

WINTER CHILL

Operating an ATV / SbS during the winter requires extra body protection against lower temperature, moisture and the wind-chill factor. Keeping dry and warm in winter is essential.

While the thermometer may indicate a reasonable temperature outside, do not forget the "wind-chill factor."

Select the right combination of clothing to keep you warm and dry. Clothing should be windproof and water-repellent and most importantly "Snug" so it doesn't get caught in the machine.
