Phone/Fax: 4042529200 / 4042520490	Age/Gender: 17 Month(s) / female
Owner: Nathalie Bern	Submitted Date: 07/08/2020 10:27:31 AM
Practitioner: Dr. Rebecca Kestle	Completed Date: 07/08/2020 03:29:08 PM

Case Status/Priority: Completed / Regular

Case History:

Pre-Breeding Consultation

Case Report:

495015 KW/bs

A digitalized radiographic image containing a ventrodorsal projection of the pelvis was submitted for evaluation. The radiograph is dated 5/29/20.

Radiographic Findings:

Both femoral heads are well seated in their respective acetabula with greater than 50% the right femoral head and approximately 50% of the left femoral head located medial to the dorsal acetabular rims.

Obvious incongruity between the femoral heads and acetabula is not identified; however, there is slight widening of the medial aspect of the left coxofemoral joint.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

Diagnosis: Normal pelvis.

Comments: Radiographic changes to suggest hip dysplasia are not present. Based on the OFA scheme of evaluating hips, the hips would be rated as fair in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude hip dysplasia and to establish a final rating on the coxofemoral joints.
