

VELOCITY SCANNER SETTINGS

A starting framework for finding liquid, active stocks that may fit an intraday momentum workflow.

1. PRICE

Use a practical price range that supports liquidity and tradeability. Adjust to the market environment rather than forcing a fixed range.

2. VOLUME

Prioritize meaningful current-day volume and avoid names that cannot support clean entries and exits.

3. RELATIVE VOLUME

Look for unusual participation compared with normal activity. A higher RVOL can help surface stocks receiving attention.

4. GAP %

Use gap percentage to identify stocks moving before the open, then evaluate whether the move has a catalyst or continuation context.

5. FLOAT / LIQUIDITY

Use float and liquidity as filters, not automatic trade signals. Prioritize names that can be traded efficiently.

6. MOMENTUM

Combine price change, volume, relative strength, catalyst/context, and key levels. The goal is to find quality candidates early—not simply the largest percentage gainers.

GAP %	☐
FLOAT / LIQUIDITY	☐
MOMENTUM	☐

DISCIPLINE RULE

Keep the workspace consistent. Change settings only when there is a defined reason to improve the process, and always test changes before relying on them in live trading.
