

VELOCITY TRADINGVIEW SETUP GUIDE

A practical guide for building a clean, repeatable TradingView workspace.

1. CHART

Use a 5-minute primary chart for intraday execution. Keep the chart clean and prioritize price action, VWAP, volume, and clearly marked key levels.

2. VWAP

Use VWAP as a core intraday reference for trend, reclaim, rejection, and trade-location decisions.

3. VOLUME

Keep volume visible beneath price. Look for participation to confirm breakouts, reclaims, and momentum.

4. KEY LEVELS

Mark premarket high/low, previous-day high/low, major support/resistance, and important breakout levels.

5. INDICATORS

Keep only indicators that serve a defined purpose. Avoid filling the chart with redundant signals.

6. WORKSPACE

Use a consistent layout so the same information is available every trading session.

QUICK CHECK

CHECK	READY
CHART	[]
VWAP	[]
VOLUME	[]
KEY LEVELS	[]
INDICATORS	[]
WORKSPACE	[]

DISCIPLINE RULE

Keep the workspace consistent. Change settings only when there is a defined reason to improve the process, and always test changes before relying on them in live trading.
