

Mark Kembel – MSN Article

Mark Kembel is the founder of [Global Surgical AI Healthcare](#), a company developing next-generation infrastructure for the future of surgery through its AI DB Core Digital Twin Platform™. The technology transforms CT, MRI, and medical imaging data into real-time, interactive 3D patient models, creating dynamic AI-driven digital twins that support predictive surgical planning, intraoperative guidance, and continuous learning across healthcare systems. At the core of the platform is a proprietary AI database that aggregates imaging data, surgical workflows, and patient outcomes into a continuously improving intelligence engine. This creates a powerful data flywheel where more procedures generate more insights, enabling increasingly advanced AI models and improved surgical outcomes over time. Mark brings decades of technology and operational experience, including work during Microsoft's Windows 95 era and scaling InterTest.com into a multimillion-dollar enterprise. Today, he is leading Global Surgical AI Healthcare's expansion as the company raises capital to accelerate engineering, hospital pilots, and commercialization efforts aimed at redefining surgical intelligence worldwide.
