

Fan Service Manual

Maintenance, Troubleshooting, Service, and Parts Manual

This manual applies to:

GGF-803XX, GGF-840XX, GGI-803XX, GGI-815XX, GGL-805XX, GGL-850XX, GGX-803XX, GGX-815XX

INSTALLATION AND WIRING MUST BE IN
ACCORDANCE WITH CEC, NEC, AND LOCAL
ELECTRICAL CODES

Read this manual before using product. Failure to follow instructions and safety precautions can result in serious injury, death, or property damage. Keep manual for future reference.

Part Number: CNA-2624 R1

Revised: February 2024

Original Instructions

This product has been designed and manufactured to meet general engineering standards. Other local regulations may apply and must be followed by the operator. All personnel must be trained in the correct operational and safety procedures for this product. Use the sign-off sheet below to record initial and periodic reviews of this manual with all personnel.

New in this Manual

The following changes have been made in this revision of the manual:

Description	Section
Corrected missing reference	Section 3.6 – Testing on page 23
Corrected missing reference	Section 5.2 – Maintenance Schedule on page 27
Updated schematics	Section 7.1.1 – Current Fan Models (No Motor Thermostat) on page 31
Updated parts list	Section 7.2.3 – Low Speed Centrifugal Fan (GGL) Replacement Parts on page 48

1. Introduction

1.1. General Description

This fan service manual provides support for the installation, operation, troubleshooting, and maintenance of the following aeration fans:

- GGF (High Speed Centrifugal) Fans
- GGI (Inline Centrifugal) Fans
- GGL (Low Speed Centrifugal) Fans
- GGX (Vane Axial) Fans

1.2. Serial Number Location

The serial number location for aeration fans are shown in the figure below. Have the serial number ready when ordering parts or requesting service or other information. Record information in the table below for easy reference.

Model Number	
Serial Number	
Date Received	

Figure 1. GGF (3–15 HP)

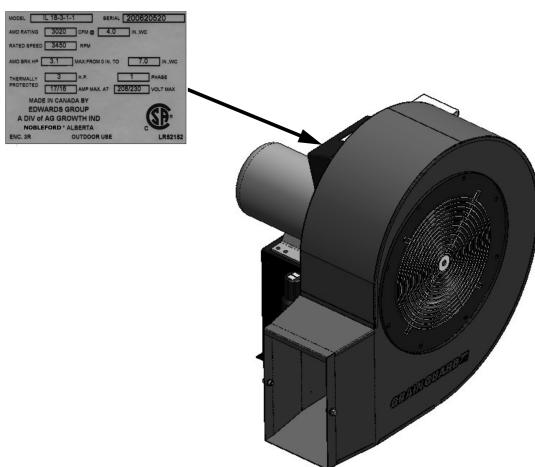

Figure 2. GGF (20–40 HP)

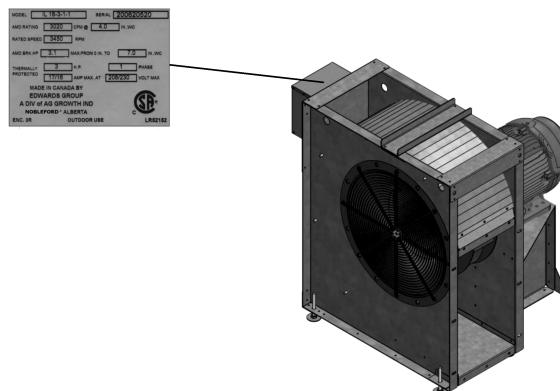

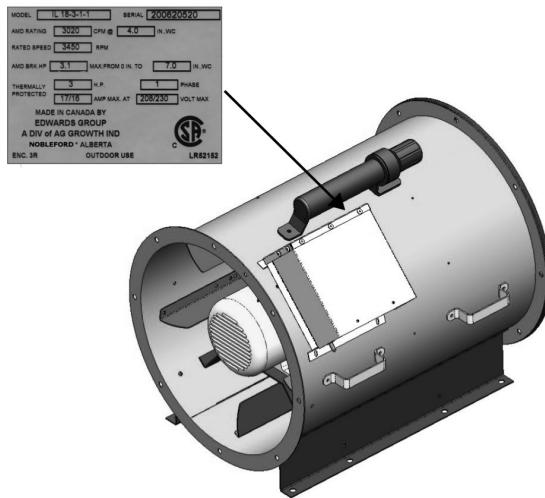

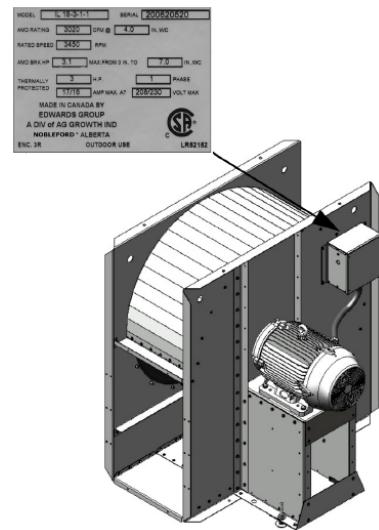

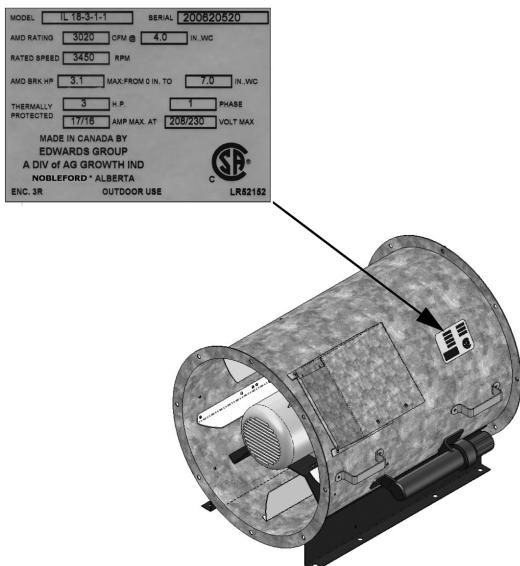

Figure 3. GGI**Figure 4. GGL****Figure 5. GGX**

1.3. Intended Use

The Fan Service manual facilitates the use of aeration fans as listed below, and described throughout this manual. Use in any other way is considered contrary to the intended use and is not covered by the warranty.

- Aeration and natural air drying of grain products.
- Connection to a properly sized upstream or downstream heater (optional).

2. Safety

2.1. Safety Alert Symbol and Signal Words

This safety alert symbol indicates important safety messages in this manual. When you see this symbol, be alert to the possibility of injury or death, carefully read the message that follows, and inform others.

Signal Words: Note the use of the signal words **DANGER**, **WARNING**, **CAUTION**, and **NOTICE** with the safety messages. The appropriate signal word for each message has been selected using the definitions below as a guideline.

	DANGER	Indicates an imminently hazardous situation that, if not avoided, will result in serious injury or death.
	WARNING	Indicates a hazardous situation that, if not avoided, could result in serious injury or death.
	CAUTION	Indicates a hazardous situation that, if not avoided, may result in minor or moderate injury.
	NOTICE	Indicates a potentially hazardous situation that, if not avoided, may result in property damage.

2.2. General Safety Information

Read and understand all safety instructions, safety decals, and manuals and follow them when operating or maintaining the equipment.

- Owners must give instructions and review the information initially and annually with all personnel before allowing them in the work area. Untrained users/operators expose themselves and bystanders to possible serious injury or death.
- Use for intended purposes only.
- Modification of the aeration fan in any way without written permission from the manufacturer is not covered by the warranty.
- Follow a health and safety program for your worksite. Contact your local occupational health and safety organization for information.
- Follow applicable local codes and regulations.

2.3. Fan Safety

⚠️ WARNING

- Keep away from fan impeller/blade; high suction can pull a person toward the inlet. Contact with an unguarded impeller/blade will cause severe injury.
- Keep the inlet screen in place at all times.
- Remove foreign material from the fan inlet before operating.
- Do not operate the fan if there is excessive vibration or noise.
- When the power is locked out, fans can still be dangerous because of potential “windmilling.” Always block the impeller/blade before working on any moving parts.

2.4. Guards Safety

⚠️ WARNING

- Keep guards in place. Do not operate with guard removed.
- Do not walk on, step on, or damage guards.
- Lock out power before removing a guard.
- Ensure all guards are replaced after performing maintenance.

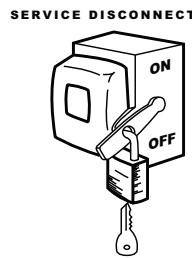

2.5. Drive and Lockout Safety

Lockout/Tagout equipment before set-up, service, maintenance, and repair. Make sure to follow lockout and tagout procedure in the Electric Motor Safety Section to prevent inadvertent start-up and hazardous energy release.

2.6. Electric Motor Safety

WARNING Power Source

- Electric motors and controls shall be installed and serviced by a qualified electrician and must meet all local codes and standards.
- Do not modify the magnetic starter. This component provides overload and under-voltage protection.
- Motor starting controls must be located so that the operator has full view of the entire operation.
- Locate main power disconnect switch within reach from ground level to permit ready access in case of an emergency.
- Motor must be grounded.
- Guards must be in place and secure at all times.
- Ensure electrical wiring and cords remain in good condition; replace if necessary.

Lockout

- The main power disconnect switch should be in the locked position during shutdown or whenever maintenance is performed.
- In the event of unexpected fan shutdown, the fan can be reset using the main power switch located on the fan or using a reset button when equipped.

2.7. Personal Protective Equipment

The following Personal Protective Equipment (PPE) should be worn when assembling, operating or maintaining the equipment.

Hard Hat

- Wear a hard hat to help protect your head.

Safety Glasses

- Wear safety glasses at all times to protect eyes from debris.

Hearing Protection

- Wear ear protection to prevent hearing damage.

Work Gloves

- Wear work gloves to protect your hands from sharp and rough edges.

Steel-Toe Boots

- Wear steel-toe boots to protect feet from falling debris.

Coveralls

- Wear coveralls to protect skin.

2.8. Safety Equipment

The following safety equipment should be kept on site.

Fire Extinguisher

- Provide a fire extinguisher for use in case of an accident. Store in a highly visible and accessible place.

First-Aid Kit

- Have a properly-stocked first-aid kit available for use should the need arise, and know how to use it.

2.9. Safety Decals

- Keep safety decals clean and legible at all times.
- Replace safety decals that are missing or have become illegible. See decal location figures that follow.
- Replaced parts must display the same decal(s) as the original part.
- Replacement safety decals are available **free of charge** from your distributor, dealer, or factory as applicable.

2.9.1 Decal Installation/Replacement

1. Decal area must be clean and dry, with a temperature above 50°F (10°C).
2. Decide on the exact position before you remove the backing paper.
3. Align the decal over the specified area and carefully press the small portion with the exposed sticky backing in place.
4. Slowly peel back the remaining paper and carefully smooth the remaining portion of the decal in place.
5. Small air pockets can be pierced with a pin and smoothed out using the decal backing paper.

Safety Decals Location and Details

Replicas of the safety decals that are attached to the fans are shown below. Safe operation and use of the fans requires familiarization with the various safety decals and the functions that the decals apply to. Safety precautions must be taken to avoid injury, death, or damage.

Figure 6. GGF (3-15 HP) Decal Locations

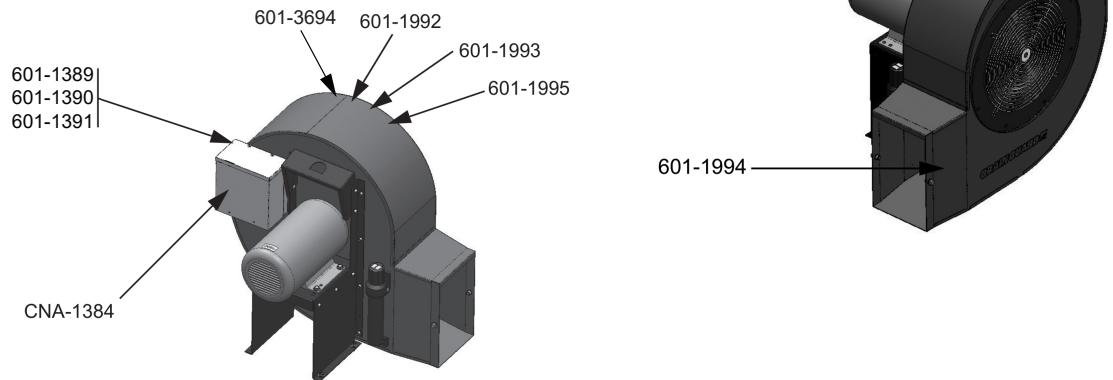

Figure 7. GGF (20-40 HP)

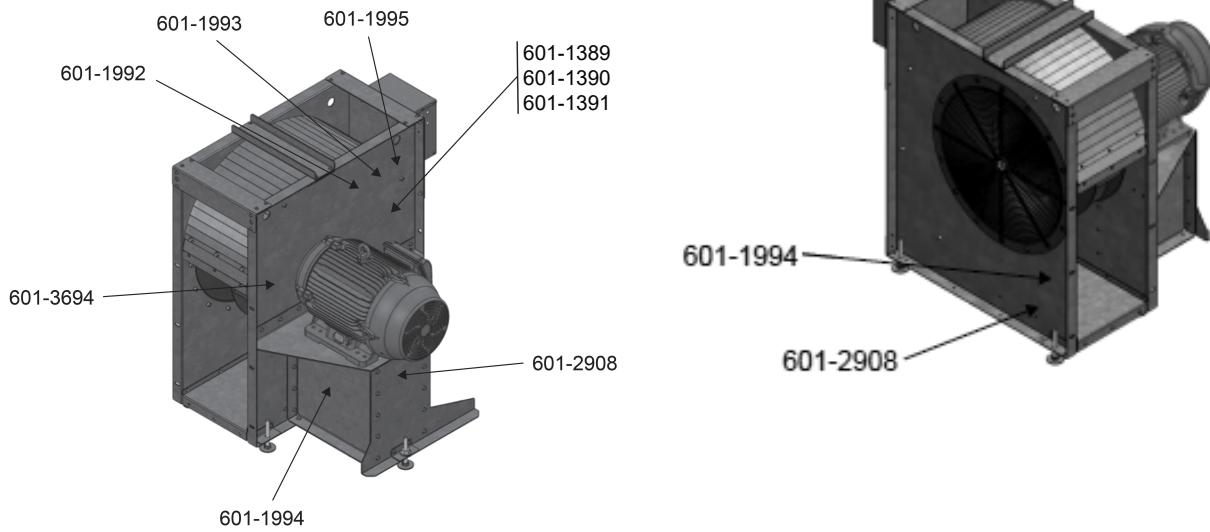

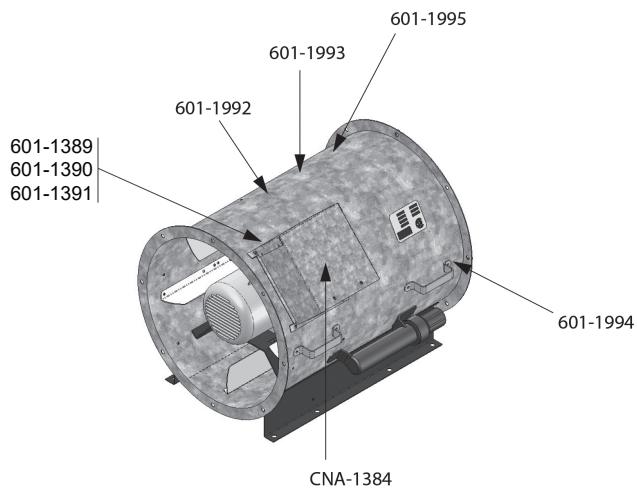

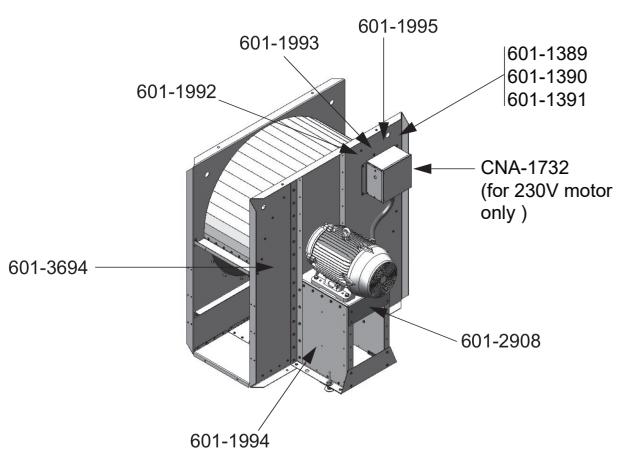

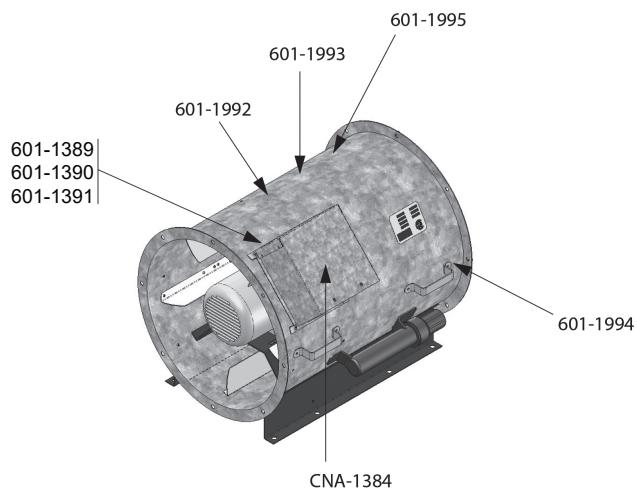

Figure 8. GGI Decal Locations**Figure 9. GGL Decal Locations****Figure 10. GGX Decal Locations**

Table 1. Safety Decals

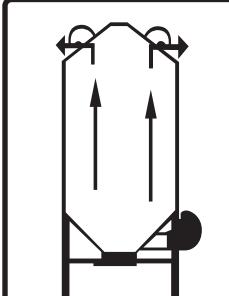

Part Number	Description
601-1992	 <div style="background-color: #00529e; color: white; padding: 5px; text-align: center;"> NOTICE </div> <p>To prevent possible roof damage, ensure that all roof vents are open and unobstructed.</p> <p>Do not operate aeration fan if it is possible that the roof vents could ice up.</p>
601-1993	<div style="background-color: #ff9933; color: black; padding: 5px; text-align: center;"> WARNING </div> <div style="display: flex; align-items: center; justify-content: space-around;">   </div> <p>AERATION FAN SAFETY INSTRUCTIONS</p> <p>To prevent serious injury or death:</p> <ul style="list-style-type: none"> • Read operator's manual and all product safety decals before installing, operating or servicing fan. • Do not operate with any safety shield or guard removed or modified. Keep in good working order. • Do not operate fan if there is excessive vibration or noise. • Before operating fan, clear work area of all children and untrained personnel. • Keep hands, legs, feet, hair, jewelry and clothing away from all moving parts. • Shut off and lock out or disconnect power before inspecting or servicing fan. <p>If the operator manual, guards, or safety decals are missing or damaged, contact AGI Nobleford at 1-800-565-2840 or www.agrowth.com for replacements.</p>

Table 1 Safety Decals (continued)

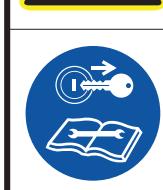

Part Number	Description
601-1994	 <div style="background-color: orange; color: white; padding: 5px; text-align: center;"> ! WARNING <p>CUTTING HAZARD</p> <p>To prevent serious injury, keep away from blade when fan is operating.</p> <p>Shut off and lockout or disconnect power before inspecting or servicing.</p> <p>Keep guards in place while operating.</p> </div>

3. Installation

3.1. Installation Safety

⚠️ WARNING

- Do not take chances with safety. The components can be large, heavy, and hard to handle. Always use the proper tools, rated lifting equipment, and lifting points for the job.
- Tighten all fasteners according to their specifications. Do not replace or substitute bolts, nuts, or other hardware that is of lesser quality than the hardware supplied by the manufacturer.
- Do not make any modification to the wire and flex cable that has been provided by the manufacturer.
- Do not suspend additional equipment/components from this kit that are not specified in the manual.

3.2. Handling the Fan

Lift the fan by the base or lifting locations only. Never lift the fan by the impeller, motor, motor bracket, housing inlet, outlet, or any fan part not designed for lifting. A spreader should always be used to avoid damage.

3.3. Mounting the Fan on a Flat Bottom Bin

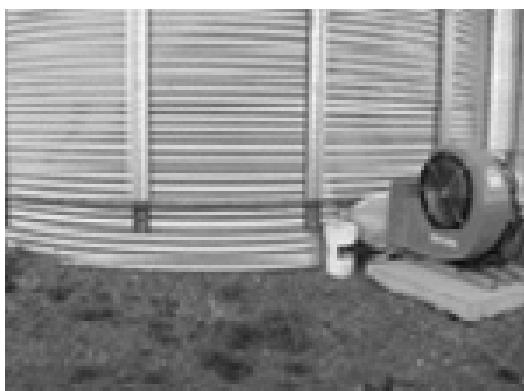

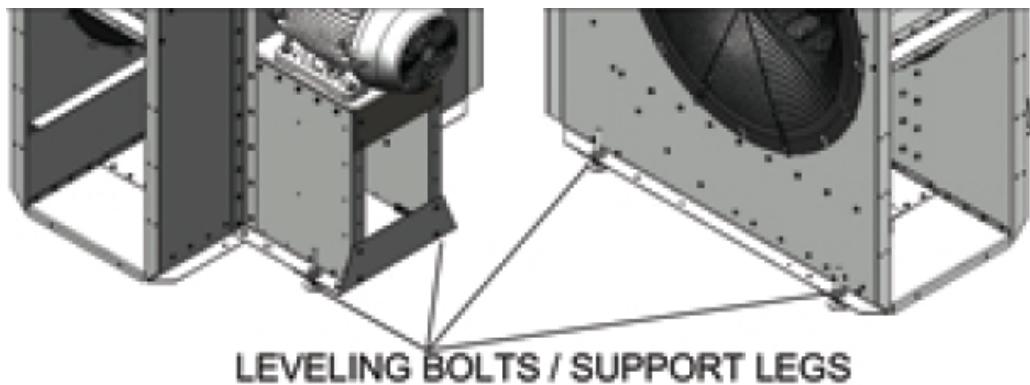

The aeration fan must be properly supported for smooth operation. AGI recommends the fan is always supported from below and not hanging from the fan housing, frame or motor.

3.3.1 Slab Mounted Fans

A concrete foundation is preferable for installing floor-mounted fans.

When installing the fan on a concrete pad the following general requirements apply:

- The concrete surface must be flat and level.
 - The weight of the slab should be two to four times the weight of the rotating assembly, including the motor.
- NOTICE** Damage will occur to the fan if the base is not constructed to sustain the loads.
- The overall dimensions of the concrete base should extend at least six inches beyond the base of the fan.
 - Ensure moisture is not accumulating around the fan.
 - Locate the fan as close to the bin as possible, leaving approximately 12" to 18" or more between the fan and bin to allow for routine servicing and inspection.
 - Level the fan by adjusting the appropriate leveling bolt on each support leg so that they all are equally supported by the foundation. This will distribute the weight of the fan evenly.

NOTICE To prevent vibration damage, adjust the leveling bolts on each support leg so that fan is level and all legs are equally supported by the foundation.

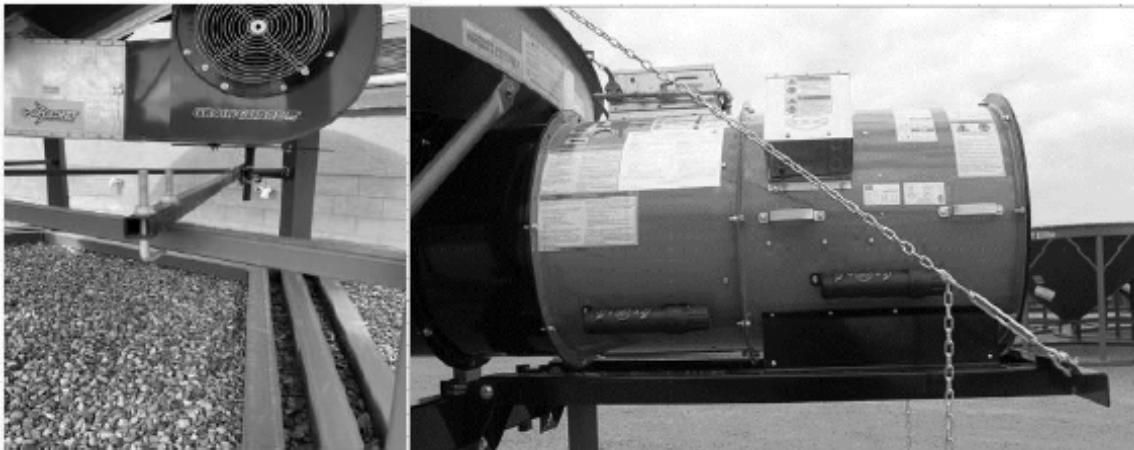

3.4. Mounting the Fan on a Hopper Bottom Bin

To install the fan on a hopper bottom bin:

- Mount the fan on a fan support that is designed by the manufacturer for this application.

Note

Damage will occur to the fan if not properly supported.

3.5. Electrical Connection

Important

Wiring must be completed by a qualified electrician in accordance with all applicable local codes and standards. Provisions of the local electrical code take precedence over the requirements stated in this manual.

- The aeration fan is not suitable for use with solid-state speed controls.
- Voltage, amperage, and rpm are located on the specification plate on the fan housing.
- A wiring diagram is located on the inside of the fan electrical box lid.
- Use a separate circuit from the distribution panel for the fan.
- Installing a time-delayed circuit breaker will allow for a higher tolerance to the motor start-up current (minimum requirement is 2.5 times the maximum running amperage on motor nameplate). Check with your local electrical code for more details.
- Install an independent disconnect switch to isolate the fan from the electrical supply. The switch should be near the fan and must be capable of being locked out by maintenance personnel while servicing the unit.
- Ensure proper cable gauge between the power source and the fan unit. See [Table 2 on page 22](#).

Note

Connecting the incorrect cable gauge will result in low voltage supply to the motor, causing premature failure.

Table 2. Conductor Sizes

HP	Phase	Motor Volts	Recommended Conductor Sizing (AWG) for Various Motor to Transformer Distances				
			100 ft	150 ft	200 ft	300 ft	500 ft
3	1	230	10	8	6	4	2
		230	12	10	8	6	2
	3	460	14	12	10	8	6
		575	14	12	10	10	8
5	1	230	6	4	4	2	0
		230	10	8	8	6	4
	3	460	12	12	12	10	8
		575	14	14	14	14	12
7.5	1	230	6	4	3	2	0
		230	8	6	6	4	2
	3	460	12	12	12	10	8
		575	14	14	14	12	10
10	1	230	4	3	2	0	000
		230	6	4	4	3	1

		460	4	2	2	1	
		575	6	4	4	2	
50	3	230	1	0	000	0000	Consult Electrician
		460	4	2	1	00	
		575	4	3	2	0	

Note

All electrical connections and wiring must follow all applicable local codes and standards.

3.6. Testing

Inspect the installation prior to starting the fan for testing.

Important

Make sure there is at least 24 inches of grain in the bin when testing the fan.

1. Check for any loose items or debris that could be drawn into the fan or dislodged by the fan discharge. Check the interior of the fan as well.
2. Ensure that the fan inlet is not obstructed or restricted in any way.
3. Ensure guards are in place.
4. Quickly start and stop the fan to check for proper airflow into the bin.

 **WARNING** Transition and guards / inlet screen must be fully installed or serious injury could result.

5. Start the fan and check for unusual sounds or excessive vibration (see [Section 6. – Troubleshooting on page 29](#)).
6. Do not run the fan for more than a few seconds if the transition is not fully installed.

4. Operation

Understand how to operate the aeration fan safely and effectively.

4.1. Operation Safety

-  **WARNING**
- Ensure appropriate safety accessories are installed. Selection and use of safety accessories for the specific installation is the responsibility of the customer.
 - Keep away from fan impeller/blade; high suction can pull a person toward the inlet. Contact with an unguarded impeller/blade will cause severe injury.
 - Keep inlet screen and safety guards securely in place at all times.
 - Ensure the fan inlet, outlet, bin floor ductwork and roof vents are not plugged with any foreign material.
 - Do not operate the fan if there is excessive vibration or noise.
 - Ensure that electrical cords are in good condition; replace if necessary.
 - Ensure maintenance has been performed and is up to date.

4.2. Start-Up and Break-In

Before operating the fan, perform a visual inspection, see [Section 5.3 – Maintenance on page 28](#).

1. Ensure that the fan is properly attached to the grain bin and properly supported. Refer to Installation section.
2. Ensure that the fan inlet is not obstructed or restricted in any way.
3. Open the bin roof vents.
4. Turn on power to fan.
5. **For 230V Models:** Move the toggle switch to the START position (this is the spring-loaded or momentary position of the switch).
6. **For 460V/575V Models:** Press the green START button and hold momentarily until fan starts. The fan should continue to run once green button is released.
7. If the fan does not start or if it stops running, refer to [Section – Troubleshooting on page 29](#).
8. During the first few minutes of operation, ensure that the unit is running properly and not vibrating excessively.

Continual use of a vibrating fan will cause premature failure of the motor and bearings. It will also cause metal fatigue in the fan wheel assembly and fan housing.

9. Bolts and nuts should be rechecked after eight hours and again in two weeks of operation.

4.3. Roof Vents

Roof vents should be sized at 1 ft² for every 1000 ft³/min of air to minimize condensation.

Roof vents may become partially or fully blocked with ice in temperatures below freezing with high humidity conditions. Discontinue operation of fan in these conditions or add supplemental heat.

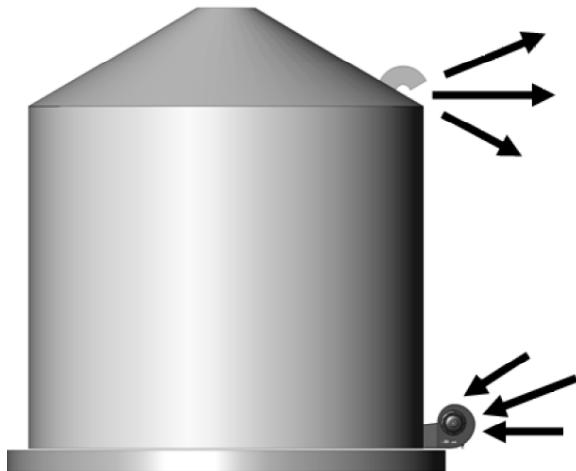

NOTICE Operating a fan without adequate roof venting or with partially or fully blocked vents can cause damage to the bin roof.

4.4. Fan Rotation and Orientation

The fan is designed to provide air flow in one direction. Operate with positive pressure with air entering through the bottom and exiting out the top, see [Figure 11](#) below.

The air flow direction is labeled on the fan's housing. Never attempt to reverse the air flow by reversing the fan's wiring. Reversing the wiring to change the airflow will result in the airflow being significantly reduced and can damage the roof. Operating with negative pressure is not covered by warranty.

Figure 11. Positive Pressure Airflow

4.5. Emergency Stop

Foreign Object Obstruction

1. Immediately shut down the aeration fan and lock out the power source.
2. Remove the obstruction.
3. Inspect the inlet screen and fan impeller assembly for damage. Repair or replace as required.

Excessive Fan Vibration or Noise

1. Immediately shut down and lock out the power source.
2. Inspect the inlet for an obstruction, remove if necessary.
3. Restart the aeration fan to see if it is still vibrating excessively. If it is, immediately shut off the fan and lock out power source.
4. Contact your local dealer for inspection of the fan impeller assembly.

4.6. Shutdown

- 1. **For 230V Models:** Move the toggle switch to the OFF position.
- 2. **For 460V/575V Models:** Press the red STOP button.
- 3. When shutting down the fan for extended periods of time, shut off the power at the disconnect/source to prevent any inadvertent start-up of the fan.
- 4. Close bin roof vents.

NOTICE DO NOT close roof vents until fan has been turned off, or roof damage may occur.

4.7. Extended Shutdown

1. Ensure that all foreign material is removed from the fan.
2. Inspect electrical wires and repair if necessary.
3. Inspect all parts and components and repair or replace as required.
4. Cover the fan with a tarp to keep out foreign material and protect it from weather conditions.
5. Ensure the storage area is in a clean and dry location.

5. Maintenance

Follow maintenance safety procedures to keep the aeration fan in good condition and prevent downtime.

5.1. Maintenance Safety

WARNING

- Keep components in good condition. Follow the maintenance procedures.
- Ensure the service area is clean, dry, and has sufficient lighting.
- Do not modify any components without written authorization from the manufacturer. Modification can be dangerous and result in serious injuries.
- Shut down and lock out power before maintaining equipment.
- All electrical maintenance must be performed by a qualified electrician in accordance with all applicable local codes and standards.
- After maintenance is complete, replace all guards, service doors, and/or covers.
- Use only genuine AGI replacement parts or equivalent. Use of unauthorized parts will void warranty. If in doubt, contact AGI or your local dealer.

5.2. Maintenance Schedule

Follow the Maintenance Schedule below. Keep good records of the hours the aeration fan has been operated and the maintenance performed.

Daily:
Section 5.3 – Visually Inspect the Aeration Fan on page 28
Annually or as needed:
Section 5.4 – Cleaning the Fan Blade and Housing on page 28
As Required:
Section 5.5 – Servicing and Part Replacement on page 28

5.3. Visually Inspect the Aeration Fan

Check the following during a visual inspection:

1. Ensure all guards are in place and in good working order.
2. Examine the aeration fan for damage or unusual wear. Make sure the impeller is clean, undamaged, and rotates freely.
3. Ensure motor is grounded through the ground lug attached to the control box.
4. Be sure all safety decals are in place and are legible.
5. Check that the air intake area is free of obstructions.
6. Inspect all moving or rotating parts to see if anything has become entangled in them. Remove any entangled material.
7. Check all components. Replace damaged or worn parts before using the aeration fan.
8. Check tightness of bolts/nuts, fasteners, and hardware. Ensure the motor mounting and impeller hub bolts are torqued to 30 ft/lb.

5.4. Cleaning the Fan Blade and Housing

1. Check the housing and fan blade regularly for debris buildup drawn in by the airstream.
2. It is not recommended that the inlet screen be removed for cleaning. If the screens or inlet cones are removed, they must be installed in the exact same place.
3. Use a pressure washer or hose to remove debris from housing and blades.

5.5. Servicing and Part Replacement

If there is any service/part replacement work required on the fan, it is important to reinstall the fan impeller assembly in exactly the same position.

NOTICE

Failure to reinstall the fan impeller in the same position will cause premature wear, vibration, and part failure.

Ensure the edge of the inlet cone (fit into the impeller) covers approximately 1/2 of the lip on the face plate of the impeller. See [Section 7.6 – Fan Impeller Placement](#) on page 63.

WARNING

Failure to reinstall the inlet cone and screen before operating the fan may result in serious injury or death.

6. Troubleshooting

Find causes and solutions to common problems that can be encountered.

WARNING Shut down and lock out all power sources before diagnosing any of the causes or attempting any of the solutions below.

The following section covers some causes and solutions to some of the problems that may be encountered.

If you encounter a problem that is difficult to solve, even after having read through this section, please contact your local dealer or distributor or, go online at <https://www.agrowth.com> for additional troubleshooting tips. You may also contact an AGI product specialist at 1-800-565-2840. Before you contact them, please have this manual and the serial number available.

Problem	Cause	Solution
Fan does not run	Blown fuse / tripped breaker.	Replace fuse or reset breaker.
	No power at fan.	Turn power on at source.
	Defective wiring / connection.	Follow wiring diagram and check for broken wires and loose connections.
	Incorrect wire size.	Refer to wiring sizing charts for correct size.
	Defective motor.	Replace if necessary.
	Defective magnetic contractor.	Check contractor for proper function.
Fan runs for a short time then shuts off.	Undersize wiring	Refer to wire sizing charts for correct size.
	Low line voltage at fan.	If wire size is correct, call power company.
	Overload devices tripping.	Let overload reset then retry; if symptoms persist check amperage draw. If high, correct, if not, thermal overload could be tripping. Check that setting on thermal overload matches the Full Load Amperage (FLA) on rating plate of motor. Adjust the setting on the overload to match the FLA of the motor if they are not the same.
	Defective magnetic contractor.	Replace the contractor.
	Defective start / stop switch.	Replace switch.
	Fan impeller rubbing the inlet cone.	Turn off power to fan; rotate impeller slowly to see if impeller is rubbing the housing. If yes, adjust inlet cone positioning to obtain equal clearance all around the impeller.
Fan making ticking sound.	Motor bearing defective.	Service the motor at an authorized service shop.
	Fan not level or poorly supported.	Level or support the fan. See Installation section.
	Dirt or foreign material buildup on impeller.	Clean the impeller / blade.
Fan vibrates excessively.	Fan not level or poorly supported.	Level or support the fan. See Installation section.
	Dirt or foreign material buildup on impeller.	Clean the impeller / blade.

Problem	Cause	Solution
	Bent motor shaft.	Replace the motor.
	Improperly mounted impeller.	Replace, or have the impeller rebalanced.
	Broken or cracked fan blade.	Replace the blade.
	Impeller out of balance.	Replace or have the impeller rebalanced.
	Lose motor mounting bolts.	Tighten the bolts. Torque to 30 ft/lb.
	Motor out of balance.	Call your dealer / AGI for assistance.
No power (110V) at Monitor terminal.	Transformer faulty/	Check the voltage (HOV) on outlet side of transformer. If no power, then replace.
	Circuit Breaker tripped or faulty.	Reset Breaker or replace if faulty.
No power (110V) at Heater terminals.	Transformer faulty.	Check for voltage (110 V) on outlet side of transformer. If no power, then replace.
	Circuit Breaker tripped or faulty.	Reset Breaker or replace if faulty.
	Auxiliary Contacts faulty.	Check for Voltage (110 V) going through Auxiliary Contact when Motor Contactor is energized. If no power, then replace.

7.3. How to Read Electric Motor Nameplate

The information from the motor nameplate is needed for motor repairs and replacement, or the purchase of parts for a motor. The nameplate contains information including the voltage, amp ratings, phase, RPM, service factor, and more. Below is a list of the main information you will likely need to service or determine specifications.

Voltage

Shown on the above example as **V 208-230//200** (208/230 is for 60 hz and 200 is for 50Hz). Motors are designed to run at the voltage listed on their nameplate. Some 3 phase motors are dual rated, and are designed to run at 230V and 460V. Typically, motors have an operating tolerance of $10\% \pm$ of the rated voltage on the nameplate (consult manual). This means that a motor designed to run on 230V can run at 208V (or 240V). Motors should not run outside their designated voltage range or damage may occur.

Full Load Amp Rating

Shown on the above example as **A 33.0-30.3//31.0** (33.0-30.3 is for 60Hz and 31.0 is for 50Hz). The full load amp (or FLA) rating is the rate at which a motor will consume power at 100% of rated load, and at rated and balanced voltage. This number is extremely important. The wiring, starter, circuit breaker, and thermal overloads are all sized based upon the full load amp rating.

Phase

Shown on the above tag as **PH 1**. The motor will be rated for single phase (PH1) or three phase (PH3).

RPM (Speed)

Shown on the above example as **RPM 3530//2935** (3530 is for 60Hz and 2935 is for 50Hz). The RPM listed on the nameplate is the shaft speed for the motor. This number represents what the manufacturer has engineered the motor will rotate at under full load with the set frequency listed on the nameplate.

Service Factor

Shown on the above example as **SF 1.25//1.00** (1.25 is at 230V and 1.00 is at 208V). Motors are designed to handle a temporary increase in demand. Service factor represents the motor's ability to handle these temporary demand increases. The service factor is expressed as a decimal. If you do not see a service factor rating on the motor nameplate the service factor is typically 1.00. Motors running on a VFD (even at 60Hz) will lose service factor and be rated at 1.00.

SFA

Shown on the above example as **SFA 38.0**. It can only be factored in at 230V. SFA is the maximum amps the motor can run at 230 volts.

Frequency

Shown on the above example as **HZ 60/50**. Frequency is directly related to the motor's speed (60Hz = 60 cycles per second). In North America, the standard frequency is typically 60Hz. Outside North America 50Hz is often the standard.

Model Number

Shown on the above example as **MODEL: ED503-2160**.

Serial Number

Shown on the above example as **1029879767** (far left edge of the motor tag).

Enclosure Type

Shown on the above example as **ENCL ODP**. Common enclosure types are Open Drip-Proof (ODP) and Totally Enclosed Fan Cooled (TEFC).

ODP – An Open Drip-Proof motor is an open enclosure that allows air to flow freely inside around the windings. It is protected from drops of liquid falling downward from a 0 to 15 degree angle, but is not waterproof.

TEFC – A Totally Enclosed Fan Cooled enclosure prevents air from flowing freely into the motor. The motor is cooled by an internal fan that blows air on the outside of the enclosure. A TEFC is not fully air or water tight. Outside contaminants can enter the motor, but this typically doesn't interfere with normal operation.

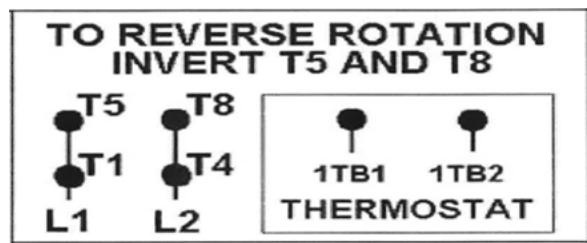

Code

Shown on the above example as **CODE H//J**. H is for 60Hz and J is for 50Hz AC motors that are started at full voltage will draw a greater current (amps) than during normal operations. This is commonly referred to as inrush current or starting current. These codes represent a range of inrush current. To find approximate inrush current for the motor, match the code letter on the motor nameplate with the corresponding approximate mid-range value on the chart; multiply the mid-range value and the full load amp rating on the motor nameplate.

Code Letter	HP Inrush Multiplier	Mid-Range Value
A	Running Amps x 0.00–3.14	1.6
B	Running Amps x 3.15–3.54	3.3
C	Running Amps x 3.55–3.99	3.8
D	Running Amps x 4.00–4.49	4.3
E	Running Amps x 4.50–4.99	4.7
F	Running Amps x 5.00–5.59	5.3
G	Running Amps x 5.60–6.29	5.9
H	Running Amps x 6.30–7.09	6.7
J	Running Amps x 7.10–7.99	7.5
K	Running Amps x 8.00–8.99	8.5
L	Running Amps x 9.00–9.99	9.5
M	Running Amps x 10.00–11.19	10.6
N	Running Amps x 11.20–12.49	11.8
P	Running Amps x 12.50–15.99	13.2
R	Running Amps x 14.00–15.99	15

Voltage Connection (Strapping) Diagrams

Connection diagrams display information about connecting the motor to the proper voltage. Some motors are designed to handle multiple voltages, so there may be more than one diagram. Carefully select the correct diagram. Incorrectly connecting wiring will damage your motor.

7.4. Fan Motor Specifications

7.4.1 GGF Fan Motor Specifications

FLA (Full Load Amps) represents the amount of current the motor is designed to draw at the rated horsepower. **SF (Service Factor)** is a measure of periodically overload capacity at which a motor can operate without damage.

SFA (Service Factor Amps) represents the amount of current the motor will draw when running at the full Service Factor.

Note

Minimum Breaker size needed is 2.5 times the Full Load Amps found on the motor plate.

Table 16. GGF Fan Motor Specifications

Fan	Motor	Voltage	Phase	FLA	SF	SFA	Overload Trip Amperage	Minimum Breaker Size

7.6. Fan Impeller Placement

To ensure the fan is running at peak efficiency, the impeller and cone placement is critical. If the impeller is not in the correct position the fan may cut out as it is running into high amps, or it may not be getting the full amount of airflow the fan can produce. See Figures [Figure 30 on page 63](#), [Figure 31 on page 64](#), and [Figure 32 on page 64](#) below.

Table 24. Impeller Placement for AGI Fans

		High Speed Fan Impeller Placement

Measurement without screen and cone	11-7/8"	14-15/16"	13-3/4"	15-5/16"	17-3/16"	
HP	25	30	40	50	-	
Measurement with screen and cone	18-11/16"	17-1/2"	19-3/4"	19-3/4"	-	
Measurement without screen and cone	18-3/8"	17-1/8"	19-7/16"	19"	-	

For High Speed Fans, Low Speed Fans, or Inline Fans

Make sure the +/- 1/16" of the values stated above the impeller is in the correct position. See diagram below for the correct impeller and cone overlap positioning.

Figure 30. Correct Impeller and Cone Overlap Positioning

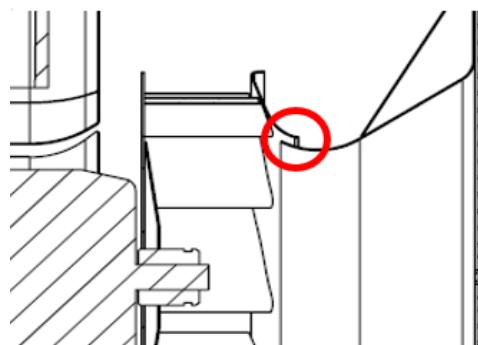

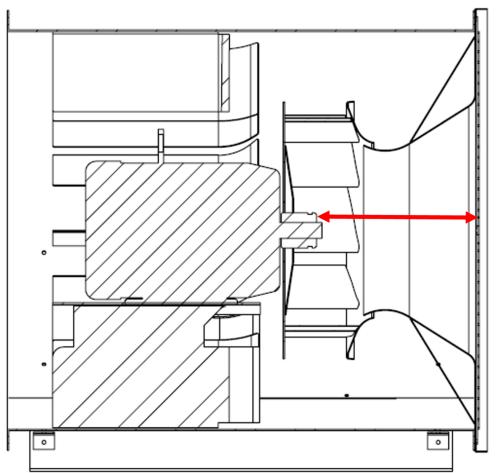

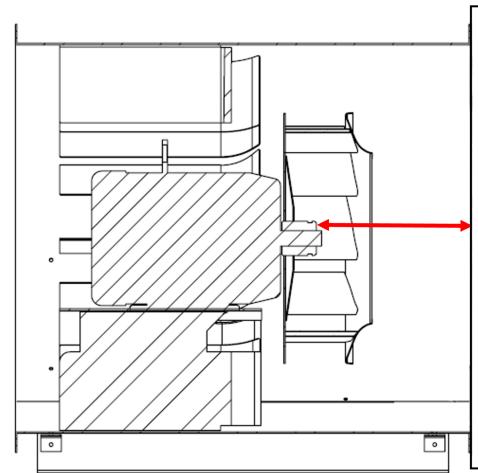

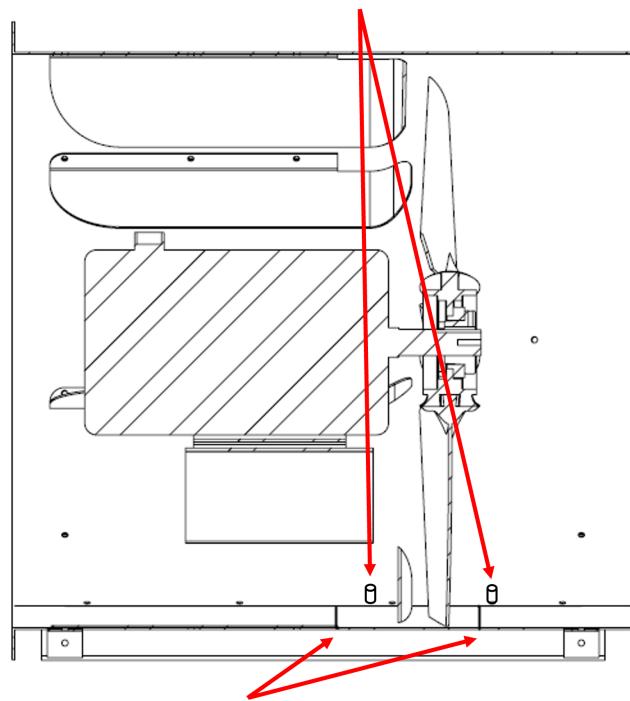

Figure 31. Measurement With Screen and Cone**Figure 32. Measurement Without Screen and Cone****For Axial Fans**

1. Once the blade has been replaced, make sure to spin the blade by hand to see if there is any rubbing or binding from the housing sides.
2. When replacing a fan blade on an Axial, make sure the blade is lined up between the body cut out on the inside of the fan.

If your Fan Blade is aluminum it will need to line up inbetween the nutserts that stick out on the inside of the fan

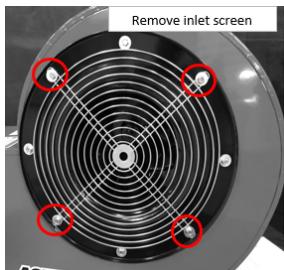

If your Fan Blade is plastic it will need to line up inbetween the body cut out on the inside of the fan

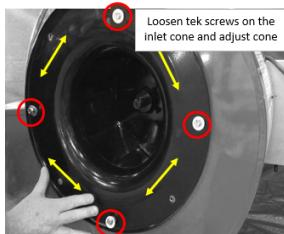

7.7. Fan Inlet Cone Alignment

To get the most efficient airflow from the fan, and to prevent damage of fan components, make sure the fan impeller is not rubbing against the inlet cone, and that there is an even gap between. Adjust the inlet cone as needed.

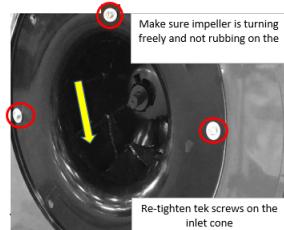

1. Remove inlet screen.

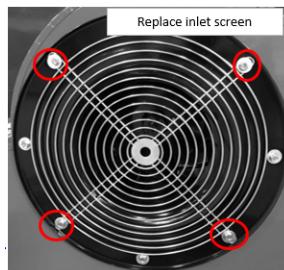

2. Loosen tek screws on the inlet cone and adjust cone.

3. Make sure impeller is turning freely and no rubbing. Re-tighten tek screws on the inlet cone.

4. Replace inlet screen.

8. Warranty

Except as expressly provided in this agreement, AGI Nobleford (hereinafter called the Manufacturer) excludes all express or implied warranties, conditions, and obligations of the Manufacturer, whether statutory or otherwise, concerning the quality of the units or their fitness for any purpose.

Under no circumstances will the Manufacturer be liable for any kind of special, consequential, indirect, or incidental damages resulting from the use of its products, nor shall the Manufacturer's liability ever exceed the selling price of the product.

The Manufacturer warrants their products as follows:

1. Goods free from defect: The unit shall be free from defects in materials and workmanship and shall operate properly in accordance with industry standards when employed in normal usage, provided the unit has been properly installed for a period of: three (3) years from the original date of purchase.
2. The warranty does not include:
 - Routine replacement of parts due to normal wear and tear arising from use.
 - Any defect attributable in whole or in part to misuse or improper installation.
 - Any damage or defect attributable to repair of the unit outside the Manufacturer's facilities or those of an authorized dealer, or the installation of unapproved parts on the unit in the Manufacturer's judgment to affect it's performance or reliability, or which has been subject to misuse, negligence, or accident.
 - Any damage attributable to accident or to lightning, power surge, brownout, leaking, damage, or connection to a power source having a greater rating than that specified in the unit specifications.
3. Repair or Replacement: Where any part of the unit fails during normal usage during the warranty period specified, the Manufacturer, or authorized dealer of the Manufacturer, shall repair or replace the defective part of the unit with a new or factory reconditioned part, such replacement or repair to be made without charge for parts or labor, F.O.B. the Manufacturer.
4. Warranties shall not apply to any product made by the Manufacturer that has not been operated in accordance with the Manufacturer's printed instructions or shall have been operated beyond the rated capacity of the product or a use not intended.
5. The Manufacturer reserves the right to make design or specification changes at any time, without contingent obligation to purchasers of products already sold.

AGI is a leading provider of equipment solutions for agriculture bulk commodities including seed, fertilizer, grain, and feed systems with a growing platform in providing equipment and solutions for food processing facilities. AGI has manufacturing facilities in Canada, the United States, the United Kingdom, Brazil, South Africa, India and Italy and distributes its products globally.
