example 7

Name a pair of supplementary angles and a pair of complementary angles in the figure below.

Sample answers:

Supplementary angles: $\angle RXA$ and $\angle RXD$ Complementary angles: $\angle RXC$ and $\angle CXD$

Two-Dimensional Figures

Name each polygon by its number of sides. Then classify it as *convex* or *concave* and *regular* or *irregular*.

- **34.** Find the perimeter of quadrilateral *ABCD* with vertices A(-3, 5), B(0, 5), C(2, 0), and D(-5, 0).
- **35. PARKS** Westside Park received 440 feet of chain-link fencing as a donation to build an enclosed play area for dogs. The park administrators need to decide what shape the area should have. They have three options: (1) a rectangle with length of 100 feet and width of 120 feet, (2) a square with sides of length 110 feet, or (3) a circle with radius of approximately 70 feet. Find the areas of all three enclosures and determine which would provide the largest area for the dogs.

Example 8

Name the polygon by its number of sides. Then classify it as *convex* or *concave* and *regular* or *irregular*.

There are 6 sides, so this is a hexagon. If two of the sides are extended to make lines, they will pass through the interior of the hexagon, so it is concave. Since it is concave, it cannot be regular.

Example 9

Find the perimeter of the polygon in the figure above.

$$P = s_1 + s_2 + s_3 + s_4 + s_5 + s_6$$

$$= 7 + 7 + 9 + 6 + 6 + 4$$

$$= 39$$
Simplify.

The perimeter of the polygon is 39 units.

Study Guide and Review Continued

Three-Dimensional Figures

Identify each solid. Name the bases, faces, edges, and vertices.

Find the surface area and volume of each solid.

42. BUILDING Chris is building a trunk like the one shown below. His design is a square prism. What is the volume of the trunk?

43. HOCKEY A regulation hockey puck is a cylinder made of vulcanized rubber 1 inch thick and 3 inches in diameter. Find the surface area and volume of a hockey puck.

Example 10

Identify the solid below. Name the bases, faces, edges, and vertices.

This solid has congruent circular bases in a pair of parallel planes. So, it is a cylinder.

Bases: circle O and circle P

A cylinder has no faces, edges, or vertices.

Example 11

Find the surface area and volume of the rectangular prism below.

The surface area is 702 square inches.

V = Bh	Volume of a prism					
= (135)(9)	Substitution					
= 1215	Simplify.					

The volume is 1215 cubic inches.

Practice Test

Use the figure to name each of the following.

- **1.** the line that contains points *Q* and *Z*
- **2.** two points that are coplanar with points *W*, *X*, and *Y*
- **3.** the intersection of lines *a* and b

Find the value of the variable if *P* is between *J* and *K*.

- **4.** JP = 2x, PK = 7x, JK = 27
- **5.** JP = 3y + 1, PK = 12y 4, JK = 75
- **6.** JP = 8z 17, PK = 5z + 37, JK = 17z 4

Find the coordinates of the midpoint of a segment with the given endpoints.

- **7.** (16, 5) and (28, −13)
- **8.** (-11, 34) and (47, 0)
- **9.** (-4, -14) and (-22, 9)

Find the distance between each pair of points.

- **10.** (43, -15) and (29, -3)
- **11.** (21, 5) and (28, -1)
- **12.** (0, −5) and (18, −10)
- **13. ALGEBRA** The measure of $\angle X$ is 18 more than three times the measure of its complement. Find the measure of $\angle X$.
- **14.** Find the value of *x* that will make lines *a* and *b* perpendicular in the figure below.

For Exercises 15–18, use the figure below.

- **15.** Name the vertex of $\angle 3$.
- **16.** Name the sides of $\angle 1$.
- **17.** Write another name for $\angle 6$.
- **18.** Name a pair of angles that share exactly one point.
- **19. MULTIPLE CHOICE** If $m \angle 1 = m \angle 2$, which of the following statements is true?

- $\mathbf{A} \ \angle 2 \cong \angle 4$
- **B** $\angle 2$ is a right angle.
- C $\ell \perp m$
- D All of the above

Find the perimeter of each polygon.

- **20.** triangle *XYZ* with vertices *X*(3, 7), *Y*(−1, −5), and *Z*(6, −4)
- **21.** rectangle *PQRS* with vertices *P*(0, 0), *Q*(0, 7), *R*(12, 7), and *S*(12, 0)
- **22. SAFETY** A severe weather siren in a local city can be heard within a radius of 1.3 miles. If the mayor of the city wants a new siren that will cover double the area of the old siren, what should the radius of the coverage area of the new siren be? Round to the nearest tenth of a mile.

Refer to the figure at the right.

- **23.** Name the base.
- **24.** Find the surface area.
- **25.** Find the volume.

Preparing for Standardized Tests

Solving Math Problems

Strategies for Solving Math Problems

The first step to solving any math problem is to read the problem. When reading a math problem to get the information you need to solve, it is helpful to use special reading strategies.

Step 1

Read the problem to determine what information is given.

- Analyze: Determine what exactly the problem is asking you to solve.
- **Underline:** If you are able to write in your test book, underline any important information.

Step 2

Reread the problem to determine what information is needed to solve the problem.

- Think: How does the information fit together?
- Key Words: Are there any key words, variables or mathematical terms in the problem?
- Diagrams: Do you need to use a diagram, list or table?
- Formulas: Do you need a formula or an equation to solve the problem?

Step 3

Devise a plan and solve the problem. Use the information you found in Steps 1 and 2.

- Question: What problem are you solving?
- Estimate: Estimate an answer.
- Eliminate: Eliminate all answers that do not make sense and/or vary greatly from your estimate.

Step 4

Check your answer.

- Reread: Quickly reread the problem to make sure you solved the whole problem.
- Reasonableness: Is your answer reasonable?
- Units: Make sure your answer has the correct units of measurement.

Standardized Test Example

Read the problem. Identify what you need to know. Then use the information in the problem to solve.

Carmen is using a coordinate grid to make a map of her backyard. She plots the swing set at point S(2, 5) and the big oak tree at point O(-3, -6). If each unit on the grid represents 5 feet, what is the distance between the swing set and the oak tree? Round your answer to the nearest whole foot.

A 12 ft B 25 ft	C 60 ft	D 74 ft
-----------------	----------------	----------------

Determine what exactly the problem is asking you to solve. Underline any important information.

Carmen is using a coordinate grid to make a map of her backyard. She plots the <u>swing set at point S(2, 5) and the big oak tree at point O(-3, -6). If <u>each unit on the grid represents 5 feet</u>, <u>what is the distance between the swing set and the oak tree</u>? Round your answer to the nearest whole foot.</u>

The problem is asking for the distance between the swing set and the oak tree. The key word is distance, so you know you will need to use the Distance Formula.

 $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ Distance Formula $= \sqrt{(-3 - 2)^2 + (-6 - 5)^2}$ $= \sqrt{(-5)^2 + (-11)^2}$ Subtract. $= \sqrt{25 + 121} \text{ or } \sqrt{146}$ Simplify.

The distance between swing set and the oak tree is $\sqrt{146}$ units. Use a calculator to find that $\sqrt{146}$ units is approximately 12.08 units.

Since each unit on the grid represents 5 feet, the distance is $(12.08) \cdot (5)$ or 60.4 ft. Therefore, the correct answer is C.

Check your answer to make sure it is reasonable, and that you have used the correct units.

Exercises

Read each question. Then fill in the correct answer on the answer document provided by your teacher or on a sheet of paper.

1. A regular pentagon has a perimeter of 24 inches. What is the measure of each side?

A 3 inches C 4 inch	es
---------------------	----

B 3.8 inches **D** 4.8 inches

- 2. What is the value of *x* in the figure at the right?F 10
- **G** 12

H 14

J 15

Standardized Test Practice

Cumulative, Chapter 1

Multiple Choice

Read each question. Then fill in the correct answer on the answer document provided by your teacher or on a sheet of paper.

1. If the dimensions of the prism below were doubled, by what factor would the volume of the prism increase?

- **2.** Find the distance between M(-3, 1) and N(2, 8) on a coordinate plane.
 - F 6.1 units

A 2

B 4

- **G** 6.9 units
- H 7.3 units
- J 8.6 units
- **3.** Which of the following terms best describes points *F*, *G*, and *H*?

Test-TakingTip

Question 3 Understanding the terms of geometry can help you solve problems. The term *congruent* refers to geometric figures, and *skew* refers to lines, therefore both answers can be eliminated.

4. What is the length of segment *BD*?

5. In the figure below, what is the measure of angle *CDN*?

6. Find the perimeter of the figure below.

7. What is the relationship of $\angle 1$ and $\angle 2$?

- A complementary angles
- **B** linear pair
- C supplementary angles
- D vertical angles

Short Response/Gridded Response

Record your answers on the answer sheet provided by your teacher or on a sheet of paper.

8. Find the distance between points *R* and *S* on the coordinate grid below. Round to the nearest tenth.

- **9. SHORT RESPONSE** Find the value of *x* and *AB* if *B* is between *A* and *C*, AB = 2x, AC = 6x 5, and BC = 7.
- **10.** Suppose two lines intersect in a plane.
 - **a.** What do you know about the two pairs of vertical angles formed?
 - **b.** What do you know about the pairs of adjacent angles formed?
- **11. GRIDDED RESPONSE** How many planes are shown in the figure below?

12. GRIDDED RESPONSE What is the total surface area of the cone? Round your answer to the nearest square centimeter.

13. GRIDDED RESPONSE What is the value of *x* in the figure?

Extended Response

Record your answers on a sheet of paper. Show your work.

14. Julie's room has the dimensions shown in the figure.

- **a.** Find the perimeter of her room.
- **b.** Find the area of her room.
- **c.** If the length and width doubled, what effect would it have on the perimeter?
- **d.** What effect would it have on the area?
