

A New Way to Manage Foxes

The 1 Million Turtles program is pleased to bring you three science based tools that can help you quickly select high priority areas to target fox management, survey before/after to better understand and communicate the effectiveness of your fox management interventions and a one stop shop free app to bring all the data together.

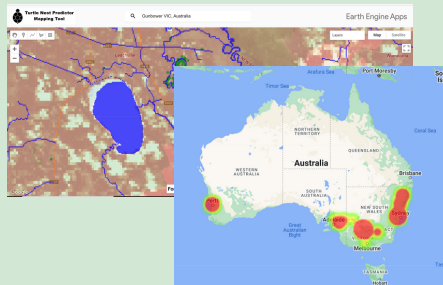

Standardised evaluation of fox/pig management interventions

The National Nest Predation Survey offers an opportunity for management agencies nationwide to construct artificial turtle nests to assess predation rates and deploy cameras to count foxes. When integrated with your fox management initiatives, the NNPS becomes a very effective means to evaluate the success of your fox management programs.

This includes pig management initiatives too. Past efforts have shown feral pigs visiting these nest predation survey sites.

Quickly identify target areas

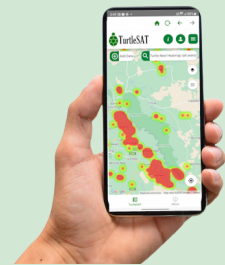

By combining Citizen Science data with AI, we have developed an online Turtle Nest Predictor tool to help identify critical nesting hotspots for turtles across Australia.

As 95% of turtle nests are destroyed by foxes, the hotspots act as a great gauge of where you are likely to find foxes, enabling a targeted fox management.

Easily access your data on TurtleSAT

Our TurtleSAT app, built on the FeralScan platform, has received over 17,000 turtle records from Citizen Scientists across Australia. Agencies collaborating with us will have access to TurtleSAT data and provide the opportunity to consolidate fox management data, e.g., pre- and post-nest predation surveys. TurtleSAT provides real-time analysis and visualisation of turtle nesting and road mortality hotspots.

Explore or download TurtleSAT at TurtleSAT.org.au.

Connect with our 1 Million Turtles program team today to discuss how we can assist to address fox and turtle management requirements specific to your area, while also involving Citizen Scientists. Email us at 1millionturtles@1millionturtles.com
